

THE
ILLUSTRATED
GLOBE ENCYCLOPÆDIA
OF
UNIVERSAL INFORMATION.

EDITED BY

JOHN M. ROSS, LL.D.

SENIOR MASTER OF ENGLISH LANGUAGE AND LITERATURE, HIGH SCHOOL
OF EDINBURGH.

VOL. I.

A—CANNA.

A. FULLARTON & CO
LONDON, EDINBURGH, & DUBLIN.

1881.

PREFACE.

THOUGH several Encyclopædias of high reputation have already been issued in Great Britain, most if not all of which are seeking to keep themselves abreast of the age by new editions or extensive changes, yet it can hardly be doubted that a work which is untrammelled by the fetters of a previous issue has considerable advantages over its predecessors in regard to the treatment of all important topics. There must always be a temptation, even in the newest editions, to retain as much as possible of the old matter, when not absolutely incorrect in statements of fact, though the general conception of the subject may be faulty, or even antiquated. On the other hand, an entirely fresh work leaves an editor and contributors free to make the amplest use of the most recent research, and to give effect to that change in the relative proportions of things which time infallibly brings about. A new Encyclopædia, therefore, may be said to have a reason for its existence, if it honestly tries to avail itself of the natural advantages of its position. It is believed that in some measure the GLOBE ENCYCLOPÆDIA will be found to have done this. In offering the first volume for the consideration of the public, it may be thought necessary or desirable that the Editor should briefly state what kind of work has been projected, and in what particular way it seeks to win a place for itself.

The time for elaborate and costly Encyclopædias, in the opinion of many, is gone by. Whether this be so or not, it is absolutely certain that there is an ever-increasing tendency on the part of the public to demand *the greatest amount of information in the smallest possible compass*. The necessity for knowing something of everything becomes more imperative every day. No man can now read a newspaper for any length of time without being brought face to face with a multitude of details about all questions of interest to the human race; and he is often unable to grasp the meaning of what he reads for want of additional knowledge or explanation. Much may not be necessary, but some is indispensable. This is what an Encyclopædia should give him. The more succinct the information, the better,—always assuming that the succinctness is not mere triviality and poverty. The editor of the GLOBE ENCYCLOPÆDIA has tried to produce a work from which superfluous elements should be strictly excluded, but which, at the same time, should embody the results of the most exact and careful research. Its limits make it, of course, impossible that an exhaustive treatment of subjects should be attempted, but it is hoped

that what is stated under any heading will in general be found clear, correct, and in harmony with the best knowledge or the best teaching on the point, so that readers, at any rate, shall not be misled, or need at some future time to unlearn and cast aside what they have acquired. In all the important parts of the work, the *GLOBE ENCYCLOPÆDIA* intends to carry out more thoroughly than any of its predecessors the practice of referring to authorities on the matters discussed or described. The meaning of names of places, &c., always interesting and often suggestive, has been given with a fulness, and, it is believed, with an accuracy, not hitherto aimed at. Although the articles, as a rule, are extremely condensed, it must not be supposed that no room has been left to present substantial information. A glance at the great departments of Geography, Biography, History, and General Literature, will show that the *GLOBE ENCYCLOPÆDIA* is designed to be as complete in treatment as much larger works. Whenever fresh and valuable statistics regarding foreign countries and great towns were obtainable from Consular reports or other sources, they have been used without stint. The Editor's previous experience has taught him where compression may be most judiciously exercised; and he believes that in five or six volumes he will be able to produce an *Encyclopædia* which, as a book of reference, will effectually serve the purpose of the public.

THE

ILLUSTRATED

GLOBE ENCYCLOPÆDIA.

the first letter in nearly every alphabet, represents in English four distinct sounds, heard in *pale, pan, rather, gall*. The first of these is its name-sound in English, but the third is probably its original and proper sound, and is certainly that by which it is named in all other languages. It is the purest and fullest sound in human speech, and the element of greatest strength both in the earlier and later forms of language. By the combination of *a* with the other two fundamental vowels, *i* and *u*, have been produced in the Aryan tongues the diphthongs *ai* and *au*, which in turn have given rise to *e* and *o*; and hence the most delicate shades and modifications of the primary meanings of verbal roots. See ALPHABET.

A, the sixth diatonic, or the tenth diatonic-chromatic step of our modern scale starting from *C* as the key-note; and the note sounded by the third string of the violin, when open *A* used to be the lowest or first note of the scale, but by the addition of *G*, *F*, *E*, *D*, and *C*, it became the sixth of *C* major.

A 1. In Lloyd's Register (q. v.) this mark is appended to each British and foreign trading vessel whose original build and age entitle it to first-class rank; consequently to insure at lowest rates. The mark *A*, which indicates the first-class character of the ship itself, may be qualified by the figure *2*, to indicate that its gear is not first class in quality or quantity. The character '*A*' is assigned for a term of years with specific stipulations for periodical surveys, repairs, &c. The original period may be extended under certain conditions. When the letter is written in red, it indicates that the vessel is still fairly trustworthy for general merchandise and long voyages, but too old to be ranked as first class. '*Æ*' in black denotes a third-class vessel, good only for a short voyage; '*E*,' that the vessel is only fit for goods which cannot be injured by being made wet by the sea. '*I*' places the same limit on the vessel's carrying power.

Aa, a word probably of Celtic origin, but allied to the old Ger. *aha*, Gothic *ahva*, Latin *aqua*, and Sansc *ap* or *ab*, 'water.' It is, either with or without additions, the name of numerous rivers and streams in Germany, Switzerland, north-eastern France, Holland, the Baltic Provinces, and Denmark (where, however, *Aa* is pronounced *o*). In parts of Low Germany, such as Hanover, Holstein, &c., the form *Au* and *Aue* appears, while in High Germany the prevalent term is *Ach* and *Aach*.

As'ohen, the German name for Aix-la-Chapelle (q. v.)

Aal, the name of a red dye obtained from the roots of *Morinda citrifolia*, a small tree, native of Central India; it is used

in giving a permanent red colour to the native cotton cloth worn by the water-carriers of India, and to turbans.

Aal'borg (pron. Olborg, i.e. Eel-town), an important town in Jutland, with a fine haven, on the Lymfjord, about 13 miles from its mouth, the seat of a Lutheran bishop, has a public library of 16,000 volumes. Its manufactures, chiefly in leather, sugar, and tobacco, are rapidly increasing. *A.* is capital of a province of the same name. Pop. (1870) 11,721.

Aar, the largest purely Swiss river, rises in the glaciers of the *Grimsel*, and joins the Rhine at the village of Coblenz, after a course of nearly 200 miles. It passes Interlachen, Thun, Berne, Solothurn, and Aarau. While still a mountain torrent the *A.* forms the Falls of Handeck, 200 feet high.

Aargau (Fr. Argovie), a canton of Switzerland, so called from the river *Aar*, by which it is watered. The Rhine forms its north boundary, separating it from Baden. *A.* is a region of high hills and fertile valleys; rich in agriculture, with considerable cotton, silk, and leather industries. Area about 530 sq. miles; pop. (1870) 198,873, more than half being Protestant. The town is *Aarau*; pop. 5449. Near Scanzbach, a town of *A.*, is the castle of Hapsburg (q. v.), from which the imperial family of Austria takes its name.

Aarhuus, the most important and populous town in Jutland, lies in a bay of the Kattegat at the mouth of the Mølle-Aa. It is the chief town of a fertile province of the same name, and the seat of a bishop, with one of the grandest Gothic cathedrals in the north. Fishing is the main industry; there are also considerable manufactures. *A.* had the first Christian church in Denmark. Pop. (1870) 15,025.

Aa'ron (Heb. *Aharon*, etymology uncertain), the elder brother of Moses, was a son of Amram and Jochebed. He belonged to the tribe of Levi, and is first mentioned in connection with the divine commission given to Moses to deliver the Israelites from bondage. Ever after he is a prominent figure, though his history shows him to have been more of an orator than a statesman. He is the chief miracle-worker at the court of Pharaoh; he strengthens the hands of his brother in the fight with Amalek; he is left to guide the people when Moses is hidden amidst the clouds of Sinai (when he proved a failure by yielding to the clamour for a return to the Egyptian idolatry), is soon after consecrated to the high priesthood, and is henceforth associated with his brother in the government of the wandering commonwealth. *A.* died, aged 123, at Mount Hor, on the southern borders of Idumæa.

Ab'aca, the name given in the Philippine Islands to a species of *Banana* (q. v.), *Musa textilis*, which yields Manila hemp, a

woody fibre obtained from its leaf-stalks, and imported into Britain for the manufacture of cordage.

Abacus was the name given by the Greeks to an instrument employed for purposes of practical reckoning by children, mathematicians, and astronomers. It is still used in China and Further India, and consists of a frame covered with parallel wires on which counters are strung.—A., in architecture, is the square or oblong tablet which rests on the capitals of columns, and was either rectangular, as in the Doric, Old Ionic, and Tuscan orders, or concave-sided, with acute angles, as in the New Ionic, Corinthian, and Roman.

Abaddon is a Hebrew word signifying the 'abyss' or 'under-world.' In Rabbinical tradition it denotes the lowest depth of Hades or Hell; but in the Apocalypse of St John (ix. 11) it is the name of the angel of destruction, who is represented as king of the demons that rise from the smoke of the bottomless pit.

Abaisé (Fr. 'lowered'), a term used in heraldry to denote that any armorial figure is placed below the centre of a shield. Other French terms have been borrowed by English heralds, as *affronté* (fronting one another), *adossé* (back to back), *aile* (winged), &c.

Abandon. The word has various legal significations corresponding to the popular meaning.

Abandonment, in marine insurance, is the giving up to the underwriter of all claim to the subject saved; the owner consequently requiring payment in terms of his policy. See **INSURANCE**.

Abandonment of Railways. 13 and 14 Vict. makes regulations for winding up of railway companies under warrant of the Board of Trade. See **RAILWAY**.

Abandoning or deserting seamen by captains of merchant vessels is a misdemeanour punishable by imprisonment. See **SEAMEN**.

Abandoning an Action. In Scotch law the 'pursuer' (i.e., plaintiff) may withdraw from an action on close of the record on paying expenses. After the judgment he cannot do so. In England the result is effected by a '*Nolle Prosequi*' in courts of common law. In the equity courts, either the plaintiff or defendant may move the 'dismissal' of the suit. See **ACTION**.

Ab'arim, or **Aborim**, the name of a mountain-range in Palestine east of the Dead Sea and the Lower Jordan, the most famous summits of which are Peor, Pisgah, and Nebo, from the second of which Moses surveyed the promised land, and on the last of which he died. From the language of Deut. xxxiv. 1, we may perhaps infer that Pisgah and Nebo were only separate peaks of the same mountain.

Abatement (Old French, *abatre*, to beat down). The word has various meanings in the law of England, mostly corresponding to its general meaning, as, 'to abate a nuisance'—to take legal steps to put it down; 'to abate an action'—to quash it by an objection, *ipso facto* fatal, as that the plaintiff is an outlaw. 'To abate into a freehold,' means to take possession without a title, to the wrong of the lawful heir.

Abatement, in heraldry, is a mark placed over part of the coat-of-arms of a family, and implies that the wearer has been guilty of some unworthy act. There are different marks for different kinds of offences, as rape, disloyalty, &c., but all are in either one or other of the two disgraceful colours, tawny and sanguine. Few heraldic authorities acknowledge these marks, which must not be confounded with others that denote real diminutions of dignity or rank, such as juniority of birth, removal from the principal branch of the family, &c.

Abat'tis, a kind of intrenchment, consisting of a line of felled trees (Fr. *abat'is*), with their branches pointed towards the enemy, whose advance it greatly impedes.

Abattoir (Fr. *abat're*, to fell), a slaughter-house. The use of the word has passed into England from France, where, by decree of Napoleon in 1807, public places, with proper sanitary arrangements, were first appointed for killing cattle. It was not, however, till 1818 that the use of private slaughter-houses was discontinued by the Parisian butchers. Abattoirs have been established in other towns in France, and in Brussels

and Mantua. In Great Britain there are now a good many; more would be required but for the fact that the meat supply of our towns is largely derived from cattle killed in the country. In London some of the old slaughter-houses still exist, under sanitary inspection. In Edinburgh an excellent abattoir was erected by the town council in 1851.

A Battuta. See **BATTUTA**.

Abau'zit, Firmin, savant and theologian, was born at Uzès in Languedoc in 1679, and died at Geneva in 1767. Though his parents were Huguenots, it was only by being sent to Geneva that he escaped an education into Catholicism, owing to the revocation of the Edict of Nantes. He was an eager and successful student, and in his twentieth year was intimate with Newton and Bayle. He aided in the French version of the New Testament (1726). His orthodoxy has been challenged, and his leanings seem to have been Unitarian. Rousseau has a fine *éloge* on him in the *Nouvelle Héloïse*. An imperfect edition of his works was published at London in 1773.

Abba, the Chaldaic form of the Hebrew word *ab*, 'father,' is used in the New Testament as a designation of God, but in ecclesiastical language has become a title of honour among men. In the Western Church, under the Latin form *abbas* (whence are derived the Fr. *abbé*, Eng. *abbot*, Ital. *abate*, Ger. *abt*), it officially denotes the ruler of a monastery, but among the Syrian and Coptic Christians it is given to bishops and patriarchs. In Abyssinia, however, the head of the Ethiopic Church is called *abouna*, 'our father,' while the simpler form A. is reserved for learned scribes.

Abbadie, Antoine-Thomson and Arnould-Michel d', born at Dublin, the first in 1810, the second in 1815, French explorers in Abyssinia from 1837 to 1845. Their papers contributed to the French Geographical Society bear specially upon questions of language and race. Antoine commenced in 1860 *Géologie d'une Partie de la Haute Ethiopie*. Arnould published in 1868 *Douze Ans dans la Haute-Ethiopie*.

Abbandonament'e, a term in music denoting self-abandonment.

Abbas I, surnamed the Great, a Persian monarch of the Soffi dynasty, was born in 1557, and ascended the throne on the assassination of his brother, 1589. As a conqueror and governor his career was brilliant. In ten years (1590–1600) he subdued Ghilan, Mazanderan, Afghanistan, and part of Tartary. Then turning his arms against the Turks, who had long been fomenting discords in his western provinces, he inflicted on them a terrible defeat at Iassorah in 1605, and in the succeeding years extended his conquests beyond the Euphrates. In 1611 he dictated a treaty of peace to the Turkish Sultan Achmet I., by which the possession of Shirvan and Kurdistan was guaranteed to Persia. His fame now began to spread over Europe, and his court, which he fixed at Ispahan, was thronged with embassies both from eastern and western states. The envoys of the Great Mogul, and the lesser princes of India, encountered those of England, Russia, Spain, Portugal, and Holland. All were amazed at his splendour, and charmed with his hospitality, but none could forecast his policy. One of the later schemes of his life, the wresting of the isle of Ormuz (1622) from the Portuguese, by the help of the English, was the ruin of that island's prosperity. His domestic life was not a success. From distrust or jealousy he killed one son, put out the eyes of two others, and poisoned a number of his khans, in whose dying agonies he found a horrid pleasure. Remorse hastened his own end, which took place in his palace at Ferahabad, 28th January 1628. Abbas was an ardent Shi-ite, and worked astutely on the religious zeal of his countrymen, who, in consequence, venerate his memory, and believe that he even worked miracles.

Abbasides, a Moslem dynasty which obtained the califate at Bagdad in 750 A.D., and held it till 1258 A.D., when it was overthrown by the Mongols. It takes its name from Abbas, the uncle of Mohammed, who for awhile was a strenuous opponent of the Prophet's pretensions, but after the battle of Bedr (624 A.D.), where he was taken prisoner, became a convert to the new religion, and used all his wealth and influence to make a party for Mohammed among the powerful tribe of the Koreish, to which they both belonged. A. died in 652 at the great age

of 86. Abul-Abbas, the great-grandson of Abbas, was the first of the Abbaside dynasty, and Motasem was the last.

Abbas-Mirza, a Persian prince, born in 1783, was the third son of the Shah Feth-Ali, but was preferred by his father to his two elder brothers, and his rights as heir-presumptive to the throne were guaranteed by Russia in the treaty of Gulistan in 1814. A soldier from his youth, he led the Persian troops in the disastrous campaigns against Russia of 1803, 1813, and 1826, in the second of which his enemies made themselves masters of the Caspian, and in the last of which they snatched from him Persian Armenia, over which he ruled as his father's viceroy. A treaty of peace followed (1828), and Russian envoys were sent to Teheran, but some of these being murdered in a popular tumult, A. was sent to St Petersburg by his father as a sort of hostage to prevent an outbreak of hostilities between the two countries. He was received with distinction, and returned to his own country loaded with presents. He died in 1833.

Abbate, Niccolo Dell, or **Niccolo Abati**, a painter, born at Modena in 1509 or 1512, died at Paris in 1571. His best known works—viz., the frescoes for the castle of Fontainebleau—were destroyed in 1738 in the course of some alterations on the building. A.'s influence is visible in the art of the latter half of the 16th c. Several artists of lesser note have sprung from the A. family.

Abbé, the French form of the Latin *Abbas*, originally denoted the ruler of a monastery, but since the concordat between Pope Leo X. and Francis I. (1516) its meaning has changed. That concordat secured to the French monarch the right to nominate 225 *Abbés Commendataires*, and, in consequence, many careless and idle youths of good family betook themselves to a clerical career, and drew the revenues of a benefice for which they did no spiritual work. After the middle of the 16th c. the title of A. was distinctively bestowed on all young ecclesiastics, whether in office or not. All, indeed, could not obtain benefices, and many had therefore to betake themselves to other careers. Not a few became tutors in great families, and in this capacity, when they happened to be men of spirit, intelligence, and taste, increased the appreciation of culture in the higher circles of society. Their influence in families, however, was not always wholesome or moral. In the French comedies of the time the A. often plays a not very edifying rôle. Others, again, more creditably sought distinction in science and literature, and thus a certain respect continued to be attached to the name. The Revolution of 1789 may be said to have abolished the A. as a distinctive feature of refined French society, and the title is now only given out of courtesy to young ecclesiastics.

Abbeville, a fortified town in the department of Somme, France, situated on the river Somme, about 12 miles from its mouth. It is badly built, and the streets are narrow; but it possesses one splendid building, the church of St Wolfran, begun in the reign of Louis XII. A. is connected by canals with Amiens, Paris, Lille, and Belgium; and small craft can sail to it up the Somme. Its chief manufactures are velvets, cottons, linens, hosiery, jewellery, and soap. Pop. (1872) 16,753.

Abbey. See MONASTERY.

Abbey, in a legal sense, denotes in Scotland the limits of protection to a debtor against legal process afforded by the A. of Holyrood. This privilege had, of course, its origin in the fact that churches were sanctuary and shelter to all who sought refuge within their walls. When the A. of Holyrood first became a secular refuge for the impecunious is not known. Buchanan is the first to record an instance—that of John Scott, A.D. 1531.

Abbie's Grasso, a town of Italy, province of Milan, on the Bereguardo Canal, noted for its silk manufactures. Pop. 9177. At some distance north and north-west lie Buffalora, Magenta, and Turbigo, which acquired celebrity during the Franco-Italian war of 1859.

Abbot, from *Abbas*, the Latinised form of *Abba* (q. v.), originally denoted an aged monk, but after the 5th or 6th c. the name was given exclusively to the superior of a monastery. Down to the 10th c. he bore no other title. After that time, however, monastic orders multiplied in the Church, and many of the new monasteries chose new titles for their superiors, as

majors, priors, guardians, rectors, &c. The relation of the A., on the one hand, towards his order, and, on the other, towards the monks placed under him, varied considerably. Among the Benedictines, for example, he was elected by the convent, but after his election was absolutely independent, while in the Cistercian order his authority was subordinate to a bureaucratic court at Clairvaux. Before the monks were reckoned to, belong to the clergy, it was the duty of the A. to see that the rule of the order was observed, to administer the revenues of the monastery, and to compel the unqualified obedience of the monks. The Benedictines, however, possessed the right of appeal to the bishop of the diocese or to the Pope. From the 6th c. abbots have been ecclesiastics, and since the 2d Council of Nice (787) have been empowered to consecrate monks for the lower sacred orders. They are all prelates of the Church, have the same rank as bishops, and an equal vote in ecclesiastical councils. In the 8th and 9th centuries the dignity of A. began to be conferred by kings on laymen; the Carolingians, in particular, used to reward their faithful followers with abbasies. In the 10th c. many of the most important abbeys in Western Christendom were in the hands of laymen, who were called *Abba-comites* (count-abbots) and *Abbas milites* (soldier-abbots), and who kept the monastic revenues for their own use. In such case the spiritual and ecclesiastical oversight of the monasteries was intrusted to deans, priors, and vicar-abbots. The Frankish sovereigns bestowed monasteries freely on the members of their own families. Hugo Capet was lay-abbot of St Denis near Paris, and of St Martin at Tours. A great reform in monastic life took place in the 11th c. Towards the close of the middle ages, however, grave departures from the severe purity of the monastic rule became prevalent. A worldly spirit pervaded the abbeys. Princes claimed and exercised the right of election, and the offices were again bestowed on laymen who took no care of the spiritual condition of their monks. Abbots of this kind were called *Secular Abbots*, the vicars who discharged their duties, as well as all abbots belonging to the monastic orders, were called *Regular Abbots*. In those countries that adopted the Reformation—such as Germany, Switzerland, England, Scotland, &c.—the revenues of the monasteries were, as a rule, wholly confiscated by the rulers, and shamefully misappropriated. The evils resulting from a secularising spirit in those countries that retained the ancient faith are visible enough in the concordat between Francis I. and the Pope. See **ABBÉ**. Italy has recently secularised monastic property, but is devoting it largely to national education. There are monasteries in the Greek Church also whose superiors are called *Higumeni* or *Mandrites*, and their abbots-general, *Archimandrites*.

Abbot, George, English prelate, was born at Guildford in 1562, and educated at Oxford. He attracted the notice of King James I. by his zeal and prudence in the mission of the Earl of Dunbar (1608) for bringing about a union between the Churches of England and Scotland, and was successively created by him Bishop of Lichfield and Coventry, 1609; Bishop of London, same year; and Archbishop of Canterbury, March 1610-11. Having accidentally shot a keeper, while hunting, in 1622, a commission was appointed to examine whether this incapacitated him for his duties. Its decision was favourable to A. As an opponent of the despotic policy of Laud and the court, he was for a time out of favour with Charles I. A. had a share in the translation of the New Testament in 1604, and wrote several theological works. He died in 1633.

Abbotsford, the seat of Sir Walter Scott, in Roxburghshire, about three miles west of Melrose, where Gala Water falls into the Tweed. In 1811 Scott here began his great territorial scheme by the purchase of one hundred acres of bleak moorland, full of historical association, substituting the name A. for that of *Clartey Hole*. The castle was built at various periods, at a cost of not less than £20,000, and has been happily described as 'a romance in stone and lime.' The present proprietor is the Hon. Joseph Constable Maxwell, son of Lord Herries, who in 1873 married the poet's great-granddaughter, and took the name of Scott.

Abbott, Charles. See TENTERDEN, LORD.

Abbott, Rev. Jacob, a voluminous writer for the young, was born in Maine, United States, in 1803. His works, which are full of simplicity, earnestness, and interest, have been fre-

quently republished, and some have been translated into various European and even Asiatic languages. The best known is *The Young Christian*. Among the others are, *Histories for the Young*, 19 vols.; *Histories of Celebrated Persons*, 30 vols., &c.

Abbreviations are in use among all nations who write, and have been so from very early times. They are of two kinds—first, A. consisting in the omission of letters or words; and second, A. consisting in the substitution of signs. The former are the older of the two, and their employment goes back to the period when uncial characters alone were used. It was then customary to shorten syllables, words, phrases, &c., as one may see from inscriptions on monuments, coins, &c. The most familiar instance of this mode of abbreviation is making the initial letter of a word do duty for the whole, as when P. stands for Publius. After the invention of the small Greek and Roman letters, particular signs of A. were introduced to represent syllables, double consonants, double vowels, and words. From Greek manuscripts the signs found their way into printed editions of Greek books, and it is only of late years they have been wholly abandoned. The Roman A. were very numerous. L. Annæus Seneca classified 5000 of them. They increased in number during the middle ages, and continued to be used long after printing had rendered them unnecessary. Deciphering these A. requires careful and patient study, and has given birth to a science called Diplomatic (q. v.) In England, since the reign of George II., the use of A. has been forbidden in all legal documents. In one or other of their two forms, however, they are still employed in philosophical works. In particular sciences, as mathematics, astronomy, physics, chemistry, natural history, grammar, and music, in which certain signs have obtained a definite technical meaning (see MATHEMATICS, PLANETS, &c.), and in publications in which it is of essential moment to save space, e.g., lexicons, encyclopædias, bibliographical works, &c. Besides these, there are certain groups of A. which are conventionally used, and which have so strongly established themselves that you hardly ever see the words written in full. Thus the forms Mr and Mrs (for Master and Mistress) are invariably employed before the names of persons. To the same class belong Christian names, titles, and terms used in indicating time, the marks for coins, weights, and measures, citations from books in general use or widely known, such as the Bible or the Corpus Juris.

Abd, in Arabic, means 'slave,' or 'servant,' and, along with the name of God, enters into the composition of many names in use among the Moslems, e.g., *Abd-Allah*, 'servant of God'; *Abd-el-Kader*, 'servant of the mighty God'; *Abd-ul-Latif*, 'servant of the gracious God'; *Abd-ur-Rahman*, 'servant to the merciful God.' The Hebrew and Syriac form is Ebed, which in the same way enters into the composition of Jewish and Christian names.

Abd-el-Kader, born in 1807 at Ghetna, near Mascara, a man of a lofty, intrepid, and tenacious character, distinguished himself by his determined resistance to the French arms in N. Africa. His father had great influence with his countrymen, both from his high lineage and his personal sanctity, an influence which his son inherited. A.'s intelligence, morality, humanity, and devotion to his own faith, without a trace of intolerance, marked him out as fitted to act an important part in the history of his country. The Turkish power being broken by the French conquest of Algiers (July 1829), the Arab tribes of Oran made A. their emir, and he was soon at the head of 10,000 cavalry. Two sanguinary battles, December 3, 1833, and January 6, 1834, obliged General Desmichels to conclude a treaty with him, and his power was acknowledged in Oran and Titeri. On June 28, 1835, he was strong enough to inflict a signal defeat on General Tretzel. But the French gradually obtaining the mastery, in 1841 A. had to seek shelter in Morocco, which thus incurred the enmity of France. A. twice attacked the French, in October 1845, and in March 1847. Having failed in an attack on the Moorish camp, he secured his retreat into Algeria, where most of his followers gave themselves up to the French, and on December 22, 1847, he had himself to surrender. He was sent to Toulon, and after two further changes of residence, was liberated by Louis Napoleon in 1852. He resided first at Brussa, then at Constantinople, and finally settled at Damascus, and was the means

of saving many lives during the Syrian massacres of 1860. He visited France and England in 1865, and was again in France in 1867, at the time of the Paris Exhibition.

Abdication, the act of giving up office; usually, however, the word is only applied to resignation of sovereignty. In some countries the sovereign can abdicate whenever he pleases, but in England it is held that the king or queen cannot abdicate without the consent of Parliament. Abdication of the sovereign may, however, be presumed in England, and acted on by the people, if his conduct is inconsistent with the established system of constitutional government. Thus the word 'abdicated' was advisedly used instead of 'deserted,' with reference to the departure of King James II., at the conference between the two Houses of Parliament, previous to the passing of the Act which settled the crown on William III. and Mary—the meaning being that the king had not only deserted his office, but that, by his acts, the desertion included, he had forfeited his right to the throne. The Scotch Convention, however, resolved that King James had 'forfaulted' (forfeited) the crown. The following are some of the most remarkable abdications of sovereignty: The Roman Emperors Diocletian and Maximian, A.D. 305; Emperor Charles V., 1556; Louis Bonaparte, King of Holland, 1810; Napoleon Bonaparte, 1814 and 1815; Charles X., King of France, 1830; Louis Philippe, King of the French, 1848; Amadeus, King of Spain, 1873.

Abdomen. The trunk is divided into two compartments by a muscular partition called the diaphragm. The upper compartment is termed the chest or thorax, the lower the abdomen. The abdomen extends from the diaphragm above to the floor of the pelvis below, and is subdivided into two parts: the upper and larger part, the abdomen proper, and the lower the pelvis. See PELVIS. The abdomen proper contains the stomach, the liver, the pancreas, the kidneys, the supra-renal capsules, the spleen, the omentum, and small and large intestines, with the exception of the last part of the great intestine termed the rectum, and blood-vessels. It is lined by a thin serous membrane called the peritoneum, which sends reduplications over the various organs.

Abdominales, a Linnæan order of fishes, including those species which have the pectoral placed before the ventral fins, or upon the abdomen, the cartilaginous fishes being excepted. Naturalists, however, now apply the term only to the family or subdivision of Malacopterygious or soft-finned fishes, including nearly all the fresh-water species, and such as periodically migrate from the sea to the rivers to deposit their spawn, such as the salmon, trout, herring, pike, &c.

Pike

Abduction means, in the criminal law of England, the unlawful taking away of a female, and the use of the word is commonly restricted to this; although under the Jewish and according to civil law the word is also applied to the illegal taking away of males. A. may either be by force or fraud.

1. **Abduction of Child**.—It is provided by 24 and 25 Vict., that if any one shall unlawfully, by force or fraud, lead or entice away any child under the age of fourteen with intent to deprive the parent or other lawful guardian of the custody of the child, or with intent to steal any article on its person, or shall with such intent harbour the child, knowing it to have been stolen, he shall be held guilty of felony, and shall be liable to penal servitude for seven years; if the offender be a male under sixteen, he is liable to be whipped. It is a misdemeanour subject to two years' imprisonment to take or decoy out of the lawful guardian's possession an unmarried girl under sixteen.

2. **Abduction of Wife**.—Formerly, in England, the husband had in this case a claim for damage against the male offender, who was also liable to two years' imprisonment, and to be fined at the pleasure of the crown. Now, under the statutes relating to divorce and matrimonial causes, the marriage may be annulled,

with, in case of the wife's adultery, damages from the adulterers, or the husband and wife may be 'judicially separated.'

3. *Abduction of Ward or Pupil.*—In England a guardian is entitled to bring an action against any one taking from him the custody of his ward or pupil; but the proper remedy is by application to the Court of Chancery, to which court belongs the supreme guardianship of all the infants in the kingdom. In Scotland a similar jurisdiction is exercised by the Court of Session.

4. *Abduction of Women.*—The statute 24 and 25 Vict. makes it felony to take away any woman against her will, or by fraud, with intent to marry or violate her, or to cause her to be married or violated; and when a woman is abducted who is an heiress, expectant or in possession, and marriage is the result of the abduction, the husband forfeits all right and interest in the property which would otherwise have come to him by marriage. To aid or abet in the abduction of a woman is also by the above statute rendered felony.

It is an offence against the statute to take a female natural child from the custody of its putative father. The operation of the statutes extends to Ireland.

Abd-ul-Hamid-Bey, a French traveller, whose real name is Du-Couret, born at Huningue, Alsace, in 1812. In 1834 he departed for Egypt, ascended the Nile into Abyssinia, and returned to Cairo along the W. coast of the Red Sea. Here he embraced Islamism, took an Eastern name, made the pilgrimage to Mecca, traversed Arabia, and landed sick and exhausted on the island of Bourbon. Thence, in 1846, he repaired to Persia, where he was thrown into prison, but returned to France in 1847. In 1849 he explored N. Africa, the results of which are given in a *Memoire à Napoleon III.*, Paris, 1853. His earlier wanderings are described in *Mémoires et Mémoires*, 3 vols., Paris, 1855.

Abd-ul-Latif, a learned Arabian, born at Bagdad in 1161, and died there in 1231. He completed his education in Mohammedan literature at Damascus, where Saladin had collected the first scholars of the age. Thence he proceeded to Egypt, where he became acquainted with the famous Maimonides. Medicine now became his principal study, more than a half of the 136 works ascribed to him relating to this science; but he also wrote a valuable description of Egypt, translated into Latin by White of Oxford in 1800, and into French by De Sacy in 1810.

Abd-ul-Medjid-Khan, thirty-first of the Ottoman sultans, was born 6th May 1822, and succeeded his father, Mahmud II., 1st July 1839. His accession to the throne occurred at a critical condition of the empire. A few days before the Turkish army had been routed by the Egyptians, led by Ibrahim Pasha, and only the intervention of the great European powers prevented Mehemet Ali, Viceroy of Egypt, from overthrowing the Ottoman dynasty. The sagacious counsels of Reshid Pasha tended much to restore and confirm the authority of the government. Judicious reforms were instituted, and religious equality, partially declared in the hatti-sherif of 1839, was formally proclaimed in 1850. His attitude during the Crimean war was not heroic; but his soldiers fought with enthusiasm for a monarch who kept his seraglio in the presence of the foe. Yet on several occasions A. acted, at great risk to his own interests, with admirable spirit and resolution against foreign dictation adverse to the claims of freedom and humanity. The case of Kossuth will not soon be forgotten. A. died 25th June 1861.

Abd-ul-Mumen. See ALMOHADES.

Abd-ur-Rahman. See OMMAIDES.

Abel (Heb. *Hēbel*, 'breath,' 'vanity,' probably so named from the shortness of his life) was the second son of Adam. He was a shepherd, and was slain by his elder brother Cain because his offering was accepted by Jehovah, and that of Cain rejected. No reason is assigned in the original narrative for this preference, but in the New Testament (Heb. xi. 4) it is explained that A.'s sacrifice was made more excellent by 'faith,' an opinion which has been generally adopted by the Christian Church. Some theological scholars consider the story only the fragment of an older and more complete tradition.

Abel, Karl Friedrich, an accomplished performer on the *Viola da gamba*, born at Koethen in 1719, was a pupil of Bach. In 1758 he came to England, and was made chamber-musician

to the queen of George III. His merits as a composer were never great, and are now forgotten. He died in 1787.

Abelard (in the oldest MSS. *Abailard*), Pierre, an illustrious scholastic philosopher and theologian, was born in 1079 at Palet or Palais, a village near Nantes in France. After a youth marked by an insatiable thirst for knowledge, he went to Paris at the age of twenty, and became first a disciple and soon after a rival of Guillaume de Champeaux, surnamed the 'Pillar of Doctors,' and head of the great episcopal school in that city. A. next established himself as a philosophical lecturer at Melun (1102), and then at Corbeil, and finally, in 1113, at Paris, where he obtained the chair of his former master. At this moment his reputation was immense. Paris idolised him. From the most distant regions, Rome, England, and Germany, students hastened to listen to his eloquent and impassioned logic. Poet and musician, as well as philosopher, he wrote songs in French for his students, and won the love of a woman whose grace was irresistible, for she charmed even St Bernard himself. This was the niece and ward of Fulbert, canon of Notre Dame, a lady celebrated for her beauty, wit, and elegance. A. became her teacher and companion, and the pair soon learned to love not wisely, but too well. When it became for Heloise impossible to conceal her frailty any longer, A. carried her into Brittany, where she gave birth to a son, who received the curious name of Astrodabe. A secret marriage followed, but the uncle was not satisfied, and when A. removed her to the monastery of Argenteuil, Fulbert in revenge hired some wretches to emasculate the rash lover, and thereby incapacitate him for ecclesiastical preferment. After this inexpressible outrage, A. became a monk in the abbey of St Denis, and Heloise a nun at Argenteuil. His disciples asked him to resume his lectures, and his popularity became greater than ever. But a council held at Soissons in 1121 condemned his opinions on the Trinity as heretical, and soon after he withdrew to Nogent-on-the-Seine, where he built an oratory, and named it the Paraclete, or Comforter; thence he passed into Brittany, where it is thought he wrote his singular book *Sic et Non*, first published by M. Cousin, and consisting of arguments for and against the principal doctrines of the faith, culled out of the Church fathers. But St Bernard could not pardon him for vindicating the rights of reason against blind submission to authority, and in 1140 the Pope again condemned him as a heretic to perpetual silence. Two years after (April 21, 1142), A. died in the abbey of St Marcel, near Chalons-sur-Marne. Heloise, who had succeeded him at the Paraclete, and survived him twenty years, received his corpse. The ashes of both were taken to Paris in 1808, and are now in the Père la Chaise. A. had a great respect for the human intellect, and thought nothing credible that could not be understood. He was a superb dialectician, and the most brilliant orator of the schools in his own age. The principal editions of his writings are those of Paris (1616), Oxford (1728), Turin (1841), and that of Cousin (Par. 1850). See also *Lettres d'Abailard et de Heloise*, translated from the Latin, with an essay by M. and Madame Guizot (Par. 1837); Cousin's *Ouvrages inédits d'Abailard* (Par. 1836); and Rémusat's *Abelard* (Par. 1845).

Abele-tree. See POPLAR.

Abelmoschus, a genus of plants of the order *Malvaceæ* (q.v.) The name, which is derived from the Arabic, has reference to the odour of the seeds of some species, which resembles musk, and is accordingly used to perfume pomatum. *A. esculentus* furnishes the ochro gombo or gombo pods used for food in the E. and W. Indies. The young fruits are also used like capers. Different species of A. yield a strong and durable fibre, and abound in mucilage.

Abencerages figure in the old Spanish chronicles and romances as a noble Moorish race in Granada, who were at feud with the family of the Zegrís, were allured into the Alhambra, and murdered there in the time of Abu-Hassan, about 1460. This tale first acquired celebrity in literature through a picturesque historical romance, entitled *Historia de las Guerras Civiles de Granada*, by G. Perez de Hita (1595-1604, Madr. 1833 and 1846), which is the basis of Chateaubriand's *Les Aventures du Dernier Abencerage*.

Aben-Esra, the most learned rabbin of the middle ages, was born at Toledo, in Spain, 1088-89. He travelled in various countries, but in his later years lived in Rome, though he died at

Calahorra, in Spain, 1176. A. was a mathematician, astronomer, philosopher, poet, physician, theologian, and grammarian—a perfect encyclopædia of learning, and the whole of his vast resources were devoted to the elucidation of Scripture. His commentaries on the Old Testament literature are a curious mixture of rationalistic criticism, intense piety, and ardent faith in revelation. He doubts the genuineness of parts of the Pentateuch, believes in a 'younger' Isaiah who wrote the latter part of the work that goes under that prophet's name, accuses the Chronist of blundering, declares the history of Jonah a dream, and denounces free inquiry as heretical! Yet in spite of such contradictions, A. is an admirable commentator, and was the first biblical scholar that raised exegesis to a science. Many of his works have been printed during the last two hundred years.

Abeoku'ta, a cluster of villages forming the capital of the Egba territory, on the W. coast of Africa, about 80 miles N. of Lagos, and 240 W. of the Niger. The mud wall which surrounds these villages is nearly 20 miles in circumference; the houses themselves are also built of mud, with high thatched roofs. There is said to be a total population of 150,000. The chief trade is in palm oil and grain.

Aber, a Celtic word, essentially the same as *Inver*, denoting the confluence of waters, either of two rivers or of a river with the sea. It originally existed both in the Gaelic and Cymric branches of Celtic, and examples can be found in all the dialects; but in Gaelic it died out at an early period, and *Inver* became more common. In Wales and Brittany, on the other hand, *Inver* became obsolete, and only A. survived, hence the frequency of the name in these countries.

Aberavon or **Port-Talbot**, a parliamentary and municipal borough in Glamorganshire, Wales, about 30 miles W. of Cardiff, and a mile above the mouth of the Avon, which flows into Swansea Bay. It is a station on the South Wales Railway. The great works at Cwm Avon, in the neighbourhood, comprising collieries, iron-works, copper-smelting, tinplate, and charcoal works, are among the largest in Wales, and are the main cause of the prosperity of the town. The port was greatly improved in 1838. Pop. in 1871 of the municipal borough, 3574; of the parliamentary borough, 11,906.

Abercrombie, John, M.D., an eminent Scottish physician and philosopher, was born at Aberdeen in 1781. He studied medicine and took his degree at Edinburgh, where he also devoted himself to the practice of his profession, soon attaining a great reputation. He wrote several professional works of considerable worth, but his celebrity is chiefly connected with his *Inquiries respecting the Intellectual Powers* (1830), and *The Philosophy of the Moral Feelings* (1833). In these works he has applied his medical experience to mental and moral philosophy, producing books of great interest and value, if not marked by much depth or originality. Dr A., who was also eminent for his genuine and unassuming piety, died in 1844.

Abercromby, Sir Ralph, K.B., a celebrated British general, was born at Menstry, in Clackmannanshire, in 1734. He entered the army in 1756, and by 1787 had attained the rank of major-general. In 1793 he accompanied the Duke of York to Holland, where his bravery in the field, and his humanity in the disastrous retreat of 1794-95, won universal admiration. In 1795 he was appointed to the chief command in the West Indies, where he quickly took from the enemy, in little more than a year, the islands of Grenada, Trinidad, St Lucia, and St Vincent, besides part of the mainland of Guiana. For a short time during the Irish rebellion he was commander-in-chief in Ireland, but on expressing his dislike to the service, was removed to a similar post in Scotland. He accompanied the Duke of York in his second unfortunate campaign in Holland in 1799, and distinguished himself as before by his bravery and skill. The last service of this gallant officer was in command of the expedition sent against the French in Egypt. Early in March 1801 he landed his forces in the Bay of Aboukir, successfully encountering the troops that opposed him. On the 21st of the same month the whole French army attacked his lines, but was completely defeated. A., however, was mortally wounded during the engagement, and died a week afterwards.

Besides his fine qualities as a soldier, A. was an able and accomplished man, of a most attractive personal character.

The British Government erected a monument to his memory in St Paul's Cathedral, and his widow was created Baroness Abercromby, with a pension of £3000.

Aberdeen, the capital of the county of A., and principal seaport in the N. of Scotland, at the mouth of the river Dee, about 111 miles N. of Edinburgh. It was made a royal burgh (1179) by William the Lion, but its present privileges are founded on a charter granted by Robert Bruce in 1319. The town was burned by the English in 1336, and on being rebuilt was called New A. Old A. is a small town a mile N., within the same parliamentary boundary. A. had formerly two universities, King's College and University in Old A., founded by the good Bishop Elphinstone 1494, and Marischal College and University in the new town, founded by Keith, Earl Marischal, 1593; but in 1860 they were merged in one, called the University of A., which in 1873-74 had 624 students. Its general council, with that of Glasgow University, returns one member to Parliament. The University of A. is distinguished for the thoroughness of its Latin scholarship, and can boast of many illustrious names both in literature and philosophy. Its two grammar-schools are also justly celebrated. During the last half century the 'granite city,' as it is called, from the material of which it is mainly built, has been greatly improved; the harbour has been enlarged, and a pier 1200 feet long has been erected. The total registered shipping of the port in 1874 amounted to 103,149 tons. The chief exports are linens, wools, cotton yarns, granite, grain, and fish. A. has considerable shipbuilding and iron trade, and the largest comb and granite-polishing works in the kingdom. Pop. in 1871, of municipal burgh, 76,348; parliamentary burgh, sending one member to Parliament, 88,125.

Aberdeenshire, a maritime county in the N.E. of Scotland, bounded N. and E. by the North Sea, W. by the counties of Banff and Inverness, and S. by the chain of the Grampians; between N. lat. 56° 52' and 57° 42', W. long. 1° 49' and 3° 48'. It is 102 miles long, and attains a breadth of 50; area, 1980 sq. miles, with 60 miles of sea-board. In point of size it stands fifth among Scottish counties, and third in respect of population. The most notable of its old historical divisions were Mar, Buchan, Garroch, and Strathbogie. The 'Buchan dialect' is a form of Lowland Scotch surcharged with Scandinavianisms. A. is in great part mountainous, well watered, and towards the N. has a rich loamy surface. The highest mountains, all in the S.W., are Ben-Muic-Dhui, 4296 feet; Cairntoul, 4245; Cairngorm, 4090; Ben-na-Buid, 3860; and Lochnagar, 3786. The rocks are chiefly granite, gneiss, and mica slate. The principal rivers are the Dee (96 miles long), Don (78), Doveran (58), and Ythan (37); they all run N. or E. into the North Sea. The coast-line is regular, but occasionally precipitous; in some parts cliffs 200 feet high overhang the sea. With a soil of ordinary character and a severe climate, A. is remarkably productive, fully 36 per cent. of its entire surface being cultivated. Its forests yield the finest fir timber in Great Britain, and it is unexcelled in Scotland for the rearing of cattle. There are 188 miles of railway, and the public roads, which are excellent, are maintained by rates instead of tolls. A. sends two members to Parliament. Pop. in 1871, 244,603; and, excluding the burgh of A., the value of real property (1873) amounted to £798,191. There are nearly 300 churches, almost equally divided between the Established and Free; and 84.83 per cent. of the children under thirteen years of age attend school.

Aberdeen, George Hamilton Gordon, Earl of, was born in Edinburgh in 1784, and educated at Harrow and Cambridge. He entered public life in 1806 as one of the representative peers of Scotland. Sent as ambassador to Vienna in 1813, he succeeded in bringing over Austria to the alliance against France, and in 1814 was created Viscount Gordon. In the Duke of Wellington's ministry, 1828-30, he held the office of foreign secretary; in the brief administration of Sir Robert Peel, 1834-35, he was colonial secretary; and from 1841 till 1846 he filled his old post of foreign secretary under the same leader. During the last period he carried through the famous 'Aberdeen Act,' which neither hindered the disruption of the Scotch Church, nor gave satisfaction to those for whom it was meant, and which is now virtually repealed by the 'Act for the Abolition of Patronage' (1874). A. was placed at the head of the

coalition ministry formed in 1852, but dissatisfaction with his management of the Crimean war caused his retirement in 1855. He died at London, 14th December 1860. The distinguishing feature of Lord A.'s career was the gradual paling of an early Toryism into a very liberal Conservatism; and of his policy, non-intervention in the internal affairs of other nations. He is known as an author by an *Essay on Grecian Architecture* (1822).

Aberdevine.

Aberdevine, more generally termed the Siskin (*Carduelis spinus*), a small migratory song-bird allied to, but smaller than, the goldfinch. In the S. of England it is called the barley-bird, as it is usually a visitant about the barley-seed time. When kept as a cage-bird, it crosses freely with the canary, the green variety of which it somewhat resembles.

Abergavenny, pron. **Abergann'y** (the *Gobanium* of the Romans), is a town of Monmouthshire, picturesquely situated amidst wooded hills in the valley of the Usk, about 13 miles from Monmouth, at the confluence of the Usk and the Gavenny. A. has a large trade in wool, but there are also numerous collieries and iron-works in the neighbourhood. A notable feature of the place is the Cymreigyddion Society, established for the promotion of Welsh literature and the Welsh industrial arts. Pop. (1871) 4803.

Aberneth'y, John, one of the most distinguished of English surgeons, was born in 1763 or 1764. He was apprenticed in 1780 to Mr (afterwards Sir Charles) Blinck, surgeon at St Bartholomew's Hospital, where he became assistant-surgeon in 1787. The lectures which he began to deliver at the hospital soon after this were extraordinarily popular. In 1813 he was appointed surgeon to Christ's Hospital, and in 1814 Professor of Anatomy and Surgery to the College of Surgeons. His death took place at Enfield in 1831. A. has the honour of first enunciating and establishing the great principle—completely revolutionising the whole field of surgery—that local diseases are symptoms of a disordered constitution, not primary and independent maladies, and to the exposition of this is devoted his principal work, *Observations on the Constitutional Origin and Treatment of Local Diseases* (1806). He was distinguished by a blunt eccentricity of manner, regarding which many anecdotes are narrated.

Aberrant, in botany, means something which differs from ordinary structure of related group of plants; thus, a natural order may be A. by being intermediate between two other orders.

Aberra'tion of Light is an apparent displacement of a star from its true position, arising from the combined velocities of the earth in its orbit and the light emitted from the star. This phenomenon is analogous to the apparent obliquity of a perpendicular shower of rain to a person in rapid motion; and is obviously dependent upon the law of the composition of velocities. See **VELOCITY**. Hence the line drawn from the star's apparent position at any instant to its true position represents in direction and magnitude the velocity of the earth in its orbit at that instant; so that the star seems to describe, in the course of a year, the Hodograph (q. v.), or projection of the hodograph, of the earth's orbit. Therefore, in consequence of A., each star describes a circle, whose plane is parallel to the plane of the ecliptic. Accordingly all stars, with but few exceptions, appear to describe ellipses, whose major axes are equal. A. was discovered in 1727 by Bradley, who fixed the major axis at about 40".

Aberration in Optics is the deviation, after reflection from a concave mirror, or refraction through a convex lens, of the rays of a pencil of light from that point in the axis of the pencil known as the principal focus of the mirror or lens in question. In the lens this is due to two causes—viz., the spherical form usually given to the lens, and the different degrees of refrangibility possessed by the different coloured rays of light—which give rise respectively to Spherical A. and Chromatic A..

Aberyst'with, a seaport of Cardiganshire, S. Wales, and one of the Cardigan parliamentary boroughs, is situated at the mouths of the rivers Ystwyth and Rheidol. Sheltered from the E. by a hilly background, which overlooks the wide expanse of Cardigan Bay, it has become the most fashionable bathing-place in Wales. A large building, intended as a national Welsh college, has been recently erected here, but it has not prospered. In 1872, 320 vessels, of 18,316 tons, entered the port. Pop. (1871) 6898.

Abeyance, an English law term, implying that a freehold inheritance, dignity, or office is not vested in any one. In the law of Scotland the principle is that the 'fee,' or right of possession, of tangible property must be vested in some one. In both countries titles of honour and right to office may be in abeyance, or 'dormant.'

Abies, a genus of coniferous trees. See **FIR**.

Ab'ingdon, a town in Berkshire, 6 miles S.W. of Oxford, and 56 N.W. of London. It is as old as the time of the Britons, and became the seat of a monastery in 680, which was destroyed by the Danes in 871, and rebuilt as an abbey in the reigns of Edgar and Canute, whence the town was called Abbandune or Abbandon, 'the town of the Abbey.' In 1645 Lord Essex held it successfully against Charles I., and put every Irish prisoner to death without trial; hence the phrase, 'Abingdon law' (like the Sc. 'Jeddart justice'). A. has manufactures of woollens, carpets, sacking, &c.; corn and cattle markets; and sends a member to Parliament. Pop. (1871) 6571.

Ab'ington, a township of Massachusetts, United States, 20 miles S.E. of Boston, with manufactures of boots, shoes, and nails. Pop. (1870) 9308.

Abjuration, Law of. See **ABJURATION OATH**.

Abjuration, Oath of. Formerly three oaths, called the Oaths of Allegiance, Supremacy, and Abjuration, were required from all persons before admission to any public office, but by 21 and 22 Vict. one oath was substituted for the three. By it allegiance was sworn to the Queen and fidelity to the Act limiting the succession to the crown, while all foreign jurisdiction, civil or ecclesiastical, was abjured 'within this realm.'

By 31 and 32 Vict., however, this form of oath was abolished, and three other forms of oath established. These are called—1st, the oath of allegiance; 2d, the official oath; and 3d, the judicial oath. Some officers require to take the oath of allegiance and the official oath, and some others the oath of allegiance and the judicial oath. The oath of allegiance is as follows: 'I, A. B., do swear that I will be faithful and bear true allegiance to her Majesty Queen Victoria, her heirs and successors, according to law. So help me God.' Most of the other statutes regarding oaths were repealed by the statute 34 and 35 Vict. There is not now, as formerly, any special form of oath required from Roman Catholics; the above-quoted oath of allegiance being the form prescribed for members of all religious persuasions, and for the whole of the United Kingdom. The oath of homage taken by ecclesiastical dignitaries was not affected by the statute 31 and 32 Vict.

Ab'lative Case. See **DECLENSION**.

Abnormal denotes in botany a deviation from normal condition. Stamens standing opposite to petals are A., it being customary for stamens to alternate with them. In the European lime-tree the flower-stalk is adherent to the midrib of a bract, and is therefore A.

Abo (pron. *Obo*), a town in the Russian government of Abo-Björneborg, Finland, situated in the Gulf of Bothnia, near the mouth of the river Aurajokki. The Swedes founded it in 1157, and it remained theirs till the *Peace of Abo* (1743), when it was annexed to Russia. In 1827 the university, with its fine library, was destroyed by fire, and the institution was afterwards removed to Helsingfors, which since 1819 has superseded A. as the capital of Finland. Pop. (1870) 19,793.—The government of Abo-Björneborg has an area of 9450 sq. miles, and a pop. (1870) of 306,331.

Abolitionists, a name used in the United States to designate a class of political philanthropists who sought by means of literature and popular oratory to destroy the institution of slavery. They are as old as the Republic itself. The first Pennsylvania

abolitionist society was formed in 1775, with Benjamin Franklin for its president. Similar associations were soon formed all over the North, but strenuous and organised opposition to slavery was first begun by Lloyd Garrison in his *Liberator*, started 1st January 1831. The exigencies of the civil war compelled the Republican party to adopt the creed of the A., and on the 1st of January 1863, President Lincoln proclaimed the emancipation of the negro, and the long agitation of the party came to an end. It expired in the moment of victory.

Abomey. See DAHOMEY.

Aborigines, a name generally used to denote the earliest (Lat. *ab origine*) inhabitants of a land, like the Gr. *autochthones*, though the latter term strictly signifies sprung from the soil. In the half-fabulous history of pre-Roman Italy, however, the name (but *aborigines*, not *aborigins*) appears as that of a special people first settled in the Apennines about Reate, and afterwards in the district of the Lower Tiber, where they are supposed to have taken the name of Latins.

Abortion, the name given in medicine to the expulsion of the ovum from the uterus before the sixth month of gestation. Expulsion between the sixth and ninth month is called a premature labour. Miscarriage, as popularly understood, is the expulsion of the fœtus at any period of gestation, and in law there is no distinction made between A. and premature labour. A. may be either natural or violent. One natural A. occurs in about 2000 pregnancies. Natural A. may be the result of disease of the uterus, placenta, or membranes, or it may be due to general weakness of body, or to the action of zymotic diseases, such as smallpox or fevers, or to violent agitation or shaking, as by jolts on a rough road. Criminal or violent A. may be caused either by mechanical means, such as pressure externally, or by the introduction of weapons into the uterus, or by the action of irritating medicinal substances on the bowels or uterus. Such abortive substances are very numerous, but the principal are oil of savin, ergot of rye, pennyroyal, and powerful purgatives, such as croton oil, elaterium, hellebore, &c. Any person producing or attempting A. in her own person, or in the person of another, is guilty of felony. It is occasionally necessary, however, to induce premature labour with the view of saving the life of mother or child. Such interference is justifiable.

Aboukir (anc. *Canopus*), a fishing village in Egypt, about 15 miles N.E. of Alexandria. It is celebrated on account of Nelson's victory over the French in the battle of the Nile, fought (1st August 1798) in the Bay of A. A Turkish army of 15,000 was defeated here (1799) by 6000 French under Bonaparte; and in 1801 Sir Ralph Abercromby, at the head of a British expedition to Egypt, landed at A., which was surrendered by the French after a sanguinary conflict.

Abousam'bul, or **Ipsambul**, a place in Nubia, on the W. bank of the Nile, notable as the site of two old Egyptian rock-cut temples. They stand a few hundred feet apart. The larger temple is ornamented in front with four colossal figures, 65 feet high. An immense doorway opens on the principal hall, in which two rows of brightly-coloured statues rise from floor to roof. This temple contains fourteen chambers, and retires about 170 feet into the rock. The walls are covered with rude frescoes, supposed to relate to the life of *Rameses the Great*.

About', Edmond François-Valentin, a well-known French littérateur, born at Dieuze (Meurthe), 14th February 1828. He was educated at the Lycée Charlemagne, and the Ecole Normale, in Paris, and studied archaeology for two years at the French school in Athens. On his return to Paris in 1853 he published *La Grèce Contemporaine* (1855), a satire on the shortcomings of the modern Greek character and government. Liveliness of style and humorous incident secured popularity for the work, and gained for the author an instant reputation which his later writings have not done much to extend. The best known of these are *Tolla* (1855), *Les Mariages de Paris* (1856), *Le Cas de M. Guérin* (1862), *Maidon* (1863), *Les Mariages de Province* (1868), and *Le Fellah* (1869), and *Alsace* (1872). *La Question Romaine*, a pamphlet published in 1861, which attracted some attention, urged the abolition of the Pope's temporal power, and was supposed to be inspired by Napoleon III. As the author of some abusive newspaper articles, A. was imprisoned (13th September 1872) for a week by the German authorities, who

chose to treat him as a German subject on account of his being a Lorrainer.

Ab'racadab'ra, a word formerly used by pretenders to magic, and supposed by the ignorant to be capable of expelling from the system various deadly fevers, more especially tertian and semi-tertian agues. It is now only employed in contempt, like the expression *hocus-pocus*, to denote a formula that has no meaning. The word was often written in the shape of a triangle.

Ab'raham, the founder of the Hebrew nation, was a native of Ur of the Chaldees (Mesopotamia), and with his wife Sarah and his nephew Lot, emigrated into Canaan. His life and character are exquisitely pictured in the Mosaic narrative; he is the noblest type of a pastoral chief in all literature; free, simple, hospitable, valiant, and devout. His trust in the Eternal was without a shadow of doubt, and it was 'counted to him for righteousness.' Later tradition, which finds an expression in Josephus (*Ant.* i. c. 7), ascribes to A. vast scientific knowledge. He is the inventor of letters, and first taught the Egyptians astronomy and mathematics. The Arabs, who also venerate his memory, affirm that he rebuilt the Caaba, but most of their stories are doubtless borrowed from Jewish sources.

Abraham-a-Santa-Clara, whose proper name was **Ulrich Megerle**, a once popular preacher of Germany, born 1642, died 1709. His sermons are coarse, racy, grotesque, but full of good sense. Even the titles are marked by a rude humour, e.g., *Heilsames Gemisch-Gemisch* ('Wholesome Hodge-Podge,' Sc. 'Mixty-Maxy'). A's *Sämmtliche Werke* were published in 21 vols. (Passau and Lindau, 1835-54). A selection appeared at Heilbron (7 vols., 1840-44).

Abrahamites, called also *Bohemian Deists*, is the name given to a religious sect that first appeared in Bohemia about 1782. They made their creed as simple as they supposed that of Abraham to be, and would not admit that they were either Jews or Christians. The Emperor Joseph declined to tolerate them, and in 1783 scattered them over various parts of the Austrian empire, where, in their isolation, they were partly converted and partly martyred.

Abraham-men, sturdy beggars who roamed about the country pretending to be lunatics, and extorted a living from the compassion or terrors of the weak. 'To sham Abraham' is a phrase still in use. In the time of James I., 'an Abram cove' and a 'Tom o' Bedlam' were identical expressions, as the sturdy beggar who had infringed the law often claimed the immunities of lunatics discharged from Bethlehem Hospital.

Abranchia, an order of animals belonging to the *Annelida*. They receive their name from having none of the ordinary external organs of respiration, breathing from the surface of the skin, or, as some suppose, by interior cavities. The earth-worm and leech belong to the order.

Abrantes, Duke of. See JUNOT.

Abra'anel (also **Abarbanel**), **Isaac Ben Jehudah**, one of the ablest Jewish statesmen and scholars, was born at Lisbon in 1437, of an ancient and illustrious Jewish family. His talents attracted the notice of the Portuguese king, Alfonso V., who frequently employed him on affairs of state, and held him in the highest esteem. On the death of Alfonso, he passed into the service of Ferdinand of Spain, but had to follow his countrymen into exile on their expulsion from the Peninsula. He then betook himself to Naples, and after various changes, died a minister of state in the service of the Venetian Republic in the year 1508. A. was both a learned and eloquent man; his style is flowing and elegant. His principal writings are exegeses of the Pentateuch and the Prophets, commentaries on the Talmudic literature, and a polemical treatise against Christianity. See Jost's *Geschichte des Judenthums und seiner Sekten* (3 vols., Leipz. 1857-59), and Fürst's *Bibliotheca Judaica* (3 vols., Leipz. 1849-63).

Abra'as Stones, the name given to a class of gems cut in various symbolic forms, such as the head of a fowl, the body of a serpent, &c. The word A. is made up of Greek letters. It first figures in the theological speculations of the Gnostic sects, especially the Basilidians, and was probably carried to Spain (where many of these stones are found) by the Priscillianists, who had adopted their views. It is believed that most of the A. were manufactured in the middle ages to serve as talismans.

Abriçot Sauvage, a name given to the mammee apple (*Mamme Americana*), and also to the fruit of *Couroupita guianensis*, which is also called from its appearance the cannon-ball fruit. The shell of the latter is used as a drinking-cup in the West Indies.

Abrogation of a law is the repealing or recalling of it. See ACT OF PARLIAMENT.

Abrus, a genus of leguminous plants. *A. precatorius* is a native of India and other tropical countries. It has small globose seeds, which are of a bright scarlet colour, with a black scar on one side. These are used for necklaces, and in India are employed as a standard of weight. The weight of the famous Koh-i-noor diamond is stated to have been ascertained in this way. The roots are similar in taste to those of the liquorice plant.

Abruzzo, a district of Italy, between the provinces of Latium and Umbria on the W. and the Adriatic on the E., and formerly the most northern part of the kingdom of Naples. Area 4899 sq. miles; pop. 920,000. Its old divisions, Abruzzo Ultiore I. and II., and Abruzzo Citra, have given place to the three Italian provinces, Chieti, Teramo, and Aquila. A. is traversed by the wildest portion of the Apennines, forming the cradle of numerous streams, of which the largest is the Pescara. The famous Gran Sasso d'Italia here lifts its snow-capped peaks to a height of 9590 feet. These mountain masses encircle a multitude of valleys, where the soil is the richest and the husbandry the most wretched. At different altitudes, on the mountain slope and in the plain, flourish the oak, fir, almond, walnut, and olive. The natives are a simple, hardy race, occupied in the highlands, for the most part, in rearing and tending sheep. As a rocky barrier on the north, A. was important in the defence of Naples, and was often the scene of invasion and civil war. In 1799 the French troops were strenuously opposed here by the sturdy mountaineers.

Ab'salom (Heb. *Abshalom*, 'father of peace') was the third son of David, and was noted for the beauty of his person, and especially for a profusion of fine hair. The main incidents of his life are the murder of his half-brother Amnon for dishonouring his sister Tamar, his three years' exile at the court of his father-in-law the Syrian prince of Geshur, his return to Israel and reconciliation with his father, his rebellion and temporary triumph, and finally, his overthrow and death in the wood of Ephraim. David dearly loved his handsome treacherous son, and bitterly mourned his loss.

Ab'salom, Archbishop of Lund. See AXEL.

Abscess. An A. is a collection of pus in any part of the tissues or organs of the body. The pus is usually surrounded on all sides by a layer of lymph which is deposited in the neighbouring tissues, called the wall of the abscess. Thus the pus is prevented from diffusing itself through the tissues. An A. may be acute or chronic. Acute A. is the result of acute inflammation. It is usually accompanied by pain, heat, redness, and swelling, and soon, unless very deeply seated, the wall of the A. gives way at one point, and the pus is discharged. In chronic A. the formation of pus is very slow; sometimes a dense layer of lymph forms a cyst round the matter, but usually, as these abscesses do not 'point' quickly, they burrow for a considerable distance from their original seat. Pus sometimes forms with very slight precursory symptoms, and with no pain. Such an A. is called a cold A. In some cases there is no limiting wall of lymph formed, and the pus spreads quickly and destroys the tissues. Occasionally from abscesses in one part of the body pus is carried by the blood to other organs, and there produces what are termed secondary or metastatic abscesses.

Abscissæ. See CO-ORDINATES.

Absentee, a term applied to proprietors of land and to capitalists who derive their income from one country and spend it in another. In no country is this practice more prevalent than in Ireland. Previous to the union with England, the principal Irish proprietors for the most part resided during the summer on their own estates and during winter in Dublin. The Union changed the habits of the Irish nobility and gentry in this respect. They were in a great measure drawn away to London or the Continent. Those who thus left their own country were re-

proachfully styled 'Absentees;' and it was maintained that their conduct was the great source of Irish poverty, as it drained the country of money. While those who so argued failed to see certain truths in political economy, that gold is not wealth, but merely its representative, and that the quantity of it permanently held by any country is infallibly determined by the productive power of that country relatively to the productive power of other countries, they were nevertheless right in considering 'absenteeism' a real evil to Ireland. The industrial energy of a people is impaired or destroyed by the continued absence of its natural leaders. Power over the tenantry fell wholly into the hands of agents, who, so long as they supplied the pecuniary wants of their principals, were allowed to exercise that power oppressively and cruelly. The evils arising from 'absenteeism' in Ireland have been forcibly drawn by Miss Edgeworth in her novel called *The Absentee*; but while the evils are evident, the remedy will probably only be found in such measures as will promote the general social and industrial improvement of the country. Much may with time be expected from the wise and generous legislation of recent years.

Ab'sinth and Absinth'ium. See ARTEMISIA and WORM-WOOD.

Absolute (Lat. *absolutus*, 'freed from') means that a thing is considered in itself, and quite apart from any reference to other things. In metaphysics it signifies the unconditioned indefinite original of things—the ground of all visible phenomena; in politics, that form of government in which the authority of the ruler is unrestricted.

Absolute Zero. See HEAT.

Absolution is a term borrowed by the Christian Church from Roman law, in which it properly signifies the freeing or acquitting a person of the charges brought against him. The earliest form of ecclesiastical A. was pronounced by the presbyter and elders in the presence of the congregation, which is understood to imply that the concurrence of the congregation was necessary. As early as the 4th c., however, A. had become an exclusive right of the episcopal office, and the public confession had become a private one, made to a priest, authorised by his bishop to hear, impose penance, and grant A. Protestant churches, as a rule, hold A. to be merely declarative, i.e., that God enjoins or permits ministers to declare His forgiveness of sin to those who repent.

Absorbents. See LACTEALS and LYMPHATICS.

Absorption. The fluid and soluble portions of food enter into the blood of the living animal by absorption. This is effected partly by means of the blood-vessels of the stomach and intestinal canal, and partly by the agency of special absorbent vessels known as the lacteals, present in minute finger-like processes on the lining membrane of the small intestine called the villi. See VILLUS.

Absorption (in botany). Plants absorb carbonic acid gas as well as fluids by their leaves and other green parts, but they depend chiefly upon the roots for nourishment. At the extremities of the rootlets there are a set of delicate cells called *spongioles*, which absorb the nourishing matters from the soil by a process called Endosmose (q. v.)

Ab'stinance Societies. See TEMPERANCE SOCIETIES.

Abstraction is an operation of the mind in which it withdraws (Lat. *abstrahere*) certain attributes of objects from the objects themselves, and either considers them apart or considers the objects exclusively in relation to these. Thus John Smith forms an objective or concrete image. But I can think of him not only in connection with the attributes which are peculiar to him, but in connection with those that are common to him, and some or all of the race to which he belongs. It is a succession of acts of A., each rising higher than the other, to think of him as an Englishman, a European, an Aryan, a man, an animal, a creature. Among the most refined abstractions may be reckoned the ideas of time and space.

Abt, Franz, a favourite German song writer, born at Eilenburg, 22d December 1819. He studied for the Church at Leipzig, but an acquaintance with Mendelssohn determined his preference for the pursuit of music. A.'s songs are full of rich harmony; several of his male quartetts are especially popular.

Abu, means in Arabic father, and is merely a form of the Hebrew *Ab*. See **ABBA**. In both languages the word enters into the composition of many proper names—e.g., *Abu-Bekr*, 'Father of the Virgin.' Often, however, the term father is used figuratively for 'possessor' in such cases—e.g., *Abulfeda*, 'Father of Fidelity,' i.e., 'the Faithful'; *Abner*, 'Father of Light,' i.e., 'the Brilliant.'

Abu, the highest mountain of the Aravulli range, in Rajpootana, Hindustan, about 5000 feet above the sea, with a very broad base and a summit divided into numerous peaks. At Dilwara, about the middle of the mountain, are four Jain temples, to which frequent pilgrimages are made. One of these temples is said to be unsurpassed in all India. The English of late years have begun to use A. as a sanatorium.

Abu-Bekr, the first Arabian calif, belonged to the great Koreish tribe, and was born at Mecca 573 A.D. His original name was Abd-el-Kaaba ('servant of the Temple'), which he changed into Abd-Allah ('servant of God') when he became a disciple of Mohammed. The name A. was given to him after the Prophet had married his daughter Ayesha (who was a virgin, and not a widow like the other wives of Mohammed). He only held the califate for two years, dying at Medinah 23d August 634; but it was during his brief rule that the new religion first began to seriously threaten the Byzantine empire. A. was a man of much learning and of great enthusiasm.

Abulfaraj, otherwise Barhebraus ('son of the Hebrew'), born at Malatia, Armenia, in 1226, died 1286. His profound acquaintance with philology, philosophy, theology, and medicine procured for him the title of the phoenix of his age. He died primate of the Christian sect of the Jacobites. A.'s best known work is a chronicle of universal history from the creation to his own time, written first in Syriac and afterwards in Arabic. The Arabic chronicle was translated into Latin by Pococke (Oxf. 1663). There is also a German version by Bauer (Leyden, 1783-85), and Bruns and Kirsch published both the Syriac and Arabic texts with a Latin translation (Leipzig, 1789). The work is full of details little known concerning the wars of the Mongols and Tartars. A. wrote numerous other works, one of which, an *Ecclesiastical History*, has been translated by Tullberg of Upsala.

Abulfeda, a Moslem prince sprung from the same Kurdish stock as Saladin, of high repute as a writer of history, born at Damascus A.D. 1273, died in 1331. From 1310 to his death he was prince of Hamat, Syria. His *Annals*, written in Arabic, were published at Copenhagen by Reiske (1789-94), under the title of *Annales Moslemici*. His *Geography* was published in full by Schier (Dresden, 1842), and also by Reinaud (Paris, 1848), with a French translation.

Abushehr, or **Bushire**, a seaport on the Persian Gulf, at the point of a barren sandy peninsula. It is well situated for commerce, and, despite a capricious climate, has become the emporium of the Indo-Persian trade. A strong natural position enabled A. to make a vigorous stand against the English in 1856, when it was taken by Sir H. Leake. It is now an Indo-European telegraph station. Its chief exports are silk, fruits, pearls, asafoetida, and horses (for cavalry service in India); imports, sugar, rice, indigo, and British manufactured goods. Pop. 15,000.

Abutilon, a genus of plants belonging to the order *Malvaceæ*. In Brazil the flowers of *A. esculentum* are used as an article of food. *A. indicum* and *polyandrum*, two Indian shrubs, furnish a strong fibre used for ropes. All the species of A. contain a quantity of mucilage.

Abutment, the name given in architecture to that part of a pier or wall from which the arch springs; when the arch is semicircular the term used is *inpost*. In bridges, the walls that support the ends of the roadway are also called abutments.

Abydos, a town of Asia Minor, on the Hellespont, opposite Sestos. The channel here is only 7 stadia wide. Near A. Xerxes formed the bridge of boats (B.C. 480) over which his army crossed to Europe. A. is associated with the story of Hero and Leander. Another A., on the Nile, has acquired some celebrity from the discovery there of a hieroglyphical genealogy of the 18th dynasty of the Pharaohs.

Abyssinia, a country in the N.E. of Africa, bounded on the E. by the Red Sea, on the N. and W. by Nubia and Kordofan, and encircled on the S. by the Blue River or Nile. It lies between 8° 30' and 15° 40' N. lat., and between 35° and 42° E. long., and is in the form of an immense tableland, intersected by deep gullies worn by the rivers. It is separated by nature into three great divisions; going from north to south, these are (1) Tigré, where the Geez, a Semitic dialect, is spoken, and which forms the main approach to the Red Sea; (2) Amhara, where the language is non-Semitic, and which contains Gondar, the nominal capital of the kingdom; and (3) Shoa, in the extreme south, surrounded by hostile Galla tribes, and also speaking the Amharic dialect. Some of the minor provinces are Lasta, Waag, Semen, and Godjam. Though within the tropics, the climate is equable and salubrious, because of the great elevation of its tablelands, which rise to a height of from 7000 to 10,000 feet. From these plains spring many volcanic mountain chains, the highest being that of Samien, 15,000 feet above the sea. There are many rivers, the largest being the Abai or Blue Nile (Bahr-el-Azrek), the Takkazie, a tributary of the Nile, and the Hawash, which flows east towards the Gulf of Aden. In the heart of the country, lies the Tzana or Dembea, a large lake, through which the Blue Nile flows. The productions are chiefly wheat, barley, maize, native grains called Tef and Toccusso, coffee, sugar-cane, and tobacco. The soil is generally rich, and in many parts the coffee-plant is indigenous. The most numerous of the wild animals are the lion, leopard, wolf, hyæna, and jackal; elephants, rhinoceroses, buffaloes, and giraffes are found; and hippopotami abound in the large rivers. The name A. is derived from the Arabic *Habesh*, which means a mixed people, and seems to throw some light on its ethnology. The predominant race occupying Amhara is Semitic, with oval face, thin lips, sharp nose, and straight hair. Another race, with features approaching the negro, inhabits the north; and the Gallas, a savage, warlike people, with round faces, thick lips, and woolly hair, occupy the south of Shoa. All the native races are of brown colour; the only negroes being those brought from the interior as slaves.

A. was first made known in Europe in the 15th c. by the Portuguese missionaries; but long before that period it had a place in history. Christianity had found its way thither in the 4th c., if not earlier; and in the 6th c. the nation was sufficiently strong to invade Arabia and seize part of Yemen. Misfortune followed this conquest, however, and for many centuries A. was a scene of chronic confusion and bloodshed. In 1540, assisted by the Portuguese, the empire was rescued from the hands of the sultan of Adal. As a condition of the support of the Portuguese, the royal family embraced the Roman Catholic faith, and a fruitless effort was made to supplant the old Coptic Church. The monarchy, which had long been absolute, now greatly declined, and the question of succession frequently gave rise to protracted struggles, which ultimately broke up the kingdom into petty governments. There have been at one time as many as twelve claimants to the crown, each supported by one of the powerful feudatories, who, under the name of Ras (head or chief), were the actual powers in the kingdom. In 1847 Ras Ali, a man of great intelligence and enterprise, became chief of Amhara. Under his rule the province made considerable advance, and for the first time relations were entered into with England. Military success, and the marriage of his mother to the nominal emperor, had all but established the supremacy of Ras Ali, when a rival appeared in Kassai (afterwards Theodore), his own son-in-law, who had early shown courage and skill as a soldier. Kassai was at first defeated and forced to withdraw, but finally overcame the troops sent against him, and was crowned in 1858 by the Abuna of the Coptic Church as Theodore of Abyssinia. Elated by success, the new-made king marched on Shoa, the third great province of the old empire, attacked and defeated the Wollo Gallas, and reached Ankobar, the southern capital, almost without opposition. Great leniency was shown to the conquered countries, and the commercial relations entered into with Europe were encouraged. In 1863 Theodore applied to Queen Victoria for aid to repel the Egyptians from his north frontier, but his letter was unaccountably neglected. Enraged by this supposed slight, he imprisoned the newly-appointed English consul and a party of missionaries. Meantime an answer from England arrived, but Theodore cast the envoy into prison. This direct violation of international law occasioned a great outcry in England, and all

attempts to negotiate with Theodore having proved ineffectual, Lord Stanley's ultimatum was issued in April 1867, ordering the delivery of the prisoners within three months. No notice was taken of this missive, and an expedition was accordingly prepared. An army of 12,000 men, under the command of Sir Robert Napier, was brought from India and landed at Zulla on the Red Sea in November. After encountering many difficulties the expedition reached Magdala (q. v.), and on the 10th April 1868 completely routed Theodore's army, and released the European captives. No lives were lost on the British side; but of the Abyssinians there were 500 killed, including Theodore himself, who was found shot in the head. The object of the war was solely the release of the captives and the punishment of Theodore, and the internal affairs of A. were left untouched. The cost of the expedition amounted to £8,600,000. A. has been a good deal disturbed since the death of Theodore by intestine war, and is now governed by Kassa, formerly Ras of Tigré, who was made king at Axum in January 1872. The chief exports are dye-stuffs, spices, ivory, and gum; but of late the trade of A. has very much decreased, and the want of good internal communication in so wild a country may seriously interfere with the prospects of commerce. A considerable trade in slaves is still carried on with Turkey and Egypt. The pop. is estimated at 3,000,000. See Plowden's *Travels in A.* (Lond. 1868), Wilkin's *Reconnoitring in A.* (Lond. 1870), and the official *Record of the Expedition to A.* by Holland and Hozier (2 vols., Lond. 1870).

Acacia, a genus of dicotyledonous trees and shrubs belonging to the sub-order *Mimosæ* of *Leguminosæ*. There are numerous species, chiefly found in the warm countries. The Australian species are called *leafless*, as the true leaves are seldom developed, but the petioles or leaf-stalks become large, and perform the functions of leaves.

Acacia arabica.

These are termed *phyllodia*. Some of the species are of great economical importance. Gum-arabic is exuded from *A. Verril*, *A. arabica*, *A. vera*, *A. Adansoni*, and other species, natives of the East. The drug called *Catchu* is prepared principally from *A. catchu*. The wood is boiled, and the decoction evaporated, which leaves an astringent extract. Bahool or Babul gum and bark are obtained from *A. arabica*. The latter is used in

Scinde for tanning. *A. Farnesiana* yields a perfume. The seeds of *A. Niopo* are ground and used as snuff among the natives in some parts of S. America. Many kinds are cultivated in greenhouses in Britain.

Academy. The word is derived from a spot in the suburbs of Athens called *Akademia*. There Socrates, and subsequently Plato, used to meet and converse with their pupils. It was the latter, however, who made the place famous by the establishment of his A., the school of philosophy over which he presided for fifty years. Plato died 348 B.C. After his death the modifications of his doctrine which came to be taught occasioned a division of the school into three branches—Old, Middle, and New A. The first term is applied to the school holding the Platonic doctrine pure, the second to the school of Arcesilaus, the third to the school of Carneades.

It is now common in England and America to call an A. any school professing to give a high-class education; but societies formed for the advancement of learning, science, or art are also frequently so named. The first institution of this kind in ancient times was the famous Museum founded at Alexandria in the 3d c. B.C. by Ptolemy Soter. It was the model of later institutions founded by the Jews and Arabians; and of that of Charlemagne in the 8th c. Though it did not survive the death of Charlemagne, his A. gave an important impulse to learning, and probably laid the foundations of the modern French language. Its extinction was owing to the jealousy of

the clergy, who feared that it would injure their authority as the sole expounders of civil and divine law.

The fall of Constantinople in 1452 caused many learned Greeks to take refuge in Italy. There, under the liberal patronage of the Medicis, they worked with zeal and success to rekindle the torch of classic learning, which had been extinguished for 1000 years. In the following century academies of wider scope arose in Italy; whose example was followed over Europe generally.

There are two classes of academies, the one having general and the other specific objects. The most noteworthy examples of the former are the *Institute de France*, founded by Colbert under another name in 1666; the Berlin Academy of Arts and Sciences, founded in 1700, and enlarged and vivified by Frederick the Great; the Imperial Academy of Sciences of St Petersburg, designed by Peter the Great, and established by his widow, Catherine I., in 1725; the Academies of Sciences at Stockholm, Copenhagen, Munich, and Vienna. It is impossible within our limits to note examples of all the different kinds of *special* academies. It is enough to say that they exist for the advancement of linguistic, historical, archaeological, medical, artistic, and other studies. Many learned societies differ from academies only in name, such as the Royal Society of London, &c.

• **Acæna**, a genus of rosaceous plants, including upwards of forty species, mostly small, and found chiefly in temperate regions. Certain species are met with at a great elevation on the Andes. *A. cæna* is a common weed in Australia and Tasmania, where it is a troublesome plant to sheep-farmers, from its spiny fruit getting entangled in the wool of the sheep. The 'Piri Piri' of New Zealand is a decoction of the leaves of *A. Sanguisorba*.

Acal'ephæ, a class of marine animals, commonly known as sea-nettles, on account of their producing a stinging sensation when touched, or jelly-fishes or sea-blubbers, from their gelatinous consistence. The name Medusæ is frequently given to them. They are transparent, often shaped like a mushroom, and vary in size from a pin-head to nearly a yard in diameter. Their metamorphosis is very remarkable. Many of them are phosphorescent, and render the sea luminous.

Acal'ephæ.

Acal'ypa, a genus of dicotyledonous plants belonging to the order *Euphorbiaceæ*, embracing about 100 species, natives of tropical and sub-tropical regions. Many of them are perennial shrubby plants, with nettle-like leaves. *A. rubra*, the string wood of St Helena, is now supposed to be an extinct species. It was a small tree, with long spikes of reddish-coloured flowers. *A. indica*, an annual weed in India, is said to attract cats as much as valerian.

Acantha'ceæ, a natural order of dicotyledonous plants, including about 1000 species, common in tropical regions. They are of little economical value, the most of them being weeds, although a few have beautiful foliage and flowers, such as some species of *Justicia* and *Kuellia*. Some are mucilaginous and bitter, others yield dye. Room, a blue dye, is obtained from a species of *Kuellia* in Assam.

Acantho'phis, a genus of Australian venomous serpents closely allied to the vipers (q. v.) They inhabit holes under the roots of trees and stones, and are very tenacious of life. One species (*A. Brownii*), found at Port Jackson, is one of the most venomous.

Acanthop'tery'gii, one of the three natural orders into which fishes are divided. They have bony skeletons, with prickly processes in the dorsal fins, as, for example, the perch and stickleback.

Acanthus spinosus.

ornamented with *A.* leaves, resembling those of the last-named species.

Acapell'a or **All'a capell'a**, a term applied in old Italian church music to vocal compositions in the severest state without any accompaniment. This was up to the time of Claudio Monteverde, in the second half of the 16th c., the usual state of church music. In modern times *A. capella* denotes a piece of vocal music, sacred or profane, without accompaniment, or with the instruments playing in unison with the voices.

Acapul'co, a town of Mexico, on a bay of the Pacific, with one of the finest harbours in the world. It had at one time the monopoly of the rich Spanish trade with the East, but the port is now little frequented. The climate is extremely hot, and the town mean and unhealthy. The principal buildings were destroyed in 1852 by an earthquake. Pop., chiefly coloured, 4000. The main exports are cochineal, indigo, cocoa, wool, and skins; the imports silks, spices, cottons, and hardware.

Acar'idæ, a group of small spider-like animals, including the mites (Trombidites), ticks (Ricinities), water-mites (Hydrachnellæ), and flesh-worms (Microphthira). The itch-insect, the cheese-mite, the red spider of our gardens, and the common harvest-bug belong to the group.

Acarna'nia, anciently the most western part of northern Hellas, bounded N. by the Ambracian Gulf, E. by Ætolia, W. and S. by the Ionian Sea. The numerous harbours on its rocky and mountainous coast became at an early date the homes of Doric colonists, but the native Acarnanians were not prominent in Greek history, and were noted mainly for stubborn valour. In modern times *A.* forms, along with Ætolia, a nomarchy of the kingdom of Greece, and has for its capital Missolonghi (q. v.)

Acathist'us, a song of praise in the Greek Church in honour of the Virgin Mary, sung in the fifth week of Lent, and derives its name from the congregation *not* being permitted to *sit down* during the whole night.

Acaulo'sia, a diseased condition of the stems of plants, in which the stem is either imperfectly developed or entirely wanting.

Acceleran'do (Ital.), speedily (*più*, much, *poco a poco*, gradually), means with growing rapidity (*tempo crescendo*) and increasing expression.

Accelerated Motion, in dynamics, is motion in which the velocity is never for any finite time constant, but is continually increasing. The rate of increase of velocity is called 'acceleration.'

Acceleration of the Moon, the fact first observed by Halley that, for several thousand years, the time of the moon's revolution round the earth has been decreasing, or her velocity has been increasing. Laplace showed this to be due to the varying eccentricity of the earth's orbit, which has been decreasing since

12,000 B.C., and will continue so to decrease till 37,000 A.D., after which it will begin to increase.

Ac'cent, in grammar, is the stress or pressure of the voice placed upon a syllable of a word to make it prominent, either for oratorical or vocabulary purposes. The Greek grammarians used accentual marks, it is said, to assist foreigners in learning their language, and there can be no doubt that *A.* played a far more important part in the enunciation of ancient Greek than most modern scholars (except Prof. Blackie) allow. In Hebrew, *A.* was always on the last syllable or the last but one; in Greek it might be on any of the last three syllables of a word; in Latin it was confined to the penultimate or ante-penultimate; and in English the irregularities inseparable from so composite a language have shown themselves in a certain lawlessness of *A.*, but it may be said that there is a strong tendency at present to throw it back to the beginning of words, which was its usual place in the English spoken and written before the Norman Conquest. It is interesting to trace the struggle of English and French *A.* in Chaucer. We find him writing at one time *bataille* and again *bat'aille*, *for'tune* and *fortu'ne*, &c.; but on the whole the native method triumphed, and Romance words received not only an English form, but an English *A.*, though the exceptions are numerous.

Ac'cent, in music, is the emphasis or stress laid upon single notes, parts of bars, or whole bars, and is divided into two kinds, viz., grammatical (metrical) and rhetorical. The grammatical accentuation is the natural one, without which any piece of music would be wanting in organic cohesion, and would therefore be incomprehensible. The rhetorical accentuation is not an artificial antithesis to the former, but surpasses its simple regularity, and is an essential part of an expressive performance.

Accept'ance, in its general sense, is the act by which any one agrees to terms, or undertakes a duty. The word is not technical in the law of England (see CONTRACTS) except as applied to a bill of exchange (see BILL OF EXCHANGE); when it means the act by which the person or firm on whom the bill is drawn, i.e., the 'drawee,' binds himself to pay the bill in whole or in part. In England this act may consist in the drawee merely writing on the bill the word 'accepted,' or *A.* may be inferred from circumstance. In Scotland the signature of the acceptor is required. The term is also technical in Scotch law of contracts. It may be written, verbal, or by inference.

Accessary or **Accessory** is one guilty of crime, not principally but by participation. The incriminating act may be either *before* or *after* the fact. An *A. before* the fact is one who advises or incites another to commit a crime, himself being absent at committal. An *A. after* the fact is one who assists the felon. In Scotch law the equivalent term is 'art and part'; a verdict of 'guilty art and part' having the same effect as a verdict of 'guilty.'

Access'ion, the acquiring of property by addition. In the law of England and of Scotland *A.* is either natural or artificial. By natural *A.* the young of cattle belong to the owner of their mother. Artificial *A.* denotes the acquisition of property which is the result of human industry; thus a house belongs to the owner of the soil on which it is built, and not to the builder.

Access'ion, Deed of, in Scotch law the deed by which creditors accept a trust-settlement of their debtor is so called. 'Liquidation by arrangement' is the analogous procedure of English law. See BANKRUPTCY.

Accessory Action is, in the law of Scotland, an action subservient to another.

Accessory Obliga'tion, in the law of Scotland, is an obligation annexed to another, antecedent.

Acciden'tal Col'ours. See LIGHT.

Ac'cidents, in logic, is the name given to those predicables of an object which may be changed, or abstracted, without, it is said, the object becoming essentially or substantially different from what it was before, e.g., a man may be 'intoxicated.' The 'accident' is a separable one; he would be no less a man if he were 'sober.'

Accipitres, the name of a Linnean order of birds, including those which have the beak hooked, with a broad lobe on each

Accipitres.

side near the point. They have also strong sharp-hooked claws. Eagles, falcons, hawks, and owls are examples of the order, which are described under the separate heads.

Acclimatisation. 1. *Animals.* This term may be used as somewhat synonymous with the domestication of animal forms in a country foreign to them. The peacock at present domesticated in Europe generally, has thus become acclimatised, its native country being India, where immense flocks of these birds occur in a wild state. The domestic turkey is similarly indigenous to N. America, where it still occurs in a wild state. Numerous examples of acclimatised animals may be thus found—the horse, originally from Central Asia; our numerous breeds of cattle and sheep, the progenitors of which are so difficult to trace or discover; and other analogous instances, will readily suggest themselves. The term 'acclimatise,' in the abstract, at least, may also be used with regard to the introduction of the fishes of foreign seas and rivers to British waters. In view of the breeding of such fishes to maintain a food supply, their A. becomes a feature of great commercial and economical import. The *Silurus glanis* of the European rivers and Swiss lakes has thus been proposed as a valuable addition to our food fishes, and experiments with a view to its cultivation are still in progress. Similarly, in Australia, British salmon, reared from ova exported to that colony, are now thriving. The conditions under which the A. of animals can be successfully carried out, are chiefly involved in the study of the natural and surrounding phases of their existence. Thus, temperature, food, the occurrence of migration, the breeding seasons, and many other and kindred points, have to be carefully considered, with a view to successful A.—2. *Plants.* Some suppose that tender plants of warm countries can be acclimatised by slow degrees to cold climates, but this has not been clearly proved by facts. There are certain limits of temperature within which certain species will only exist, although these limits often vary much. Many plants from warm regions, when first introduced into Britain, were grown in greenhouses and stoves, and subsequently planted out, and quoted as cases of A., whereas they were capable of enduring the cold of this country from the very first. The Japan laurel (*Aucuba japonica*), now so common in gardens, was treated at first in this manner. The African pondweed *Apongeton* (q. v.) was long grown in hot-water tanks at the Edinburgh Botanic Gardens, when accidentally a specimen was thrown into an open-air pond, where it has flourished ever since. Species brought from warm countries, and supposed to be delicate, are often quite hardy in Britain, such as the *Araucaria* from Chili, and many Japan and Nepal plants; while, again, the potato, the dahlia, and some others which have long been cultivated in Britain, are not in the slightest degree hardier than when first introduced, but are killed down by the first touch of frost.

Accolade. When a candidate for knighthood was received into his order, the grand-master embraced him, folding his arms round the neck (*ad collum*) of the new member. This act was termed in French the A.

Accompaniment (in music), part or parts added to a solo, instrumental or vocal, to support and enrich it. In chamber-music the A. is commonly played upon the pianoforte; in opera or oratorio it is arranged for an orchestra. The A. for a *concerto*, or accompanied instrumental solo, is always for an orchestra. Occasionally a piece of music is written for a solo instrument

accompanied only by two or three others; and in some cases a vocal chorus is used to accompany a solo voice. With the older composers the A. to a vocal solo was often itself a composition written in parts, and possessing considerable inherent difficulty and complication. The modern Italian writers, and the composers of operas bouffes, and of 'drawing-room' songs, have gone to the other extreme, and made their accompaniments mere meaningless rhythmic repetitions of commonplace chords. A good A. should express the same idea as the solo, but enlarged and developed; it should have form and interest of its own, but should neither drown the solo by its loudness nor dwarf it by appropriating interest properly due to the principal part. The songs of Schubert form excellent illustrations of the beauty and variety which A. can take in the hands of a great musician.

Accordion, a toy instrument in which wind supplied by bellows causes the vibration of metallic tongues of various strength and various sizes.

Accountant, a profession whose business it is to audit and unravel accounts, and to adjust and balance mercantile accounts and books. An A. ought to be thoroughly skilled in Book-keeping (q. v.), and in mercantile practice generally. He ought to have a competent knowledge of commercial law. It will also be an advantage to him to have at least an elementary knowledge of algebra. In a commercial country like England, this profession is plainly one of very great importance. Hence in all our great cities it is one which has been largely followed by men of requisite education and ability. Yet, strange to say, it is only of recent years that it has been recognised as forming a distinct and honourable profession, for whose proper exercise some years of preliminary study and training are required. See notice of Chartered Accountant, *infra*.

Accountant in Bankruptcy. The A. in B. is a Scotch law officer whose business it is to watch over the proceedings of trustees and commissioners in bankrupt estates. The office was created under the Act of 1854. See BANKRUPTCY.

Accountant of Court of Session is an officer whose duty it is to superintend the conduct of all judicial factors, tutors, and curators in Scotland.

Accountant, Chartered. In addition to the usual duties of an A. in Scotland, the profession discharge the duties which in England formerly belonged to the Masters in Chancery. They act as trustees on bankrupt estates, as judicial factors, as arbiters and referees, privately, or under remit from the Court of Session. In Edinburgh the body was incorporated by royal charter in 1854. The members are professionally designated by the initials C.A. For admission to the corporation a pupil must be articled to a member, and pass examinations in law, mathematics, and book-keeping. There is a similarly constituted society in Glasgow, incorporated by royal charter.

Accrington, a town of Lancashire, 19 miles N. of Manchester, on the banks of the Hindburn, is an important seat of the cotton-printing trade in England. It has also numerous cotton-mills, large bleaching-works, and coal-mines. Pop. (1871) 21,788.

Accum, Friedrich Christian, chemist, was born at Bückeburg on 29th March 1769. He went to London in 1793, held for some time the post of lecturer at the Surrey Institution, but ultimately returned to Germany, and obtained employment in Berlin, where he died 28th June 1838. His best known work is *A Practical Treatise on Gas-Light* (Lond. 1815), which was the means of introducing that mode of illumination into this country. A's writings, both German and English, entitle him to more recognition than he has got.

Accusative Case. See DECLENSION.

Acephala, a class of Mollusca having no conspicuous head. Some of the species are naked, others have a shell covering—the latter are the most numerous.

Acephalocysts, a name given by Lænnec to small bladder-like bodies found in various tissues of the body, more especially in the liver. They are now called hydatids, and are known to be tape-worms in a particular stage of development. See TAPE-WORMS or TÆNIA.

A'cer, a genus of dicotyledonous trees, including the sycamore and the maples; they are indigenous to temperate regions. From their rapid growth, and beauty of foliage, several species are largely planted in Britain. In America *A. saccharinum* is of great economic value, sugar being manufactured from the sap. See MAPLE-SUGAR. The common sycamore, *A. Pseudo-Platanus*, called plane in Scotland, is supposed to have been introduced into Britain from the Continent in the 14th c. The tree grows to a large size, and its wood, which is white and firm, is used for a variety of purposes. It is one of the most valuable of woods as fuel, and for making ordinary charcoal. It received the name sycamore from a former belief that it was the tree of that name mentioned in the New Testament, which, however, is a species of fig (*Ficus Sycomorus*). Other important species of *A.* are *A. campestris*, a small tree, native to England, but naturalised in Scotland; it is the badge of the Clan Oliphant; *A. platanoides*, the Norway maple; *A. striatum*, the striped maple; and *A. rubrum*, the curled maple of America.

Acera'ces, a natural order of exogenous or dicotyledonous trees inhabiting the temperate parts of Europe, Asia, and North America. The sap of some species in the order yield sugar. See MAPLE-SUGAR. Their wood forms useful timber. Their bark is astringent, and yields reddish-brown and yellow coloured dyes. The order includes three genera and about sixty species.

Acer'ra (anc. *Acerra*), a cathedral town of Italy, province of Caserta, 9 miles N.E. of Naples, with which it is connected by railway. The neighbourhood is malarious, partly owing to half-stagnant canals, and partly to the stalks being left to rot in the flax-fields. Pop. 12,000.

Ac'e'tic Acid diluted with water is the principal ingredient of common vinegar, whence its name (*acetum*, Lat., vinegar). It occurs in small quantities in the juices of plants and of animals, sometimes in the free state, but usually combined with bases. It is produced by the oxidation of alcohol; one atom of oxygen removes two atoms of hydrogen in the form of water, and another atom of oxygen replaces the two atoms of hydrogen thus removed.

Alcohol. Oxygen. Acetic acid. Water.

Vinegar, which contains about 5 per cent. of *A. A.*, is produced by exposing beer or wine mixed with nitrogenous substances to the air; a particular ferment (*Mycoderma aceti*) develops, and through its agency oxidation of the alcohol, contained in the beer or wine, gradually takes place. Pure *A. A.* is usually obtained from the acid liquor produced by the distillation of wood. See PYROLIGNEOUS SPIRIT. From this liquor acetate of lime is prepared, and on distilling this salt (previously dried) with strong sulphuric acid, pure *A. A.* passes over.

In its pure state *A. A.* is known by the name of *glacial A. A.*, and is a solid crystalline substance at temperatures below 16° C. It boils at 119° C., and has the specific gravity 1.063. Applied to the skin it causes a blister, and is sometimes used as a caustic. It is miscible in all proportions with water, alcohol, and ether.

A. A. combines with bases to form salts, which are called *Acetates*. The best known of these are acetate of lead, or sugar of lead; acetate of ammonia, known in solution as spirit of milderer; acetate of alumina, used in dyeing; and a basic, acetate of copper, called verdigris.

A. A. is used in the arts and in pharmacy. Its chemical composition is expressed by the formula $C_2H_4O_2$. Its constitution by the formula CH_3-COOH , which shows it to be a *monobasic acid*: It has been prepared synthetically, that is to say, has been built up from its elements, carbon, hydrogen, and oxygen.

Aoh, the name given to a red dye obtained from the bark of the root of *Morinda tinctoria*, a small tree of Central India. The colour is rather fugitive, but alum is used to fix it. The wood, which is hard and durable, is used for gun-stocks and other purposes.

Aoh'e'ne, or **Achene**, a term applied to any small, hard, indehiscent fruit, such as Linnæus called a naked seed. Examples of *A.* are seen in the fruit of buttercup, borage, and dead-nettle. The *achenia* of the rose are enclosed within the fleshy calycine

tube; in the strawberry they are borne on the succulent receptacle which is eaten.

Acha'ia, anciently the name given to the northern coastland of the Peloponnesus. It is mainly mountainous, but the valleys and shores are fertile, and still produce abundance of corn, wine, oil, and fruits. The Achæians in Homer's time were of such importance that their name was given to all the Greeks, and after the Roman conquest, B.C. 146, the ancient designation was revived, and Greece became the province of *A.* From B.C. 280 to B.C. 146 the *Achaian League* was the most powerful body in Greece. In modern times *A.* forms, along with Elis, a nomarchy of the kingdom of Greece, with Patras for its chief town.

Ach'ard, Franz Karl, a German naturalist and chemist, was born at Berlin in 1753, and died at Kunern in 1821. He is chiefly celebrated for his improvements in the manufacture of beet-sugar, in which he was supported by the King of Prussia. His principal literary work is an essay on the *European Manufacture of Sugar from Beet* (Leipzig, 1809).

Achar'd, Louis Amédée, Eugène, a prolific French litterateur, born at Marseilles in 1814. He first acquired note as an author by his contributions to the *Vert-Vert*, *Entr'acte*, and *Charivari*. Among his best known writings are his *Lettres Parisiennes* (1845), under the pseudonym of Grimm; the romance of *Belle-Rose* (1847), perhaps the most charming and popular of all his writings; a new set of *Lettres Parisiennes* (1849); *La Chasse Royale* (1849-50); *Les Petits-fils de Lovelace* and *Les Châteaux en Espagne* (1854); *Maurice de Treuil, Madame Roser*, and *Le Clos-Pommier* (1856-57); *Les Séductions* (1860); *Les Mœurs d'un Millionnaire* (1861); *Noir et Blanc* and *Le Roman du Mari* (1862); *Les Fourches Caudines* (1866); *La Chasse à l'Idéal* (1867); *Marcelle* and *La Vie Errante* (1868). Besides these fictions, *A.* has written many pieces for the theatre. He died March 27, 1875.

Achel'ous, now the **Aspropotamo**, or White River, the largest and most famous river in Greece, rises in Mount Pindus, and flows into the Ionian Sea. It is celebrated in ancient mythology, for the combat between its tutelary deity and Hercules for the possession of Deianeira.

Ach'bach, Andreas, one of the most prolific German painters of modern times, was born at Cassel 29th September 1815, studied at Dusseldorf under Schadow, and has devoted himself chiefly to landscapes and sea-pieces. The Rhine, the Alps, Norway, Italy—all places, far and near, have furnished scenes for his vivid and brilliant pencil. Most of the German galleries contain specimens of his work, but the greatest number are to be found in the Pinakothek of Munich. A few of his more notable pictures are, *High Tide at Ostend*, *View of Corleone in Sicily*, *A Stormy Sea on the Coast of Sicily*, *Moonlight, a Landscape*,—all of which figured at the Paris Exhibition of 1855; *Sea-shore at Scheveningen in Holland* (1861), *Landscape in the Netherlands* (1863), *Neighbourhood of Ostend in rainy Weather* (1866). *A.* is a member of the Royal Academies of Berlin, Amsterdam, Philadelphia, &c.

Ach'eron (Gr. 'river of woe'), the name of several rivers, once supposed, from their bitter taste or dark colour, to have a connection with the infernal world. The *A.* in Epirus passes through lake Acherusia, and flows into the Ionian Sea; the *A.* in Elis, now the Sacuto, is a tributary of the Alpheius; and Pliny mentions an *A.* which cannot now be identified. Homer's *A.* is one of the rivers of the nether world.

Ach'lar, a condiment, formed of the young shoots of bamboo in some parts of India.

A'chill, or 'Eagle' Isle, lies off the county Mayo, Ireland, and has an area of 35,000 acres. The soil is boggy and barren; the houses are mere hovels; and emigration and a high death-rate are gradually reducing the population. *A.* is one immense mass of mica slate, and rises towards the north in a mountainous ridge about 2000 feet high, overhanging the sea. The largest of the three villages of *A.* is a mission-station, with a corn-mill, printing-press, and schools. Pop. (1871) 6417.

Achill'ea, a genus of plants belonging to the natural order *Compositæ*. *A. Plarmica*, sneezewort, and *A. Millefolium*, yarrow or common milfoil, are natives of Britain. The former is

common in moist meadows, and when pulverised it has the property of exciting sneezing. The plant is aromatic and pungent. The common milfoil is astringent, and was at one time used as a vulnerary. It has been called nose-bleed, 'because the leaves being put into the nose caused it to bleed.' The musk milfoil, *A. moschata*, is sometimes cultivated as food for cattle. The Swiss tea of the Alps is formed of the dried plants of *A. atrata* and *A. naja*. *A. ageratum* is used on the Continent as a vulnerary.

Achilles, the son of Peleus, and of the Nereid Thetis, was instructed in eloquence and the arts of war by Phoenix, and in medicine by the centaur Cheiron. Though warned by his mother that the pursuit of glory would result in an early death, he led the Myrmidons to Troy in fifty ships, and was there the great bulwark of the Greeks. Being deprived by Agamemnon of Briseis, he ceased to take further part in the war, and the fortunes of the Greeks became desperate. The slaughter of his friend Patroclus at last roused him to action, and reconciling himself to Agamemnon he attacked the Trojans, of whom he slew great numbers, and among them their bravest warrior Hector, whose body he afterwards restored to Priam for a ransom. Here the Homeric legend ends, the death of A. in battle at the Scaean gate not occurring in the Iliad, though mentioned in the Odyssey. Later legends represent his mother as having dipped him in the Styx to render him immortal, in which she succeeded, with the exception of the ankles, by which she held him, while the so-called Dicty Cretensis affirms that he was assassinated by Paris in the temple of Apollo at Thymbra, whither he had come as the lover of Polyxena, one of Priam's daughters. His concealment, disguised as a maiden, among the daughters of Lycomedes of Scyros, that he might not accompany the Greeks to Troy, where it was prophesied that he should perish, his discovery by Odysseus, the contest between Odysseus and Ajax for the possession of his armour, are legends of comparatively late date, as also that of his being appointed a judge in the infernal regions, and having his abode in the 'Islands of the Blest.'

Achilles Tatius, called by Suidas, Achilles Statius, a Byzantine rhetorician, who probably belonged to the end of the 5th or beginning of the 6th c., as he imitates Heliodorus of Emesa. He is the author of a licentious romance (*The Loves of Leucippe and Cleitophon*), which is, notwithstanding, one of the best love-stories of the Greeks. It has been edited more than once, but the best edition is that of Fr. Jacobs, Leipzig, 1821, 2 vols. 8vo.

Achime'nes, a genus of dicotyledonous herbs belonging to the order *Geraneaceæ*. They are much cultivated for the beauty of their flowers and foliage in British stoves and greenhouses. They increase principally by scaly underground tubers.

Acholia. When from destruction of the liver-cells, the elements of the bile are not separated from the blood, jaundice is the result. This is A. It is to be distinguished from those cases of jaundice in which, from obstruction of the bile-ducts, bile is prevented from flowing away, and is consequently reabsorbed. A. is jaundice from suppression; the other condition is jaundice from obstruction and reabsorption.

Achromatic (without colour) is the name applied to a combination of lenses of different kinds of glass, by which chromatic aberration (see **ABERRATION**) is overcome, and the image is presented to the eye clearly defined and free from coloured fringes. Newton, from defective experiments, was led to believe such A. combinations impossible; and it is to Dollond that we owe the first practical solution of the difficulty. See **TELESCOPE**.

Acids. The most characteristic and important properties of A. are, that they possess a sour taste, colour blue vegetable substances red, and combine with *bases* to form salts. The two first of these properties apply only to A. soluble in water, and are also possessed by some salts; the third property is common to all A., and is the most distinctive. Most A. contain oxygen, and are called in consequence *oxy-acids* or *oxacids*. These, again, are divided into *hydrated* and *anhydrous* A., according as they contain water (or the elements of water) or not.

There is a second group of A. which contain no oxygen. In them the element hydrogen is always present, hence they are called *hydro-acids* or *hydracids*: their number is small.

Many chemists of the present day take a different view of the

nature of A., and hold that hydrogen is a necessary constituent of all A.

They define an acid as a compound of hydrogen with an element, or group of elements, which yields, when treated with a metallic hydrate, water and a *salt*; the hydrogen of the acid becoming partially or wholly replaced by the metal.

On this view of the constitution of A. only the hydrated oxacids and the hydracids can be regarded as belonging to the list. The anhydrous A. cease to be called A., and receive the name of 'Acid Anhydrides.' The great advantage of this definition of A. is, that it establishes a close relation between hydrated oxy-acids and the hydracids; in fact, regards all A. from a common stand-point, and enables their reactions to be expressed in a uniform manner.

By the *basicity* of an acid is understood the number of replaceable hydrogen atoms it contains, or, on the old view of the constitution of A., the number of *equivalents* of base with which the acid can combine. Thus, hydrochloric acid (Cl) H is monobasic; sulphuric acid (SO₄) H₂ di-basic; phosphoric acid (PO₄) H₃ tri-basic. Regarding the nomenclature of A., the hydracids invariably have the prefix *hydro* or *hyd*, the suffix *ic*, the intermediate syllable being a contraction of the name of the element or group of elements with which the hydrogen is combined—thus, *hydro-chlor-ic*, *hyd-iod-ic*, *hydro-cyan-ic* A. The nomenclature of the oxy-acids is more complicated, on account of the greater number of A. one element may form on combining with different proportions of oxygen. For instance, there are four oxy-acids containing chlorine:—

Hypo-chlor-ous acid, HClO
Chlor-ous acid, HClO₂
Chlor-ic acid, HClO₃
Per-chlor-ic acid, HClO₄

The termination *ic* denotes a high stage of oxidation; *ous*, a low stage; prefix *per*, suffix *ic*, the highest stage; prefix *hypo*, suffix *ous*, the lowest.

Subjoined is a list of the most important A. :—

HYDRACIDS—

Hydrochloric acid (spirit of salt), HCl.
Hydrocyanic acid (prussic acid), HCN.

OXY-ACIDS—

(Inorganic.)

	New View.	Old View.	Anhydride, or Anhydrous Acid.

Acetic acid.....	C ₂ H ₄ O ₂
Citric acid.....	C ₆ H ₈ O ₇
Tartaric acid.....	C ₄ H ₆ O ₆
Oxalic acid.....	C ₂ H ₂ O ₄

Acidimetry is the name given to the process for determining the quantity of free acid in a solution.

The process is based on the fact, that a certain quantity of an alkali will neutralise a definite quantity of any acid, or that an *equivalent* of the alkali neutralises an *equivalent* of an acid. See **EQUIVALENTS**. Thus—

56 grains of caustic potash (KHO), or 40 grains of caustic soda (NaHO), are equivalent to, or neutralise—
49 grains of sulphuric acid (H₂SO₄)
63 grains of nitric acid (HNO₃)
36½ grains of hydrochloric acid (HCl)
60 grains of acetic acid (C₂H₄O₂)

A solution is said to be *neutral* when it exercises no action on vegetable colouring matters. Tincture of blue litmus, if added to an acid solution, becomes reddened; if a solution of any alkali be now added to this red solution, the acid the latter contains is gradually neutralised, and when a certain quantity of alkali is added, the litmus assumes its original tint. The acid is now completely *neutralised*, and will neither colour blue litmus red nor red litmus blue: This, then, is a means of knowing when a solution of acid has been neutralised. Suppose that it is desired to determine the quantity of sulphuric acid in a solution

containing this acid in the free or uncombined state. A standard solution of alkali is first prepared. For this purpose 56 grains of caustic potash, or 40 grains of caustic soda (or equivalent quantities of the carbonate of potash or soda), is dissolved in 100 fluid grains of water.

As 56 grains of caustic potash, or 40 grains of caustic soda, neutralise 49 grains of sulphuric acid, it follows that 100 fluid grain measures of the standard alkaline solution will also neutralise this quantity of acid.

A measured quantity of the solution containing the sulphuric acid is now taken—say, 100 fluid grains—and to it a drop or two of litmus solution is added; to the red solution thus produced the standard alkaline solution is gradually poured in from an apparatus called a *urette*, which is nothing more than a glass tube graduated in such a manner as to show how many fluid grains of standard solution are being used. The addition of the alkali is continued until it is seen by the colour of the litmus that the acid is just neutralised.

Suppose that 20 fluid grains of the standard alkaline solution have been required for this purpose, the quantity of sulphuric acid is deduced by the following proportion:—

$$100 : 49 :: 20 : 9.8$$

There are, therefore, 9.8 grains of sulphuric acid in 100 grains of the solution.

In this manner the amount of any acid in a solution can be determined.

Acine'sia, a term used in medicine, meaning paralysis of motion, as distinguished from anesthesia, meaning paralysis of sensation. The paralysis may be complete or partial in both instances.

Aci Realé, an important town, province of Catania, Sicily, at the mouth of the small river Aci. It lies near the base of Mount Atna, is built of lava, and is noted for its mineral waters. The manufactures are chiefly linen, cotton, and silk; and there is considerable trade in flax, cutlery, filigree-work, and grain. In the neighbourhood is the cave of Polyphemus and the grotto of Galatea. Pop. (1872) 35,787.

Ackermann, Rudolf, born at Schneeberg, Saxony, in 1764, and finally settled in London as a printseller. He brought from Germany the art of lithography, and inaugurated with his *Forget-me-not* the once popular 'Annuals' (q. v.) A. greatly promoted English science and art, and published many fine topographical works, including Histories of Westminster Abbey, Oxford and Cambridge Universities, and the Public Schools. He died 30th March 1834.

Ac'ne, a skin disease, characterised by the presence of small isolated pustules, with deep red bases. These pustules, after suppurating and bursting, leave behind small reddish-coloured hard tumours. A. occurs most frequently on the nose, giving rise to the appearance called 'copper nose.'

Ac'olytes, a name first used in the 3d c. to denote an inferior order of ecclesiastics who assisted the bishops and presbyters in lighting candles or tapers, in handing round the bread and wine at the communion, and whose presence was also required at the administration of the other sacraments. They ranked immediately under the sub-deacons. Since the 7th c. the offices of the A. have been performed by lay servitors and boys, but the name is still retained in the Roman Catholic Church, and an aspirant to the priesthood still passes through a stage where he receives the name, and is presented with the candles and cups that marked his former duties.

Aconcag'ua, one of the highest peaks in the Andes (q. v.), 22,422 feet above the sea-level and 10,500 above the snow-line. It gives name to a province (pop. (1868) 1,130,672) and river of Chili, in which kingdom A. is situated.

Aconitine is an alkaloid contained in the leaves of the monk's-hood (*Aconitum Napellus*). It is a white uncrystallisable substance, having a bitter acid taste. Its chemical composition is expressed by the formula $C_{30}H_{48}NO_7$. It is a virulent poison. When rubbed on the skin it causes tingling, followed by numbness, and is thus used to allay local pain, as rheumatism and neuralgia. Tincture of aconite taken in very small doses diminishes the pulsations of the heart, and is very useful in certain forms of heart disease.

Aconit'um, a genus of plants belonging to the order *Ranunculaceæ*, with peculiar irregular flowers. They are natives of Europe, Asia, and N. America.

A. Napellus, or monk's-hood, is a doubtful native of Britain. All the species, except *A. heterophyllum*, possess virulently poisonous properties. The famous Bikh poison of the E. Indies is prepared from several Indian species. The roots of *A. ferax* are used in Hindostan for poisoning arrows. When an animal, such as a tiger, is struck by one of these arrows, it generally falls dead within a few seconds. The roots of *A. Napellus* have been used by mistake for Horseradish (q. v.), with fatal results. The poisonous property of the A. depends on an alkaloid called Aconitine (q. v.) A tincture of the root is used in cases of heart disease.

Aconitum Napellus.

Ac'orn, the fruit of the different species of oak. The acorn-cups of several species of oak are employed for tanning. See OAK and VALONIA.

Ac'orus, a genus of plants belonging to the natural order *Araceæ*, or the *Arum* family.

A. Calamus, or sweet-smelling flag, is a native of Asia, and naturalised in Europe, Britain, and N. America, where it grows by the banks of ponds and rivers. The plant, more especially its farinaceous rhizome, has an aromatic and bitterish acid taste; it has been used in medical practice as a stimulant and mild tonic. Confectioners and perfumers use the rhizome. Gin and beer are frequently flavoured with it. In Constantinople it is eaten freely during the prevalence of epidemic diseases. Formerly large quantities of it were grown in Norfolk, and sent annually to the London market; but it has now nearly disappeared. The plant very rarely fruits in this country.

Acorus Calamus.

Acos'ta, Gabriel, later **Uriel**, surnamed the 'Jurist,' the son of a Portuguese Jew who had embraced Christianity, was born at Oporto in 1594. For awhile he shared his father's enthusiasm for the new creed, but ultimately lapsed into his ancestral faith, and with his mother and brothers quitted Portugal to settle in Holland, where he submitted to circumcision, and took the name of Uriel. But he soon began to doubt Judaism, as he had doubted Christianity, and was before long entangled in controversies with the rabbis. The remainder of his life was a succession of squabbles, persecutions, and imprisonments. Finally, in an access of rage at some intolerable chastisements inflicted on him when seeking readmission to the Synagogue, he blew out his brains with a pistol, April 1647. Among his papers was found an autobiography, which Limborch printed in 1687; a new Latin edition, with a German version, appeared at Leipzig in 1847. His principal work, first published in Portuguese, and afterwards in Latin, is *Examen das Tradicoens Pharisæas conferidas con a ley Egerita* ('Examination of the Traditions of the Pharisees compared with the written Law: 'Amst. 1624). See Tellinck's *A.'s Leben und Lehre* (Zerbst, 1847).

Acotyledonous Plants, applied to cryptogams, or flowerless plants, as their spores possess no seed-leaf or cotyledon. They comprehend ferns and their allies, mosses, lichens, fungi,

and sea-weeds. *Acotyledones* is the third great class of plants, according to the natural system.

Acoustics (Gr. *akouo*, I hear) is strictly the science of hearing, but it now embraces all phenomena connected with the origin, nature, forms, and perceptions of Sound (q. v.) Except as regards its applications to music, A. may be regarded as a wholly modern science. The mathematical investigation of the properties of sound dates from the time of Bacon and Galileo; and Newton first showed how the propagation of sound through any medium depends upon the elasticity of that medium. Since then the most distinguished mathematicians, such as Lagrange, Euler, and Laplace, have brought their powerful analysis to bear upon the subject. Considering the extent of our knowledge of acoustic principles, it is surprising how little they are regarded in practical life. There are many instances of halls or churches, specially intended for speaking in, of which the acoustic properties are so defective that a speaker finds the greatest difficulty in making himself distinctly heard. In some cases the sounds cause numerous and perplexing reverberations; in others they are almost completely lost on account of the height of the roof.

Acquaviva, a town in the S. of Italy, province of Bari, 16 miles S. of the town of Bari, and a station on the Bari and Taranto Railway. It is walled and ditched, has several convents and two hospitals. Pop. 6776.

Acqui (Lat. *Aquæ Statiellæ*), a walled town, province of Alessandria, N. Italy, on the N. of the Ligurian Apennines. It has a fine cathedral and many beautiful buildings. The hot sulphur springs, from which it is named, were known to the Romans, and are still a favourite resort of invalids. Pop. 6824.

Acre (A.-S. *accr*, a field; comp. Lat. *ager*, Gr. *agros*, a field) is the standard British measure for the areas of fields. Its size varies in different localities; thus the Scotch A. and the Irish A. are both larger than the English or standard A., the former in the proportion of 1:27:1, the latter in the proportion of 1:62:1. The English or standard A. contains 4 roods, 160 perches, 4840 square yards. 1-10th of an A. is called a square chain, the linear chain being 22 yards.

Acre, St Jean d', the *Accho* of the Old Testament, and the *Ptolemais* of the New Testament, a seaport on the Syrian coast, about 8 miles from Mount Carmel. The harbourage is unsafe, the harbour being shallow and exposed. Pop. estimated at from 10,000 to 15,000. A. has been the scene of many a bloody conflict. It was taken by the Crusaders in 1104, by Saladin in 1187, by the Turks in 1517, by Ibrahim Pasha in 1832, and by the English fleet in 1840. Bonaparte besieged it unsuccessfully in 1799.

Acri, a town in the S. of Italy, province of Cosenza, and 13 miles N.E. of the town of Cosenza, on the small river Macrone, lies in a fertile and beautiful district, and has a pop. of about 12,000.

Acrobat (Gr. *akron*, extremity, and *baino*, I go), a name generally given to athletes who vault, and walk or dance on a rope, slack or tight. The ancient acrobats seem to have been as skillful as the modern ones, though some of these perform feats of extraordinary difficulty and daring.

Acrogens, a division of flowerless plants, whose stems increase principally by the summit. Ferns, mosses, club-mosses, and horsetails are examples of A. The plants are *Acotyledonous* (q. v.)

Acropolis, a name applied to the citadel of many Greek cities, as Athens, Corinth, Argos, Messene, &c., because forming the 'highest part of the city.' The A. was a centre round which a population gradually collected, and was not only a stronghold, but a depositary of the treasure and most valuable effects of the citizens.

Acrostic is the Greek name (*akron*, an extremity, and *stichos*, a verse) given to a poem the first or last letters of whose verses taken together form a complete word, phrase, or sentence, but most frequently a name. The invention of this species of composition cannot be traced to any particular individual, but it originated on the decline of pure classic literature. The early French poets, from the time of Francis I. to that of Louis

XIV., frequently practised it; but it was perhaps carried to its greatest perfection by the English Elizabethans. Sir John Davies has no fewer than twenty-six poems entitled 'Hymns to Astræa,' every one of which is an A. on the words 'Elizabetha Regina.' Although the invention of the A. proper may belong to post-classic times, yet traces of something analogous are found in the poetry of the Jews (e.g., the 119th Psalm), the Latins (Plautus), and the Greek 'Anthology.'

Act, in the general legal sense, denotes the formal execution and completion of any legal procedure.

Act, in the university sense, is an exercise to be done by students before taking their degree. It is chiefly in force at Cambridge as a test of the comparative merits of candidates for the degree of Bachelor of Arts who aspire to *honours*. It consists of a syllogistic discussion in Latin.

Act, in the drama, is a portion of a play during which action is supposed to be going on unseen; it is marked by the fall of the curtain. Greek plays were not so divided, action being indicated by the chorus, who occupied the stage when the other actors had left. On the Roman stage the play was divided as with us. A play seems naturally to divide itself into three parts—the exposition, the development, and the catastrophe. If this be so, it is difficult to see why five acts have come to be considered the proper number.

Act and Commission is the judicial act of the Court of Session in Scotland empowering a special commissioner to take a proof in a legal action.

Act of Bankruptcy, an ostensible proof of inability to pay a debt is so called in the law of England. The proof may be passive on the part of the debtor as well as active; thus if he allow himself to be arrested for debt he is held to have committed an A. of B. The Bankrupt Law Consolidation Act, 12 and 13 Vict., enumerates legal proofs of bankruptcy; the principle of the law being that proof of intention to delay payment of a debt, or to defraud a creditor, makes the debtor bankrupt. The equivalent term of Scotch law is 'Notour Bankruptcy;' regarding which the principle of the law of Scotland is the same as the English. See BANKRUPTCY.

Act of God is a legal expression used to signify an occurrence in which human action forms no element, such as the results of lightning. No one is bound to make good to another loss so arising.

Act of Grace, an old Scotch Act (1696) for the relief of paupers imprisoned for debt.

Act of Parliament is a bill which has been passed by both Houses of Parliament, and received the assent of the sovereign. Acts of P. are either *public* or *private* in their scope. The term *statute* is applied only to the former. A public Act affects a community; a private Act only regards a private concern. In England the law is that a statute is in force until repealed; in Scotland, again, it is held that it may become obsolete by disuse. Anciently in Scotland Acts of P. were proclaimed in towns and burghs. The Act of 1581 declares proclamation at the cross of Edinburgh sufficient. But no promulgation is now required for an A. of P. to become binding, which it does from the date of passing, unless it be otherwise provided by the Act itself. By the Act 13th Vict. provisions are made for the forms of bills submitted to Parliament. There is, the title, the preamble, the enacting sections and clauses, and, if required, the forms and schedules for working the Act.

Three volumes preserved in the Court of Exchequer contain the earliest Acts of the English Parliament—the first containing the Acts before the reign of Edward III.; the other two, those from Edward III. to 7th of Henry VIII. They are all well written. The printing of Acts began in the reign of Richard III. Between 1810 and 1824 ten volumes were printed containing the whole Acts of the English Parliament to the end of the reign of Anne.

Act of Settlement is the title given to the statute 12 and 13 Will. III. c. 2, which regulates the succession to the throne of Great Britain. Immediately after the Revolution of 1688, Parliament had passed an Act by which the succession was barred to Roman Catholics, or to any one married to a Roman

Catholic. The same Act settled the crown on the issue of Queen Mary, Queen Anne, and King William, but made no further provision. This becoming necessary by the death of Anne's son, the Duke of Gloucester, led to the passing of the A. of S., settling the crown upon the line of Elizabeth Queen of Bohemia, daughter of James I. of England. Elizabeth and her daughter Sophia, Electress of Hanover, having died before Queen Anne, the son of Sophia succeeded as George I., who was succeeded by his son George II., predeceased by his eldest son Frederick Prince of Wales, father of George III., father of George IV. and of Edward Duke of Kent, the father of Queen Victoria. The inheritance, formerly absolute, is now conditional, being limited to the heirs of Elizabeth daughter of James I., being Protestants, married to Protestants, and members of the Church of England.

Act of Toleration. This title is especially given to the Act 1 William and Mary, c. 18, confirmed by 10 Anne, c. 2, by which all persons in England dissenting from the Established Church, except Roman Catholics and those denying the Trinity, are allowed religious freedom. In Scotland the Act allows all sectarians to meet for religious services, imposes a penalty on any one disturbing them, and allows the Episcopalian clergy to celebrate marriages. The progress of religious toleration since the reign of Anne has been slow but steady. 53 Geo. III. c. 160, removes the disability of those denying the Trinity; 9 Geo. IV. c. 17, freed Protestant dissenters from the fetters of the Test and Corporation Acts (q. v.); 15 and 16 Vict. c. 36, allows them to register their churches, births, deaths, and marriages with the Registrar-General, freeing them in these matters from the supervision of the Church of England.

Roman Catholic disabilities were in full force in England, and in still greater force in Ireland, in the earlier years of the reign of George III. The American war extorted some concession from government in the latter country; in England the severer penalties were greatly mitigated in the reign of Geo. III.; while 10 Geo. IV. c. 7, commonly called the Roman Catholic Emancipation Act, admitted the members of that faith in England and in Ireland to almost full civil rights. Liberal progress has been continued in the present reign, and 21 and 22 Vict. c. 59, may be said to have completed the work of religious emancipation.

Act of Uniformity is the title of 13 and 14 Car. II. c. 4. It enacts that the revised Book of Common Prayer be used in the parish churches of England, and that the schoolmasters subscribe a declaration of conformity to the Liturgy. It also required a declaration by the clergymen before the congregation of assent to the doctrine and ordinances of the Book of Common Prayer, the penalty of refusal being loss of ecclesiastical status. Immense numbers of the clergy were thus deprived of their livings. 9 and 10 Vict. c. 59, repealed a provision of the Act requiring schoolmasters to get a licence from the ordinary to entitle them to teach privately.

Acts of the General Assembly of the Church of Scotland are binding on all members and judicatories of that Church. See GENERAL ASSEMBLY.

Acts of Sederunt are rules made by the judges of the Court of Session in Scotland for the conduct before them of civil and criminal business. The original power of the court to make these rules is derived from a Scotch statute passed in 1540. More explicit powers are given to the court under comparatively recent statutes; but Acts passed in virtue of these require, with a few exceptions, to be laid before Parliament within a limited time. Nine judges are a quorum in passing an Act of S.

Acta Diurna, the name of a Roman publication resembling our newspaper, being a daily record of public affairs. Under consulship of Julius Cæsar it gave an account of the proceedings of the Senate. Under Augustus this was stopped.

Acta Eruditorum, the title of one of the oldest and most celebrated literary and scientific journals, begun at Leipzig January 1682. The last volume is for 1776. A work on similar principles, called *Account of Books and Transactions of the Learned World*, was begun in Edinburgh in 1688. See *Watt's Bibliotheca Brit.*

Acta Sanctorum, the collective title of all the old records that have come down to us concerning the saints and martyrs of the Greek and Latin Churches. The beginnings of this branch of ecclesiastical literature are the *Acta Martyrum*, or accounts of the trials, condemnation, and execution of the early Christians in the times of persecution. The greater part of these, however, were destroyed by an edict of Diocletian, A.D. 303, and the rest perished during the inroads of the barbarians in the 5th c. When the Christian religion became dominant, many people found a pleasure in collecting the fragmentary notices of the martyrs still extant, or the more picturesque oral traditions of the times in which they lived. Examples of such collections are the *Martyrologies* or *Menologies* of the Pseudo Hieronymus, Bede, Rabanus Maurus, &c., the *Martyrologium Romanum*, the *Menologium Græcorum*, and the *Martyrologium Ecclesiasticum Germanicum*. By far the most famous collection, however, of the kind, and the one to which the name A. S. has been specially given, is that undertaken by the Bollandists (q. v.), a society of learned Jesuits at Antwerp. This vast work, begun in 1643, and not yet finished, though it had reached in 1868 the month of October in the ecclesiastical year, contains the entire literature of the subject, and is not only a colossal monument of human industry, but, within certain limits, is marked by careful and even critical treatment.

Actæa, a genus of plants belonging to the natural order *Ranunculaceæ*, so called from the fancied resemblance of their leaves and fruit to those of the elder, in Greek *akta*. *A. spicata*, or baneberry, is the only species native in Britain, being found in the limestone districts of the N. of England. Its berries are black and poisonous. Its root has been used with good effect in nervous disorders. Two American species are grown in our gardens. About Lake Huron they are considered valuable medicines by the natives, especially as a remedy against the bite of the rattlesnake, hence they are sometimes called rattlesnake herbs.

Actæa spicata.

Actæon, grandson of Cadmus, and trained to hunt by Cheiron, was torn to pieces by his own dogs—Diana, whom he had surprised while bathing, having changed him into a stag.

Actinia, a genus of interesting marine animals closely allied to the sea-nettles (*Acalephæ*). The popular names given them are *animal-flowers* and *sea-anemones*, from their resemblance to flowers when they are fully expanded. They are found on the rocks by the shores of every sea. In Britain there are many beautiful species, but those of tropical regions surpass them in gorgeous brilliancy. The *A. Jordaica*, a deep crimson species of the Mediterranean, is esteemed a delicacy by the Italians. Dr M'Bain, at Trinity, near Edinburgh, has an *A.* called 'Grannie,' *Alseobryanthemum*, which has lived in a glass tumbler for fifty-one years, having been taken from the Firth of Forth at North Berwick in August 1823, by the late Sir John G. Dalyell.

Actinia.

Actinism is the property possessed by certain solar rays (hence called *actinic rays*) of producing chemical effects. See SPECTRUM.

Action, in its legal sense, means a judicial proceeding, criminal or civil. Civil actions are 'real,' 'personal,' or 'mixed.' The first demands restitution of property, the second damages for wrong sustained, the third demands both. In the equity courts of England the word 'suit' is used to denote the litigation; 'A.' being only applied to procedure at common and statute law. The function of an equity court in England is to consider the circumstances of the individual case, and, so far as legal principle permits, to do what is equitable in it. In Scotland, again, there is no distinction between law and equity in the legal administration. While in both countries any one who has been actually wronged may seek redress from the law, the law of Scotland has this advantage, that any one having a latent right may have it *declared*—that is, established—by law, even though no one is denying the right. The danger of lapse, or lapse of proof, by time is thus averted. The necessary A. is called 'A. of declarator.' There is no analogous procedure in the law of England, though endeavours have been made to introduce it.

Action, Principle of Least, is a law of motion first given by Maupertuis, and afterwards extended by Lagrange. It may be enunciated thus: 'The integral of the product of the kinetic energy (see ENERGY) of a system and the element of time is a minimum,' or in analytical language, $\delta \int 2mv^2 dt = 0$.

Varying Action is a remarkable extension of the above by Sir W. R. Hamilton of Dublin, and consists in an investigation of the integral when it is not a minimum.

Actium (now *Asio*), a town and promontory at the entrance of the Ambraciot Gulf (Gulf of Arta), near which Octavian (afterwards Augustus) defeated Antony and Cleopatra in the famous sea-fight of September 2, B.C. 31. The defeat was owing mainly to the flight of Cleopatra with the Egyptian fleet. Antony, infatuated by his passion, followed her with several ships, and in a few days his land forces surrendered to Octavian. On the promontory was a temple of Apollo, where a festival had formerly been celebrated in honour of that god. Grateful for his victory, Augustus enlarged the temple and revived the festival, which was observed quinquennially. He also founded, on the opposite coast of Epirus, Nicopolis (city of victory).

Acts of the Apostles, the earliest historical record of the Christian Church, forming part of the literature of the New Testament, announces itself as the work of the same person who wrote the third Gospel, who is believed to be 'the beloved physician' of Col. iv. 14, and whom tradition (*Nicéphorus*; Cent.) declares to have been a painter also. The style of both treatises is similar, even to the usage of particular words, and no one, in early times, except the Marcionites and Manichæans, is known to have denied either its authenticity or its genuineness. Baur, the head of the Tübingen School, however, has tried to show that instead of being an unsophisticated narrative of the more important facts regarding the spread of the gospel, it is a partisan effort of the Pauline party in the 2d c. to vindicate their Master and his principles at the expense of the apostle Peter. But this view, though urged with much critical subtlety, has not established itself, and the book still keeps its ground as an evangelical product of the apostolic age.

Actuary. In ancient Rome the *actuarii* were the recorders of the *Acta* of the Senate and corporations. In recent times, the development of the business of life assurance has originated a distinct profession, whose special function it is to calculate the monetary results of the combined elements of rate of interest, the laws of probability, and age, with reference to the expectation of life. See LIFE, EXPECTATION OF. The members of this profession are called actuaries. Many other questions, however, besides those connected directly and indirectly with duration of life come within the scope of the profession; all practical questions do whose solution requires mathematical knowledge of the Laws of Probability (q. v.)

Acupressure. By this term is meant the occlusion of an artery, by means of the pressure of a needle in such a way as to arrest the flow of blood through it or bleeding from it. The method was introduced by the late Sir James Simpson, Bart., as a substitute for the ligature usually employed, but has now been abandoned by almost all surgeons. See WOUNDS and ANTISEPTICS.

Ad'a, a town of the Austro-Hungarian empire, in the Woiwodina, on the river Theiss, 8 miles S. of Zenta. Pop. 9350.

Adafu'dia, a town of Sudan, Central Africa, in the Fellatah country, about 400 miles S.E. of Timbuktu, and 150 miles W. of the Niger. A considerable slave-trade is carried on here. Pop. about 24,000.

Adagio (Ital. slow, lingering), a musical term used to signify a very slow rate of movement. It comes between 'grave' and 'andante,' and is nearly equivalent to 'largo' and 'lento.' The second part or movement of a sonata or symphony is very frequently in this time, thus forming an effective contrast to the first movement, which is commonly an 'Allegro' (q. v.) In speaking of such a movement, the word A. is used as a substantive, as 'the A. of the Sonata Pathétique,' &c.

Adal', or **Adel'**, the Arabic name given to the sterile maritime country between Abyssinia and the Red Sea, extending as far S. as the Somauli country.

Ad'Albert (of Prague), the apostle of the Borussi (mod. Prussians), was the son of a Bohemian nobleman, and was born in 956 A.D. Educated at Magdeburg, he was made Bishop of Prague in 983, but his zeal for religion, and his rigid attachment to the usages of the Romish Church, involved him in quarrels with his half-pagan countrymen, in consequence of which he quitted his diocese for a monastic seclusion in Italy. Recalled to Bohemia in 993, he was forced to leave again within two years, and after visiting Germany, and the monasteries of Tours and Fleury in France, he went to Poland, where he conceived the idea of converting the heathen Borussi. At Danzig he baptized his first converts, and thence passed into E. Prussia, where, however, he was assassinated by a pagan priest on his second attempt to preach the gospel, 23d April 997. Boleslav Duke of Poland, it is said, ransomed his corpse with its weight in gold, and brought it to the metropolitan church at Enesen, where it was reported in later times to have worked miracles. A.'s 'day,' as a saint and martyr, in the calendar of the Church, falls on the 1st of June.

Ad'am, the name given in Scripture to the first man. The word conveys in Hebrew the sense of 'redness,' and may have reference to the earth (Heb. *adamah*, Gen. ii. 7) from which he was formed. (*Edom*, i.e., the 'red' desert region, is but another form of the name.) In Gen. ii. 23, considered by some scholars to be part of a later narrative (see GENESIS and PENTATEUCH), A. calls himself *Ish*, i.e., 'one of substance or worth.' The biblical tale is familiar to every one. The Tal mudists have spoiled its simple beauty by their tasteless exaggerations. According to them, A. was at first a hermaphrodite; his head reached the heavens, and the splendour of his countenance outshone the sun. He inspired the argels themselves with fear, and all created things hastened to do him reverence. But the Lord, wishful to show his superior power, caused a deep sleep to fall upon A., during which he took away, by a curious process, his colossal stature. His first wife was Lilith (i.e., the 'night-spectre'), the mother of the demons, who fortunately fled off through the air. After her departure, the Lord formed Eve from a rib of A., and brought her to him superbly appareled. The angels descended and played around them upon heavenly instruments; sun, moon, and stars danced in their courses. But the envy of the angels was now excited, and one of their number, the seraph Sammael, seduced Eve from the paths of innocence. She and her husband were immediately driven out of Paradise, and forced to wander over the face of the earth. According to the Koran, all the angels did reverence to A. except Eblis, who was in consequence expelled from Paradise, which received A. in his place. Here Eve was created. In revenge, Eblis seduced the pair, who were then driven down to earth and separated. But after a time God had compassion upon A., and sent the archangel Gabriel to teach him the divine law, which he faithfully followed, and as a reward had Eve restored him on Mount Arafat, after the lapse of 200 years. See Eisenmenger's *Entdecktes Judenthum* (Frankf. 1700), and Herbelot's *Bibliothèque Orientale* (Par. 1697).—In the New Testament theology A. appears as the federal head or representative of the human race in the covenant of works which God made at the creation.

Ad'am (of Bremen), an old German chronicler and geographer, was a native of Upper Saxony, and was called to

Bremen in 1067 as canon of the cathedral and *magister scholarum*. He died in 1076. His chief work is the *Historia Ecclesiastica Hamburgensis et Bremensis vicinarumque Locorum Septent. ab Anno 788, ad 1076*. It is a storehouse of information about the affairs of his own diocese, and of the northern countries, Denmark, Sweden, and Russia, visited by the devoted missionaries of the north. In reference to the Slavic peoples it is especially valuable. The work was first printed by Velleius (Cop. 1579) from a MS. discovered in the monastery of Soroc; the best edition is that of Pertz, in the *Monumenta Germaniæ Historica*.

Ad' am, Albrecht, a celebrated German painter of animals and battle-scenes, was born at Nordlingen 16th April 1786, and died at Munich 28th August 1862. His principal works are a series of pictures representing scenes in the French campaign in Russia, of which he was an eyewitness; a splendid series of lithographs (120 in number), entitled *Voyage pittoresque militaire*; portraits of the King of Würtemberg on horseback, and of his finest Arabian steeds; the battle of Moscow, for King Ludwig of Bavaria; the battles of Novara and Custoza, in the Austrian campaigns against Sardinia; and the famous fight of Zorndorf for the Maximilianeum at Munich shortly before his death. There is a wonderful life, clearness, and artistic accuracy about his pieces. As a horse-painter, in particular, he had no equal among his contemporaries. Four of his ten children became painters, and have won celebrity—Benno and Franz in the same style as their father.

Ad' am, Alexander, LL.D., a celebrated Scotch teacher and scholar, was a native of Rafford parish, in the county of Elgin, and was born in 1741. He was educated at the University of Edinburgh, became head-master of Watson's Hospital, in the same city, in 1761, and seven years later was appointed rector of the Edinburgh High School, a situation which he held till his death, December 18, 1809. A. was a man of high character and liberal thought, not uninfluenced by the republican sentiments that sometimes flow from a classical culture. He was, moreover, an educational reformer, and his efforts to infuse animation and reality into the study of Latin, though much opposed by the municipal authorities, and sometimes frustrated, conferred a renown on the school which it has never since lost. His best known production is his *Roman Antiquities* (1791; transl. into German by J. L. Meyer; Erlang. 1806; 2d ed. 1812; and into French; Par. 1818), a work which has fallen into disuse since the appearance in later times of larger, more accurate, and more searching treatises, but which was long the best thing of the kind either in England or Scotland. He was also the author of a *Summary of Ancient Geography and History* (1794), *Classical Biography* (1800), and a *Compendious Dictionary of the Latin Tongue* (1805).

Ad' am de la Halle, surnamed *le Boçu d'Arras* (the Hunchback of Arras), a *trouwer* of the 13th c., was the son of a citizen of Arras, and died at Naples about 1287. For the amusement of the Neapolitan court he composed, shortly before his death, *Li Jeu de Robin et de Marion*, a pastoral operatic comedy, which is printed in the *Mélanges de la Société des Bibliophiles Français* (Par. 1822). Other productions of A.'s are, *Li Jeu d'Adan*, *Li Congit d'Adan d'Arras*, *C'est du Roi de Sicile*, and a number of songs and rondeaux, which may be found in Roquefort; *État de la Poésie Française aux douzième et treizième Siècles*. Like most of the poets of his age, A. composed the music for his works, and followed the notation invented by Arezzo. The *Li Jeu de Robin et Marion* is the oldest comedy of modern Europe; it is a real operatic work, is divided into scenes, has the dialogue interrupted with music, and has eleven *dramatis personæ*. It gives A. a claim to be considered one of the founders of the French theatre.

Ad' am, Melchior, a German scholar and writer, born in Silesia about the middle of the 16th c., became rector of the College of Heidelberg, and died in 1622. His chief works are, *Apographum Monumentorum Heidelbergensium*; *Parodia et Metaphrasæ Horatiana*; *Vita Germanorum Philosophorum*; *Decades duæ, Continentes Vilas Theologorum exterorum Principum*. Moreri and Bayle, the great encyclopædists, made liberal use of the writings of this laborious author.

Ad' am, Robert, architect, born at Edinburgh in 1728, and educated at the university there. He proceeded to Italy in 1754,

and thence to Spalatro in Dalmatia, where he made drawings of the ruins of Diocletian's palace. These he published in 1763, on his return to England, under the title *Ruins of the Palace of the Emperor Diocletian at Spalatro, in Dalmatia*, a magnificent work, containing 71 plates. He soon acquired such distinction in his profession that he was appointed architect to the king. In conjunction with his brother James, he executed many public and private buildings, among which are Caenwood House, Luton House; the Register House, the University buildings, and St George's Church, in Edinburgh; the Glasgow Infirmary, the Adelphi buildings, London, the gateway of the Admiralty, &c. His designs, though marred by a fondness for minute ornamentation, exhibit good and even elegant taste. In 1768 he was returned to Parliament for Kinross-shire. He died 3d March 1792, and was buried in Westminster Abbey, in which there is a tablet to his memory.

Ad' amites, or **Adam'ians**, an ecclesiastical sect of the 2d c.; of Gnostic tendencies, who sought to bring back the state of innocence that existed before the Fall by abstaining from all sensual gratifications. They rejected marriage, went about naked, &c., but soon got involved in moral confusions, which ended in a worse licentiousness than that against which they had originally testified. In the 15th c. a fanatical sect of the same name appeared in Bohemia and Moravia. They also called themselves Picards (from their founder, Picard), and 'Brethren of the Free Spirit.' Among other wild crotchets, they declared for the abolition of the priesthood and a community of wives. Both Hussites and Catholics naturally disliked them, but in spite of great persecution from both parties they managed to survive, and as late as 1849, when the edict of religious toleration was issued by the Austrian government, some A. reappeared and actually began to proselytise.

Ad' amnan, or **Adomnan**, an Irish saint and ecclesiastic, best known as the biographer of St Columba, was born in Donegal about A.D. 624. He belonged to one of the great families in the N. of Ireland, and in consequence exercised considerable influence in secular as well as ecclesiastical affairs. At the age of fifty-five he was chosen abbot of Ily or Iona, and ruled that famous monastery for twenty-five years. It cannot, however, be said that his rule was a success, for during one of his visits to Aldfrid King of Northumbria, whose acquaintance he had made in Ireland, he became converted to the Roman view of the true time for celebrating Easter, and provoked bitter opposition among the Scoto-Irish clergy by seeking to introduce the foreign usage on his return to Iona. The last years of his life were spent mainly in Ireland, but he died in Iona A.D. 704. A.'s *Vita Sancti Columbae* ('Life of Saint Columba') is a work of great value for the light which it throws on the dark Pictish times, which were soon after again swallowed up in gloom, and on the peculiarities of that Scoto-Irish Christianity which was partially independent of Rome. It was first printed at Ingolstadt in 1619, but the latest and best edition of the work is that executed by Dr Reeves in 1857 for the Bannatyne Society of Edinburgh and the Irish Archaeological Society, and which, with an English translation, forms (1875) the 6th volume of the admirable series of *Scottish Historians* in course of publication by Edmonston and Douglas (Edinb.). A. also wrote, from information furnished to him by a French bishop, an account of the Holy Land, which is the earliest we possess belonging to the dark ages.

Adam's Bridge, a spit of shoal, 60 miles long, reaching from the peninsula of Hindostan to Ceylon. There are two openings in the barrier, but these only allow small craft to pass.

Adam's Needle, the popular name for *Yucca* (q. v.).

Adam's Peak, a mountain in the S. of Ceylon, 7420 feet high. On the platform at the summit of the granite peak there is a deep impression like that stamped by a monster foot, which is an object of curious tradition. The Mohammedans believe that after Adam was expelled from the garden of Eden, he did penance on this spot by standing on one foot for a thousand years. The Buddhists regard the indented mark as the *Sri-pada*, or holy footprint of Buddha. The place attracts immense numbers of pilgrims.

Adams, John, second president of the United States, was born at Braintree, Massachusetts, October 19, 1735, educated at Harvard College, and afterwards qualified himself for the bar.

He removed to Boston in 1765, and soon acquired a high professional reputation. He was a member of the congress which met at Philadelphia in September 1774, and strongly supported Jefferson and Lee in their proposal for total separation from the mother country. In November 1784 A. signed the preliminaries of a peace with Britain, and was American minister in London in 1785. There he published his *Defence of the Constitutions of Government of the United States* (1787). In 1789 he was elected vice-president of the United States, and president in 1797. The latter part of his life was devoted to agriculture and literature, and he died 4th July 1826.

Adams, John Couch, astronomer and mathematician, born near Bodmin, June 5, 1819. Entering St John's College, Cambridge, he was senior wrangler in 1843, and afterwards fellow and tutor. In 1841 he began to investigate the irregularities of the motion of Uranus, which in October 1845 he showed to be caused by an unknown planet within a definite range. Le Verrier's announcement of the same import was made on the 10th of November following. The discoveries being independent, the Royal Astronomical Society gave each a printed testimonial, instead of awarding its gold medal to either. In 1858 A. became Lowndean Professor of Astronomy at Cambridge.

Adams, John Quincy, sixth president of the United States, and son of John Adams the second president, was born at Braintree, Massachusetts, 11th July 1767. While but a youth he accompanied his father to Paris, where he acquired a thorough command of the French language, which in his subsequent career proved of great importance to him. After graduating at Harvard College he devoted himself to legal pursuits, and to writing for the press. He was sent as minister to the Hague in 1794; was minister at Berlin 1800-1801; and in 1803 was elected to the Senate of the United States. After being for some years professor of rhetoric in Harvard College, he was in 1810 appointed by Madison minister to Russia, whence he was transferred in 1815 to London. In 1817 he was appointed secretary of state, and obtained the presidency in 1825. From 1830 till his death, 23d February 1848, he was a member of the House of Representatives, and latterly an uncompromising advocate of the abolition of slavery. From a party point of view, his political career was somewhat shifty, but he was much superior in knowledge and intelligence to the majority of American statesmen. See *Memoirs of John Quincy Adams*, the first two vols. of which appeared in 1874 (Philadelphia, Lippincott & Co.)

Adams, Samuel, a prominent leader in the movements that led to the separation of the American colonies from Britain, born at Boston, U.S., 27th September 1722. He graduated at Harvard in 1743, became a member of the legislature in 1766, and ten years later signed the Declaration of Independence. From 1789 to 1794 he was lieutenant-governor of Massachusetts, governor for the succeeding three years, and died at Boston, 2d October 1802. A. was an eager, passionate, obstinate republican, who won and deserved the title of the American Cato.

Adamson, Patrick, a notable Scotch ecclesiastic and an elegant scholar, born in Perth 1543. He studied at St Andrews, became minister of Ceres in the Reformed Church, passed some years on the Continent as tutor to the son of Macgill of Rankellor, one of the Lords of Session, escaping with difficulty from the massacre of St Bartholomew, and returned to Scotland in 1570 to find a party among the nobles bent on keeping up Episcopacy in the Kirk of Knox. The remainder of his career is part of the ecclesiastical history of the time. Appointed minister of Paisley by the General Assembly, he soon after (1577) amazed his brethren by accepting from the Regent Morton the yet unabolished office of Archbishop of St Andrews, and henceforth was almost at open war with the General Assembly, of which, however, till his excommunication, he continued to be a member. His shifty, unprincipled, and worldly policy closed in disaster and misfortune. King James neglected him in his later years, and bestowed the revenues of his see on a favourite. Driven to despair by debt, disgrace, and misery, he sent a 'recantation' of his anti-Presbyterian policy to the Synod of Fife; the excommunication was taken off, but he died in the first stages of his humiliation, February 19, 1592. A collection of the best of A.'s writings was published by his son-in-law, Thomas Wilson (Lond. 1619). As a Latin poet he may almost rank with Buchanan or Melville.

Adana, the capital of a Turkish vilayet of the same name, Asia Minor, on the river Seihun, 120 miles N.W. of Aleppo. It

was founded by the caliph Haroun al Raschid, on the site of the anc. *Antiochia ad Sarum*, and commands the passes of the Taurus mountains. It is now a chief place of trade between Syria and Asia Minor. Pop. 30,000, mostly Turks.

Adanson, Michel, an eminent French botanist of Scotch extraction, born at Aix in Provence 7th April 1727, studied his favourite science at Paris under M. M. Jussieu, sailed for Senegal in Africa when only twenty-one years of age, and after a five years' residence returned to Europe with a valuable collection of specimens in natural history. In 1757 appeared his *Histoire Naturelle du Sénégal*, and in 1763 his *Familles des Plantes*, in which he endeavoured unsuccessfully to supersede the Linnæan system of classification. His proposal (1774) to the Académie des Sciences of an immense encyclopædic work on his peculiar method of classification was not adopted, and the rest of his life was spent in solitary speculation, and in amassing materials for a work that was never to be finished or even published. He died at Paris 3d August 1806. See Cuvier's *Éloge d'Adanson* in the *Recueil des Éloges Historiques*, &c. (Paris, 1819).

Adansonia, a genus of trees belonging to the natural order *Bombacæ*. There are only two known species. *A. digitata*, the baobab, sour gourd or monkey-bread, common in several parts of Africa. Its stem is short, but grows to a great thickness. It has been spoken of as 'the tree of a thousand years,' and 'the oldest organic monument of our globe.' Adanson, whose name the genus bears, and who travelled in Senegal in last century, met with two trees, one of which was 30 feet in diameter, and which he supposed to be 5150 years old. Livingstone says, 'I would back a true *morvana* (the native name for it at Lake Ngami) against a dozen floods, provided you do not boil it in salt water; but I cannot believe that any of those now alive had a chance of being subjected to the experiment of even the Noachian deluge.' The wood of the baobab is soft, but the inner bark yields a strong fibre. The stems often become hollow, owing to the attack of a fungus, and within these hollows the natives suspend the bodies of those who are refused the honour of burial. *A. Gregorii* is a native of N. Australia, and is called the cream-of-tartar tree from the agreeable acid taste of its fruit.

Adansonia digitata.

Adda (Lat. *Addua*), a river of Lombardy, rises in the Rhætic Alps. After flowing through Lake Como, it crosses the plain of Lombardy, passes Lodi and Pizzighetone, and about 8 miles above Cremona joins the Po.

Adda, a small lizard found in the East. It is supposed to be efficacious in cases of cutaneous diseases, to which Arabs and Egyptians are very subject.

Adder, a venomous reptile of the serpent kind. See VIPER.

Adder's Tongue, the English name of a small British fern, *Ophioglossum vulgatum*.

Addiscombe. See CADET.

Addison, Joseph, the most exquisite of English essayists of society, the founder of our periodical literature, and a poet of graceful genius, was the son of the Rev. L. Addison, Dean of Lichfield, and was born at Milston in Wiltshire, 1st May 1672. Sent to the Charterhouse School, London, he there, as a boy, made the acquaintance of Steele, afterwards his coadjutor on the *Tatler* and *Spectator*. At fifteen he entered Oxford, where he signalled himself by the peculiar excellence of his Latin verse, and graduated M.A. in 1693. Having secured the patronage of Lord Keeper Somers, and obtained a pension of £300 a year, he travelled in Italy for two years, returning to England in 1703. During his residence in Italy, he penned his poetical *Letter to Lord Halifax*, in which his classic enthusiasm gives an unwonted ardour to his verse. In 1704 he wrote *The Campaign*, a poem addressed to the Duke of Marlborough, celebrating

his 'famous victory' of Blenheim, became member of parliament for Malmsbury in 1708, and so rapid and fortunate was his public career that in 1717 he was appointed secretary of state. In the previous year he had married the Dowager-Countess of Warwick—a union which did not yield him any happiness. He died at Holland House 17th June 1719. A. commenced to write for the *Tatler* in 1709, and for its successor the *Spectator* in 1711. His tragedy of *Cato*, produced in 1713, met with unbounded success. Whigs and Tories vied with each other in the enthusiasm of their admiration. The work seemed immortal, but is long since dead. A. is also the author of an unfinished work on *The Evidences of the Christian Religion*, and of numerous pamphlets, poetical epistles, and political articles. Of his poetry one or two sacred pieces will endure as long as the language; but it is as an essayist that he maintains his place among the illustrious of English authors. For humour, exquisite in ingenuity, playfulness, and poetic grace; for satire, incisive as it was wise and wholesome; and for a moral influence powerful enough to elevate the tone of social intercourse even of his own day, the essays of the *Spectator* remain unsurpassed. The most complete edition of A.'s works is Greene's (6 vols., New York and Lond. 1854). See also *The Life of A.* by Miss Lucy Aiken (2 vols. Lond. 1843).

Addison's Disease. This name is given to a peculiar form of disease first described by Dr Addison of London. It is characterised by anemia, or a deficiency of the coloured corpuscles of the blood, great and progressive debility, loss of appetite, faintness, flabbiness of the muscles, and a peculiar brownish or dingy discoloration of the skin. It is associated, though not invariably, with disease of the supra-renal capsules, two small ductless glands placed in close proximity to the kidneys. A.'s D. is invariably fatal, and is not amenable to any known treatment.

Addition is a mathematical operation by which two or more quantities are put together so as to form one new quantity, which is said to be the *sum* of the original quantities. In arithmetic the distinctive mark of A. is + (plus). In algebra, however, there is an extension of meaning, not only +, but also - (minus) being employed; and these two signs are connected by the law, $+ a - a = 0$; or if + a be added to - a, the result is zero.

Adelaer, Cort Sivertsen, a famous admiral, born 1622 at Brevig in Norway, entered the Dutch navy at the age of fifteen, and subsequently fought for the republic of Venice against the Turks. On one occasion near the Dardanelles in 1654, A. won a most brilliant victory over the Ottoman fleet. With a single ship he broke a line of 65 galleys, sent 15 to the bottom, burnt several others, and destroyed about 5000 of the enemy. In 1661 he left the Venetian service. Frederick III. of Denmark, who made him a splendid offer in respect of salary, obtained his services in 1663, and in 1675 he was appointed admiral-in-chief of the Danish fleet, but died at Copenhagen in the same year.

Adelaide, the capital of S. Australia, founded in 1836, lies on both banks of the river Torrens, about 7 miles E. of the Gulf of St Vincent, in $34^{\circ} 45'$ S. lat., and $138^{\circ} 26'$ E. long. It is built on a sandy plain, and walled in on the E. and S. by the Mount Lofty range (2100 feet). The streets run at right angles, and are broad and well kept. A. possesses a number of handsome public buildings, chief among them, in addition to those occupied by the governor, the legislature, and government departments, being the South Australian Institute and the Hospital, and several other charitable institutions. The number of churches is remarkable. A. is lighted with gas, and well supplied with water from reservoirs several miles distant. It has beautiful botanical gardens, and is surrounded by a public demesne half a mile wide, called the Parklands. A. supports four daily and nine weekly newspapers, besides several monthly publications. It is a see of the Anglican and Roman Catholic Churches. An Anglican cathedral was consecrated in 1878. Pop. (1873) 29,000.

Adelsberg, a market town of Carniola, 22 miles N.E. of Trieste, in the vicinity of which is the largest stalactite cavern in Europe. This cavern is of double form, the larger chamber being 8550 feet long, fretted with beautiful stalactites, and resonant with the music of a rapid stream. The cavern is in the care of guides, who show it by torchlight.

Adelung, Johann Christoph, a once notable philologist, born in Pomerania 8th August 1732, studied at Halle, became a professor at Erfurt 1759, and librarian at Dresden 1787, where he died 10th September 1806. He is best known by his *Mithridates oder Allgemeine Sprachkunde*, only one volume of which he lived to publish. Three additional volumes were added by Vater (1809-17). Other works of A., of much use in their day, though now superseded, are his *Versuch eines vollständigen grammatisch-kritischen Wörterbuchs der Hochdeutschen Mundart* (Leipz. 1774-86; 2d ed. 1793-1801), and *Adelre Geschichte der Deutschen, ihrer Sprache und Literatur*.

Aden, a free port and peninsula in the S.W. of Arabia, at the base of a mountain range which rises to the height of 1776 feet. It was called Aden or Eden (Paradise) by the Arabs, because of its rich trade and splendid climate. The town lies in a hollow formed by the vast crater of an extinct volcano, and has capital harbours. It was a flourishing entrepôt in the ancient commercial world, being known to the Greeks and Romans under the name of Adana or Athana. The town played an important part under the Himyarite, Abyssinian, and Sassanide dynasties, was long the capital of Yemen, and the greatest emporium in Arabia for the products of Southern Asia and E. Africa. It first began to decline under Turkish rule (1538-1630), and continued to do so under all changes, until it passed into the hands of the British in 1839. It is now a strong garrison, a coal-depôt for Indian steamers, and a station of the Indo-European telegraph line. It is rapidly increasing in trade and population. An extensive range of rock-cisterns was lately discovered, capable of holding 30,000,000 galls. In 1876-77 the sea-borne trade was valued at £5,000,000, not including mere transshipments. Area of settlement, 11 sq. miles; pop. (1877) 19,289.

Adenanthera, a genus of leguminous plants, principally indigenous to India. *A. pavonina* is a large E. Indian tree, from the wood of which a dye is obtained. The Brahmans use the dye for marking their foreheads after their ablutions. The seeds of the tree are bright scarlet, and are used by jewellers in the East as weights, each seed being very uniformly four grains. They are sometimes used for food, or made into bracelets and other ornamental articles.

Adenitis, inflammation of a lymphatic gland. It usually proceeds to suppuration and destruction of the gland. It is common in the cervical glands of children while recovering from eruptive fevers, more especially in those of a strumous habit of body. Inflammation of the glands of the groin frequently follows venereal disorders, and is then termed a bubo.

Adenoma, a tumour of the mammary gland, consisting of an hypertrophied condition of the proper gland structure. The term is also sometimes applied to any tumour formed by hypertrophy found in lymphatic glands.

Aderno (anc. *Adranum*), a town of Sicily near the river Simeto, 17 miles N.W. of Catania. It lies at the foot of Mount Etna, and is built chiefly of lava. Convents and nunneries abound in the place. Pop. 13,000.

Adhesion is a kind of attraction subsisting between two separate bodies, by which they tend to remain attached to each other when their surfaces are brought into contact. The most interesting cases are those with respect to solids and gases, which latter become so condensed that in many instances their chemical action is increased. Thus oxygen is so condensed on the surface of spongy platinum, that it will unite at once with hydrogen to form water without the application of heat.

Adhesion, a term employed in pathology to express the union between two cut surfaces or between two membranes by the effusion of lymph between the opposed surfaces. The kind of lymph necessary is called plastic or fibrinous, because it tends rapidly to become developed into connective tissue, and to be supplied by blood-vessels. Thus the parts become firmly and permanently united.

Adiabatic Lines are curves which express the relation between the pressure and volume of a gas of given mass, the quantity of heat in the gas being constant. Hence, as the volume increases, not only the pressure but also the temperature decreases. Accordingly these lines cut successive equal temperature lines, which represent the variation of pressure with

volume, supposing the temperature constant. These curves are of immense service in treating of Thermodynamics (q. v.)

Adiantum, a genus of ferns. See MAIDENHAIR.

Adigé, a river of N. Italy, rises in the Rhetian Alps, flows E. into the Tyrol, then turns to the S., passing Trent, Roveredo, and Verona, and enters the Adriatic about 5 miles below Chioggia. Next to the Po, it is the largest river in Italy, having a course of about 250 miles. It is a means of transit for the trade between Germany and Italy; nearly 200 flour and rice mills are driven by it; but it is subject to overflows. Near the A. the Austrians gained a triple victory over the French in March and April 1799.

Adipoceré. This is a fatty substance formed under certain conditions in the dead body when exposed to the action of water or a damp soil. It is an unctuous soapy substance, varying in colour from a pale white to yellow or brown. It melts at 202° F., and burns like spermaceti, but with an ammoniacal odour. It is essentially a kind of soap produced by the union of the fatty acids of the fat of the body with ammonia. Many specimens might be termed oleate or stearate of ammonia. It is supposed that during decomposition ammonia is formed from the breaking up of the muscular structures. This unites with the fatty acid of the fat to form A. After being converted into A., the body may retain this condition for many years. Bodies immersed in hard water containing lime, or buried in graveyards traversed by water which has percolated through chalk, produce a harder kind of A., which consists of oleate or stearate of lime.

Adjective is the name given to that part of speech which adds to the meaning of a noun, by the mention of some circumstance or quality that renders our knowledge more definite. In doing this the A. necessarily narrows the range of the noun. For example, the term 'rose' is applicable to all kinds of roses, but 'red rose' denotes only one kind. The image presented to the mind is more distinct, but all other classes of possible images—such as white roses—are wholly excluded. It is not true that A. always qualifies a noun. It may only express an accidental circumstance or peculiarity. Thus in the phrase 'three men', three obviously does not express any quality or property inherent in men, as red does in the phrase 'red rose.' We render the term 'men' less vague in point of number by the introduction of an external and separable accident. Adjectives are classified according to their characteristics into those of *quality*, *quantity* (in which may be included 'number' and distribution), and pronominal adjectives. In modern English the A. is infected only for comparison.

Adjudication is a term in the law of England and in the law of Scotland; but the meaning in the former differs from that in the latter. In English law, A. is the fiat of court by which a debtor is adjudged bankrupt, and his estate and effects made the property of his creditors. The A. proceeds upon a petition to the court by a creditor, or more than one, setting forth that the debtor has committed an Act of Bankruptcy (q. v.) See also BANKRUPTCY.

In Scotch law there are various kinds of A. *Adjudication for Debt* is a process by which a creditor attaches the land or other heritable estate of his debtor. The process applies to heritable estate (see HERITABLE and MOVABLE) in its widest signification.

Adjudication contra Hereditatem Facientem. When the debtor's apparent heir renounces this succession, the creditor obtains a decree *cognitionis causa*. This A. carries right to the rents due prior to the date of the decree, and is redeemable within seven years by any coadjudging creditor, either of the deceased debtor or of the heir who has renounced.

Adjudication in Security is the form to be followed when the claim is contingent or latent. The debtor must be *vergens ad inopiam*, or other creditors must be adjudging.

Adjudication in Implement is a form for completing a defective title.

Adjudication on Trust Bond is a mode of making up titles to heritage where an heir is apprehensive about incurring representation of his predecessor.

Adjudication on Trust Disposition is a similar legal choice.

Adjudication Declaratory is a form of action appropriately classed with adjudications.

Adjustment, in the law of insurance, is the fixing the amount of indemnity which the insurer is entitled to under his policy, and the adjusting of the loss among the underwriters. In complicated or disputed cases a professional referee is usually chosen.

The A. is not legally binding, but it is held to transfer the *onus probandi* from the insurer to the underwriter.

Adjutant (Lat. *adjuvare*, to help) is the title of the officer who assists the commander of a regiment or fort. He keeps the books of the regiment, promulgates orders, inspects generally, and notes all infraction of discipline. The *Adjutant-General* assists the general of an army. The *Adjutant-General of the Forces* is an important officer of the Horse Guards.

Adjutant, the English name for *Leptoptilos Argala*, a large Indian bird allied to the stork. The natives call it *argala*. It is of great use in removing noxious animals and carrion, on which it feeds. Its capacity of swallowing is remarkable, making but one mouthful of any substance agreeable to its fancy a foot square. Marabou feathers are obtained from its wings, as well as from a Senegal species.

Adjutant.

Adjygu'rh, a town of British India, Presidency of Bengal, about 100 miles S.W. of Allahabad. It is notable only for its fortress, which occupies an isolated granite hill, and contains within it the ruins of richly-sculptured temples, whose architecture resembles that of the Deccan and the Carnatic. Pop. 5000.

Ad Libitum (in Ital. *a piacere*), an expression sometimes met with on the titlepage of musical compositions with reference to their execution by different instruments. For instance, a Sonata for the piano, with horn and flute or violoncello *ad lib.*; it being left to the performer to choose one of the three instruments for accompaniment. It means also that the solo singer or player may introduce a spontaneous ornament or leave it out.

Administration and **Administrator**. In England, when any one dies intestate or without appointing an executor, or when an executor declines to act, the ordinary or bishop of his diocese appoints some one to 'administer'—that is, to collect and distribute his property. The personal property of the deceased vests in the A. from the date of grant of letters of A. In ancient times the right to administer fell to the crown; but by Magna Charta it was given to friends and relatives, under direction of the Church. Under ecclesiastical guidance, however, beneficiaries found that what seemed to them an undue share was applied to 'pious uses.' This view led to the passing of an Act under Edward III., by which the right to A. was given 'to nearest and most lawful friends.' See EXECUTOR.

Administration, in politics, is usually used in England to denote the sovereign's Cabinet or Ministry (q. v.). In its larger sense it denotes the whole executive machinery of a state.

Administration of Charities is chiefly regulated by 16 and 17 Vict. c. 137, giving powers to the crown to appoint officers for the purpose. The relative claims of the English and Roman Catholic Churches are equitably provided for. Charities more or less depending on voluntary contribution are exempt from the operation of the Act.

Administrator-in-Law is, in Scotch law, the office of Tutor or Curator (q. v.) for one in Pupilage or Minority (q. v.); belongs to the father, who has jurisdiction over all property bequeathed to the child, unless otherwise provided by the bequest. It ceases if the child discontinues to live with the father, unless he continues to live at his expense. It ceases on the marriage of a daughter.

Admiral, the title of the highest rank of naval officers. The word probably comes from the Arabic *Emir* or *Amir*, 'lord,' and was originally written in English 'Amiral' or 'Armiral' (e.g., *Paradise Lost*, B. i. l. 293, 294), 'To be the mast of some great armiral'. It is so preserved in French. The first English 'Admiral of the Seas' mentioned is William de Leybourne, 1286. The title under which the powers of this office were subsequently held was Lord High Admiral of England. The last Lord High Admiral was the Duke of Clarence, afterwards William IV. The administrative functions which belonged to the office are now vested in the *Lords Commissioners of the Admiralty*; and the judi-

cial authority which belonged to it is exercised by the *High Court of Admiralty*. In the British navy there are three classes of admirals—Admirals, Vice-Admirals, and Rear-Admirals. The admiral carries his colours at the main, the vice-admiral at the fore, and the rear-admiral at the mizzen mast-head. *Admiral of the Fleet* is a higher rank conferred at the will of the sovereign.

Admiralty Court. The jurisdiction of this court now embraces all questions relating to war prizes and piracy. Abroad, the Vice-Admiralty courts have jurisdiction in the latter questions. While the office of Lord High Admiral existed, the judge in this court derived his authority from him, but he now holds it directly from the crown. The decisions of the Admiralty courts at home and abroad are now subject to appeal to the Judicial Committee of the Privy Council. The jurisdiction of the Vice-Admiralty courts in the foreign dominions of the Queen has been extended and defined, and their procedure regulated by statute. The civil jurisdiction of the courts embraces all questions of maritime rights and contracts, such as arise between shareholders of ships, or regarding wages, pilotage, bottomry, and respondentia bonds, salvages, wrecks, collisions, &c. By the statute, the judge in the A. C. is, in virtue of his office, also a judge of the Central Criminal Court, and that court is empowered to try criminal offences which would formerly have come under the jurisdiction of the A. C. There is a separate A. C. in Ireland. In Scotland it has been abolished, and its ordinary jurisdiction transferred to the Court of Session, the Court of Justiciary, and the sheriffs. Jurisdiction in questions regarding prizes and condemnations, however, belongs exclusively to the High Court of Admiralty in England.

Admiralty Droits once formed part of the revenues of the Lord High Admiral, or, when his office was vacant, of the crown. They were obtained from the seizure of enemies' ships lying in port at the declaration of hostilities, or coming into port in ignorance of hostilities having been declared, from the capture of piratical cruisers, or from the proceeds of wrecks. All such moneys or chattels obtained in this way are now paid into the public exchequer.

Admiralty Island, on the N. American coast, belongs to United States, lies about 58° 24' N. lat., and 135° 30' W. long. It is about 80 miles long and 20 wide, and is clad with pine forests.

Admiralty Islands, about forty in number, lie in the Pacific, N.E. of New Guinea, between lat. 2° and 3° S., and long. 146° 18' and 147° 46' E. The centre isle of the group, surrounded by a cordon of reefs, is about 50 miles long. Some of the islands are covered with cocoa-nut trees, and are inhabited by a race of the negro type.

Adonis, the Graecised form of the Phœnician word *Adon*, 'lord,' is the name of a beautiful youth beloved by Aphrodite. Being mortally wounded by a wild boar, Aphrodite sprinkled nectar into his blood, whence flowers immediately sprang up. On his descent to the infernal world, Persephone also became enamoured of him; but commiserating Aphrodite, she allowed *A.* to spend six months every year with her in the upper world. The myth of *A.* was introduced into Greece from Syria, and inwoven with the Greek mythology. Originally, perhaps, it was nothing more than an emblem of the death of nature in winter and of its revival in spring, an idea strengthened by the fact that the name *Adon* was applied by the Phœnicians to the sun.

Adonis, a small genus of plants belonging to the order *Ranunculacea*. One species (*A. autumnalis*) is naturalised in Britain, and called Pheasant's Eye. It has also received the name of *Flos Adonis*, from its bright scarlet-coloured petals having poetically suggested the notion of their being stained with the blood of *Adonis*. *A. vernalis* and *A. autumnalis*, natives of Central Europe, are commonly cultivated in gardens.

Adoption Controversy. The, arose in Spain towards the close of the 8th c. Elipandus, Archbishop of Toledo, and Felix, Bishop of Urgel, maintained that though, in respect of his *divine* nature, Christ might be called the Son of God, yet in his *human* nature he could only be supposed to be such by adoption. From Spain the controversy was carried into the Frankish empire, and the new opinions were condemned as heretical, first by the Synod

of Ratisbon in 792, and again by the Synod of Frankfurt in 794, at which Charlemagne himself was present. Felix retracted his views at the Synod of Aix-la-Chapelle in 799, but Elipandus adhered to them with courage or obstinacy, and in later times they have been maintained by various distinguished men, as Duns Scotus, the schoolman (14th c.); Basquiz, the Jesuit (17th c.); and the Protestant theologian Calixtus (17th c.).

Adoption, in Roman law, was a term properly applicable to the act by which, in the case of a child, the *patria potestas* was transferred from the real parent to the person who adopted it. The child took the name of its adoptive father, and came under an obligation to perform all the religious rites and observances incumbent on the members of the family into which it had passed. When the person adopted was old enough to be his own master, the act was called *adrogatio*, and sometimes it was resorted to for political ends. Thus a public man would get himself transferred from a patrician to a plebeian family that he might be eligible for some office. *A.* was only possible where the adoptive father had no children of his own. The practice was also followed in Greece, but was not known among the Teutonic nations, and it is a part of the Roman law which has not established itself in modern communities. In England or Scotland a child may be adopted, *i.e.*, received into the house of one who is not its real parent, and may receive the name of such person, but no filial duties are imposed by law, and no legal position in the family is secured to such a child by the act of its adoptive father.

Adour, a river of France, nearly 200 miles long, rises in the department of the Upper Pyrenees; forms a fall 100 feet high in the beautiful valley of Campan; flows through Gers and Landes, entering the Bay of Biscay three miles below Bayonne. It is navigable for about 80 miles.

Adowa, a town of Abyssinia, capital of Tigré, and 145 miles N.E. of Gondar, lies on a tributary of the Atbara. It is the great entrepôt of trade between the N. of Abyssinia and the Red Sea ports, has manufactures of cotton cloths, iron, and skins, and exports by transit gold, ivory, and slaves. Pop. supplies to be about 8000.

Adra (the *Abdera* of the Phœnicians) is a seaport in the of Spain, province of Granada, 49 miles S.E. of Granada. Tally inhabitants are largely employed in the neighbouring lead-mines, but also carry on a considerable export trade in grapes and wheat. Pop. 9000.

Adria, a very old town of N. Italy, in the province of Rovigo, with a population of 10,000, gives name to the Adriatic Sea. Anciently it was a station for the Roman fleet, and a considerable seaport, but owing to the gradual silting up of this part of the Adriatic it now stands 10 miles from the coast.

Adrian, a name borne by six popes. Of these Adrian IV., whose name was Nicolas Breakspere, was the sole Englishman that ever wore the triple crown. He was born near St Albans; entered the abbey of St Rufus, near Avignon, as a lay-brother, and was elected abbot in 1137; was made cardinal-bishop of Albano in 1146 by Eugenius III.; succeeded Anastasius on the papal throne in 1154; died September 1159. The notable thing in his pontificate was the beginning of the papal conflict with the Hohenstaufens of Germany—the fourth crisis of the Guelph and Ghibelline struggle.

Adrianople, the second city of Turkey, stands on the Mariza (anc. Hebrus), in a vilayet of the same name, and is walled and defended by a citadel. Its finest buildings are the immense bazaar of Ali Pasha, and the beautiful mosque of Selim II. *A.* was the European capital of the Ottoman Turks till the capture of Constantinople in 1453. The war with Russia was terminated here in 1829 by the Treaty of *A.*, which virtually restored to independence the Danubian Principalities, and ceded to Russia the plain of the Kuban, and the right of navigation of the Black Sea, Danube, and Dardanelles, the Danube to be the northern boundary of Turkey. The chief manufactures are silk, cotton, and perfumes; exports, opium, wool, and leather. Pop. (*Almanach de Gotha*, 1875) from 100,000 to 150,000.

Adriatic Sea, a name applied to that arm of the Mediterranean that stretches from S.E. to N.W., between Italy on the

MO

Austria on the other. It is connected with the Ionian Sea. In the N. lies the N.E. the Gulf of Trieste, and to the S. of the Gulf of Fiume or Quarnero. Except the rivers running into it are mere moun-

After becoming said to have fallen of his way at the 16 (mod. Zulla), on the W. coast of the Red Sea. Here Cosmos Indicopleustes (q. v.), a merchant of the 6th c., found a Greek inscription, the *Monumentum Adulitanum*, useful for purposes of ancient geography, which he has preserved in his *Topographia Christiana*.

Adultery is the sin of incontinence in a married man or woman. According to the Roman and Mosaic law, a man was not guilty of the offence unless the participant woman was married. Following the ecclesiastical law, however, modern Europe and America generally have held that a man may commit A. with an unmarried woman, thus placing husband and wife on the same footing. During the Commonwealth in England, the offence was made a capital crime. It is now only held by the law to be a civil injury, the remedy being provided by the Divorce Acts of the present reign. The adulteress is made co-respondent in the suit, and may be found liable for costs and damages. The extent of the latter will be affected by the social position of the plaintiff, means of the defendant, and circumstances of the case. By the old law of Scotland, certain flagrant forms of A. were held a capital crime. But the statute (1563) so constituting it has long since fallen into desuetude; and in Scotland now, as in England, the offence is not held to be a crime; but it constitutes a ground of action of divorce, and of a civil action for damages. See DIVORCE, SEPARATION.

Advent (Lat. *adventus*, the 'coming' or 'approach'), in ecclesiastical usage, denotes a certain period before Christmas. In the Greek Church it lasts forty days; in that portion of the Latin Church which still observes it, viz., the Roman, Anglican, and to some extent the Lutheran communions, it lasts four weeks. A. is first mentioned as a festival enjoined by the Church at the Synod of Lerida, 524 A.D., which forbade marriages to be celebrated during its continuance. The explanation of the four weeks is to be sought in the old theological view of the fourfold coming of Christ, viz., his coming in the flesh, his coming at death to receive the spirits of the faithful; his coming at the fall of Jerusalem; and his coming at the judgment-day; and the 'gospels' for the four Sundays were chosen in harmony with this. As the beginning of the ecclesiastical year, and the season that ushers in the holy day of the Nativity, it has always been regarded as an appropriate time for solemn and penitent thought. ('Repent, for the kingdom of heaven is at hand.') Hence the prohibition of worldly amusements and festivities in the Roman Catholic Church. This view of A. was finally sanctioned by Urban V. in 1370.

Adverb. This part of speech receives its name because it is most frequently joined to the verb, which it limits in some way that an adjective does a noun. It can, however, be also joined to an adjective or another A. Like the adjective, it admits of comparison only where gradation is possible. As we can have the adjectival forms bright, brighter, brightest, so we can have the adverbial forms brightly, brighter, brightest, but degree is alike inconceivable in the adjective 'round,' and the A. 'here.' Adverbs are classified by grammarians under the heads of time, place, degree, manner, cause, &c.

Advertisement (Fr. *avertissement*), a notice to the public, usually given in the newspapers and other periodicals. An A. has often an important legal effect; thus the advertising of a ship for a particular voyage places the master on the footing of a public carrier, entitling the merchant to have his goods shipped, so long as sufficient freightage is disengaged. See CHARTER-PARTY, CARRIER. A. is frequently required as a qualification for statutory privilege, as under Road and Bridge Acts, &c. In the *Gazettes* of London and Edinburgh it is frequently required by law, as in dissolution of partnership, under the Bankrupt Acts, &c. See NEWSPAPER.

Advocate (Lat. *advocatus*), one called in, inferentially, to plead for another. In Scotland, the profession of an A. corresponds to that of a barrister in England. See ADVOCATES, FACULTY OF. In ancient Rome, the office of the A., or bar-

rist, was, as with us, quite distinct from that of the attorney or agent, who represented his client in the litigation and furnished the A. with information regarding the case. The division of these occupations does not everywhere prevail. They are united in many of the states of Germany, in Geneva, in America, and in some of our colonies.

In France the *avocat* and *avoué* correspond pretty nearly to the barrister and attorney in England. The French A. possesses the same privileges as to irresponsibility for his advice, and for the statements of his instructions, as belong to members of the corresponding branches of the legal profession in this country. Like the English barrister, he has no legal claim for his fees. It is etiquette at the French bar that in communicating articles of process to each other no acknowledgment shall be given; and it is asserted that during the many centuries this rule has existed, it has never once been ignored.

In Belgium, Geneva, and those German states by which the Code Napoleon has been received, the organisation and discipline of this branch of the legal profession are similar to the French.

Advocate, Lord. This is the title of an important legal and political officer in the management of Scotch affairs. He is necessarily a member of the Faculty of Advocates; and, according to custom, he is selected from the most eminent counsel belonging to the political party in power. He is *ex officio* one of the Queen's ministers, but he is not usually a member of the cabinet. The L. A. is assisted in his duties as public prosecutor by the solicitor-general, and four junior advocates called advocates-depute. The parliamentary duties of the office are very onerous, involving the preparation and introduction of all government measures which are especially Scotch. An excellent historical account of the office will be found in a judgment of the late Lord Medwyn, in 'King's A. against Lord Douglas,' 24th December 1836. The title was originally King's A.; one of the fifteen original judges of the Court of Session being so named between 1525 and 1538. The first mention of a Lord A. is in the record of the Court of Justiciary in 1598. In 1582 the salary of the office was £40 Scots. It is now £2387, with considerable emoluments from patents and other sources. The official duties of the L. A. do not prevent him from continuing his ordinary practice. Though not necessarily a privy councillor, he is by courtesy addressed as 'The Right Honourable' during his tenure of office.

Advocates, Faculty of, in Scotland. The constitution of this body is derived from that of the French *avocats*. The profession of advocate is a very old one in Scotland. In 1424 we find a statute for securing the assistance of an advocate to the poor: 'And gif there bee onie pure creature,' says the Act, 'for fault of cunning or dispenses that cannot or may not follow his cause, the king, for the love of God, sall ordain the judge before quhom the cause sulde be determined to pursue, and get a leill and wise advocate to follow sik pure creatures causes.' This regulation has remained in force with but little alteration to the present time. See POOR'S ROYL. The profession, however, was not constituted a Faculty till the institution of the College of Justice (q. v.) in 1532. The number of members was originally limited to ten, but it is now unlimited. All candidates for admission require to pass an examination in law. An examination must also be passed in general scholarship, unless the candidate is a Master of Arts in a British university, or has so graduated in a foreign university, as to satisfy the Dean of Faculty and his council that such scholarship has been attained, as is denoted by the British degree of M.A. The scholarship examination is on the following subjects: Latin; Greek, or, at the candidate's option, any two of the following languages--French, German, Italian, or Spanish; Ethical or Metaphysical Philosophy; Logic, or at the candidate's option, Mathematics. The candidate being found qualified, may, after one year, go in for the law examination. He must not, however, in the meanwhile, have been engaged in any trade or profession either on his own account or as assistant. Proof of attendance at the law-classes of Edinburgh University is requisite. An advocate may plead before all the law courts of Scotland, civil and ecclesiastical, as also before the House of Lords. There is a widows' fund belonging to this body, which is regulated by statute. The supreme judges of Scotland and the sheriffs of the counties are always chosen from the Scotch bar; so also are generally the sheriffs-substitute. The fees of admission to the Faculty of A. are about £340.

Advocates' Library, the library belonging to the Faculty of Advocates, Edinburgh, instituted 1682 by Sir George Mackenzie. It ranks as the fourth British library, and is by far the largest in Scotland, containing (1875) 250,000 volumes. It is specially rich in Scottish history, law, and scholastic theology; but modern foreign literature is not adequately represented. The complete character of its collection of English literature is due to its receiving a copy of every new book published in the kingdom, a privilege granted by the copyright law of 1709, and continued down to the present day.

Advoca'tion, the process was so called in Scotland by which a cause was moved from an inferior to the superior court, either that it might go on there or that a judgment might be reviewed. The process was abolished in 1868; and an appellant from a sheriff-court judgment does not now, as formerly, require to find security for expenses. An appeal is open for twenty days after date of final judgment, and it is competent for six months after the twenty days, unless it has been extracted or implemented in the meantime.

Advoca'tus Diab'oli ('Devil's Advocate') is the name given in the Roman Catholic Church to the individual whose business it is when any deceased person is proposed for canonisation, to urge all possible objections to the proposal. His opponent who favours the canonisation is called *Advocatus Dei* ('God's Advocate').

Advow'son, the right of presenting to a benefice. The person who presents is the *patron*, the presentee is the *clerk*, and the bishop of the diocese is the *ordinary*. An A. is either *appendant* or *in gross*. An A. appendant, having been immemorially annexed to a manor, is conveyed by any deed that transfers the manor itself. An A. once detached from a manor becomes annexed to the person of its owner, and is then an A. *in gross*. When the bishop and patron are one he *collates* a clerk, and the A. is *collative*. A *donative* A. is when the patron can appoint to the benefice without the approbation of the ordinary, the right of visitation being vested in himself.

Ædiles, originally so called from their having the care of the temple (*ædes*) of Ceres, though their supervision subsequently extended to all public buildings and places. At first there were two plebeian Æ., their institution dating from B.C. 494. Two curule Æ. were selected from the patricians, 365 B.C., and in B.C. 45 Julius Cæsar added other two plebeian Æ., the number being then six.

Æga, a genus of *Isopodous crustacea*. They are generally termed fish-lice, being parasitic on the bodies of fish. They are found in all parts of the world. The fishermen of Newfoundland call them 'fish-doctors.'

Ægilops, a genus of grasses allied to wheat-grass, or *Triticum*. *Æ. ovata* is supposed to be the plant from which has originated our cereal wheats.

Ægina, an island in the Gulf of Egina, area 41 square miles. The western part is level and fertile, but the rest is hilly and barren. Rocks and shallows render it difficult of access, and it possesses only a single haven. Of the ancient Æ. (now Egina) numerous remains are still extant. The islanders, who number 7000, are remarkable for their industry. Corn, wine, oil, and fruits are the principal products.

Æginetan Sculptures. Ægina was anciently celebrated as a school of art, and the names of many of its sculptors were famous. In 1811 a party of English and German art-students excavated the sculptures which had occupied the tympana of the temple of Jupiter Panhellenius, or, as some believe, of Pallas. They were purchased for the Royal Gallery of Munich. Casts of them are now in the British Museum. Though not of the best age of Æginetan art, they are natural, graceful, and well proportioned.

Ægis (a goat-skin), the shield of Zeus, who is hence styled ægis-bearing. This shield exhibited the head of the Gorgon. The Æ. was also an attribute of Athena, and symbolised the divine protection.

Æglé, a genus of plants belonging to the order *Aurantiacæ*, or Orange family. *Æ. Marmelos* yields the Bhel or Bael-fruit of India, which resembles a large orange. The rind of the unripe fruit is strongly astringent, and is used in

cases of dysentery in India. The present. Felix retracted his assent flavoured, and a yellow dye is obtained in 799, but Elipandus

Ægoph'ony is a term employed in metry, and in later times peculiar sound, similar to the bleating of a goattinguished men, as ear is applied to the back of the chest, over the base of the Jesuit (17th in cases of pleurisy in which a large amount of fluid effused into the pleural cavity. It is produced by the sound, to the voice being modified by passing through a layer of fluid.

Ægopod'ium Podagra'ria, an umbelliferous plant, which is a great pest in many gardens. It is known as herb Gerard, ash-weed, English master-wort, cow-cabbage, and gout-weed. It was formerly used as a specific for gout, hence its specific name. The A. is indigenous to Britain.

Ægospot'ami (the Goat-River), in the Thracian Chersonesus, where Lysander defeated the Athenian fleet, B.C. 405. This defeat virtually brought the Peloponnesian war to a close.

Æl'fric, an English ecclesiastic of the 10th or 11th c., whose history is more obscure than his fame. He is said to have been of noble birth, but the evidences are not satisfactory. From a simple 'monk and mass priest,' as he calls himself in the preface to his *Homilies*, he rose to be Archbishop of York or Canterbury. The date of his death is uncertain. A. had the true English love of the mother tongue which marked our countrymen before they came under the foreign rule of the Latinised Normans, and a good deal of his scholarship and literary activity was bestowed on the vernacular. Of his good sense and clear Christian doctrine we have abundant evidence in his writings, some of which were popular long after the Conquest, and reappeared in the corrupt English of the time. Those usually ascribed to A. are two volumes of homilies, canons or injunctions to the clergy, a translation of the younger Priscian, with a glossary, and a translation of various parts of the Old Testament.

Ælia'nus Claudius, who lived probably about the middle of the 3d c. A.C., was born at Palestina. He was a citizen of Rome, where he taught rhetoric. He acquired such a mastery of Greek that he spoke and wrote it with ease and elegance. His two principal works are his *Varia Historia*, or *Miscellaneous History*, in fourteen books, a compilation valuable for its numerous extracts from authors whose works have been lost; and a gossiping treatise, in seventeen books, *De Animalium Natura*, or, *On the Peculiarities of Animals*. Of the former there is an edition by Kühn, Leipz. 1780, 2 vols. 8vo; and of the latter one by Fr. Jacobs, Jena, 1832, 2 vols. 8vo.

Æmil'ius Paulus, subsequently surnamed **Macedon'icus**, son of the consul Lucius Æmilius Paulus, who fell at Cannæ, was born about 230 B.C. Though inheriting the patrician prejudices of his family, and too proud to flatter the people for office, his unquestioned integrity in the midst of manifold temptations secured for him unbroken respect and confidence. After having rendered the state valuable services, both as a civilian and as a soldier, he was, when fully sixty years of age, pressed to conduct the war against Perseus, King of Macedonia. Elected consul for a second time, B.C. 168, he arrived in Macedonia in June of that year, and by the defeat of Perseus at Pydna terminated the war, and put an end to the Macedonian kingdom. He sent immense booty to Rome, where in November 167 B.C. he celebrated his triumph with extraordinary magnificence. But family misfortune dimmed his glory, for of his two younger sons one died five days before, and the other three days after, his triumph—calamities which he bore with touching equanimity. He died B.C. 160.

Æne'as, the son of Anchises and Aphrodite, after Hector the great bulwark of the Trojans in their contest with the Greeks. On one occasion he led the fourth division of the Trojans, and on another engaged in combat with Achilles, from whom he was rescued by Poseidon. Such is the Homeric story. After the fall of Troy, according to later stories, he collected the people at Mount Ida, but being threatened by the Greeks, he left the coasts of Asia, and crossed over into Europe, and finally settled in Latium. He is the hero of Virgil's epic, the *Æneid*, in which, to connect him with the Julian family, he is, after many wanderings, conducted to Latium. Latinus, King of the Aborigines, prepared for war, but afterwards concluded an alliance with Æ., and gave him his daughter Lavinia in marriage. A. founded a town, which he named Lavinium, after his wife

After becoming sole ruler of the Aborigines and Trojans, he is said to have fallen in a battle with the Rutulians. The account of his wanderings given in the *Æneid* is substantially the same as that of Dionysius of Halicarnassus, Virgil's contemporary, and neither has any historic value.

Æolian Harp, a musical instrument producing harmonic sounds by the action of the wind on strings of catgut or wire, tuned in unison, and stretched over a box of thin deal. The inventor is said to have been the German Jesuit, Athanasius Kerches (1602-80); but it first became well known through Pope and the Scotch musician Oswald in last century.

Æolians, one of the most powerful of the Hellenic people. Originally settled in Thessaly and Boeotia, at an early period they spread themselves over the N. of Greece and the W. of Peloponnesus. Still later they sent numerous colonies to Asia Minor and to Lesbos. The Lesbian colonists established a variety of the Æolic dialect, carried to perfection in the lyrics of Alcæus and Sappho.

Æon (comp. Lat. *æum*, Eng. *ever*, Ger. *ewig*), a Greek word strictly denoting an age, but also applied to eternity. The Æons of the Gnostics were certain emanations of the divine nature, and were so called either because as powers they were placed over the different ages of the world, or because they partook of the eternal duration of God.

Ærated Bread. The vesiculation or raising of bread in baking is accomplished in two distinct ways. By the ordinary, or fermentation, process (see **BREAD**) carbonic acid gas is generated in the dough by induced alcoholic fermentation, but when the carbonic acid is developed from a foreign substance, such as an alkaline carbonate, or introduced from without, aerated or unfermented bread is the result. The principal method of manufacturing A. B. is by a process patented by the late Dr. Dauglish. It consists in making dough with water charged with carbonic acid under high pressure, which, by its expansion removal from the closed mixing vessel, renders the mass finely spongy throughout. The water for mixing is charged with carbonic acid in the same manner plain Aerated Water is prepared (q. v.), and the mixing is accomplished in a strong cast-iron cylinder, in which a series of arms revolve by steam-power. The whole process of mixing a sack of flour into dough can be finished in less than half an hour. The dough is expelled from the lower end of the cylinder into a box which is gauged to hold a two-pound loaf, and from the box it is removed into pans for firing without any portion of the material ever being handled. The advantages claimed for A. B. are—1, rapidity and certainty of manufacture; 2, cleanliness of processes; 3, economy, resulting from the fact that there is no waste of flour in mixing nor any degradation of material as in fermentation; and 4, the practicability of making good bread from flour which, by the common process, requires the addition of alum. The absence of flavour in A. B. is one of the chief bars to its more extensive use.

Ærated Waters are effervescent beverages prepared by the solution of carbonic acid gas in water, to which small quantities of saline substances or fruit syrups are frequently added. The simplest form of aerated water is seen in the preparation of 'seidlitz powders,' which are made by dissolving separate portions of tartaric acid and bicarbonate of soda in water. A chemical reaction takes place in which the tartaric acid combines with the soda to form tartrate of soda, liberating the carbonic acid, and the solution is drunk while the carbonic acid is bubbling up through the water. The so-called effervescent citrate of magnesia is essentially the same as seidlitz powder in its character and action. The free use of water so aerated introduces within the system tartrate of soda, or other alkaline salts, in proportions which have a deleterious influence. Such an objection is obviated by the ordinary methods of manufacturing aerated water, which depend for their operation on the fact that water absorbs its own volume of carbonic acid at ordinary temperature. Increase of pressure consequently increases the absorption of the gas, but on removing the pressure, as in the case of soda-water bottle, all the gas beyond what is retained by ordinary atmospheric pressure escapes. Plain aerated water is the basis of all the numerous effervescent waters, two principal methods. In the first case, carbonic acid is evolved from chalk or whiting by the action of either

sulphuric acid or hydrochloric acid in a generator, and washed by passing through water. It then enters a receiver, or strong vessel, in which is placed the water intended to be aerated, and by its own accumulated pressure the gas sufficiently saturates the water. An example of this method, on the small scale, is seen in the 'gazogene,' an apparatus used in houses and small establishments. In the second system, which is that usually adopted by manufacturers, the gas is generated as above stated, but after washing it is stored in a gas-holder. From this it is drawn into the receiver by an air-pump, where it meets and saturates the water; the admission of both being regulated by means of cocks, so that any desired pressure may be maintained. The bottling and corking are performed at an apparatus which has to be guarded specially to prevent accidents by the bursting of bottles. Soda, potash, lithia, and other waters, are prepared by placing measured quantities of solutions of these salts in the bottles before drawing off the aerated water; and similarly, lemonade and other fruit flavours are placed in the bottles and the plain aerated water added to them. Nothing but the aerated water passes through the machines, and the pressure of gas varies only for the different class of beverages. The variety of recipes for lemonade, seltzer, potash, and soda waters, &c., is infinite, each manufacturer suiting his own and his customers' tastes. It is of great importance that the water used should be pure, and that no lead should be employed in any part of the apparatus beyond the point where the gas is washed, as water charged with carbonic acid acts powerfully on lead, and a large admixture of that metal has been detected in samples of A. W., to which cases of lead-poisoning have been traced.

Ærodynamics is the science which treats of the motion of air and other gases, investigating the laws of the passage of air through an orifice or through a tube; the force, nature, and effects of wind, &c., and also the resistance of the air to a body moving through it. For moderate velocities the law that the resistance varies directly as the square of the velocity is sufficiently true for practical purposes; but when the velocity becomes considerable, there is another cause which must be taken account of, viz., the great condensation of the air particles in front of, and the partial vacuum formed behind, the moving body.

Ærolites (Gr. *aer*, air, and *lithos*, stone) are stony or metallic masses which from time to time are precipitated upon the earth. There are different names given to A., according as they appear with or without explosion, at daytime, or at night. Meteors and fireballs (or *bolides*) are explosive, the former appearing during the day, and the latter at night. It is probable, however, that the dark cloud accompanying the explosion during the day would be luminous at night. Shooting-stars do not explode, but A. similar to shooting-stars have been observed to be projected from fireballs. Such facts seem to tend to the conclusion that these are similar in all but outward circumstances.

Until the beginning of this century, the numerous records of the falling of stones from the sky were not generally believed by scientific men; and it was only when M. Biot's inquiry into, and report of, the extraordinary meteoric shower at L'Aigle, in Normandy, in the year 1803, was given to the world, that all doubts of the phenomenon were dispelled.

Among the ancients meteoric stones were regarded as mysterious visitants from the gods, and were consequently worshipped with great veneration. As examples of such we may mention the holy Kaaba of Mecca, and the black conical stone at Emesa in Syria.

A most interesting fact connected with shooting-stars is their periodic appearances. They usually appear singly, and may be observed almost every night; but at certain times they appear

Ærolites.

in great number, radiating from a fixed point in the heavens; and these appearances take place annually. This periodicity affords a strong argument in favour of the theory that they are planetary bodies revolving round the sun in an orbit intersecting that of the earth, and especially as they radiate from that point in the heavens towards which the earth is travelling at that time. The great American shower of November 12th and 13th, 1833, first drew the attention of astronomers to this fact. Exactly a year later another great shower was observed, and now these phenomena are yearly expected. It would also appear that the intensity of the shower varies from year to year, reaching a maximum every thirty-four years. Another great periodic swarm occurs from the 9th to the 14th of August, the magnitude and brilliancy of which reach a maximum every twenty-two years. The August display has also been connected with the appearances of Beila's Comet (q. v.)

A. are to a great extent composed of metals, iron especially being present in great abundance, and resemble very much our own plutonic or volcanic rocks. It was upon this resemblance that the now exploded hypothesis of their being projected from lunar volcanoes was advanced. The specific gravity varies from two to eight times that of water; but Reichenbach remarks that their *mean* specific gravity is rigorously that of the earth; and, reasoning from this, he suggests that the earth and other planets are merely a combination of A., which may be thus an intermediate step between asteroids and comets, which, he urges, differ from the other bodies in the solar system only in their much less density.

Aéronautics. See BALLOON.

Aërostatics is the science which treats strictly of the equilibrium and pressure of air, and the methods for measuring such; but it now embraces similar properties of all other gaseous portions of matter. For information concerning air in particular, see ATMOSPHERE.

According to Boyle's or Mariotte's law, the pressure, or expansive force, of a gas at constant temperature varies inversely as the volume, or directly as the density, of the same gas. Gay-Lussac's law is an extension of this, and states that the absolute temperature (see HEAT) of a gas varies directly as the product of its pressure and volume. These laws are, however, only approximately true for known gases. The ideal gas which obeys these laws is called a *perfect gas*.

Aërostatic Press is a machine for extracting the colouring matter from dye-woods, and similar substances, by means of the pressure of the atmosphere, which forces the extracting liquid through the substance, below which a vacuum has been formed.

Æschines, an Athenian orator, was born 389 B.C. Demosthenes accused him of accepting bribes from Philip, King of Macedon, who had planned the conquest of Greece, to advise the Athenians to conclude a peace with him. Æ., who believed that this policy alone could avert ruin from his country, headed the peace party, while Demosthenes roused his countrymen to a final but unavailing struggle at Chæroneia 338. A crown having been proposed to Demosthenes for his lofty and stainless patriotism, Æ. accused Ctesiphon, the proposer, of illegality, but being defeated, withdrew to Asia Minor, and finally established a school of eloquence at Rhodes, which afterwards acquired celebrity. He died 314 B.C. Of the three orations published by Æ., against Timarchus, on the Embassy, and against Ctesiphon, the best edition is that of Bekker, vol. iii. of his *Oratores Attici*, Oxford, 1822, 8vo.

Æschylus, the father of Greek tragedy, born at Eleusis 525 B.C., died at Gela, in Sicily, 456 B.C. He fought at Marathon 490 B.C., and ten years later in the great naval engagement at Salamis. Of the seventy dramas which he is said to have written, only seven are extant—the *Persians*, the *Seven against Thebes*, the *Suppliants*, the *Prometheus*, the *Agamemnon*, the *Choephora*, and the *Eumenides*. The energy and sublimity of his style well become his daring genius, and the lofty characters he portrays. His plots are simple, and the obscurity with which he has been charged is probably owing to the acknowledged corruption of the text. The drama owes to Æ. the formation of dialogue, properly so called, by the introduction of a second actor, and artistic effect was produced by improved scenery, and appropriate masks and dresses. Numerous versions of Æ. have been made in various languages. The Italian version of F.

Bellotti (Milan, 1821) has a high reputation; the French version of Pierron (Paris, 1841) has been crowned by the Academy; the best German version is that of Voss (Heidelb. 1826); and the English version of Professor Blackie is faithful and spirited.

Æsculapius, the god of the healing art, is represented in the Homeric poems merely as a human being, but the common tradition made him the son of Apollo and Coronis. He was instructed in medicine by Cheiron, and was reputed to have succeeded in restoring the dead to life. He was killed with lightning by Zeus, who feared that men might escape death altogether, or because Pluto had complained that the number of the dead was diminishing. At the request of Apollo he was placed among the stars. He was worshipped over the whole of Greece, and had a famous temple and grove at Epidaurus. His statues resembled those of Zeus. One hand held a staff, the other rested on the head of a serpent, while a dog lay by his side. Serpents were always connected with his worship, and he himself often appeared in that form. Those cured of disease sacrificed a cock or a goat to Æ., and hung up votive tablets in his temple. Several of these have been preserved.

Æsculus. See HORSE-CHESTNUT.

Æsir is the common name given to the gods of the Northern mythology. At first we hear of only three, Odin, Vili, and Ve; but afterwards the number was increased to twelve, not counting Odin, viz., Thor, Njord, Frey, Baldr, Tyr, Heimdal, Bragi, Forseti, Ilad, Vidar, Vali, Ullr. Loki, who figures among them (like Satan in the prologue to Job), is rather to be regarded as the Norse Fiend, or Adversary. Along with these rank certain goddesses, of whom Frigga, Freyja, Idun, Eir, Saga, Nanna, and Sif are the best known. The old chroniclers of the 13th c., connected the word A. with Asia, and imagined an emigration from that continent, under the leadership of a chief named Odin, who established himself in Scandinavia, and carried thither the language and culture of the South. But such attempts to give a pseudo-historic reality to Odin have long been abandoned, and it is now believed that the A. is the mythic expression of an old indigenous Teutonic worship. The name appears in all the great Teutonic languages; e.g., Goth, *ans*, pl. *anseis*. *Ad* High Ger. *ans*, pl. *ansi*; old Norse, *æs*, pl. *æsir*; Sax. *as*, pl. *es*; and it is seen in such names as Ansgar, of which the Norse form is Asgeir, Anselm, and the Eng. Oscar, Oswald, Osborne.

Æsop, the fabulist, on the late authority of Diogenes Laertius and Plutarch, is stated to have lived in the 6th c. B.C. No work of his is extant, nor is it probable that he committed any fables to writing. Some have even denied his existence. According to the writers mentioned, he was originally a slave, but subsequently received his freedom, visited Croesus and Pisistratus, and was thrown from a precipice at Delphi in consequence of a dispute with the citizens. Fables, ascribed to Æ., were popular at Athens, and allusions to them are found in Aristophanes. Bentley's theory, that his fables were transmitted by oral tradition, is the only probable one. Both Socrates and Demetrius Phalereus turned some of them into verse. The fables now bearing his name are undoubtedly spurious, and are not found in any MS. older than the 13th c. The different sets of them that are extant were published at Breslau in 1810 by J. G. Schneider.

Æsthetics (Gr. *aisthêtikos*, belonging to perception, or sensation; *aisthanomai*, I feel), the name originally applied in Germany by Baumgarten (q. v.) and his followers to the 'science of the Beautiful,' or the philosophy of the fine arts as the highest expression of the beautiful. Baumgarten's view of the science included all sensuous apprehension. He perhaps states his position most clearly when he says, 'We perceive beauty wherever we meet with perfection manifested in reality, and a thing is perfect if it is adequate to its notion; beauty, accordingly, is the perfectness of an object manifested in its appearance.' Kant insisted that beauty is not a property of objects, but has its origin in the disposition of our mental faculties. Schiller regards beauty as originating in the perfect union of matter and spirit, and his wander-theory of the beautiful is that of the absolute idea. The Aborigines, consequently, there is nothing absolutely beautiful in alliance with, although, on the other hand, there is an eternal marriage. *Æ* wards this. Poetry reaches more nearly the absolute after his wis-

than the constructive arts, for in poetry the ideal element of *thought* obtains a higher development than in the more material arts of Painting, Architecture, or even Music.

The discussion of the theory of the beautiful, in England, may be said to have begun in the early part of last century. Dr Hutcheson, in his *Enquiry*, argues for the existence of an 'internal sense,' by which we perceive the beautiful. In his *Treatise on the Sublime and Beautiful*, Burke has drifted into confusion as to what is meant by beauty. Next came Alison's once famous *Essays on the Nature and Principles of Taste*, in which the 'association' theory is maintained. His brilliant and clever disciple, Jeffrey, made it very attractive for a time. According to him, our emotions in the contemplation of the beautiful 'are not produced directly by any qualities in the objects which excite them; they are occasioned, not by any inherent virtue in the objects before us, but by the accidents, if we may so express ourselves, by which these may have been enabled to suggest or recal to us our own past sensations or sympathies.' Sir Wm. Hamilton, in his *Lectures on Metaphysics*, maintains that beauty is both absolute and relative. The former is the result of a free exercise of imagination, perception, recognising, say, the absolute beauty of a flower or shell; the latter is attained by an act of the understanding, in which the adaptation of means to an end is seen to be admirable. Among the most lucid British writers on *Æ* are Dr McVicar (*Philosophy of the Beautiful*, 1855), Mr Ruskin (*Modern Painters*), and Professor Blackie, whose work *On Beauty: Three Discourses delivered in the University of Edinburgh*, 1858, is perhaps the simplest and most satisfactory handbook on the philosophy of the beautiful yet written. In the main points of the discussion these writers agree. Ruskin says, 'There is not one single object in nature that is not capable of conveying' ideas of beauty. The 'internal sense' of the older writers, by which we appreciate beauty, is not, says Blackie, 'a distinct faculty of the mind, but only a function of the imagination, whereby it perceives beautiful forms and sounds, accompanied by a pleasurable emotion.' 'What then,' he asks, 'is the speciality in the case of what, with the Germans, for want of a better epithet, we must call the æsthetic action of intellect? Plainly, the mind in this case has to do with concrete wholes, originally insinuated by means of the inlets of the internal senses, but acted upon and moulded by the imagination (which is a sort of inner and more intellectual sense), so as to receive from it a new, and, in the case of the fine arts generally, a more perfect type; and these types, of well-ordered form and colour, being entertained by the mind, produce an emotion of serene pleasure and complete satisfaction.' In a very clever little work, *The Philosophy of Art*, by Taine (q. v.), Professor of *Æsthetics* in the *École des Beaux Arts*, Paris, the author explains his system of *Æ* as an 'application of the experimental method to art in the same manner as it is applied in the sciences.' 'The modern (æsthetic) method,' says Taine, 'which I strive to pursue, and which is beginning to be introduced in all moral sciences, consists in considering human productions, and particularly works of art, as facts and productions of which it is essential to mark the characteristics, and seek the causes; and nothing beyond this.' But perhaps M. Taine too easily satisfies himself. The whole philosophy of the subject lies beyond his 'positive' criticism, and is probably to be found in the higher idealism of Hamilton and Blackie.

Æstiva'tion, a term used in botany to denote the mode in which the parts of a flower are folded in the flower-bud before it opens.

Ætius, the last champion and bulwark of the Western Roman Empire, was of Scythian origin, and was born, A.D. 395 or 396, at Dorostana, in Lower Moesia. He entered the imperial army at an early age, and for some years was a hostage among the Goths and Huns, over whom he exercised great influence. In A.D. 424, after the death of Honorius, he brought together 60,000 of them to maintain the claims of the usurper John against the descendants of Theodosius, and on his reconciliation with the latter, he employed them to combat Boniface (q. v.), who had delivered Africa into the hands of the Vandals. Under the regency of Placidia, and the rule of her son Valentinian III., *Æ* became patrician, and wielded the whole force of the empire. In a series of brilliant campaigns (A.D. 426 and 430) he repelled the assaults of the Visigoths in Southern Gaul, of the Franks on the Lower Rhine (A.D.

428 and 431), of the Burgundians (A.D. 435 and 436), and of the Celts of Armorica (A.D. 436). When he saw the great storm of Hunnic savages about to break over the West, he swiftly formed an alliance with Visigoths, Armoricans, Burgundians, Alans, and Franks—the very tribes with whom he had been warring for nearly twenty years—and by their help scattered the hordes of Attila on the world-famous field of Chalons (A.D. 451). The struggle was renewed on the N.E. border of Italy in 453, and *Æ*, though no longer supported by his Celtic and Teutonic allies, was preparing to obstinately defend the peninsula, when Attila was induced by Pope Leo I. to withdraw his forces. *Æ* then presented himself at the imperial court, to ask from Valentinian the fulfilment of his promise, viz., the hand of his daughter in marriage. The answer of the jealous voluptuary was the murder on the spot of the hero who had saved the empire (A.D. 454).

Ætna. See ETNA.

Ætolia, a district of ancient Greece, bounded on the W. by Acarnania, E. by Locris, N. by Thessaly and Epirus, and S. by the entrance to the Gulf of Corinth. It had only two plains of any magnitude, the rest of the country being occupied by wooded and craggy mountains, which neither in ancient nor modern times have been crossed by a road. At the time of the Peloponnesian war the Ætolians were wholly uncivilised, but they ultimately became one of the three great powers of Greece. The Ætolian League, the general assembly of which was styled the *Panætolicon*, first became important after the death of Alexander the Great, and was formally dissolved B.C. 167, *Æ* having some years before been subjugated by Rome. Along with Acarnania (q. v.) it now forms a nomarchy of the Greek kingdom.

Affidavit, an oath in writing, or a written declaration, the truth of which is sworn to or affirmed (see AFFIRMATION) before a person legally authorised to administer an oath. In England, when evidence is laid before a jury, it is given orally; where it is to inform a court or judge it is put in form of an *A*. In Scotland a voluntary *A*. is not generally received as evidence, there being no opportunity to cross-examine the deponent. Under the Scotch Bankrupt Act, however, claims must be lodged with affidavits of verity; and there are similar statutory provisions. The Lord Chancellor of England is empowered to grant commissions for taking affidavits, affirmations, and declarations in Scotland.

Affinity, in law, is the relationship arising from marriage between the husband and his wife's blood-relations, and between the wife and her husband's blood-relations. A husband's relation is held equally related to his wife, and a wife's relation equally related to her husband; but no *A*. is created by marriage between the kinsmen themselves. Thus the husband's brother or sister is not related to his wife's brother or sister, and the connection is no impediment to marriage. The legal effect of *A*. as regards marriage is somewhat obscure. See MAR-RIAGE.

Affinity (chemical) may be defined as the tendency of bodies to unite together. In proportion as this tendency is greater or less, so the *A*. of the substances in question is said to be powerful or weak. The more powerful the *A*. of two bodies, so much the greater is the difficulty experienced in disuniting them, when combined. The stability of a compound (or its power of resisting decomposition) is a measure of the *A*. of its components for one another. Hydrogen has a strong *A*. for chlorine; the two elements readily combining to form a very stable compound called hydrochloric acid (HCl). Hydrogen and iodine, on the other hand, have a very slight *A*. for one another. They do not combine *directly* under ordinary conditions; nevertheless a compound called hydriodic acid (HI) is easily obtained by indirect means, and this compound is in many respects very analogous to hydrochloric acid. It is so unstable, however, that if heated, or even kept for some time exposed to the light, it splits up into its components hydrogen and iodine. Moreover, if chlorine is introduced into a vessel containing hydriodic acid, the chlorine immediately combines with the hydrogen of the hydriodic acid, forming hydrochloric acid, and setting the iodine free. Thus chlorine is said to have a greater *A*. for hydrogen than the iodine has.

Affirmation, a form of oath or declaration specially adapted to members of certain religious persuasions in place of the usual

oath, on the judge being satisfied that the recusant's motive is conscientious. The penalties of perjury are imposed on those who knowingly affirm falsely. See OATH.

Afriquo, St., a town in the S. of France, dep. of Aveyron, on a feeder of the Tarn, 31 miles S. of Rhodéz, and 79 miles N.E. of Toulouse. It lies in a fine valley on the N. side of the Cevennes, in the midst of orchards and vineyards, has some cotton and woollen manufactures, and a large trade in *Roguefort cheese*, made from ewe-milk in the hill pastures, which was famous as long ago as the time of Pliny. Pop. (1872) 5071.

Afghanistan, a country of Asia (part of ancient *Ariana*), extends from lat. 28° to 38° N., and long. 62° to 73° E. It is 450 miles long, and 470 broad; its area 212,000 sq. miles, and the population differently estimated at from 5,000,000 to 9,000,000. A. is bounded N. by Turkestan, E. by the Punjab, S. by Beloochistan, and W. by Persia. Its mountainous character makes it a valuable barrier for the protection of India. In the E. the Suliman Mountains completely separate A. from the plains of the Punjab; the only passes are the ravine of the Cabul river, in the N., part of which is known as the Khyber Pass, and in the S. the Bolan Pass. The Hindu Kush Mountains, a continuation of the Himalayas, extend along the northern frontier, rising in alpine grandeur to heights of more than 20,000 feet. Owing to the inequality of surface and irregular distribution of water, the climate of A. varies greatly, and the products are most diversified. On the high tablelands of the N. the fruits of Europe grow wild; the fertile terraces produce aromatic herbs, tobacco, rhubarb, and asafoetida; luxuriant Indian vegetation covers the deep valleys; and in the southern plains cotton and sugar are cultivated. The only important rivers are the Cabul and Helmund. The country is rich in copper, iron, and other metals. The Afghans are a brave race, strongly influenced by national sentiment, but addicted to predatory strife, and treacherous beyond even Asiatic bounds. Their religion is Mohammedan after the Sunnite or 'orthodox' form, but toleration is extended to other creeds. The *Pushtu* language belongs to the Aryan family of languages, but whether to the Indian or Iranian branch is still uncertain. Poets are the only authors who employ the native language; all prose writings are in Persian. The name Afghan is Persian; the natives calling themselves *Pushtaneh* (pl. of *Pushtu*).

After many centuries of family feuds and harem intrigues, the history proper of A. begins with the advent of Ahmed Khan in 1747, who seized the moment when Persia was disturbed by the assassination of Nadir Shah (q. v.) to effect the independence of his country, and to make it one of the most powerful kingdoms in the East. He founded the Douranee dynasty, and was succeeded by Timur, who died 1793, and left the crown to be fought for by his three sons, Zemaun, Mahmud, and Shah Sujah. Zemaun first succeeded in obtaining supreme power; but after some years he was dethroned by his half-brother Mahmud, who in turn was compelled, by an insurrection of the Afghan chiefs, to abdicate in 1823. Dost Mohammed, one of these chiefs, made himself master of Cabul and Ghizni, and was recognised as virtual ruler of the country. Shah Sujah, full brother of Zemaun, and the legitimate sovereign, was expelled from A., and lived as a stipendiary on the British government at Loodianah, always keeping an eye on his lost kingdom. Dost Mohammed's foreign policy was to check the encroachments of Runjeet Singh (q. v.), the ruler of the Punjab, and to cripple the power of Persia. The close relations between Dost Mohammed and Russia induced the British government to sign a treaty of alliance with Runjeet Singh and Shah Sujah, at Lahore, 26th June 1838, for the purpose of replacing the latter on the throne of A. War was declared against Dost Mohammed (1st October 1838) by Lord Auckland, then Governor-General of India. A strong force, under Sir Alexander Burnes, advanced through the Bolan Pass, and reached Candahar, where Shah Sujah was formally placed on the throne. After the taking of Ghizni (q. v.) Dost Mohammed surrendered, and the supposition was that the country had been finally conquered. The British took up quarters at Cabul; but in the winter of 1841, when help from India was cut off, they were hemmed round, and forced, with every circumstance of humiliation, to evacuate the country. During the retreat by the Khyber Pass, the severity of the weather and cruelty of the enemy spared neither woman nor

child, and of a host numbering 15,000 only one man (Dr Brydon) reached Jelalabad. When the news of the disaster reached India, a fierce cry for vengeance arose. General Pollock was despatched by way of the Khyber Pass with a retributive force, and being joined by General Nott, who marched N. from Candahar, routed the Afghan army, releasing captives and devastating the country. It was not, however, till the battle of Gujerat, in 1849, that the Afghans were fairly subdued, along with their famous enemies the Sikhs. The consolidation of his empire occupied Dost Mohammed from this time till his death in 1863. He appointed as his heir Shere Ali, the third and favourite of his sixteen sons. The two elder brothers, who were thus disinherited, rebelled, and plunged the country into a civil war, which lasted for five years. Shere Ali (q. v.), however, firmly secured his position as Ameer, aided by British money and arms, and by the intelligence and bravery of his son Yakub Khan (q. v.). The latter rebelled in 1870, but was propitiated when made governor of Herat. In 1875, however, he was enticed to Cabul, and thrown into prison, from which he only emerged on the flight of his father in 1878. The subsequent history of A. has been a succession of startling and deplorable incidents. The occupation of Quetta (q. v.) by the British first awoke the suspicions of the Ameer that his independence was being threatened. Then followed in 1877 the rejection of Sir L. Pelly's proposals, which involved the reception of a British Resident at Cabul, the ostentatious welcome accorded to the Russian Embassy (1878), the affront a month later to the British Mission under Sir Neville Chamberlain at the mouth of the Khyber Pass, the victorious invasion of A. by the British, the flight and death of the Ameer, the accession of Yakub Khan, the treaty of peace concluded (May 30, 1879) with the conquerors, the massacre of Sir Louis Cavagnari and the members of the British Mission in Cabul (September 4), the return of the British troops, their reoccupation of the country, the execution of the assassins, and the abdication of the Ameer (October 19).

Afium Kara-Hissar (Opium Black Castle), a town of Asiatic Tu.  vilayet of Anatolia, 170 miles N.E. of Smyrna. It derives its name partly from the opium grown in the neighbourhood, which forms a large part of the trade of the place, and partly from the lofty rock behind the city, which was once crowned with a fortress. A. is an entrepôt for the great trade between Smyrna and the interior of Asia, and it has also manufactures of saddlery, carpets, &c. Pop. estimated at 60,000.

Africa, the second in size of the great divisions of the globe, lies in the eastern hemisphere, and extends from lat. 37° 20' N. to 34° 50' S., and from long. 17° 34' to 51° 16' E. Its greatest length is about 5000 miles, its greatest breadth 4700, its area 11,700,000 sq. miles, and its coastline 15,000 miles. A. is shaped like an irregular triangle, having its vertex to the south, and is bounded N. by the Mediterranean, E. by the Red Sea and Indian Ocean, and W. by the Atlantic Ocean. It is joined to Asia by a narrow neck of land, which, however, has been cut through by the Suez Canal. There are few large gulfs and bays; the most important are the Gulfs of Sidra and Kabes (the greater and lesser Syrtes) on the N.; Suez, Aden, and Delagoa Bay on the E.; Algoa Bay on the S.; and the Gulf of Guinea on the W. The principal capes are Bon on the N.; Guardafui on the E.; Good Hope on the S.; and Verd on the W.

Chief Political Divisions.—N., Egypt, Tunis, Tripoli, Fezzan, Algeria, Morocco; E., Nubia, Abyssinia, Somali, Mozambique, Sofala, Natal, Kaffraria, Transvaal Republic, Orange River Free States; S., Cape Colony; W., Senegambia, Upper and Lower Guinea; interior, the States of Sudan.

Chief Islands.—Socotra, Seychelles, Comoro Islands, Madagascar, by far the largest, off the coasts of Mozambique, and Sofala, Mauritius, Reunion, St Helena, Ascension, Cape Verd Islands, Canary Islands, Madeira Islands, &c.

Physical Features, Mountains, &c.—1. The southern triangular part of A. consists of a large elevated tableland surrounded by mountain ranges. On the N. its boundary is undefined. The ridges on the W. and E. subside before reaching the sea, leaving belts of flat country on the coasts. The W. ranges have their highest point (13,000 feet) in the Cameroons, to the N.; the E. mountains are also highest (20,000 feet) towards the N., where they enter the mountainous district of Abyssinia. On the S. the mountains rise from the coast in three distinct stages,

having broad terraces or *barros* between them. Their highest point is about 10,000 feet. The tableland is composed partly of waste lands, such as the Desert of Kalihari, N. of Cape Colony, and partly of fertile and populous districts. Towards the E. edge, inland from Zanzibar and Mozambique, is the great lake district of A., containing the Albert and Victoria Nyanza, Lake Tanganyika, Lake Nyassa, Lake Bangweolo or Bemba, &c. Further S. is Lake Ngami. The principal rivers, besides the Upper Nile, are the Zambesi, of this division, which falls into the Mozambique Channel; the Orange River, the Congo, Coanga, and Ogowai, which fall into the Atlantic; and the imperfectly-known Luababa.

2. *Sudan*, comprising the whole of A. between the S. tableland and the Sahara, including on the W. the basin of the rivers Niger, Gambia, and Senegal, and having on the E. the mountainous region of Abyssinia, which occupies the space between the Nile basin and the Indian Ocean. In the centre is the very large alluvial basin of Lake Tchad. In the W. there are mountain ranges of no great elevation, in which the river Niger (the second largest in A.), which flows into the Gulf of Guinea, the Senegal and Gambia, which flow into the Atlantic, have their origin. On the E. we have the White Nile flowing from its source S. of the equator, and the Blue Nile, passing through Lake Tsana in Abyssinia, to join it at Khartum. The Welle is another large river towards the E. of this district.

3. The *Sahara* or Great Desert, between Sudan and the lands of the Mediterranean coast. This division consists of a vast undulating district of hard barren soil, with tracts of shifting sand, and occasional *oases*, spots of great fertility, owing their existence to subterranean springs. Over a great part of the Sahara rain never falls. It is a tableland of considerable elevation, and reaches in some peaks a height of 5000 or 6000 feet.

4. The regions of the Atlas Mountains, and Tripoli. The Atlas range extends across the N.W. corner of A., running through Morocco, Algeria, and Tunis. In the loftiest summits a height of upwards of 10,000 feet is attained. The southern slope of these mountains extends to the Sahara; the northern slope reaches to the sea, and in climate, productions, &c., is very similar to the opposite coast of Europe. There are numerous short rivers flowing into the Mediterranean, and several small lakes. Tripoli, further E., stretches along the Mediterranean coast for about 1000 miles. Near the sea it is very fertile, further inland it is barren. Fezzan, lying immediately S. of Tripoli, is the largest oasis in the Sahara.

5. The regions of the Nile, viz., Nubia and Egypt. A range of mountains runs along the whole coast of the Red Sea through Nubia and Egypt. On the W. side of these countries is a low ridge of hills separating them from the Sahara. Between the two ranges lies the fertile basin of the Nile. After the White Nile is joined by the Blue Nile at Khartum, the two roll on as a single river through Nubia and Egypt into the Mediterranean.

Climate.—A. lies almost wholly within the torrid zone, and is the hottest of the continents. The warmest part is N. of the equator, owing to the greater extent and less elevation of the northern half. The coasts of the S. and N. possess the climate of the temperate zones in which they lie. The flat regions next the sea are generally unhealthy, while the terraces a little inland enjoy an agreeable climate, and are made temperate by the proximity of the sea. The district of tropical rains extends from 25° S. lat. to about 20° N. lat. In the greater portion of the Sahara, and in the desert of Kalihari, rain never falls. The N. is much exposed to hot, dry winds from the Sahara.

Vegetation.—The vegetation of A., in the neighbourhood of the tropical rivers, and wherever humidity and heat are combined, is extraordinarily luxuriant, vigorous, and abundant in species, though, on the whole, less grand and varied than that of Asia or S. America. The productions of the temperate zones are found on the terraces in several parts of A. Among the most important wild plants are the baobab (*Adansonia*), butter-tree (*Bassia*), various palms, aloes, papyrus, gum-trees. Of cultivated plants the following, grown with success in many parts of A., may be mentioned: cotton, indigo, banana, maize, wheat, rice, vine, European fruits, durra, coffee (wild in Abyssinia), and sugar-cane.

Animals.—The wild animals of A. surpass those of similar kinds in other parts of the earth in strength and ferocity. The number of peculiar species is great, such as the giraffe, zebra, quagga, and the various kinds of antelopes (gnu, spring-

bok, &c.) The African elephant differs considerably from the Asiatic, and is nowhere tamed. Lions, leopards, hyenas, jackals, the hippopotamus, various species of the rhinoceros, monkeys (gorillas, chimpanzees), wart-hogs, &c., are abundant. Crocodiles (smaller than those of Asia) abound in the rivers, and there are many gigantic and poisonous snakes. Among birds are the ostrich, flamingo, secretary-bird, parrot, and bright-plumaged small birds in great variety, though few songsters. Locusts appear in enormous hosts, and often do great damage; the ant species is numerous; and the tsetse fly in S. A. has earned for itself an evil reputation from its destruction of cattle. The most important of the domesticated animals are the horse (Barbary, Abyssinian, Nubian), the camel and dromedary (introduced from Arabia), asses, oxen, cattle, sheep, and goats. These are found in all parts of the continent.

Minerals.—The mineral wealth of A. is but imperfectly known. Salt is very generally diffused, though large tracts, such as Sudan, are without it. Egypt and Abyssinia are rich in minerals. Gold is found in the sands of nearly all the great rivers. The diamond-fields of Griqualand, in the S., have proved very productive, and coal has been found in the eastern part of the southern plateau. The geological formation of the known districts of A. is treated under their various headings.

Population.—The population of A. is estimated at about 190,000,000. N. of the Sudan, the Berber race prevails from the Atlas Mountains to Libya; the Nubians are partly of Arab and partly of Negro origin, while the Copts of Egypt belong probably to the Semitic family, but the frequent conquests and colonisations of the N. African sea-board both in early and later times have complicated the question of race. Turks are numerous in Tunis, Tripoli, and Egypt. The middle of A. is peopled almost entirely by the Ethiopian or Negro family, and the S. is occupied by the Hottentots and Kaffirs—members, probably, of the same great family. European colonists are numerous in the islands and coasts, especially in Cape Colony and Algeria.

Religion.—Mohammedanism has about 67,000,000 votaries N. of 10° N. lat. Christianity is found among the Europeans, and, in a corrupt form, in Abyssinia. It embraces about 9,000,000 people. There are about 1,000,000 Jews. The remaining 113,000,000 are heathens, following varieties of fetishism, &c.

Government.—There are few great organised states, except those on the N. coast, the most important of which is certainly Egypt. Zanzibar, on the E. coast, may also claim notice, but despotic or patriarchal governments prevail. Algeria and Cape Colony are the chief of the European possessions, which are less important than those of Asia and America.

Science, Art, Literature.—These may be said to be unknown among the natives. There are schools for teaching the Koran in all Mohammedan districts.

Commerce.—The trade of A. is in a great measure carried on by barter. The internal trade is in the hands of the Arabs, and (in Sudan) the Mandingoes and Fulahs. It is conducted by caravans crossing the interior, especially the deserts of the N. The coast trade is chiefly in the hands of Europeans. The principal exports are coffee, sugar, rice, dates, palm-oil, gum, cotton, ivory, spices, ground-nut, timber, hides, ostrich-feathers, musk, wax, and gold-dust. The traffic in slaves has been a great blot on African commerce, the slaves being brought from the interior to the coasts. In 1873 Great Britain made a treaty with the Sultan of Zanzibar, by which he agreed to abolish slavery in his dominions; and Sir Samuel Baker returned in the same year from a successful expedition up the Nile, organised by the Khedive of Egypt, ostensibly for the purpose of putting down the slave traffic. Until the slave trade is extinct, the legitimate commerce of A. cannot be fully developed.

Agriculture is prosecuted on a large scale and in an effective manner on the coasts, in the Nile Valley, Abyssinia, Sudan Cape Colony, and Kaffraria.

Mining is carried on in Upper Sudan, Abyssinia, and Kaffraria. The Kaffirs are skilful miners.

Explorations.—The early name of this continent was Libya, Africa having been originally merely the Roman province in which Carthage was situated. Until the 15th c., Europeans knew little of A. except the N. coast; but explorers have been numerous since Vasco da Gama doubled the Cape of Good Hope in 1497. Nothing more can be attempted here than a list of a few of the greatest travellers in the present century

which has been the great era of African exploration. The travels of Mungo Park in the valley of the Niger; of Burckhardt in Nubia; of Oudney, Clapperton, Denham, Lander, and Barth in the Sahara and Sudan; of Burton, Speke, Grant, Baker, and Stanley in the valley of the Nile; and of Moffat in S. A., have resulted in great discoveries, and in vast additions to our stock of geographical knowledge, for a special notice of which we refer to the names of the explorers. David Livingstone, however, is the greatest name in the annals of African exploration. He devoted twenty-five years to making known to us the interior of S. A., where he finally lost his life in 1873. In the end of 1874 the important discovery of an affluent on the western side of Lake Tanganyika was made by Lieutenant Cameron, and in 1877 Stanley traced the course of the Congo, and proved it to be the river which Livingstone had mistaken for the Nile.

African Teak, or African Oak, is a wood of much value in shipbuilding, for which it is generally imported. It is very durable, but rather heavy. The tree is called *Oldfieldia africana*, and belongs to the natural order *Euphorbiaceæ*.

Ag'a, or Agha, in old Turkish, means the elder brother, but in modern Turkish is given as a title of honour to illiterate dignitaries. It is therefore used in contrast to Effendi, which is never given except to those who possess, in addition to rank, literary culture. The title acquired its greatest historical distinction in the time of the Janissaries, whose commander was an A.; now the only high officer who bears it is the chief of the Black Eunuchs.

Agades, a town of Central Africa, the capital of Air or Asben (q. v.), situated, S. of the Sahara, in lat. 16° 33' N., long. 7° 30' E. It was formerly a prosperous city, and before the decline of the gold trade of Gogo had probably 60,000 inhabitants. Though it still sends out caravans to the rich marts of the Sudan, its trade is trifling, and the population has dwindled to about 6000. The people are partly of Berber descent.

Agama, a genus embracing numerous species of saurian reptiles, natives of warm climates. They have a loose skin, which can be distended with air at the animal's will. Certain S. American species are called chameleons, owing to their power of changing their colours like the true chameleon. The frilled A. is a singular species found in Australia.

Agamemnon, son of Atreus, and brother of Menelaus, whose wife Helen was carried off by Paris, son of Priam, King of Troy. The Greek chiefs made A. generalissimo of the forces which they had collected to punish Troy. At the close of the siege, returning home with Cassandra, the daughter of Priam, A. was murdered by his wife Clytemnestra, who had been seduced during his absence by Ægisthus. His children—Iphigenia, Electra, and Orestes—were favourite subjects of Greek tragedy.

Agami, or gold-breasted trumpeter-bird of S. America. It is the *Prophias crepitans* of zoologists; is rather larger than a domestic fowl, but has much longer legs and neck. It runs very swiftly and is easy of domestication.

Agapæ (Gr. *agapê*, love), in the primitive Christian Church, were the feasts of brotherly love that accompanied the celebration of the Eucharist. The two together were originally regarded as a whole, which was spoken of as the 'Lord's Supper' (Gr. *deipnon tou kuriou*). In the early apologists and fathers of the Church, Justin, Tertullian, Chrysostom, &c., we find a full description of the A. They were provided by the richer brethren; they were introduced and closed by prayer, and, according to Tertullian, every one during the feast was required to sing something to the praise of God either from Scripture or his own thoughts, so that it soon became visible if any one had partaken to excess. Pliny, in his famous letter to Trajan, alludes to these A., and mentions the sobriety with which they were conducted; he also indicates the prevalent but erroneous suspicion of the pagan magistrates that they were secret societies, and had sinister political aims. From a very early period, however, a tendency to irregularity in the celebration of the A. had shown itself. St Paul (1 Cor. xi. 20-22) earnestly rebukes it, and though the persecutions would repress selfish and sensual indulgence, yet it was found advisable in the 2d c.

to separate the A. from the celebration of the Eucharist. After the establishment of Christianity in the 4th c. the A. were placed under strict regulations by ecclesiastical councils, they were not allowed to be held in church. A distinction is made between the Eucharistic love-feasts, and others of which we read in ecclesiastical writers; as *A. natalitia*, held in honour of the martyrs; *A. connubiales*, which were simply marriage-feasts, and *A. funerales*, or funeral-feasts.

In modern times the Moravians, the Wesleyans, and the Glassites hold love-feasts in connection with the celebration of the Eucharist.

Agapem'one (Gr. 'abode of love'), a curious religious establishment near Bridgewater, in Somersetshire, set up in 1859 by a Mr Henry James Prince, at one time a clergyman of the Church of England. While curate at Charllynch, in the same county, he first began to preach certain mystical doctrines about himself and the Holy Ghost, which excited great scandal and alarm, and led to his withdrawal to Suffolk. Here matters grew worse with him, and after holding a conference with some clerical adherents whom he had secured, it was resolved to secede from the Church. Prince started preaching on his own account at Brighton, and his principal ally, Starkey (who had formerly been his rector), at Weymouth, in Dorsetshire. Both met with great success in various quarters, and among different orders of society. At last three of the brethren, Prince, Thomas, and Cobbe, crowned their good fortune by marrying three lovely and wealthy girls, daughters of a widow of the name of Notridge. With the money thus obtained all went on admirably for a time, but at last (1846) Mrs Thomas became discontented with her situation, and was expelled from the society. This led to legal proceedings (1850), in which she sought (successfully) to obtain the custody of her child. The revelations of the 'inner life' of this strange community did not tend to elevate it in public estimation, and if Mr Hepworth Dixon's account (*Spiritual Wives*, 2 vols., 1868) of his interview with Prince is not overcharged, its singular sentiments and usages are still maintained. Meanwhile the 'abode of love' at Spaxton, near Bridgewater, was getting ready, and in 1859 it became the final residence of these strange saints. Prince has been a zealous pamphleteer all his life, but it is scarcely possible for a sane mind to understand his mysterious and apparently impure jargon about the redemption of the flesh. In 1859 appeared *Brother Prince's Journal, an Account of the Destruction of the Works of the Devil in the Human Soul by the Lord Jesus Christ through the Gospel*, in which he calmly expresses his belief that he has at length reached perfection, and cannot possibly become better than he is. The sect is still (1875) in existence, but is making no further progress. It vegetates rather than lives in the sleepy luxury of Spaxton, and must perish with its founders.

Agaricus. One of the largest and most important genera of fungi. See MUSHROOM.

Agass'iz, Louis Jean Rodolphe, a distinguished naturalist, was born May 28, 1807, at Motiers, between the lakes of Neuchâtel and Morat, in the canton of Freyburg, Switzerland, received his earlier education at the Gymnasium of Bienne and the Academy of Lausanne, and studied medicine and the experimental sciences at Zürich, Heidelberg, and Munich, where he took the degree of M.D. In 1829 he published an account and classification of 116 species of fish collected by Spix; and having by this means been attracted to the study of ichthyology, he published from 1839 to 1845 three volumes entitled *Natural History of the Fresh-Water Fish of Europe*. At the same time appeared *Researches on Fossil Fishes, and Descriptions of Echinodermes*. His best and most generally known work is his *Study of Glaciers*, which he supplemented by his *Researches*

Agaricus campestris (Common Mushroom).

of *Glaciers* (Paris, 1847). In 1846 A. removed to America, and became Professor of Geology and Zoology in the Lawrence Scientific School at Harvard; and subsequently explored extensive portions of the New World, accompanied an expedition to Brazil (1865-66), and superintended deep-sea soundings in the Gulf Stream (1871). In his *Outlines of Comparative Physiology* (1848) he has advocated the anti-evolution theory. A. died Dec. 14, 1873.

A'gata de Goti, Santa, an episcopal city in the S. of Italy, province of Benevento, 14 miles E. of Capua, lies on a hill, at the base of which flows a tributary of the Volturno. Besides the cathedral it has seven other churches and an abbey. Pop. 7951.

Ag'ate, a siliceous mineral, composed of closely-compressed layers of coloured varieties of quartz, capable of a fine polish, and much used in the manufacture of ornaments. It is found in Saxony, Scotland, Siberia, India, Java, Arabia, and other countries.

Ag'atha, St., according to the legend of her life, was the daughter of a Sicilian nobleman, and was celebrated for her beauty and wealth. When the Decian persecution of the Christians broke out in the middle of the 3d c. A.D., she steadfastly refused to save her life by granting unworthy favours to the Roman prefect Quintianus, and was in consequence put to death with horrible cruelties, 5th February 251, which is the day dedicated to her in the Catholic calendar of the saints.

Agath'ocles, a Sicilian Greek of humble birth, born at Therma, in Sicily (B.C. 361). Having married the widow of his patron, Damas of Syracuse, he obtained great wealth, which enabled him to collect an army, by the aid of which he made himself sovereign of Syracuse. His rule was marked by oppression and cruelty. In an attempt to expel the Carthaginians he was defeated at Himera, but passing over into Africa, his successes were rapid and brilliant. In a mutiny which followed a defeat there, his son was slain, but he himself escaped, and returning to Sicily, he re-established his authority. His grandson, Archagathus, having killed the heir to the throne, that he might obtain it himself, caused his grandfather, aged seventy-two, to be destroyed by a poisoned quill, used as a toothpick (B.C. 289).

Ag'ave. A genus of monocotyledonous plants belonging to the order *Amaryllidacea*, principally natives of S. America. They have large, succulent, spiny leaves, forming a spreading tuft, from the centre of which the flowering stem is developed. The *A. americana*, which is cultivated in conservatories in Britain, is the best known species. It is commonly called the American

Agave.

and roots furnish a coarse but tough fibre called Pita flax or Maguay, which is used for making ropes and paper. The juice of the leaves has been used as a substitute for soap, and forms a lather with salt as well as with fresh water. The roots of *A. saponaria* are employed in the same way. The Mexican Indians ferment the juice of *A. mexicana*, which forms an intoxicating drink called *pulque*.

Agde, a walled town of France, on the left bank of the Hérault, about a league from the Gulf of Lyons. It was founded by Greek colonists. From the dismal aspect of the basalt of which it is built it has been called the Black Town. The trade of A. is rapidly increasing, and is chiefly in wine, oil, salt, corn, silk, wool, and timber. It has an active coasting trade, and considerable commerce with Spain, Italy, and Africa. Pop. (1872) 7843.

Age. A man or woman is said in law to have arrived at 'age' on the day preceding the twenty-first anniversary of his or her birthday. In English law the boy or girl under twenty-one is called an *infant*, and relatively to the person having charge of him or her a *ward*. If an estate be left to an infant, the father is by common law the guardian, and must account to his child for the profits. A father may by deed or will appoint a guardian. A male at twelve years old may take the oath of allegiance; at fourteen he may consent or not to marriage; at twenty-one he is at his own disposal. A female at seven may be betrothed or given in marriage; at nine is entitled to dower; at twelve may consent or not to marriage; and at twenty-one may dispose of herself and lands. Marrying a ward of Chancery without consent of the court is 'contempt, and as such punishable, even though the offender be ignorant of the wardship. In Scotland the period of life under twenty-one, or minority, is subdivided into *pupilarity* and *puberty*. In a male pupilarity extends to fourteen years of A., in a female to twelve. In both puberty is the period between pupilarity and twenty-one, or *majority*. A minor who has reached puberty may take an oath and give evidence. No one under twenty-one can vote at an election for member of Parliament, or be elected a member. In France the male marriageable A. is eighteen, the female fifteen. In America a member of the House of Representatives must be twenty-five, of the Senate thirty. See INFANTS, LIABILITIES OF, CONSENT, CONTRACT, MARRIAGE.

Agen, an old episcopal town in France, capital of the dep. of Lot-et-Garonne, stands on the right bank of the Garonne, midway between Toulouse and Bordeaux. In early times it was plundered successively by Goths, Vandals, Huns, and Saracens. The English held it in the reign of Henry II., and in the 16th c. it was twice captured by the Huguenots. Joseph Scaliger was born in the immediate neighbourhood, and long lived in A., which now carries on a prosperous trade in woollen fabrics, sailcloth, colours, hemp, brandy, and plums. Pop. (1872) 15,752.

Agent, one authorised to act for another. An A. cannot bind his principal by deed, unless empowered by deed to do so. Authority given him is revocable at any time, and falls by the death or bankruptcy of the constituent. An A. must act in good faith and according to business usage; he must act with due diligence and skill: if he fail in these points his principal can recover damage. An A. must keep accounts, and duly inform his principal of material acts. He is entitled to remuneration, and has a 'lien' (Scot. Law Hypothec, q. v.—see LIEN) over property in possession, both for incidental charges and for the general balance due to him. An A. acting gratuitously must act in good faith, but he is not answerable for want of skill, or even for carelessness. See FACTOR, BROKER, COMMISSIONER, COMMISSION AGENT, MASTER AND SERVANT.

Agent and Client. The constituent of a law agent is called his client. The general principles of law given above apply in this relationship. The law agent has a 'lien' (Scot. law hypothec) over deeds and other papers in his possession for his account against his client; and the client has a claim for damage against an agent acting with gross professional ignorance. The agent is not responsible for a result, whatever opinion he may have given. See ATTORNEY, SOLICITOR, WRITER TO THE SIGNET.

Agent, Army, an official chosen by the colonel of a regiment, who is answerable for his honesty to the Crown. His functions are to apply to the War-Office when money is required to pay the officers and men, and other regimental charges. He also assists the private soldiers in remitting money to their families, and in their other pecuniary arrangements. He accounts annually directly with the Paymaster of the Forces. The tendency of recent years has been to curtail the functions and emoluments of the office; and many competent authorities have been in favour of its abolition, on the ground of its causing an unnecessary complication and expense.

Agent, Navy. By 27 and 28 Vict. c. 24, each of H.M. ships of war, while in commission, have an agent appointed by the commander, and registered. His duties are to act for the ship in questions of salvage, merchant shipping law, capture of slave-ships, distribution of prize-money, &c. He receives 2½ per cent. as payment in full for his services.

Ages, a term of unprecise import used to denote supposed periods in the history of the human race. The idea first occurs in Greek writers. Hesiod reckons five A.—the golden, the silver, the brazen, the heroic, and the iron. The first was, of course, the purest and best; the others marked a gradual deterioration, except perhaps the heroic, which was a sort of wild desire for a better state of things; and the last, or iron age, in which the poet himself lived, was one in which all virtue and goodness had departed from the earth. From poetry the idea passed into the speculative philosophy of the Greeks. The cosmos, or universe, had now its A. These formed the divisions of a great world-year, on the completion of which the events of history repeated themselves. The Apocalypse seems to sanction the notion, which is also to be found in the ancient literature of the Hindus, and, with modifications, in the recent metaphysicians of Germany and the positivists of France.

Agésilas, King of Sparta, succeeded to the throne (B.C. 398) while the hegemony or leadership of Sparta was still uncontested. Two years later, to aid the Ionians, he crossed into Asia and defeated the satraps of Artaxerxes (B.C. 395). Being summoned home to suppress a rising of the Greek states against Spartan authority, he defeated his enemies at Coroncia (394 B.C.). He approved of the treacherous seizure of the *Cadmia*, or citadel of Thebes, and was therefore responsible for the subsequent reverses that befell his country, though his heroism in the field continued unabated. A. died in Egypt A.D. 361, in his eighty-fourth year, a true Spartan, but not a great Greek.

Agincourt, or **Azincourt**, a village in the dep. of Pas-de-Calais, France, where Henry V. of England, with from 10,000 to 14,000 men, defeated about 60,000 French on the 25th October 1415. Not fewer than 10,000 French were slain, including 'princes of the blood, feudatories of the crown, warlike bishops, and innumerable knights;' among the prisoners were the Dukes of Orleans and Bourbon. The English lost some 1600, among whom were the Duke of York and the Earl of Suffolk. This brilliant victory occurred after the siege of Harfleur, while King Henry was returning to Calais with his sadly-reduced forces.

Agis, the name of several Spartan kings, the first of whom is said to have reigned in the 11th c. B.C. The second flourished in the 5th and the third in the 4th c. B.C. A. IV. commenced his eventful reign in 244 B.C. The Spartans had then greatly degenerated, the old simplicity and virtue having given place to luxury and its kindred vices, and A. resolved to restore the ancient discipline. As the land was possessed by only a few families, while the poor were overwhelmed with debt, A. proposed a cancelling of debts, and a redistribution of the land, as to the first of which he was strongly seconded by a large landowner called Agésilas, who was himself involved in debt, but who contrived to delay the execution of the second to save his own estates. This incensed the poorer classes, who had hitherto been the chief supporters of A., and they permitted his enemies to throw him into prison, where he was strangled (240 B.C.).

Ag'rate (Lat. *agnatus*, 'a kinsman by birth') is the name given both in English and Scotch law to persons related through the father, those related through the mother being termed 'cognate.' This is not exactly the meaning the word had in Roman law. There the A. denoted strictly a relationship not only to, but also *through males*; e.g., a brother's son was his uncle's A., but a sister's son was his uncle's cognate, because the relationship was preserved by means of a *female*. The origin of the Roman distinction is to be sought in the institution known as the *patria potestas*, and the reason why a different distinction exists in modern law is that the *patria potestas* in its ancient sense has not been introduced into any modern society.

Agnes, St., according to the legend of her life, was born at Rome, and on account of her beauty and wealth obtained in her thirteenth year, from Symphronius, the son of the Roman prætor, an offer of marriage, which, being a pious Christian, she declined.

The enraged youth then caused her to be publicly stripped naked, but her long hair fell down to her feet and clothed her like a garment. When Symphronius sought to approach her with unchaste looks, he fell to the ground, bereft of eyesight. At the entreaties of his friends, she caused his sight to be restored. She was then condemned to be burnt, but the sportive flames refused to touch her body. At last she was beheaded A.D. 303. Her emblem is a lamb, perhaps from the similarity of the Latin word for a lamb (*agnus*). Her day is the 29th of January. Readers of Keats will remember the line—

'St Agnes' Eve, ah, bitter chill it was!'

Agne'si, **Maria**, **Gaetana**, an Italian lady, was born at Milan, 16th March 1718, and at an early age was distinguished for her knowledge of Greek, Latin, French, Spanish, German, and various Oriental languages. She next betook herself to mathematics, and in 1748 published her *Istituzioni Analitiche*. When thirty-two years of age, she succeeded her father as professor of mathematics in the University of Bologna. Subsequently she retired from learned society, became a nun, and devoted her whole time to works of charity. A. died August 4, 1799. See *Vita di Mar. Gatt. Agnesi*, by Bianca Milesi-Mojon, Milan, 1836.

Agno'ne, a town in the S. of Italy, province of Campobano, 22 miles N.W. of the town of Campobano, has large copper-works. Pop. 10,500.

Ag'nus Dei (Lat. 'Lamb of God'), a name given to Jesus by John the Baptist (John i. 29). In the liturgy of the Roman Catholic Church it is also the name of a prayer, which since the close of the 6th c. (when it was first enjoined by Pope Gregory the Great) has been used by the priest during the service of the Mass shortly before the communion, who recites three times, *Agnus Dei, qui tollis peccata mundi, miserere nobis* ('O Lamb of God, who takest away the sins of the world, have mercy upon us!') except that in the third repetition of the prayer, *da nobis pacem* ('give us peace') is substituted for *miserere nobis*. Pope Sergius I. (7th c.) commanded this prayer to be sung both by the priest and the congregation during the consecration of the Host. Still later the name was given to an oval-shaped medal of wax, silver, or gold, on which was stamped the figure of a lamb bearing a cross.

Agos'ta, a fortified town on the E. coast of Sicily, 12 miles N. of Syracuse, on a rocky isle connected by a bridge with the peninsula of Santa Croce. The harbour is large and safe, but not easy of access. The chief export is salt, but a trade is also carried on in wine, oil, flax, honey, sardines, &c. Pop. 9735. A. was founded by the Emperor Frederick II. in 1229, and suffered severely in the Sicilian wars of the middle ages. It was the scene (1676) of a great defeat of the combined Dutch and Spanish fleets under De Ruyter by the French under Admiral Duquesne. In this battle De Ruyter got his death-wound. A. was destroyed by an earthquake in 1693.

Agou'ti (*Dasyprocta*), a genus of mammals belonging to the Guinea-pig tribe of the *Rodentia*. The species are natives of S. America and the W. India Islands, and resemble the hare and rabbit in their form and manner of living. One species is very destructive to sugar-cane plantations.

Ag'ra, the chief city of the N.W. Provinces, British India, 139 miles S.S.E. of Delhi by rail, is the seat of the government, and headquarters of the military force for the N.W. Provinces. Its cantonment can accommodate 10,000 troops. The daily market is well supplied with meat and vegetables. The *Agra Banking Co.*, '*Agra Prize*,' Assembly Rooms, '*Metcalf's Testimonial*' (dancing-room and refectory), and the churches and chapels are prominent institutions. The *Taj Mahal*, mausoleum of Shah Jehan and his consort, is a beautiful building of marble, dazzling white, carved and ornamented with imitations of flowers in precious stones, many of which, however, were removed during the mutiny (1857-59). The building of this tomb occupied 20,000 men for twenty-two years, and cost over £5,000,000. The Pearl Mosque is a marvel of architectural and decorative beauty. Pop. (1872) 142,661, engaged in the cotton, salt, and transit trade. During the mutiny the Europeans, to the number of 5846, took refuge in the *fort*, an important stronghold with a rampart 80 feet high, which was gallantly relieved by Colonel Greathed. The garrison made several effective sallies; but the most brilliant

exploit was Major Montgomery's march to Allygurb, where, with 300 men, he defeated a vastly outnumbering force of rebels.—The British district of A. is populous and fertile, yielding chiefly cotton, flax, tobacco, maize, and some rice. Area 1887 sq. miles. Pop. (1872) 1,094,184.

Agra-agra (*Plocaria candida*), a sea-weed which is occasionally imported into this country for making a jelly for dressing silks. It is used as an article of food in India and China. When boiled in syrup or sugar it forms an excellent preserve.

Agram, a fortified town of Austria, capital of the crown-land of Croatia, pleasantly situated at the base of a woody mountain range. It is cut by a stream into three divisions, each having a distinct jurisdiction. The town is, on the whole, well built, and contains a royal academy and public library. Its trade is chiefly in porcelain, silk, tobacco, and wheat. Pop. (1869) 119,857.

Agrarian Law. In the Roman State there were two kinds of land, public and private, and till the time of the Licinian rogation, or bill, the public land was held only by the patricians, who formed the original *populus*, or burgesses. For liberty to cultivate this an exaction was made of a tenth of the produce of arable land, and a fifth of the produce of oliveyards and vineyards, while a rate was fixed for the right to pasture. Gradually the rich, by force or purchase, got possession of the smaller holdings, and thus became cultivators of extensive tracts. Though the land was the property of the State, and the cultivators mere tenants-at-will, long possession produced the feeling of ownership, and the land was regularly transferred by sale. The State, however, occasionally asserted its rights. When the plebeians, as distinguished from the patricians or original burgesses, became a separate estate, they claimed a share in that portion at least of the public land that had been acquired by conquest, and many difficulties arose between the two estates, which were attempted to be settled by enacting agrarian laws, which are not to be confounded with the modern proposal of an equal division of the lands of the rich among the poor. The A. L. of Spurius Cassius (B.C. 484) proposed that the unassigned portion of the public land should be divided among the plebeians, and that the rent or tithe of the remainder should be exacted, and applied to the payment of the army. It never, however, came into operation, as its author was put to death in the following year. By the A. L. of C. Licinius Stolo (B.C. 367) no occupier was to have more than 500 acres, and the surplus was to be divided among the plebeians, at the rate of seven acres each. After a time the Licinian law began to be disregarded, and at length Tiberius Sempronius Gracchus (B.C. 133) revived the measure for restricting the possession of public land to 500 acres, giving each son of a possessor 250 acres additional; while the land resumed was to be distributed among the poorer citizens, who were not to have the power of alienating their allotments. This measure Gracchus carried in spite of the opposition of the patricians, but he lost his life in a riot excited by his legislation. The Sempronian law was not repealed, but it became virtually inoperative, and shortly after the death of its author the clause forbidding the alienation of allotments was rescinded, and they naturally fell into the hands of the rich, who soon became again possessed of overgrown estates. Other agrarian laws, such as those that proposed the division of conquered lands among veteran soldiers, were less violently opposed. Various objects were contemplated by this system, one of the least satisfactory of which was the extending of the influence of a popular leader. As a means of relieving the wants of the poor these laws were a failure, for the refuse of a large city never prove efficient cultivators, as they have neither patience nor skill.

Agricola, Gnaeus or Oneius Julius, a Roman commander and statesman, born at Forum Julii (mod. Tréjus, in Provence), 37 A.D., commenced his military career in Britain under Suetonius Paulinus, 60 A.D. After holding many civil offices he was elected consul, 77 A.D. Next year he was made Governor of Britain, the greater portion of which he subdued. He defeated the Caledonians in the great battle of the Grampians, circumnavigated Britain, built a chain of forts between the Clyde and the Forth, and introduced civilisation into the island. Being recalled by the jealousy of Domitian, he lived in privacy till his death, A.D. 93. His life by Tacitus, his son-in-law, is a biographical masterpiece.

Agricola, Johann, a notable German theologian and writer, surnamed *Magister Isidorus*, from his place of birth, Eisleben, in Saxony, but whose real name was Schneider or Schnitter, was born 20th April 1492. In 1525 he was sent to Frankfurt to establish the Protestant worship, and on his return became a preacher in his native town, where he remained till 1536. Meanwhile his opinions began to change in the direction of Antinomianism, and when called to Wittenberg in 1537 a rupture took place between him and Luther. After some persecution he found a refuge in Brandenburg. He died at Berlin 22d September 1566. A. was a man of bold and active genius, but he had not much discretion, and his career was therefore stormy and distracted with quarrels. Besides numerous theological writings, some Church hymns, and a tragedy, he published in Low German a truly national work, full of strong sense, pure morality, and hearty patriotism, *Die gemeinen Deutschen Sprichwörter mit ihrer Auslegung* ('Common German Proverbs, with their Explanation,' Magdeb. 1528); shortly after, in High German, under the title *Dreyhundert Gemeiner Sprichwörter* (Nurnb. 1529); and later still, *Siebenhundert und Fünffzig Deutscher Sprichwörter* (Hagenau, 1534).

Agricola, Rudolphus, properly **Roelof Huyamann** ('husbandman,' Latinised into A.), and also, from his fatherland, **Frisius**, one of the most distinguished restorers of classical literature in Germany in the 15th c., was born at Babelo, near Groningen, in Friesland, in 1443. After studying at Louvain and Paris, he went to Italy, where he stayed two years. On his return to Germany in 1479, he did much by his lectures and otherwise to revive a taste for ancient literature. His principal work, *De Inventione Dialecticæ*, was mostly written while on a journey to Rome with the Bishop of Worms in 1485; but his fame rests not so much upon his written works as upon his personal influence at that period. He died at Worms in 1485. See Trusling's *Vita et Merita Rud. Agricolæ* (Grön. 1830).

Agriculture, a word derived from the Latin, signifying the tillage of a plot or field of land. From the time that 'Adam delved,' the culture of the ground has been one of the chief industries of man. A system of mixed husbandry has prevailed from primeval ages, and no better method of supplying corn and cattle for the food of the population of the earth has ever been devised. Since the abolition of the Corn Laws in the United Kingdom, the question has constantly cropped up as to whether the growing of corn or the rearing of cattle is the most profitable method for the farmer to adopt. During the Crimean war prices of wheat rose to a height unprecedented, except in the days when the 'Iron Duke' waged deadly feud in the Peninsula against Napoleon. In 1812 foreign growers were deluged from entrance to English ports; in 1856 they were not, and yet the prices obtained by British farmers in the latter period were nearly equal to those realised before that Act which gave a 'free loaf' to the people. What was the result of these high values placed upon wheat? A general recommendation that all or nearly all pasture-lands should be subjected to the operation of the plough. Cattle and sheep were at that time rather a sluggish trade in the market. Wool had to be sold at a moderate rate, and stock-farmers had the worst of it. The grazing lands were broken up, and before the value of the manures had been nigh exhausted, corn slid down the scale and meat went up. Meat has continued at high rates, and it is urged now (1875) that grass should be more extensively cultivated than it is. One reason, besides the high price of meat, given for this course of cultivation, or rather the negation of cultivation, is that much horse and manual labour might be saved. Horses are very dear, the average value of a good farm-horse being about £60 to £80; and wages of agricultural labourers have increased in proportionate ratio with that of the equine quadrupeds. It is a mistake to recommend all grass and no corn. The land requires change. It is not possible to develop it to its full extent without varying the rotations in ordinary farming practice. The land, like that mythical boy Jack, if it have no play, is a dull clod. It is not necessary, however, that it should lie bare fallow, although in some cases on heavy soils, where weeds have congregated, owing to the unpropitiousness of the season, entire non-production for one year might be recouped by the succeeding one, if due care were expended on the choice of good seed and the after tidiness and carefulness of treatment. Mr Lawes, the great experimentalist, has grown successive crops of

barley on his farm at Rothamsted for twenty-three years (up to 1875), but it would be unadvisable for all farmers to follow his example. Before such continuous rotation is resolved upon, the soil and climate ought to be thoroughly understood, and looking generally at farms where rent must be paid out of profit, it would not be very wise to farm on a fourth for the rotation, or at the most a sixth.

The practice of conducting A. has so much changed within a quarter of a century, that the old modes of tilling the soil may be passed by with a reference. The land was scratched to a depth of some three or four inches, and grain was scattered upon it at the discretion of the sower. His hand was not always judiciously steadied, or else the wind came and blew the seed upon furrows which wanted not. The consequence was that at harvest-time the fields exhibited much 'patchiness.' On some places there proved not to be tenfold return where a hundredfold might have been expected. There is not much danger of such blank spaces occurring now in fields, because the drills which the ingenuity of agricultural mechanists have invented are nearly proof against wind and weather.

A., not long out of its cradle in the United Kingdom, is still wrapped in its swaddling-clothes in most other countries on the continent of Europe and our colonies. Reaping-machines, by saving labour, have given a stimulus to the practice of A., and tended to an increase of rents in some districts. Portable threshing-machines proved a great boon to agriculturists. In out-of-the-way districts they quite superseded the flail and the cumbersome horse-gearing machines, and even the fixed steam-machinery, as it was found cheaper to employ these peripatetic severers of the corn from the chaff than to light unwonted fires and burn expensive coals.

After drainage A. in this country depends more for success upon steam-ploughing than on any other *modus operandi* on the farm. The success which has attended the working of the various systems in use has been very marked. It is claimed for these steam-drawn ploughs, cultivators, and grubbers that they can accomplish work at seasons when horse-ploughs would not be able to overtake it. They can achieve thorough tilth at a time when the pressure of horses' hoofs upon the land would be extremely inimical to the growth of the seed soon after. The hollows horses make leave the land water-logged at every step, and consequently at every step the grain falling thereon is doomed to blight.

Half of the land in occupation is not cultivated properly, because the tenants do not get security for their capital. Were they to drain and manure, and feed, off cake in their stalls or sheds for cattle, and on turnips for the sheep, the fertility of the land would be immensely improved. Leases are the safest agreements that a tenant can have, however good the landlord's intentions may be. A new landlord might come in after the one that the farmer had bargained with, and in England dismiss him with a six months' notice.

Wheat, barley, oats are the principal cereals in Great Britain. Roots are now one of the best paying crops—potatoes particularly so, if that wondrous malady, about the origin of which so many doctors differ, did not every now and again appear in their midst.

It has been said that there are scarcely any small holdings in England. There are nearly 230,000, ranging between five and twenty acres, and very nearly half of these are not above the smaller figure. There is therefore a fair opportunity for the frugal agricultural labourer to obtain a plot.

Up to the end of 1874 there were 47,143,000 acres under crops, bare fallow, and grass. To look after the land there were, including farmers, graziers, and bailiffs, 1,246,000 persons in England and Wales; in Scotland 220,000, and in Ireland 931,706. From these figures it would appear that Scotland can accomplish better work at a smaller expenditure of labour than other countries.

It has been thought sufficient here to give a general sketch of A. as it stands at the present time, reserving other information for special heads, such as Agricultural Implements, Agricultural Societies, Agricultural Education, Chambers of Agriculture, Land Tenure, Leases, Rural Cottages, Game Laws, Irrigation, Sewage, Tillage, &c.

Agricultural Customs. In 1848 Mr Philip Pusey, an eminent agriculturist, obtained a Parliamentary Committee of the

House of Commons to inquire into the A. C. of England and Wales in respect to tenant right. The evidence taken was very voluminous, embracing information from all the principal agricultural counties in England. An admirable digest of this unwieldy blue-book was made by Messrs William Shaw and Henry Corbet of the *Mark Lane Express*, and published by Ridgeway, Piccadilly, London. The conclusion arrived at from evidence given by fifty-three representative witnesses was, that customs giving compensation for purchased food for stock, and certain kinds of manure, for draining, chalking, and working of the soil—the result of all which outlays is to effect an improvement of the soil, more or less lasting, and requiring more or less time to elapse before the increased productiveness, thereby obtained, reimburses the expenditure incurred—existed only in few districts of counties, and that only in these few localities, unless by direct stipulation with the landlord (who generally made the incoming tenant pay), was compensation for any improvements made to the outgoing tenant, however short the time between their completion and the termination of the occupancy. The evidence on custom proves how much revision of customs is required. 'Where best known and most practised, they scarcely ever in reality possess a stronger power than that of a custom by courtesy. Any man can resist or defy them, if he thinks fit to do so, for the expensive, tardy, and problematical process required to enforce his obedience is, from motives of prudence, rarely resorted to. Even then the custom comes into court to claim the support of an authority it has only indirectly, if ever, actually received, and which will require very clearly-traced proof of its existence to extend to such a usage any recognition at all. The custom of the county, in short, has been allowed, or rather been received as law, from the want of any law upon the matter; and vague and uncertain in its origin, it naturally becomes equally so in its action. Twenty-seven years have made no notable alteration in the matter of tenant right. We gather this from the reports and summary schedules of an inquiry into the A. C. of England and Wales (1875). Customs are very capriciously distributed, the greater portion of England still remaining without compensation to the tenant for capital expended in improvements. A map of England in which the prevalence of such custom should be represented by a distinguishing colour would exhibit a series of most irregularly-shaped and unequally-distributed patches—the most conspicuous feature being the very small proportion of the surface of England enjoying any custom of adequate compensation even for purchased feeding stuffs. (See Reports of Committee of Central and Associated Chambers of Agriculture on Unexhausted Improvements.) The universal opinion of farmers is that a general principle of compensation should be legalised.

Agricultural Education. It is impossible to give a definition to this heading. It embraces all the sciences (theoretically); practically it means that those who till the soil should be well acquainted with natural laws. If seed is sown at a wrong season, or when the soil is not in proper tilth, then the farmer is not educated. There is a great want of general education among farmers—too much haphazard work. Farmers do not, as a rule, keep farm-books; their accounts extend from week to week in the corn-markets, and then, the items on their note-books struck through, the transactions are at an end. The Cirencester College, established in 1845 entirely through the efforts of Mr E. Holland, has been very successful. The terms are £50 for non-residents, and £130 for resident pupils. After a good general education, in which geology and meteorology should be combined, the best education for a young farmer is that which is to be obtained by going over the farm of a skilled farmer. There are many gentlemen who take in youths as pupils, and the three Lothians of Scotland are the best for those who desire knowledge of arable and stock husbandry.

Agricultural Implements and Machinery. For centuries attempts have been made to improve the implements intended for the cultivation of the soil—to supersede the mere wooden forked stick of Eastern countries, and the scarcely more efficacious instruments that prevailed from that time down to a comparatively recent date. It is curious, in looking over old books on agriculture, to notice what prejudice existed against the use of iron and wheel ploughs—a prejudice which in Kent especially is not entirely removed from the minds of the farmers with regard to tillage instruments of iron construction, and

which is only being gradually overcome in Scotland with regard to wheels on ploughs. Lord Kames, in *The Gentleman Farmer*, expresses his dislike to two-wheeled ploughs thus: 'All complicated ploughs are baubles; and this as much as any. The pivots of such wheels are always going wrong; and besides they are choked with earth, as to increase the friction instead of diminishing it.' A good authority on husbandry, as it was practised in 1765, the Rev. Adam Dickson of Dunse, agrees in this opinion; and in 1795 Mr Robertson, an eminent farmer at Granton, whose *Agricultural Survey of Midlothian* is an exhaustive one, writes still more contemptuously about the wheels on the earliest instruments employed in tillage. He says of a plough made by Mr Small (an implement still in use, and of proved utility), that it 'is now universal over Scotland, and perhaps were it better known in England, it might come to displace the complicated ploughs with wheels and other trumpery with which agriculture there is at present encumbered; as it is not apt to be put out of order, but simple in the construction, and effective in operation, it is adapted to almost every situation.' The swing-plough and the wheel alike are gradually giving way to the double-furrow and the three-furrow ploughs, and even these are being superseded by steam-tackle on moderately-sized farms where too many land-fast stones do not present almost insuperable obstacles in the expensive process of removal.

There have been many abortive efforts in perfecting machines for cultivating the soil, for sowing seed, and for drilling; for rolling, for hoeing after the blades attain a certain height, for reaping and gathering when the cereal crop reaches fruition, and for digging potatoes without manual labour. But the supremacy of mechanical adaptation over either manual or horse labour, or both combined, may be dated from the 'Great Exhibition' of 1851. Long and wearisome was the struggle to get reaping-machines introduced into the United Kingdom, although to Scotland belongs the honour of having first invented these great savers of human toil. To a Forfarshire clergyman, the Rev. Patrick Bell, is undoubtedly due the invention for cutting corn. In 1826 he tried the machine in the Carse of Gowrie, but it was then only in a rudimentary state, and the principle practically lay dormant until the 'World's Great Fair.' Then came M'Cormack and Hussey, Americans, who 'bettered' the instruction given, and whose first machine was tried in 1851, upon a field on Mr Mechi's farm at Tiptree. Since that time these machines have been multiplied by hundreds and by thousands, and the names of the makers are legion. So also are they in grass-mowers, in combined machines, in harrows, in rollers, in chaff-cutters, in root-pulpers, in hay-makers, in root-washers, in cake-breakers, in corn-grinders, in winnowers, in threshing-machines, drills, &c. Steam cultivation is rapidly growing in favour. It was at first looked upon askance; it is now recognised as the most profitable mode of cultivation where fences are not too frequently interposed. Fences, forest-trees, and small holdings are the great obstacles to steam in the field. Winnowers were introduced in 1710 from Holland by a Scotchman; Jethro Tull, in 1740, was first to make the drill known, and a long time it took to make it popular. The horse-hoe was also his invention (the inventor of both died in Fleet Prison). Andrew Meikle introduced a threshing-mill into Scotland in 1786, and mills, after his construction, became very general in East and Mid Lothian shortly after. This machine was propelled by horse, and was a very primitive affair. In 1788 a dibbling-machine was invented, and the first agricultural portable steam-engine was set in motion by Davies of Birmingham in 1841. Since that time marvellous strides have been made in the manufacture and improvement of all the implements and machinery mentioned. The character and description of the more important machines will be found under their particular headings.

Agricultural Societies. Associations for the promotion of agriculture have existed from about the commencement of the 18th c., but they can scarcely be said to have done much to forward the improvements in agriculture in this country before 1777, when the Bath and West of England Agricultural Society was established for advancing the cause of agriculture, and combining with this object the encouragement of the fine arts. For nearly 100 years the history of this society has been one of almost uninterrupted prosperity. It holds its annual exhibition of stock, poultry, roots, seeds, and implements in various parts of the kingdom, its operations ranging from Plymouth to Guildford, Croy-

don, and Windsor, the last three within easy distance of London. It is extremely popular wherever it goes, much more so than the Highland and Agricultural Society of Scotland or the Royal Agricultural Society of England. Venetian flags and festoons of evergreens wreath the whole streets on its progress from the triumphal arch at entrance of the town it visits to the place where its tents are pitched. The prizes offered are very liberal, and accordingly attract a large number of exhibitors of horses, cattle, sheep, and pigs from all parts of the kingdom. It publishes annually a volume of *Transactions* containing many valuable essays on practical and scientific questions specially relating to agriculture. Next in date and importance comes the Highland and Agricultural Society of Scotland, by far the wealthiest in the United Kingdom, its accumulated funds being about £60,000. This society was instituted in 1784, its object being then limited to the improving of waste districts in the Highlands of Scotland. It was not long, however, before it extended its area of usefulness, and it now embraces the whole of Scotland, holding its annual shows of stock and implements in rotation in Edinburgh, Glasgow, Stirling, Perth, Aberdeen, Kelso, Inverness, Dumfries, and Berwick. Besides the encouragement which this society bestows upon exhibitors at its own displays, it likewise gives prizes and medals to local exhibitions, and stimulates proper cultivation of the soil by awards to efficient ploughmen in most of the agricultural districts of Scotland. Further, it takes an interest in agricultural education generally, but perhaps not to the extent that its means would enable it to do; in the veterinary art, especially in the Edinburgh Veterinary College; and it also supplies its members with cheap analyses of feeding stuffs and manures by chemists whom it salaries. In 1793 the Board of Agriculture was established through the instrumentality of Sir John Sinclair, which had for its secretary the famous Arthur Young. In 1798 the Smithfield Club was formed for the purpose of improving the breed of stock through the age of fat animals, which have to combine symmetry with well-early maturity, and good quality of flesh. The Royal Society of England, now the first in the world, did not come into existence until 1838, and the Royal Agricultural Society of Ireland until three years afterwards. Like the Highland, these two combine exhibitions of stock with the publication of instructive essays upon husbandry. Among the more prominent provincial societies the Yorkshire Society may be mentioned, which is not excelled, if even equalled, by any, in its exhibition of that grand breed of animals, the shorthorn. The London Farmers' Club was established in 1845, the first of its kind; and since then similar institutions have become common in all central rural districts. These societies have effected vast changes for the better in the form and quality of cattle and sheep, causing production of more palatable beef and mutton, heavier fleeces of wool, and, as a rule, at much less cost in proportion to the prices realised. The Benevolent Association, founded in 1860, mainly through the efforts of Mr Mechi, ought not to be forgotten in this list. It has proved of great benefit to aged and decayed farmers, and to widows and offspring of agriculturists.

Agrirentum (Gr. *Akragas*), now Girgenti, on the S.W. coast of Sicily, founded by a colony from Gela (582 B.C.), was at one time so flourishing that Diodorus estimated the population at 200,000. The Carthaginians destroyed it B.C. 405. After the Punic wars it became subject to Rome. The Saracens held it from 825 to 1086 A.D. The modern town, of which the population is about 15,000, has a cathedral and a public seminary. It also contains magnificent and extensive ruins of the ancient A., the best preserved of which are the Temple of Concord and that of Juno Lucina, both Doric.

Agrimonia (Agrimony), a genus of herbaceous plants belonging to the order *Rosacea*. *A. Eupatoria*, or common agrimony, is a frequent roadside plant in Britain. Its foliage is astringent and slightly aromatic, and is occasionally used as an 'herb tea.' It contains tannin, and has been recommended as a tonic. Hemp A. is *Eupatorium cannabinum*.

Agrippa, **Cornelius Heinrich**, a celebrated writer, philosopher, and physician of the 16th c., was born at Cologne in 1486. First a teacher of theology in Franche Comté, and then at Cologne, where he also dabbled in alchemy, he next distinguished himself as a soldier, and was knighted by Maximilian I. Not content with such honour, he took the degree-

the Council of Constance, and was accessory to the death of Huss. Though holding strongly the superiority of councils to popes, and in favour of ecclesiastical reform, he was thoroughly opposed to the tenets of Huss. He died at Avignon in 1420 or 1425. A. was surnamed the Hammer of Heretics and the Eagle of the Doctors of France. His works have been often printed. See *Dinaux's P. d'Ailly* (Cambrai, 1824), and Tschackert's *Peter von Ailli* (Gotha, 1877), in which his ecclesiastical position is clearly set forth.

Ailsa Craig, a huge rock near the entrance to the Firth of Clyde, and about 10 miles from the coast of Ayrshire. It is a mass of trap, 2 miles in circumference, rising in a cone shape 1114 feet above the sea. It slopes abruptly, and on the N.W. strikes perpendicularly to the sea from a height of 300 feet. It is haunted by myriads of solan geese and other sea-fowl.

Ain, a frontier dep. in the E. of France, occupies an angle formed by the confluence of the Rhone and the Saône, and is bounded on the N. by the dep. of Jura. Where it adjoins Switzerland, in the N. and E., A. is hilly and fertile, but a vast malarious swamp covers most of the portion W. of the river A. The chief town is Bourg (q. v.) Area, 2258 sq. miles; pop. (1872) 363,290.—The river A. rises in the Jura, and joins the Rhone 18 miles above Lyon, after a course of nearly 100 miles.

Ainmüller, Maximilian Emanuel, the restorer of the art of painting on glass, was born at Munich, February 14, 1807, and died there, December 8, 1870. When very young he showed an extraordinary talent for decorative art, to which he ultimately wholly applied himself. Many cathedrals and churches possess monuments of his skill, e.g., the windows of the cathedrals of Ratisbon, Augsburg, and Cologne. But the most elaborate and comprehensive of all his undertakings was the restoration of the windows of Glasgow Cathedral (1864). His talent in architectural oil-painting is also well known, and specimens are to be seen in many galleries and churches in Europe.

Ainsworth, Robert, born near Manchester in 1660, and educated at Bolton, was the author of a once popular Latin dictionary, commenced in 1714, and published in 1736, which is now superseded by more accurate and scientific works. A. was long engaged in teaching, first at Bolton, and afterwards at Bethnal Green, London. He composed some Latin poems, and several treatises now forgotten. He died 4th April 1743.

Ainsworth, William Francis, geologist and traveller, born at Exeter in 1807, studied medicine in Edinburgh and geology in France, accompanied the Euphrates expedition as physician and geologist in 1835, and in 1838 was again sent to Asia Minor by the Geographical Society and the Society for the Diffusion of Christian Knowledge, to explore the river Halyr, and visit the Christians in Kurdistan. His chief works are, *Researches in Assyria* (1841), *Travels in the Track of the Ten Thousand Greeks*, and *Cilicia and its Governors*.

Ainsworth, William Harrison, a well-known English novelist who was born in 1805. His works are numerous, and were once popular. None exhibit high talent, and those in which he selects highwaymen and housebreakers for his heroes are positively pernicious. The following may be named: *Rookwood* (1834), *Crichton* (1836), *Jack Sheppard* (1839), *Old St Paul's*, *The Tower of London*, *The Lancashire Witches*, *The Court of St James*, and *The Good Old Times* (1873), *Merrie England* (1874), and *The Leaguer of Lathom* (1876). He edited *Bentley's Miscellany* for some years, and in 1842 started *Ainsworth's Magazine*.

Ain-Tab, or **Antab**, a town of Asiatic Turkey, vilayet of Syria, 60 miles N.N.E. of Aleppo, on a tributary of the Euphrates. It is a place of military importance, is well built, has abundance of water, and carries on a considerable trade in hides, leather, cotton, wool, wax, wheat, and rice. The castle of A. is a picturesque object. Pop. 20,000.

Air, or **Asben**, a country of Central Africa, lies between the kingdoms of Tebu and Songhai, towards the S. of the Sahara, extending from about 17° to 19° N. lat., and from 8° to 9° E. long. It is naturally fertile, but wretchedly cultivated, most of the food being imported. The sultan, who is merely nominal ruler, resides at Agades, the capital (q. v.) The population is chiefly divided into the Kel-owi, Kel-geres, and Itisan tribes.

The word *air* denotes 'settled people'; many of the tribes, however, are nomadic.

Air is the name applied to the atmosphere of the earth, but was formerly a general term for all those ætiform fluids which are now included under the name of gas. The properties of A. will be found under **AERODYNAMICS**, **ATMOSPHERE**, **BAROMETER**, &c.

Air-Beds are mattresses made of vulcanised india-rubber divided into separate compartments, each of which is provided with an air-valve. When inflated, they form very light, clean, and comfortable couches. They are chiefly used for invalids. Air-cushions are similarly prepared.

Air-Bladder, **Swimming-Bladder**, or '**Sound**.' A sac or membranous bag found in many fishes, and generally lying beneath the spine. It varies greatly in shape, being in some (as in the perch) a simple closed cylindrical sac, or divided (as in *Cyprinidae*). It may consist of a single sac, or be divided internally into cells, as seen in the *Lepidosiren*, or mud-fish. In some cases (e.g., perch, &c.) it is entirely closed; whilst in others (carp, herring) it communicates with the throat by a tube, the *ductus pneumaticus*, which is the homologue of the windpipe, just as the A. itself is the homologue of the lungs of higher vertebrates. It is never used for breathing, however, in any fishes except in the *Lepidosiren* (q. v.) The A. contains gases of various kinds; oxygen abounding in that of marine fishes, and nitrogen in that of fresh-water forms. Its use in fishes is to alter their specific gravity, and to enable them thus to rise or sink in the water by expanding or compressing the contained gas. Some fishes (e.g., flat-fishes, sharks, skates, mackerel, &c.) want this structure.

Air-Cells, or **Air-Sacs**, and **Air-Tubes**. The term applied to certain sacs or cavities in the interior of the bodies of birds, formed by folds of the lining membranes of the viscera, and into which air from the lungs is sent. The obvious function of these air-cells is to render the body of the bird light for flying, whilst the distribution of air also tends to increase the temperature of the body. The air-cells of the lungs (see **LUNGS**) are the minute cavities or sacs in which the bronchial tubes terminate, and on the walls of which the capillary networks of blood-vessels ramify, and so subject the venous blood to the action of the oxygen contained in the air within the air-cells. Air-tubes, or *tracheæ*, constitute the respiratory organs of insects.

Air-Cells or **Air-Cavities**, in plants, consist either of circumscribed spaces surrounded by cells, or of lacunæ formed by the disappearance of the septa between a number of contiguous cells, as in hemlock and pith of walnut. They are large in aquatic plants, and enable them to float.

Air-Engine. See **CALORIC ENGINE**.

Air-Gun is an instrument for projecting bullets by means of compressed air, which is condensed in a chamber by a condensing syringe in the stock of the gun. This chamber opens by a valve in connection with the trigger, just behind where the bullet is lodged. In some forms the condensing syringe is distinct from the stock, thus affording more room for the air. The advantages of the A. over the rifle in producing no noise, smoke, or disagreeable odours, and in being less expensive, are more than counterbalanced by its much smaller range.

Air-Plants, a name applied to plants which derive their nourishment from the moist atmosphere. See **EPHYPHYTES**.

Air-Pump.

Air-Pump is an instrument for removing air from a vessel, and consists essentially of a metal or glass cylinder in which a piston with a valve opening outwards is fitted air-tight; a plane disk of metal (usually brass) connected with the lower end of the cylinder by a tube; and a glass bell-like vessel called the receiver, which is placed upon the disk, and in which it is intended to produce the vacuum. At each stroke of the piston, the quantity of air in the receiver and connecting-tube is lessened and by repeating the operation again and again, a tolerably

perfect vacuum may be formed. A mercury gauge is usually present, in order to ascertain at once the pressure of the air inside the receiver.

Aird, Thomas, poet, born at Bowden, Roxburghshire, Aug. 28, 1802, and educated at Edinburgh University. He contributed to *Blackwood's Magazine* most of those poems which were afterwards collected into a volume in 1848, and republished in 1856. The best Scottish critics praised them highly, but they have never become popular, with the exception of *The Devil's Dream*, a poem combining stern grandeur with touching pathos and beauty. In 1835 A. was appointed editor of the *Dumfriesshire Herald and Galloway Register*, an office which he held till 1863. Two prose works, *Religious Characteristics* (1827), and *The Old Bachelor* (1848), are full of quiet grace and beauty. In 1852 he edited, with a memoir, the poems of David M. Moir. A. died April 25, 1876. See *The Poetical Works of T. A.*, 5th ed., with a Memoir by the Rev. Jardine Wallace (Edinb. 1878).

Airdrie, a town in Lanarkshire, Scotland, 11 miles E. of Glasgow. Though an old town, it has only risen into importance during the present century. The cause of its sudden growth is the abundance of coal, and of the 'black-band' ironstone peculiar to the district. A. has two stations on the N. British Railway. It unites with Falkirk in returning a member to Parliament. There is considerable cotton-weaving, paper-making, and engineering works. Pop. (1871) 15,671.

Airy, Sir George Biddell, K.C.B., F.R.S., D.C.L., &c., Astronomer Royal, was born June 27, 1801, at Alnwick, in Northumberland. He finished his education at Cambridge, and was Senior Wrangler in 1823. As Plumian Professor in 1828, he superintended the Cambridge Observatory, and succeeded Mr Pond at Greenwich in 1835 as Astronomer Royal. His *Astronomical Observations* were published at Cambridge in 9 vols., 1829-38. A. has made many improvements in scientific instruments, and conducted many interesting investigations, such as the determination of the density of the earth by pendulum experiments at the Harton coal-pits, the effect of a ship's magnetism on the compass, &c. He has also written many valuable scientific treatises, such as the article on *Gravitation* in the *Penny Cyclopædia*; *Trigonometry*, for the *Encyclopædia Metropolitana*; treatises on *Sound* (1869), *Light*, *Magnetism* (1870), *Errors of Observation* (1861), and *Mathematical Tracts*, besides numerous papers in the *Philosophical Transactions*, the *Cambridge Transactions*, the *Athenæum*, &c.

Aisle (Fr. *aile*, Lat. *ala*, a wing) is a term in architecture properly applied to those parts of a church which lie between the outside walls and the columns or pillars which flank the nave. It is also applied to the lateral divisions of the choir and transept. Many of the Continental churches have double aisles, Cologne has three.

Aisne, a dep. of France, in the basin of the Seine, and extending to the Belgian frontier. It contains rich pasture and arable land, and has considerable manufactures of cotton fabrics, soap, glass, and leather. The chief town is Laon (q. v.). Area, 2830 sq. miles. Pop. (1872) 552,439.—The river A. rises in the dep. of Meuse, and flows first N.W. and then W. past Soissons, till it joins the river Oise above Compiègne, after a course of 150 miles.

Aix (*Aque Gratiæ*, *Allobrogum*), a town of Savoy, in a pleasant valley, 823 feet above the sea-level. It lies picturesquely near Lake Bourget, and as early as the Roman empire was celebrated for its two hot springs, which still attract above 2000 visitors annually. Among various Roman remains are an Ionic temple, a vaporarium, and the arch of Pomponius.

Aix (the *Aqua Sextia* of the Romans), a town in the S. of France, in the dep. of the Bouches-du-Rhône. It possesses a court of justice, an academy, and a public library of 100,000 volumes and 1100 MSS. Its graceful architecture, sheltered situation, and hot springs, make A. a pleasant and fashionable resort. It can boast of an unbroken municipal life since its foundation by the Consul Sextius (120 B.C.), and has buildings now devoted to the service of the Christian religion that were first used as pagan temples. Under the Counts of Provence, in the middle ages, it was long the centre of the Troubadour literature. There is an active trade, chiefly in olive-oil, cotton, wine, and leather. Pop. (1872) 18,905.

Aix-la-Chapelle (Ger. *Aachen*), a town of Rhenish Prussia, and capital of a district of the same name, lies in the rich valley of the Wurm, 20 miles S.E. of Cologne. It derives its French name from its famous springs (*aix*) and from a chapel built there by King Pepin before 765 A.D. Charlemagne made it his capital, rebuilt its chapel, and died here in 814 A.D. The chapel was destroyed by the Normans, but restored in 983 by Otto III., who opened a tomb inscribed 'Carolo Magno,' and discovered the body of Charlemagne in almost perfect preservation. The emperor, sceptre in hand, and dressed in state robes, was seated on a marble chair, with a copy of the Gospel on his knee. The tomb was reverently built up, but was twice subsequently reopened, by Frederick I. and II., and finally in 1215 the remains were transferred to a costly chest, still preserved in the sacristy of the cathedral. Till 1558 the marble chair of Charlemagne was used as a throne when German emperors were being crowned. The cathedral of A. is built in the Byzantine style, and is rich in relics, the display of which once in seven years brings many thousands of devotees to the city. What remains of the imperial palace is now included in the town-house, which contains a splendid hall, where thirty-seven emperors and eleven empresses of Germany have been crowned, and which has lately been ornamented with frescoes from Charlemagne's life by Rethel. Long a decayed town of great historical interest, A. is fast becoming an important industrial centre. It is a station on the Belgian-Rhenish Railway; contains a Polytechnic school, erected in 1870; and is noted for its manufactures, chiefly of machinery, bells, chemicals, woollen fabrics, and cigars. The French captured A. in 1792; it was retaken by the Austrians in 1793; but by the treaties concluded at Campo Formio and Lunéville it was ceded to France (1797), and made capital of the dep. of Roer; finally, in 1815, it became a Prussian city. Pop. (1871) 74,238. See Quix, *Geschichte der Stadt A.* (History of A., 2 vols. 1841.)

The *mineral springs* of A., known as early as the time of Charlemagne, attract many thousands of visitors to the city annually. There are six hot and two cold springs: the former are sulphurous, with a temperature from 111° to 136° F., and are very effective in the cure of gout, rheumatism, and cutaneous diseases; the latter are chalybeate.

The first *treaty of peace* concluded at A. (1668) settled the succession to the Spanish Netherlands, and resulted from the triple alliance between England, Holland, and Sweden against France. It allowed Louis XIV. to retain the fortresses of Charleroi, Lille, &c., on returning Franche Comté to Spain. The second peace, concluded 1748, terminated the Austrian War of Succession. The *Congress of A.* in 1818 was attended by the sovereigns of Austria, Russia, and Prussia, assisted by ministers from England and France. It resulted in the withdrawal from France of the army of occupation, 150,000 strong, and in the formation of a 'Holy Alliance' (q. v.) of the great powers.

Ajaccio, the chief town of Corsica, on the W. coast of the island, mainly notable as the birthplace of Napoleon. It has considerable anchovy and pearl fisheries, and some trade in wine, olive-oil, and fruit. Pop. (1872) 13,580.

Aja'n, an unexplored tract of the E. coast of Africa, from Cape Guardafui to the equator, inhabited by Somauli tribes.

Ajax. Of the Greek heroes at the siege of Troy there were two of this name. 1. A. the Less, son of Oileus, King of the Locrians, brave and fleet of foot, next to Achilles. On his return from Troy, Athena caused him to be drowned because he had violated the sanctuary of the goddess in the seizure of Cassandra. 2. A. the Greater, son of Telamon, King of Salamis, excelled all the Greeks in stature, and in beauty was second only to Achilles. On the death of that hero, A. and Ulysses contended for his armour, and A. being defeated killed himself.

Ajmeer (*Ajmir*), the capital of a province of the same name in Rajputana, India, under British protection, is built on the slope of a hill. The principal object of interest is the tomb of a Mahomedan saint, to which the emperor Akbar made a celebrated pilgrimage. The military cantonments are at Nasirabad. The A. college, founded in 1868, is attended by 400 pupils. Pop. (1876) 26,569. The *province* of A. has an area of 2711 sq. miles, and a pop. (1876) of 396,889. It is hilly and barren, and was without means of communication until the opening of

the Rajputana railway. The inhabitants mostly belong to the wild tribes of Bheels. The administration of the province was made over to the British in 1818.

Ajuruo'oa, a town of Brazil, province of Minas Geraes, about 100 miles N.W. of Rio Janeiro. It lies at the base of the Sierra Mantiqueira, near the sources of the Parana, and is the centre of a district which produces coffee, sugar, tobacco, millet, and mandioc. Pop. of town and district, 12,000.

Aka, the New Zealand name for *Metrosideros scandens*, a plant belonging to the natural order *Myrtaceæ*. Its wood is called New Zealand Lignum Vitæ, on account of its hardness.

Ak'bar ('the Great'), properly Jalâl-ad-dîn-Mahomed Akbar, the greatest of the Mogul emperors, and one of the most enlightened monarchs the world ever saw, was the seventh in descent from Timur-Leng, and the grandson of Baber, who first established the Mogul ascendancy in Hindustan. He was born at Umarnot, in the desert of Sind, 14th October 1542, during the exile of his father Humâyûn, who had been driven from his throne by an Afghan prince named Sher Shah. His childhood was passed in perils or captivity; but in 1555, when A. was only thirteen years of age, Humâyûn crossed the Indus, defeated the Afghans in a memorable campaign, and remounted the throne of Baber. He died a few months afterwards. A., who succeeded him, was fortunate in having for his guardian and minister Bairâm Khân, a friend of his father's, who on the plains of Panipat (5th November 1556) thoroughly crushed a formidable Afghan insurrection. Bairâm Khân, however, was proud and tyrannical, and when A. reached the age of eighteen he relieved him of office. Stung with rage the fierce minister rushed into rebellion, but was soon beaten and captured. A. behaved very magnanimously to his old guardian, who was, however, soon after assassinated on his way to Mecca.

Henceforth the career of A. in war and peace is alike splendid. He never met defeat in the field, he was never baffled by a fortress. The earlier years of his reign were partly spent in suppressing disorder or mutiny among his enemies, which he did with such promptitude, skill, valour, and wisdom, that at the age of twenty-five (1567) he was thoroughly master of his own dominions. He then turned his attention to external conquest, reduced Rajpootana in spite of the heroic struggles of the native princes, conquered Ahmedabad, Surat, and Guzerat (1573); invaded and established his power in Bengal (1575-77), which had become the home of the vanquished Afghans; made himself master of Cashmere, 'the paradise of India' (1586); after two campaigns, confirmed his authority in the basin of the Indus and Western Afghanistan (1587-92); and finally, passing the Vindhya Mountains, compelled several of the kingdoms of the Deccan to acknowledge his supremacy (1595-1601). Thus the empire of A., which on his accession to the throne comprised only the Punjab and the provinces of Delhi and Agra, four years before his death formed an immense quadrilateral, more than a thousand miles in length from E. to W.

His activity and intelligence in furthering the material prosperity of his subjects was no less remarkable. He constructed roads, introduced a uniform system of weights and measures, insisted on a prompt and faithful administration of justice, and established an admirable financial system, of which a complete account is given in the *Ain-i-Akbari* of Abû'l Fazl 'Allami, court historian and friend of A. The monarch also surrounded himself with men eminent not only in war and government, but in arts and letters. He was likewise singularly tolerant and philosophical in matters of faith. At an early age he doubted the infallibility of the Koran, in spite of his name, Jalâl-ad-dîn ('Glory of the Faith'), and began to dream of a religion which would not be dependent on the character or pretensions of its founders. The result was a pure deism, belief in a God infinitely powerful, just, and good. On this basis he hoped to unite Mussulman and Hindu, and throughout his whole reign he sought to bring about a closer relation in thought and feeling between these two. The memory of his humane ambition long survived him, and he is still remembered in the East as a 'benefactor of the human species.' He died in 1605, after a reign of fifty years. A.'s history has been written by three of his contemporaries—Nizam-ud-Din, Abd-ul-Kâdir, and Abû'l-Fazl, whose *Akbar-Nâma* is a great work, though written with Oriental servility. But the greatest and most enduring monument of A.'s reign is the *Ain-*

i-Akbari, translated into English by Gladwin (3 vols., Calcutta, 1786), and again in part by Blochmann (Calcutta, 1874).

Akbarpur ('city of Akbar'), a town of India, N.W. Provinces, district of Cawnpore, 28 miles W. of Cawnpore. Pop. 6330.

Akee, the name given to the fruit of *Blighia sapida*, one of the *Sapindaceæ*, a small tree, native of Guinea, but which has been introduced into the W. Indies and S. America, where it is now widely spread. The fruit is about the size of a goose's egg. It splits into three parts when ripe, exhibiting three black seeds immersed in a white cellular substance called the *aril*, which is the eatable part of the fruit, and which possesses a slightly acid taste. The seeds yield a fatty oil.

A'kenside, Mark, poet and physician, was born at Newcastle-on-Tyne, November 9, 1721. He commenced his medical studies at Edinburgh in 1739, and continued them at Leyden, where he graduated M.D., 1744. In the latter year he published his *Pleasures of the Imagination*, a poem suggested by Addison's essays on the same subject in the *Spectator*. He was engaged in rewriting this work, and had half completed his task, when his death took place in London, June 23, 1770. A second edition of the *Pleasures of the Imagination*, with odes and miscellaneous poems, was published by Mr Dyson in 1772. A.'s poetry, though it lacks abiding human interest, evinces high command of the rhetorical capabilities of blank verse; and the study of his chief work in its original and in its amended and improved form is one of the most useful exercises in English composition which the language affords. The best edition of A. is that by Dyce, in the Aldine edition of the 'British Poets,' to which is prefixed an excellent memoir.

Akhalzi'kh, or **Aki'ska**, a town of Russian Armenia, on a tributary of the Kur, about 90 miles W. of Tiflis, in a valley of the Keldir Mountains. The mosque of A. had one of the most valuable libraries in the East, but when the Russians took possession of the place in 1828, they carried off its treasures to St Petersburg. A. carries on trade with the ports on the Black Sea, in the produce of the neighbourhood, maize, wheat, barley, flax, grapes, figs, and honey. Pop. (1867) 15,977.

Ak-Hissar, the *Thyatira* of Scripture, a town of Asia Minor, province of Anatolia, 52 miles N.E. of Smyrna, abounding in fragmentary remains of antiquity. Pop. 10,000.

Akhla't, or **Ardi'sh**, a fortified town of Asiatic Turkey, vilayet of Van, on the N.W. shore of Lake Van. Pop. 6000. At a short distance from it lay the old city of A., the capital of the Armenian kings, which was plundered by the conqueror Jalâl-ad-dîn in 1228, and utterly destroyed by an earthquake eighteen years later.

Akhtyr'ka, a town of European Russia, government of Khar'kov, 58 miles N.W. of Kharkov, on a petty tributary of the Dnieper, has some manufactures, but is chiefly noted for its great yearly fair. Pop. 17,500.

Ak'jermann, or **Akkermann** ('white town'), a fortified town in Bessarabia, Russia, at the point where the Dniester enters the Black Sea. It has a capital harbour, and in the vicinity are important salt-pits. By the treaty of A. (1826) between Russia and Turkey, the latter consented to the separate government of Moldavia and Wallachia, and granted to Russia free intercourse with all the states of the Porte, and the right of navigation of the Black Sea and the Strait of Constantinople. In 1828 Russia took up arms to enforce the fulfilment of these terms, and the war ended in the peace of Adrianople (q. v.)

Akron, a town of Ohio, United States, 36 miles S. of Cleveland, at the junction of the Ohio and Erie Canal with the Pennsylvania and Ohio Canal, and a station on the Cleveland and Zanesville Railway. It has woollen factories, flour-mills, and manufactures of agricultural implements. Pop. (1870) 10,000.

Ak-Shehr, the 'white city,' and the *Philomelion* of the ancient Greeks, a town of Asiatic Turkey, pashalic of Karamania, 5 miles S. of a salt lake of the same name, is famed for its manufactures of carpets. Pop. about 6000.

Aksu, a town of Eastern Turkestan, at the foot of the Thian-shan range, 260 miles N.E. of Yarkand, on the river

Aksu, a tributary of the Tarim. On the decay of the empire of Genghis Khan, it became the capital of an independent state, but was almost destroyed by an earthquake in 1716, and an inundation in the present century. It was a Chinese garrison town till 1867, when it surrendered to Yakub Beg. A. has manufactures of cotton cloth, saddlery, &c., and is an entrepôt for the caravan trade between Russia and China. Pop. from 6000 to 20,000.

Akyab, formerly a native fishing village called Tsit-daw-way, at the mouth of the Kaladan river, is situated on the right bank of the river, and is now a flourishing seaport and the principal town of the province of Arakan, British Burma. It possesses one of the finest harbours in India, being effectually sheltered by a double reef of rocks. A lighthouse stands on the outer reef on Savage Island, and another screw-pile lighthouse has been lately erected near the south end of Oyster Reef, a dangerous ledge of rocks running parallel to the coast 16 miles westward. A. has no direct import trade, and rice is almost the only article of export. The first cargo shipped to Europe was in 1847, when the first European houses settled there, and so rapid was its progress that in 1855 over 160,000 tons were exported. In 1874 the exports were 162,744 tons. Seven large rice-mills on the European principle have during the last few years been erected here. A. is daily visited by a cool sea-breeze, and is styled the Brighton of the Bay of Bengal. A. has a fixed population of over 21,000, composed of Mughls, Bengalees, and Madrasses. But as many as from 9000 to 10,000 Bengalees come from Chittagong to work during the busy season from January to June.

Alabama, one of the southern states of the United States of America, bounded N. by Tennessee, E. by Georgia, S. by Florida and the Gulf of Mexico, and W. by the Mississippi. It lies between 30° 10' and 35° N. lat., and between 85° and 88° 30' W. long. It contains an area of 50,722 sq. miles, or 32,462,080 acres, is 336 miles in extreme length, and varies in breadth from 150 to 200 miles. A. would form a rectangle were it not that Florida occupies the greater part of the coast-line, leaving to A. only about 60 miles on the Gulf of Mexico. The Alleghany Mountains terminate on the N. E. part of the state in a series of low hills. The surface gradually declines from the N. to the S., till near the coast it becomes level. There are three bays in its short coast-line, of which Mobile Bay is the chief. The rivers, which are numerous, follow the general southward deflection of the surface. The three largest are the Tennessee, the Tombigbee, and the A., the last two of which unite near the coast to form the Mobile. Though A. reaches to nearly within 7° of the torrid zone the thermometer is seldom above 90°. In 1850-60 the average annual temperature was 66° 14', that of summer 79°, that of winter 52° 43'. Snow does not lie long, and the rivers never freeze. The climate of the elevated country is very salubrious, but the lowlands near the rivers are unhealthy.

The hilly regions of the N. afford excellent pasturage, while the valleys interspersed are exceedingly rich in soil. The undulating prairie, which forms the central part of the state, is also remarkably fertile, and, though the soil in the S. is often sandy, the river bottoms are all wonderfully productive. Oaks, hickories, chestnuts, poplars, and mulberries cover the N. and centre of the state, while in the S. are the cypress, loblolly, and pine. A. is mainly an agricultural state, and includes among its principal products cotton, Indian corn, wheat, rye, buckwheat, oats, barley, potatoes, tobacco, hay, indigo, sugar, rice, and wool. The total value of the agricultural products in 1870 was 67,522,335 dollars. The yield of cotton was inferior only to that of Mississippi and Georgia. Among the wild animals are deer, bears, wolves, foxes, turkeys, geese, and ducks. The minerals, in which A. is very rich, include iron, coal, lead, manganese, ochres, marble, and a little gold. There are also numerous salt, sulphur, and chalybeate springs. The sulphur water of Blount's springs attracts large numbers of visitors. According to the state reports for 1870, the value of manufactured articles in that year was 13,040,644 dollars, in the production of which 8248 hands were employed. In 1872 there were 1602 miles of railway. In 1870 A. possessed 10 colleges and 2812 public schools. The state university, a very handsome building, is situated at Tuscaloosa. Among religious denominations, those of the Baptists and Methodists embrace by far the largest number of adherents.

The government resembles that of the other states. The governor is elected for two years, the 33 members of the senate for four years, and the 100 members of the house of representatives for two years—all by the people. A. is divided into 63 counties. The largest town and chief seat of commerce is Mobile; the seat of government is Montgomery.

The population of the state in 1870 was 996,992, of whom 475,510 were coloured.

History—The name A., which means 'here we rest,' is taken from the language of the aborigines. The first Europeans who visited A. were the adventurers under De Soto, who fought their way through the aboriginal tribes on their march to the Mississippi in 1541. The first settlement was made by the French at Mobile Bay in 1702. Nine years afterwards the city of Mobile was founded. The peace of 1763 transferred A. to the British crown, and it was incorporated first with Georgia and then with the Mississippi territory in 1802. In 1819 it became an independent member of the United States of America. A. was one of the slave and seceding states, but in 1868, after the war of secession, it acceded to the demands of Congress, and was restored to its place in the Union.

Alabama, *The*, a vessel built at Birkenhead in 1862, by Messrs Laird & Sons, for the Confederate Government. Her career was frightfully destructive, but far from honourable. In the opinion of Americans she was essentially a piratical craft, and it is certain that she was forced to deal with her captures precisely as a pirate does, against whom every port is closed, i.e., she first plundered and then burnt them. As her devastations gave rise to the 'Alabama Question,' and ultimately cost Great Britain a heavy sum of money, it may be important to note the circumstances under which she was built and her subsequent fortunes. When the civil war in the United States broke out in 1861, the Northern or Union Government rapidly effected a complete blockade of the Southern ports. Now and again an adventurous ship managed to run the blockade, but on the whole the Confederates were powerless at sea. They neither received much help nor were able to do much harm. They could not carry out their original idea of equipping a fleet of swift cruisers to make havoc of the Northern merchant shipping. After three or four months of civil war, however, the *Sumter*, a small steamer hitherto employed in the Gulf trade, and commanded by Captain Raphael Semmes, formerly of the United States navy, and a man of strong and resolute character, ran the blockade of *New Orleans* (30th June 1861), and quickly filled with consternation the merchants of the North, who saw their entire commerce imperilled by the incessant attacks of a solitary cruiser. Before the close of the year she had become unseaworthy, and was laid up at Gibraltar, after having captured or destroyed eighteen vessels. Her success, however, only showed the Confederates what might be achieved by a ship thoroughly equipped for such work, and engagements were accordingly entered into with Messrs Laird & Sons, Birkenhead, for the construction of a screw steam-sloop. Everything was arranged with such caution and secrecy that this ship was nearly finished before the United States officials suspected its purpose and destination. The greatest care was taken to avoid any infringement of public law. Nothing was done except what was perfectly lawful in the case of any 'belligerent,' and the Union Government had been compelled by the necessities of war to grant belligerent rights to the South. At length the United States minister demanded that the suspicious vessel should be detained. The Crown lawyers at first hesitated to recommend this course, but subsequently advised it. It was too late! 'No. 290' (the name of the new ship, from her number in the list of steam-ships built by the firm) was gone! No one can doubt that there was a great deal of illicit knowledge and underhand activity in connection with her hasty departure from Birkenhead, and the conduct of Messrs Laird & Sons, viewed in regard to its results, cannot be commended as either prudent or patriotic. The new cruiser was a wooden ship of 1040 tons register, barque-rigged, with two engines of 350 horse-power each, pierced for 12 guns, besides being able to carry two heavy pivot-guns amidships, and cost in all nearly £52,000. At Terceira, one of the Azores, she was 'equipped,' i.e., she received guns, stores, and coals from another vessel, the *Agrippina* of London. Captain Semmes then stepped on board, and on the 24th of August 1862 produced his commission, named the vessel the *A.*, hoisted the Confederate flag, and prepared for her deadly

work. Before the 16th of September she had destroyed more than her own cost, and for nearly two years after she was the terror of Northern merchantmen in every sea. In all, she captured sixty-five vessels, and destroyed property estimated at 4,000,000 dollars. The shipping trade of the United States was partially paralysed, and had to be carried on in foreign 'bottoms.' Public indignation was great, not only against Semmes, but against the British Government, which had allowed 'No. 290' to escape. Swift-sailing cruisers scoured the seas in search of the 'pirate,' who was at length forced, partly from want of stores, to take refuge in the port of Cherbourg, on the coast of Normandy, 11th June 1864. A few days later, the United States steamer *Kearsage*, commanded by Captain Winslow, also arrived at Cherbourg, and was soon after recklessly challenged by the 'pirate' ship. It is supposed that Semmes was ignorant of the great superiority of the *Kearsage* to the *A.* in equipment; but at any rate, on the 19th of June, the fight took place outside the port, in presence of thousands of spectators, and in less than an hour the terrible *A.* was sunk. Semmes and others were picked up by an English yacht, the *Derhound*, and at once placed within neutral jurisdiction. See *The Cruise of the Alabama and the Sumter*, compiled from the papers of Captain Semmes, and also the work written by Captain Semmes himself, entitled *My Adventures Afloat* (2 vols. 1868).

Not many months after the *A.* had commenced her destructive career, Mr Seward, in his capacity of Secretary of State, informed the British Government that the United States held themselves entitled to damages for the injuries done to American commerce by a vessel fitted out for war in a British port, and would claim them in due time. The idea took strong hold of the American mind, and at length Great Britain was induced to submit to arbitration the question of her culpability in regard to the escape of the *A.* A congress met at Geneva, 17th December 1871, consisting of representatives of Great Britain and the United States, and of three members appointed by the King of Italy, the President of the Swiss Confederation, and the Emperor of Brazil. The decision was given 15th September 1872. It was adverse to Great Britain, which was ordered to pay to the United States the sum of £3,229,166, 13s. 4d.

Alabas'ter. See GYPSUM.

Alago's, a maritime province of Brazil, bounded N. and W. by the province of Pernambuco, E. by the Atlantic, and S. by the navigable river San Francisco. A flat belt of rich alluvial soil runs parallel with the coast, abounding in lagunes (*lagoas*), from which the name of *A.* is derived. The productions are chiefly sugar-cane, cotton, mandioc, maize, rice, dye-woods, and timber. Area, 530 sq. miles; pop. 300,000. The capital was formerly a city of the same name, but is now Porto Calvo, a prosperous shipping town in the N.

Alais (anc. *Alatum*), a town of France, dep. of Gard, at the southern base of the Cevennes, on the left bank of the Gardon, a tributary of the Rhone, and 23 miles N.W. of Nîmes, with which it is connected by railway. The neighbourhood is rich in coal and iron, and also produces lead and manganese. Besides large iron foundries, the town has manufactures of silks, gloves, glass, earthenware, machinery, &c. In the time of the Huguenots *A.* embraced the Protestant side, and suffered in consequence. After the revocation of the Edict of Nantes it was erected into a bishopric for the conversion of Protestants. Pop. (1872) 15,384.

Alajuela, a town of Costa Rica, Central America, 23 miles W.N.W. of Cartago. Pop. about 12,000, many of whom are largely engaged in the cultivation of the sugar-cane.

Alamanni, Luigi, an Italian poet of noble extraction, born at Florence 1495. For a time he stood high in the favour of Leo X., but had twice to leave his country for political offences, and finally settled as a diplomatist at the French court. He died at Amboise in 1556. His chief works are (1) a collection of eclogues, hymns, satires, elegies, fables, &c.; (2) *Opere Toscane*; (3) *La Coltivazione*, a didactic poem in blank verse, considered the author's finest work; (4) *Girone di Cortese*, and *La Avarichide*, both epic poems; (5) a pleasant comedy in verse, entitled *Flora*;—all remarkable for their clearness and purity of style. *A.* is probably the poet who introduced blank verse into Italian poetry.

Alamos, Los (*is.*, The Poplar), or **Real-de-los Alamos**, a town of Mexico, province of Sonora, on the right bank of the Mayo, about 50 miles from the Gulf of California, is the chief town of a district noted for its silver mines. Pop. 10,000.

Åland Islands, a group of about 200 rocks and islands, 80 of which are inhabited, situated at the entrance to the Gulf of Bothnia, and named from the chief island. The population consists of Swedish sailors, seal-hunters, and fishermen, and amounts to 16,000, of whom, however, 11,000 belong to Åland itself. The archipelago was ceded by Sweden to Russia, 1809, and in the reign of Nicholas I. the island of Bomarsund was strongly fortified. During the Crimean war this fortress was destroyed by an Anglo-French force under Sir Charles Napier and Baraguay d'Hilliers.

Alangium, a small genus of trees belonging to the natural order *Alangiaceæ*. The fruit of some of the species is fleshy and edible, but rather slimy. Their roots are aromatic, and their timber is durable and of a beautiful colour. They are natives of India.

Alarcon Y Mendoza, Juan Ruiz de, a Spanish dramatist, born at Tasco in Mexico towards the end of the 16th c., was a jurisconsult by profession. In 1622 he is mentioned as Reporter of the royal council of the Indies, and must have then been in Spain. He failed to conciliate contemporary writers, probably from having formed too just an estimate of his and their powers, and was therefore subjected to much vituperation and ridicule. He did not even enjoy the credit of his own works, some of the best of them being assigned to other poets. There is as yet no complete edition of them, and as they are scattered through miscellaneous collections, he is less known and appreciated than he deserves to be. A number of his *Comedias* were published in two parts, the first at Madrid in 1628, and the second at Barcelona in 1634; a complete edition was carefully prepared by Hartzenbusch (Madrid, 1848-52). He ranks next after Calderon and Lope de Vega, and the works of no poet of his nation could with more justice be selected as a model for a national drama. His plots are ingenious, and his style chaste and vigorous. He is simple, unaffected, and possesses rare elevation of moral feeling. He excelled in the heroic drama, in character-comedies, and in comedies of intrigue. He died in 1639.

Alaric I. (the name is a form of *Athalaric*, 'noble ruler,' comp. Eng. *Ethelric*), the famous Visigothic warrior, born about 376 A.D., first emerges into history in 394, when Theodosius gave him the command of his Gothic auxiliaries. The discords that followed the death of Theodosius inflamed his ambition. In 396 he invaded and pillaged Greece, from which, when pressed by Stilicho (397), he made a masterly retreat to Illyria, of which the scared Arcadius made him governor. In 400 he invaded Italy, but sustained a defeat from Stilicho at Pollentia (403), followed by a treaty, in terms of which *A.* transferred his services from Arcadius to Honorius. But Honorius having failed to pay him 4000 pounds of gold, *A.* made a second invasion of Italy, memorable for three sieges of Rome. The first (408) was bought off, but the second (409) resulted in the surrender of the city, and the substitution of Attalus for Honorius. The incapacity of Attalus induced *A.* to restore Honorius, who having sanctioned a treacherous attack on the troops of *A.*, Rome was besieged for the third time, taken 24th August 410, and sacked for six days. *A.* intended to invade Sicily and Africa, but dying at Cosenza, he was buried in the bed of the Busento, the captives who had assisted in the work being put to death. *A.* was naturally generous, and it was owing to him that the splendid edifices of Greece and Rome suffered so little damage during his invasions. The faith which he had learned from Arian teachers was not without effect on his conduct. The most lasting effect of his inroads on the Western Empire was the establishment of the Visigothic Empire in Spain by the warriors whom he left behind him. See Simonis' *Kritische Untersuchungen über die Geschichte A.'s* (Gött. 1858).

Alaric II., eighth king of the Visigoths, succeeded his father in 484 A.D. He preferred peace to war, and, though an Arian, granted privileges to the Catholics. Clovis, King of the Franks, coveted his possessions to the W. of the Loire, and on the pretence that *A.* was an Arian, broke the peace. Theo-

Alaric, King of the Ostro Goths, and father-in-law of A., tried conciliatory measures, but in vain. In a battle at Vouillé, near Poitiers, the army of A. was defeated, and himself slain (507). The *Breviarium Alaricianum*, a selection from the imperial decrees and the writings of Roman jurists, called also *Lex Romana* and *Corpus Theodosii*, is a proof of his anxiety for law and order. It is a work of great importance in the history of Roman legislation, and contains documents not to be found elsewhere. An edition was published at Basel in 1528.

Alaria, a genus of sea-weeds (*Alga*), embracing few species, confined to the colder regions of the Atlantic and Pacific. One species is very common on British shores, viz., *A. esculenta*, which is known in Scotland under the names of badderlocks, henware, and murlins. It is regarded as the best of all the esculent *Alga* when eaten raw. Badderlocks is believed to be a corruption of Balderlocks, or the locks of Balder, a Scandinavian deity.

Alarm, in a military sense, means a warning of imminent danger given to a camp or garrison. When the enemy has effected or is supposed to be designing a surprise, a drum is beat or a gun fired, and soldiers know to hasten to a rendezvous called the alarm-post.

Ala-Shehr ('the variegated city'), a town of Asiatic Turkey, pashalic of Anatolia, at the foot of Mount Imolus, 75 miles E. of Smyrna, in a fertile district on the caravan route between Smyrna and the interior, and carries on a considerable trade in corn, cotton, and tobacco. A. is the ancient *Philadelphus*, so called because enlarged by Attalus II. Philadelphus, and was the seat of one of the seven churches of Asia. It was the last place in Asia Minor that submitted to the Ottoman Turks. Many remains of Greek antiquity are still to be found. Pop. 8000.

Alaska, a peninsula on the N.W. coast of N. America, whose natural continuation, the long chain of the Aleutian Isles, stretches towards Kamtchatka. Its connection with America was not known till Captain Cook explored the region in search of an Arctic passage. A volcanic mountain range, subject to frequent eruptions, extends through the entire length of the peninsula, which abounds with mooses, reindeer, bears, and seals. The name A. is now given to the whole territory once known as Russian America, which was ceded by Russia, 1867, to the United States for 5,000,000 dollars. Area, 577,390; pop. (1870), whites, 461; Indians, estimated at about 70,000.

Alaternus, the name of a common evergreen shrub (*Rhamnus alaternus*), native of the S. of Europe. Its roots and bark have been used in dyeing.

Alauisi, a town of S. America, republic of Ecuador, and province of Chimborazo, on a small stream of the same name, which flows into the Gulf of Guayaquil. It stands 7980 feet above the sea. The neighbourhood very abundantly produces grain, sugar, and fruits. Pop. 6000.

Alava, Don Miguel Ricardo de, a distinguished general of Spain, born at Vittoria 1771. In the war of independence he sided with the French till the fortunes of Joseph began to decline; he then joined the national party, and was appointed aide-de-camp to Wellington, who soon advanced him to the rank of general of brigade. After the restoration of Ferdinand VII. he was appointed ambassador to the Hague. When the revolution of 1820 broke out, he was returned as a deputy to the Cortes by the province of Alava, and became a leader among the Exaltados, voting for the suspension of royal authority. The restoration of Ferdinand in 1823 drove him to England, where he remained till the regency of Maria Christina. He then became Spanish ambassador to London in 1834, and to Paris in 1835. A. gave in his resignation in 1837, after the insurrection of La Granja, retired to France, and died at Baréges in 1843.

Alba, or Alva, Ferdinand Alvarez de Toledo, Duke of, a notable Spanish general and statesman, was born in 1508. Though his education as a soldier began very early, for he was present at the battle of Pavia in 1525, it was long before he showed himself to possess military talent of the highest order. The victory, however, which Charles V. gained at Mühlberg in 1547 over Johann Friedrich, Elector of Saxony, was considered to be mainly due to the efforts of A. He served under

the emperor in the unsuccessful campaign in France to recover the fortresses of Metz, Toul, and Verdun, which Henry II. had seized, and several times defeated the combined armies of the King of France and Pope Paul IV. in Italy in 1555. After the abdication of Charles V. in 1556, the French army having retreated, he held the States of the Church in complete subjection, but the new Spanish monarch, Philip II., ordered him to restore his conquests and to make peace with the Pope. In 1559 he visited the French court, where as proxy for his sovereign he married Elisabeth, daughter of Henry II. When the Netherlands rose against the tyrannical and bigoted rule of Spain, A. was sent (1567) with absolute power and a large army to quell the insurrection. Having defeated the Princes Louis and William of Orange, and driven the latter into Germany, he made a triumphant entry into Brussels, 22d December 1568. There is probably no other record of such atrocious cruelty and oppression as that of A.'s rule in the Netherlands. He established what was called the 'Bloody Council.' All were condemned by this tribunal who were even suspected of disaffection to the Spanish rule, or whose wealth was a cause of jealousy, and their property confiscated. Even the dead were not exempt from trial. A grateful Pope conferred on the successful warrior a consecrated hat and sword as 'Defender of the Catholic Faith,' an honour which no one had hitherto received under the rank of a monarch. The contest for freedom was meanwhile maintained in Holland and in Zealand, the insurgents ultimately succeeding in destroying the Spanish fleet. Philip was at last convinced of the impossibility of effecting union by force and oppression, and A. was at his own desire recalled, after having, in the course of six years, according to his boast, executed 18,000 men. His reception at Madrid on his return to Spain was highly flattering; but in a short time a court intrigue of one of his sons, whom he assisted to escape after detection, caused his disgrace and banishment. For two years he lived at his castle of Uzeda. War then broke out between Spain and Portugal, and A. was again put at the head of the Spanish forces. Portugal was swiftly conquered and plundered by a rapacious soldiery. The treasures of the capital were seized by the leader himself. Philip was dissatisfied, but dread of a revolt and the determined bearing of the duke, prevented him from giving practical effect to his displeasure. A. died 12th January 1582, aged seventy-four. See *The Rise of the Dutch Republic*, by J. L. Motley.

Alba (anc. *Alba Pompeia*), a town in the N. of Italy, province of Cuneo, on the river Tanaro, 31 miles S.E. of Turin. Its finest buildings are the cathedral (1486), the Franciscan church, the episcopal palace, and that of the counts of Castelletto, rich in treasures of antiquity. It is also noted for its promenades, lined with splendid acacias. A. carries on trade in wine, truffles, cattle, and cheese.

Alba Longa (the 'long white' city), one of the most ancient cities of Latium, on the eastern side of the Alban Lake, was built, according to Roman legend, by Ascanius, and was the parent city of Rome. It was certainly the metropolis or sacred city of the Latins. Tullus Hostilius destroyed it, and removed the inhabitants to Rome.

Albacete, a town in the S.E. of Spain, capital of the province of the same name, on a broad plateau rich in corn-fields, 82 miles S.W. of Valencia, and a station on the Madrid and Alicante Railway. It is well built, and has considerable manufactures of steel goods. Pop. 15,150.

Alban, St. surnamed the *proto-martyr* of England, flourished, according to the Church legend, in the 3d c., and suffered martyrdom in 285 A.D., during the persecution of Diocletian. Bede, who wrote in the 8th c., is the first to record the story of his death, but he surrounds it with such grotesquely miraculous accessories that one is tempted to doubt the whole narrative. A.'s name, however, is known to the hagiographers of the 6th c. His anniversary is celebrated on the 22d of June.

Albani, Francesco, an Italian painter, born at Bologna 1578, studied under the Caracci, and won a great reputation both by his religious and mythological pictures. His altar-pieces are numerous, but his finest production is a representation of the seasons. A. died at Bologna 1660.

Albania, a province of European Turkey, bounded E. by Macedonia and Thessaly, N. by Montenegro, Servia, and Bos-

nia, W. by the Ionian and Adriatic Seas, and S. by Greece. Upper or Northern Albania corresponds to ancient Illyria, and Lower or Southern Albania to Epirus. It is now divided into the Vilayets of Janina and Prisen (including Scutari since Oct. 1874). The mountain ranges are the Bora-dagh and Pindus, and the valleys between are swamps. The highlands of Epirus, densely wooded, stretch to the sea. The most remarkable river is the Glykus (Acheron), which for a portion of its course is subterranean; and Janina is one of the principal lakes. In the N., though the conditions are favourable, agriculture is not actively prosecuted; some maize and barley and rice in the moister valleys being the only cereals. In Epirus, however, vines and olives, mulberry and other fruit trees are cultivated, and even fair crops of wheat, maize, and rice are produced. Enterprise alone is wanted to put agriculture on a hopeful footing. The Albanians, like most half-civilised mountaineers, prefer semi-warlike to industrial pursuits. The country is the abode of anarchy, neighbouring villages, and even the different divisions of the same village, being often at deadly feud. After the death of Scanderbeg many of the Albanians, who were all previously Christians, became Mohammedans. The Suliot, inhabiting the steep valleys of the Acheron, distinguished themselves by their determined resistance to Ali Pasha. The chief ports are Durazzo and Avlona; the chief inland towns, Scutari and Arta. Area, 34,150 sq. miles; pop. 2,051,721.

Albano, a town on Lake Albano, 18 miles from Rome, a favourite retreat of the more opulent Romans. Alba Longa stood on the opposite side of the lake. Near A. are the remains of an amphitheatre. A fine wine is grown in the neighbourhood. Pop. 5000.—The **ALBAN LAKE** (Lago di Castello), about 1000 feet above the level of the sea, and 1000 feet deep, with a circumference of 6 miles, occupies the basin of an extinct volcano. Roman legend says that in 390 B.C., during the siege of Veii, the Romans let off the water by means of a tunnel driven through the banks of lava that girdle it, which still remains. The Alban Mount (Monte Cavo), 3000 feet high, is on the E. bank.

Albans, St., an ancient borough in the county of Hertford, 21 miles N.W. of London. It lies on the slope and summit of a hill at the foot of which flows the Ver, on the other side of which is the site of the ancient Roman town of Verulamium, an important place during the whole period of Roman occupation. Here St Alban (q. v.) suffered martyrdom, and 500 years later, Offa, King of Mercia, founded a Benedictine abbey in his memory, which became famous during the middle ages, its abbot obtaining from Pope Adrian IV. the right of precedence over all English abbots. This abbey was the origin of the modern town, which dates from the 10th c. During the wars of the Roses A. was the scene of two battles, in the first of which (1455) the Yorkists were victorious, and in the second (1461) defeated. Not a few great Englishmen were born here in past times: Nicholas Breakespeare, afterwards Pope Adrian IV. (12th c.), Alexander Neckham (13th c.), Sir John Mandeville (14th c.), Sir F. Pemberton and Sir J. King, both great lawyers (17th c.), &c.

The chief industries of A. are the manufacture of straw-plait, silk fabrics, Berlin wool, canvas, &c. There are also foundries, rope-walks, breweries, and in the neighbourhood numerous corn-mills, &c. Pop. (1871) 8293.

Albany, or **Albainn**, the original Celtic name probably of the whole of Britain, certainly of the Highlands of Scotland. The root of the word is *alp* or *alb*, which in Gaelic and Kymric denotes a hill or craggy rock, so that A. means 'the land of hills.' Philologists, however, believe that the Celtic term is connected with the Lat. *albus*, 'white;' and that 'Albion,' the oldest name of Britain (see Aristotle's *Treatise on the World*), was perhaps so called because its 'white' cliffs were visible to the natives of Gaul. As a titular name A. was first used when the brother of King Robert III. was made Duke of A. in 1398. The last who legally bore it was Frederick, second son of George III., but Prince Charles Stuart assumed in exile the title of 'Count A.'

Albany, the capital of New York, U. S., on the W. bank of the navigable river Hudson, 145 miles N. of New York city. It was founded by the Dutch in 1623, and passed into English possession in 1664, when it was called A. in honour of the

Duke of York and Albany. Its city hall is a fine marble building with gilded dome, the new capitol (commenced in 1871) is a costly specimen of Renaissance architecture, and the most imposing of its sixty churches is the Catholic Cathedral of the Immaculate Conception. A. has a scientific university, instituted in 1852, a State library of 90,000 vols., a State museum of natural history, &c. It has manufactures of tobacco, iron, and ropes, and a great trade in timber; but, in spite of its central position, has not materially advanced in prosperity for some years. Pop. (1875) 86,000.

Albany, Louise-Marie-Caroline, Countess of, daughter of the Prince of Stolberg Gern, born in 1753, was married to Prince Charles-Edward, the Young Pretender, in 1772. In 1780 she left her husband, who ill-used her, and retired to a convent. After his death in 1788 she settled at Florence, where she died 29th January 1824. She was privately married to Alfieri (q. v.), and their remains rest in the same tomb in the church of Santa Croce, at Florence.

Albatross (*Diomedea*). These birds are included in the order of natatorial or swimming birds, and form a genus belonging to the division *Procellariidae* or Petrel family. The upper mandible or bill is strongly arched or curved, the lower mandible being abrupt or truncate at its point. The anterior part of both mandibles is separated from the posterior or basal portion. The nostrils exist in the form of tubular structures, which open on the surface of the upper mandible. The hinder toe is of rudimentary nature—this toe in the gulls being well developed—and, as in swimming birds generally, the three front and developed toes are webbed. These birds resemble the other members of the petrel tribe in that they are of free oceanic habits, spending the greater part of their existence on the wing, and flying abroad in the most stormy weather, and far out at sea. The nest is of rudimentary construction, the eggs frequently being deposited on the ground. The A. is the largest member of the tribe, the wings frequently measuring fifteen feet from tip to tip. The familiar species is the *Diomedea exulans*, or wandering A.; the habitat of this form being to the S. of the Cape of Good Hope. A northern species, the *D. fuliginosa*, inhabits the N. Pacific and Antarctic regions. The colour of the former is a general white, greyish on the upper parts, with black feathers on the tail and back. The latter species is an almost uniform brown.

Albatross.

Albay, a town in the southern part of the island of Luzon, Philippine Islands, about 2 miles from the bay of A., capital of a province of the same name, is well built, but subject to earthquakes, and carries on considerable trade. Pop. 13,000.

Albe, or **Alb** (Lat. *albus*, white), the *alba tunica*, *alba linea*, *camisia*, interior tunic of ecclesiastical writers, is the long white garment worn under the chasuble or tunic by priests in the Roman Catholic Church while engaged in divine service. The Anglican surplice is essentially the same thing.

Alb.

Alberoni, Giulio, Cardinal, a subtle, ambitious, and unscrupulous minister of state, was born at Firenzuola on the 31st of May 1664. Though but the son of a gardener, his abilities were so great that in 1711 he was thought worthy to accompany the Duc de Vendôme to Spain in the capacity of his secretary. In 1713 the Duke of Parma employed him as his agent at Madrid, where he quickly rose into favour at court,

and brought about the marriage of Philip V. with Elisabeth Farnese. He was made successively bishop, prime minister, and cardinal. To gratify the ambition of the queen he invaded Sardinia in violation of the treaty of Utrecht, and afterwards Sicily. This unlooked-for audacity made England, France, and the emperor unite against Spain in 1719. As Holland subsequently joined them, the league was known as the *Quadruple Alliance*. But A. was unmoved. To irritate England he favoured the Pretender; he claimed for Philip V. the regency of France; and to annoy the emperor he corresponded with the sultan. But the misfortunes which he brought upon the country by land and sea provoked general indignation, and a court conspiracy drove him from Spain Dec. 20, 1720. He wandered about Italy in disguise, and was for some time imprisoned in the territory of Genoa, but after the death of Clement, Innocent III. reinstated him in his dignities. He died at Piacenza June 26, 1752, at the age of eighty-eight, entirely forgotten by the world. See Rousset, *Vie d'A.* (Hague, 1719), and Bersani, *Storia del Cardinale Giulio A.* (Piacenza, 1862).

Albert, Francis-Augustus-Charles-Emmanuel, Prince of Saxe-Coburg-Gotha, late Consort of Queen Victoria, was the second son of Ernest, Duke of Saxe-Coburg-Gotha. He was born August 26, 1819, and educated at Bonn University. In 1840 he became the husband of the Queen of England. On his marriage he was naturalised as a British subject, received the title of Royal Highness, and then and afterwards he had conferred upon him many other honours and dignities. In 1857 his status was definitely settled by his being declared the 'Prince Consort.' The name of Prince A. will ever be remembered as that of a true friend of progress and the people. He was an earnest promoter of science and art, and was the first to suggest the International Exhibition of 1851. The manner in which he filled his somewhat anomalous position as the Queen's Consort was marked by the greatest sagacity and tact. His death, 14th December 1861, caused the most profound grief throughout the nation. See *The Early Years of the Prince Consort*, by Lieut.-General Grey (1867), and *Life of the Prince Consort*, by Theodore Martin (vols. i-iii. 1875-77). A collection of the speeches of Prince A. was published soon after his death.

Albert N'yanza, an immense lake of E. Central Africa, about 80 miles W. of the Victoria N'yanza, whose limits as yet are far from being accurately known. It is oblong-shaped, and its E. shore is overhung by high cliffs, rising in occasional peaks to from 5000 to 10,000 feet; and the N. and W. sides are bordered by the Blue Mountains, which have an altitude of over 7000 feet. The A. N. lies 2720 feet above the sea-level. It drains an equatorial mountain-range where rain falls for ten months in the year, and its water is sweet and of great depth. The Victoria branch of the Nile, here called the Somerset River, after leaving Victoria N'yanza, enters the A. N. at its northern extremity. The lake was known to Speke and Grant as the Little Luta Nzige, and was first visited by Sir Samuel White Baker (q.v.) in 1864. The latest travellers who have explored the lake are Stanley and Colonel Mason (1877).

Albertus Magnus. See ALBRECHT OF BOLLSTÄDT.

Albi, an old city of France, capital of the dep. of Tarn. It stands on a height above the river Tarn, and has a fine Gothic cathedral, and a public library of 12,000 volumes. A. gave name to the Albigenes, and suffered severely during their persecution. The manufactures are chiefly table-linen, cotton and woollen goods, and leather; and a considerable trade is carried on in fruit and wine. Pop. (1872) 13,698.

Albigenses, a common name applied to various religious sects that sprang into existence in the S. of France during the 12th c. in opposition to the Romish Church. Albigeois, in Languedoc, was the district where they were most numerous; hence their name. The murder of a papal legate, hated by the people for his cruelties, afforded a pretext to Pope Innocent III. for a crusade against the A. in 1209. This expedition was in reality, however, meant to deprive of his lands a noted tolerant of the 'heretics,' Count Raymond VI. of Toulouse. The papal forces took Beziers, and it is said massacred 40,000 of the inhabitants. The war of persecution thus fiercely begun raged in the territories of Raymond and his allies for many years. After the death of hundreds of thousands on both sides,

a treaty of peace (1229) was forced on Raymond VII., by which he gave two-thirds of his estates to Louis IX., paid large sums to the Church, and made his son-in-law, the brother of the king, heir of his remaining possessions. Soon afterwards he died, and Toulouse reverted to the French crown. When peace was declared, the newly-instituted order of Dominicans began the work of proselytising among the scattered sects. Most of the A. who had escaped the sword were afterwards condemned by the bloody tribunals of the Inquisition. Before the end of the 13th c. the name disappears. See Flauriel, *Croisade contre les Albigeois* (Par. 1838); Faber, *Inquiry into the History and Theology of the Vallenses and Albigenes* (Lond. 1838); and Hahn, *Geschichte der Ketzer im Mittelalter* (Stuttgart. 1845).

Albino, the term applied to such members of dark-skinned races (e.g., negroes) as exhibit a want of the full development of normal colouring-matter or pigment in the skin. This condition is occasionally known as *leucosis*. The pigment is deposited in the deeper layer of the outer skin or epidermis, and hence in albinos the skin appears of an unusually pale tint. The eye, in which colour is also deposited, exhibits a similar want of pigment, the iris appearing of markedly red or congested appearance. The hair also participates in this colourless condition. The absence of pigment in the eye renders the sight of albinos weak in diffuse or ordinary daylight. The causes of albinism are among the undetermined points connected with developmental and reproductive processes and conditions. This condition occurs also in lower animals—the ferret being thus supposed to be an A. polecat.

Albion. See ALBANY or ALBAINN.

Alboin, the founder of the Lombard kingdom of Italy, was a descendant of the Amals, and succeeded his father in 561 A.D. as ruler of Pannonia, and other countries in the valley of the Danube. Five years later he destroyed the nation of the Gepidæ, slew their king Kunimund, and married his daughter Rosamunda in 567. A. invaded Italy at the instigation of Narses, the Byzantine conqueror of Italy, who had been recalled to Constantinople by the Empress Theodora 'to spin with the other eunuchs,' and who swore that 'he would spin her a thread that would serve her all her life.' The whole valley of the Po was swiftly conquered. A. was, however, murdered in 573 by one of his own soldiers, whom Rosamunda had hired to avenge the outrage A. had inflicted on her at a public banquet, in compelling her to drink wine from a goblet made of her father's skull.

Albornoz, Gilles, or **Egidius Alvarez Carrillo**, a warlike Spanish prelate, born at Cuenca about the beginning of the 14th c. Alfonso XI. of Castile appointed him, while still a youth, Archbishop of Toledo. In the wars against the Moors he saved the life of the king. Incurring the enmity of Peter the Cruel, he repaired to Avignon, and was made a cardinal by Clement VI. Innocent VII. sent him to Rome as cardinal-legate, and Urban V., whose dominions he had recovered for him, appointed him legate at Bologna. He died at Viterbo in 1367. A. left behind him a work on the constitution of the Church of Rome, which was not published till 1473.

Albox, a town in the S. of Spain, province of Almeria, formerly part of Granada, 42 miles N.E. of the seaport of Almeria, on the river A., a small tributary of the Almanzora. It has manufactures of blankets, linens, hempen articles, and corn and oil mills. Pop. 7430.

Albrecht, last Grand-Master of the Teutonic Order, and first Duke of Prussia, was born in 1490. In 1511 he was chosen Grand-Master of the Teutonic Order, which held dominion over that part of present Prussia which borders on the Baltic, and which alone bore the name of Prussia at that time. He refused to take the oath of feudal allegiance claimed by Sigismund, King of Poland, as due from the Teutonic Order, and became involved in war with that monarch in 1520. In 1525, by the advice of Luther, whose cause he had espoused, he arranged a peace at Cracow, in accordance with which the duchy of Prussia was secured to him and his descendants as a fief of Poland, the rights of the order being thus laid aside. A. spent the remainder of his life in attending to the welfare of his duchy. In 1543 he founded the since famous University of Königsberg, but his later years were troubled and unhappy, owing to the bitter disputes, political and ecclesiastical, of the age. He died in 1568.

Albrecht, Archbishop of Magdeburg, Elector of Mainz, and cardinal of the Church, better known as A. of Brandenburg, the younger son of Johann of Brandenburg, surnamed *Cicero Germanicus*, was born in 1489, became Archbishop of Magdeburg in 1513, and Elector of Mainz in 1514. He has a place in history mainly because he was the man that appointed the monk Tetzel in 1516 to 'preach the sale of indulgences,' and thereby precipitated the Reformation. But he also deserves to be remembered, though not admired, as the first German prince who admitted the Jesuits into his dominions. All through life A. was 'dreadfully short of money' (Carlyle's *Hist. of Frederick the Great*, vol. i. b. iii. ch. iv.). It was this which compelled him at an early date to employ Tetzel, and late in life (1541) he found himself driven to grant religious liberty to his subjects in order to get his debts, which amounted to half a million florins, paid. A. died at Aschaffenburg in 1545.

Albrecht I., Duke of Austria, and afterwards Emperor of Germany, born in 1248, was the son of Rudolph of Hapsburg, the founder of the Austrian imperial dynasty. On the death of his father he seized upon the insignia of empire without consulting the Diet, but afterwards considered it prudent to take the oath of allegiance to Adolphus of Nassau, chosen emperor by the electors. In 1298, however, he defeated and slew Adolphus, who had become very unpopular, and was crowned emperor in his stead. Pope Boniface VIII., who at first refused to acknowledge A. as emperor, was afterwards induced to enter into amicable relations with him, by the successful boldness of his resistance to the papal authority. A. was also engaged in war with Holland, Hungary, and Bohemia, but had no success. The revolt of the Forest Cantons in Switzerland is the most memorable incident in his career. While on his march to crush the Foresters he was assassinated in 1308 by his nephew, Duke John of Swabia, whose possessions he had usurped. His daughter Agnes, Queen of Hungary, exacted a most dreadful vengeance for his death.

Albrecht, Archduke of Austria, born in 1559, was a son of the Emperor Maximilian II. Devoting himself at first to the Church, he was made a cardinal (1577), and Archbishop of Toledo (1584). He was appointed governor of Portugal (1594-96), and of the Netherlands (1596). Two years later he married Isabella, daughter of Philip II. of Spain, receiving the Netherlands as her dowry. After several campaigns against the Dutch he made a truce with them in 1609, and died at Brussels in 1621.

Albrecht the Bear, founder of the Markgrafsdom of Brandenburg, and one of the ablest German princes of his time, was the son of Otho, Count of Ballenstadt and Aschersleben, and was born in the year 1106. In 1125 Lothar II. conferred on him, in regard for his steady loyalty, the district of Lausitz, to be held as a fief of the German empire. In 1134 he was made Markgraf of Northern Saxony, which he extended by conquering some of the lands of Prebislav, King of the Wends, and in 1142 he obtained the government of Swabia. Up to this point the great aim of A.'s ambition was to get possession of the dukedom of Saxony, to which he had the best claim. As he could not, however, succeed in making it good, he now renewed his old struggle with his Wendish neighbours, wrested from them the Middle Mark and the New Mark, and so founded the state of Brandenburg. In his last Wendish war (1157) he almost exterminated that unfortunate people, and then brought colonists from the Rhine, both Dutch and Flemings, to fill their places on the Elbe, the Havel, and the Spree. After a pilgrimage to Palestine, from which he returned in 1159, the remainder of his life was spent in thoroughly Germanising his new possessions. He died at Ballenstadt in 1170. See Heinemann's *A. der Bär* (Darmst. 1864).

Albrecht, Count of Bollstädt, better known as Albertus Magnus, born at Lauingen, in Swabia, in 1193 or 1205. He studied at Padua, joined the Dominicans (1222), taught in Ratisbon, Strasburg, and Cologne, and then removed to Paris (1245) with his pupil Thomas Aquinas. Here, though forbidden by the Church, he expounded Aristotle. In 1260 he became Bishop of Ratisbon, but soon resigned his see, and retired to a convent at Cologne, where he died in 1280. A.'s influence during his life was immense, and all kinds of honours, scholastic and ecclesiastical, were conferred upon him. His works, consisting to a large extent of commentaries on Aristotle, fill 21 large folio

volumes. His knowledge of chemistry and mechanics is wonderful for the time in which he lived. He is generally regarded rather as a diligent student than an original thinker, but there is an able vindication of his genius in the *Nouvelle Biographie Générale*, which merits consideration.

Albuera, a small village in the province of Estremadura, Spain, celebrated as the scene of a battle, 16th May 1811, between the French under Marshal Soult, and the Anglo-Spanish army under General Beresford. The result was a brilliant victory for the allies; but on both sides the loss was severe.

Album, among the Romans, was the name originally given to a tablet of some 'white' (Lat. *albus*) material on which was written anything of a public nature; e.g. (according to Cicero), the *Annales Maximi* of the College of Pontiffs; also the edicts of prætors, the rules relating to actions and interdicts. By-and-by it came to signify a list of the members of any public body. Tacitus speaks of an *album senatorium*, and Suetonius of an *album judicum*. This was also its meaning in the middle ages, when we read of albums of saints, soldiers, gymnasia, and universities. It is now popularly used both in France, Germany, and England to denote collections of poetry, engravings, autographs, plants, &c., done up into the form of a book.

Aluma'zar, properly Abumashar Djafar Ibn-Mohammed, an Arabian astronomer, born at Balkh A.D. 805-806. He destined himself for the law, but late in life commenced to study mathematics, and to practise judicial astrology. Hebelot calls him *le prince des astronomes de son temps*. He died 885. His two best works are *Khitabul-Mudakkhal ila Ahkami-n-Nجوم* ('Book of the Introduction to the Science of the Stars'), translated into Latin and printed at Augsburg, 1489; Venice, 1506; and *Khitabul-Kironat fi Ahkami-n-Nجوم* ('Book of Conjunction on the Science of the Stars'), translated into Latin, Augsburg, 1489; Venice, 1515. A list of fifty of his work: is preserved in the library of the Escorial.

Albumen is a highly complex chemical substance, having the formula $C_{216}H_{322}N_{51}S_3O_{98}$ (Liebig), familiarly known under the form of white of egg, of which 12 per cent. consists of pure A. It also exists in the serum of the blood, in the juice of muscle, in b. m., in pancreas, in the amniotic fluid, and generally in all the fluids and solids of the body. It is present in the solid excrements of man and of other animals, but it is not present in healthy urine. A. is coagulated by heat, and the solid condition has the same chemical composition as that in the fluid state. In the fluid state the A. is united with alkali, forming an albuminate of an alkali, such as soda or potash. Nearly all acids, but more especially nitric acid, precipitate A. from its solutions. The following varieties of A. are known to chemists: (1) Paralbumin, found in dropsical fluids, and differing from ordinary A. in not being completely precipitated by boiling; (2) metalbumin, found also in dropsical fluid, resembling generally paralbumin, but further characterised by giving no precipitate with hydrochloric acid or ferrocyanide of potassium and acetic acid. The following albuminates are recognised: Albuminate of (1) barium, (2) copper, (3) lead, (4) mercury, (5) potassium, (6) sodium, (7) silver, and (8) zinc.

A. forms a very important constituent of food. It is the pabulum in the blood from which the different animal tissues are formed. At one time supposed to be the chief agent in force-production in the body, it is now regarded as contributing more to make up for the tear and wear of the tissues—force being produced principally by the oxidation of hydrocarbonaceous substances, as fat, starch, and sugar. At the same time there can be no doubt that a certain proportion of A. introduced as food is concerned in force-production, and it is held by most physiological chemists that at least a part of it may split up in the body into a nitrogenous portion and a non-nitrogenous residue. The nitrogenous portion is partly used for the repair of the tissues, and is partly excreted in the form of urea, uric acid, &c. The non-nitrogenous residue, consisting of carbon, hydrogen, and oxygen, by oxidation, produces force, or it may become temporarily stored up in the body as fat. Whether these views be correct or not, there can be no doubt that A., either animal or vegetable, forms an important part of every diet. In certain diseases of the kidneys A. escapes into the urine. The consequence is great debility from impoverishment of the blood.

Albumen, in plants, is generally known as the perisperm. It is the matter interposed between the skin of the seed and the embryo, or, in other words, the substance deposited in the cells of the nucleus during the growth of the seed. A seed having the A. separate from the embryo is said to be *albuminous* or *perispermic*, while one having the A. incorporated with the embryo, as in the pea, is said to be *exalbuminous* or *aperispermic*.

Albumenuria is the appearance of albumen in the urine. It is a symptom, not a disease in itself. See KIDNEY, DISEASES OF.

Albuñol, a town in the S. of Spain, province of Granada, 41 miles S.E. of Granada, and about 3 miles from the Mediterranean. Its port is La Rabida. The neighbourhood produces abundantly grapes, figs, and almonds, and the inhabitants find their chief employment in preparing wines, brandy, and raisins. Pop. 6764.

Albuquerque, a town of Estremadura, Spain, 24 miles N. of Badajoz, with a castle, which is the original seat of the Dukes of A.; has some cotton and woollen manufactures, and is situated in a district of country rich in corn, wine, oil, and fruits. Pop. 7500.

Albuquerque, Afonso de, styled the Great, a Portuguese admiral, and viceroy of the Indies, the greatest of the *conquistadores* that contributed to establish the Portuguese empire in the East, belonged to the first order of Portuguese nobility, and was born at Alhanra, near Lisbon (others say at Melinda, in Africa), in 1452 or 1453. The greater part of his life was spent at court and in learned studies, mathematical and physical, but he had also in slight affairs of war given proof of high courage and sagacity. In 1503 he sailed with a fleet to India, and built a fort at Cochín, which was considered the foundation of the Portuguese supremacy in India. In 1506 he was in command in the Arabian Seas, and took the then flourishing town and island of Ormuz (q.v.), which he was soon after compelled to evacuate. He sailed for Malabar in 1508, was appointed general and commander-in-chief in India, took the wealthy town of Goa in 1510, captured the island of Malacca with immense booty, and returned to Cochín in 1512. His next enterprise was his siege of Alen (q.v.), which he failed to capture; and his last acquisition was Ormuz, which the Portuguese continued to hold down to 1622. Superseded in command by an ungrateful monarch, he died at Goa, 10th December 1515. His letter, written ten days before his death, to the Portuguese king, recounting his services and recommending his son to the royal protection, is a model of loyalty and self-respect. It was first published in its integrity in 1842 by M. da Fonseca. A. was buried at Goa, where around his grave for years the Moors and Indians went to assemble to implore from the dead victory protection against the rapacity and cruelties of his successors. He was intrepid, unscrupulous, and ambitious; but his viceroyalty was marked by a rough justice and a generous liberality which endeared his memory alike to his own soldiery and to the Indian subjects of the Portuguese empire. See *Commentaries do Grande Afonso de A.* (Lisb. 1570, 1774).

Alburnum, the name applied to the outer or sap wood of an exogenous tree. Being the younger wood, and therefore not choked up by sedimentary deposits, it is permeable to the fluids or sap of the plant.

Alca. See AUK.

Alcæus, of Mitylene, among the greatest of the Greek lyric poets, began to flourish about 611 B.C. His party, which was that of the nobles, being defeated in the civil war, he was exiled, and, unable to regain his country, he travelled in various lands, but the date or place of his death is unknown. He wrote in the Æolic dialect, and is said to have invented the Alcaic metre. Only fragments of his odes are extant, but the imitations of Horace enable us to estimate their character. While some extol the delights of love and wine, others lament the factions of his state and his own misfortunes. The most recent editions are Matthiæ, *Alcæi Mitylenæi Reliquiæ* (Leipz. 1827), and Bergk, *Poeta Lyrici Græci* (Leipz. 1843).

Alcala de Guadaira ('the castle of the Guadaira'), and the *Hienippa* ('place of many springs') of the Greeks and Carthaginians, is a town of Andalusia, Spain, 7 miles S.E. of Seville,

on a hill overlooking the Guadaira. It derives its name from a Moorish fortress, the ruins of which are still very fine. A. is a favourite summer residence on account of its healthiness. Its chief industrial prosperity is the manufacture of bread for Seville. It has no fewer than 200 flour-mills and 50 bakeries. A. also supplies Seville with water, which is conveyed to the city by means of underground canals or tunnels. Pop. 7000.

Alcala de Henares ('the castle of the river'), a town in New Castile, Spain, situated on the river Henares, 22 miles N.W. of Madrid. Pop. 5300. It was built by the Moors in 1083, near the site of the Roman *Complutum*, and became famous as the seat of the university founded by Cardinal Ximenes in the 16th c. Here was edited and printed the celebrated 'Complutensian Polyglot,' a splendid Bible in Hebrew, Greek, and Latin, the original of which is still preserved in the library. A. is supposed to be the birthplace of Cervantes.

Alcala la Real ('the castle of the king'), a town of Andalusia, Spain, on the frontiers of Granada, about 26 miles N.W. of the city of that name. It is built on a conical hill, and is nearly 3000 feet above the sea-level. A. got its name when taken from the Moors in 1340 by Alfonso XI., King of Portugal. It has some slight trade in wine and wool, but country work employs most of the inhabitants. Pop. 11,520.

Alcalde (Arabic, *el-cadi*, the judge), a term introduced by the Moors into Spain, where it signifies any magisterial or judicial office.

Alcamo, a town in the N.W. of Sicily, province of Trapani, on the highroad between Palermo and Trapani, and about 3 miles from the Gulf of Castellamare. The district is very fruitful, yet A. is not thriving, though it contains some fine churches. Pop. 19,520. Old A., which stood on a hill above the present town, is said to have been built by the Arabs in 827.

Alcánde'té (anc. *Uditunum*), a town in the S. of Spain, province of Jaén, part of Old Andalusia, 22 miles S.W. of Jaén, on a feeder of the Guadalquivir. It lies in a valley surrounded by hills, has an old castle, and carries on various industries, as weaving, rope-making. Pop. 6242.

Alcañiz, a town of Spain, province of Teruel, part of Aragon, on the river Guadaloupe, 63 miles S.E. of Saragossa. It is well built, has some handsome squares, and a splendid church noted for its fine paintings and tombs. A. has silk, woollen, and linen manufactures, with corn and oil mills, and a trade in grain and cattle. Pop. 6400.

Alcantara (Arabic, the bridge), an old town in Estremadura, built by the Moors. Pop. about 4000. Its most notable building is the bridge built for Trajan 105 A.D.; but it is meanwhile a ruin. It has six arches, and is 670 feet long and 210 high.

Alcantara, The Order of (originally of St Julian), takes its name from the town of A., where it has its seat. It dates as a military confraternity from 1156, but in 1197 Celestine III. made it a religious order of knighthood to animate it with increased zeal against the Moors. In 1495 Alexander VI. vested the grand-mastership in the Spanish crown. The knights, who are Benedictines, have since 1540 been freed from the vow of celibacy. Candidates must prove a nobility of four generations. The costume is green; the crest a pear-tree.

Alcara'z, a town of Spain, province of Albacete, formerly part of Murcia, lies not far from the source of the Guadarmena, an affluent of the Guadalquivir. It has considerable industrial activity in weaving and iron-working. It received its name from the Arabs, and was the scene of a great victory won by Alfonso I. of Aragon over eleven Moorish generals in 1123.

Alcazar de San Juan, a town of Spain, province of Ciudad Real (New Castile), 49 miles N.E. of Ciudad Real, on the Madrid and Alicante Railway. The name A. is Arabic, and signifies the castle or fortress. The place has manufactures of saltpetre, powder, chocolate, silks, and woollens. Pop. 7540.

Alce'do. See KINGFISHER.

Alchemilla, a genus of plants belonging to the natural order *Rosacea*. See LADY'S MANTLE.

Alchemy, a word of Arabic origin (*Al chemie*), used to designate the art which had for its main object the transmuting of the baser metals, such as lead and copper, into gold and silver. The origin of the art is somewhat obscure. The oldest alchemist of note of whom there is any record was the half-mythical Hermes Trismegistus (q. v.) of Egypt. He is said to have written many treatises, and is spoken of as the founder of A., which has been called after him the Hermetic art. At his death the secret results of his life-labour, engraven on emerald, were buried with him, but long afterwards they were exhumed by Alexander the Great, and found to be so obscurely written as to be unintelligible.

In the first centuries of Christianity the study of A. was limited to the East, and was principally cultivated in Alexandria. It was taken up by the Arabs during the famous Abbassid califates, and perhaps the most notable product of the Arabian school of A. is the *Summit of Perfection* by Gebir (q. v.), belonging to the 8th c., which is, indeed, the first book written on the subject of chemistry proper. In the 10th c. A. was brought to Spain by the Arabs, and soon spread over Europe. In Germany it found many eager votaries, and a kind of science or system of A. was gradually developed. It taught principally three things: first, that there was a *philosopher's stone*, the *great elixir* or *red tincture*, which could convert substances into gold; second, another stone, the small elixir, or *white tincture*, which could convert substances into silver; and third, that the philosopher's stone was at the same time a wonderful drug, which could restore youth to the aged, and give health and long life to the sick.

The leading alchemists were not quite agreed as to the physical properties and appearance of the stone, but that did not deter their followers from seeking for a treasure whose virtues were so great. Thousands spent their fortunes and wasted their lives in the vain search for the elixir, while a few declared they had found it, and publicly manufactured their false gold and silver for a credulous world. They were called *Adepts*. Kings and princes were among their number, and even coined their yellow alloy, and caused it to be received as gold. The Emperor Rudolph II., in the beginning of the 17th c., is said to have manufactured upwards of 80 cwt. of gold and 60 cwt. of silver. The power of continuing life, too, was said to have been discovered by some adepts, who had wealth and honours showered upon them as the price of their secrets.

Though ignorance and superstition were the soil in which A. grew rankest, and fraud and quackery too often the instrument of its propagation, yet many cultivated it honestly and with pure motives; and though they did not succeed in obtaining the wished-for treasures, yet they made many valuable discoveries, such as the manufacture of porcelain (Dresden china), and accumulated a vast multitude of facts which find a place in modern chemistry, a science which bears the same relation to alchemy that astronomy does to astrology.

Alcibiades was born at Athens B.C. 450. His father, Cleinias, fell at Coronea, and Pericles became his guardian. Connected with the noblest Athenian families, possessed of a large fortune, which his marriage with Hipparete greatly increased, and endowed with remarkable personal beauty, he entered on public life under the most favourable auspices. His inflexible will, restless energy, persuasive eloquence, and brilliant talents, however, were marred by his inordinate vanity, audacious violence, and unscrupulous ambition. He was through life the slave of passions, the deep-seated power of which his friend Socrates weakened, but was unable to subdue. On the death of Cleon, A. and Nicias became, in the Assembly, the rival advocates of conquest and peace. In B.C. 421 A. opposed Sparta, and effected an alliance with Argos, Elis, and Mantinea. In B.C. 415 he was the leading promoter of the memorable Sicilian expedition. He was sent out as one of the generals, but was soon recalled to Athens to stand his trial in connection with the mutilation of the Hermes busts. He escaped at Thurii, and went to Sparta, where he acted openly as the enemy of Athens. Having fled to Tissaphernes, he became once more the enemy of Sparta. He made overtures to the friends of oligarchy at Athens, but when the Four Hundred were assembled, he was not recalled. The soldiers at Samos then appointed him a general, and he remained abroad till he had gained the victories of Cynossema, Abydos, and Cyzicus, and had taken

Chalcedon and Byzantium. He returned to Athens B.C. 407, and was received with great enthusiasm. His property was restored, and he was appointed commander-in-chief. In B.C. 406, however, by the defeat of his lieutenant Antiochus at Notium, he was once more disgraced. He lived in exile in Thrace, till, fearing Sparta, he fled to Pharnabazus, the satrap of Phrygia, who, at the instigation of the Thirty Tyrants, ordered his assassination. His house was surrounded and set on fire, and in attempting to escape A. fell pierced with arrows B.C. 404.

Alcira (anc. *Sebaticula*), a walled town of Spain, province of Valencia, on an island in the river Xucar, about 20 miles S.W. of Valencia, and a principal station on the Valencian Railway. It has earthenware and silk manufactures, and a large trade in agricultural produce. In the times of the Moors A. was called Algecira ('the island'). Pop. 10,300.

Alcman, the Spartan lyric poet, by birth a Lydian of Sardis, and a slave, flourished about 631 B.C. He wrote in the Doric dialect, and is said to have invented erotic poetry. Only a few fragments, of no great excellence, have come down to us.

Alco Dog, a variety or race of dogs existing wild in Mexico and Peru, and distinguished by the large drooping ears and small head. The A. was tamed in these countries before America was discovered. In all probability the variety took origin from the escape into a wild state of a domestic breed of dogs.

Alcohol is a liquid substance containing the elements carbon, hydrogen, and oxygen. Although not occurring in nature, it is always obtained from bodies of vegetable origin—namely, from the different kinds of sugar and starch. If these substances, mixed with a large proportion of water, are allowed to ferment with yeast, they are at first converted into *grape sugar*, and then this body becomes decomposed into A. and carbonic acid. This change is expressed by the equation—

Grape sugar. Alcohol. Carbonic acid.

A dilute solution of A. is thus obtained, and from it the A. is partially separated by distillation, as it boils at a much lower temperature than water, and therefore distils over first. Owing, however, to the strong attraction of A. for water, the separation of the two can never be completed by distillation; the strongest *rectified spirits of wine* (as it is called) that can be prepared by this means containing about 9 per cent. of water. To obtain pure A., rectified spirit must be left in contact with quicklime for some time; the quicklime combines with the water contained in the spirit to form slaked lime, whilst the A. is not attacked, and may be distilled off. The A. thus prepared is called *absolute A.*, but still contains 1-2 per cent. of water. This may be removed by repeated rectification with metallic sodium. Pure A. is a colourless, limpid liquid of burning taste and characteristic odour. It readily ignites, and burns with a bluish flame, forming carbonic acid and water. It boils at 78° C., and has the specific gravity 0.809 at 0° C. It has a strong attraction for water, as already mentioned; so strong, indeed, that if the two be mixed, considerable rise of temperature takes place, and the mixture is observed to contract. A. is lighter than water (sp. gr. 0.809), and has never been frozen (hence its use as a fluid for thermometers to measure low degrees of temperature). A characteristic physiological property of A. is the intoxicating effect it produces when swallowed. Fermented Liquors (q. v.) contain A. in quantities varying from about 7 to 50 per cent., and owe their stimulating properties to its presence. A. is largely employed in the arts as a solvent of resins, fats, &c., but owing to the heavy duty levied on pure A., a mixture of it and wood-spirit, called *methylated spirit*, is employed for all ordinary purposes. No duty being levied on methylated spirit (as it cannot be rendered potable), it is of course much cheaper than pure A. *Proof-spirit*, largely employed in pharmacy in the preparation of tinctures, is a mixture of 49.5 per cent. of pure A., and 50.5 water.

Alcohol, Physiological and Medicinal Action of. This substance acts principally on the nervous system. In small doses it stimulates, in medium doses it perverts, and in large doses it destroys, function. It acts not only on the nerve centres, more especially on the cerebral hemispheres—that part of the brain connected with the manifestation of the mental faculties—but also on the

nerves, both sensory and motor. Through the nervous system also it affects the quantity and quality of the various secretions and excretions. When A. is taken internally, modern research has shown that a portion of it is eliminated unchanged by the kidneys, skin, and bowels, while the remainder is consumed by oxidation, like any other non-nitrogenous alimentary principle. After excessive drinking, A. may be found in the various tissues, and in serum effused into the shut cavities of the body, such as the ventricles of the brain. Apart from any effect due to oxidation, alcoholic liquids exert an influence on special functions. For example, in moderate quantity, the activity of the circulation is increased; the heart beats more rapidly; the pulse is fuller and more frequent; the small vessels of the skin become filled with blood; there is a very slight increase in the average temperature of the body; the urinary secretion is increased, the appetite stimulated, and the functions of the nervous system, including the mental faculties, are exhilarated. Dr Parkes, of Netley, has shown that A. does not affect the amount of nitrogen eliminated daily. It does not enable the body to do more work on less food, but by stimulating a weak heart it may enable more work to be done. In other words, it elicits force without supplying it. The experience of all men accustomed to severe muscular exertion is that they can work better without A. than with it. Taken daily, even in small quantity, A. exerts a slow prejudicial effect on the system; taken immoderately, nothing, as life assurance authorities know, leads sooner to premature disease and death. Strong alcoholic beverages act injuriously on the stomach, liver, and nervous system. The various alcoholic beverages owe their chief properties to A., but they differ in their effects generally, according to the associated constituents that may happen to be present. See under WHISKY, RUM, WINE, &c. As medicinal substances, alcoholic fluids may often be of great service. Small doses are useful in some cases as stimulants to digestion and secretion; and larger doses, in cases of extreme prostration from the effects of fever or exhaustive disease, may save life by keeping up the action of a flagging heart until the body recovers from the exhaustion. At one time many diseases were treated by an excessive use of stimulants; now it is not so. Such remedies are used with caution, and therefore with greater success.

Alcoholism. In a large dose alcohol destroys life, and may thus be regarded as an active poison. In smaller doses, frequently repeated, it acts prejudicially on all the important organs, more especially on the stomach, liver, kidneys, and nervous system, and it may produce various kinds of nervous disease which are included under the general term A. Those directly referable to alcohol are, Delirium tremens, Mania à potu, and Dipsomania. See under these heads.

Alcohols. The A. form a large and important group of compounds, containing the elements carbon, hydrogen, and oxygen, and resemble in their chemical properties common alcohol or spirit of wine. In their chemical relations they are analogous to the hydrates of the metals, and are indeed regarded as the *hydrates of hydrocarbon radicals*, or substances derived from water by the partial replacement of its hydrogen by hydrocarbon radicals. Thus—

According as the alcohol contains one, two, three, four, &c., quantities of *hydroxyl* (that is to say, the group OH); in other words, according as it is derived from one, two, three, four, &c., molecules

of water, it is said to be *mon-atomic*, *di-atomic*, *tri-atomic*, *tetr-atomic*, &c. Thus ethyl alcohol, $\text{C}_2\text{H}_5(\text{OH})$, and methyl alcohol, $\text{CH}_3(\text{OH})$, are monatomic; ethene alcohol, $\text{C}_2\text{H}_4(\text{OH})_2$, diatomic; propenyl alcohol, or glycerine, $\text{C}_3\text{H}_7(\text{OH})_3$, triatomic; mannite, or manna, $\text{C}_6\text{H}_8(\text{OH})_6$, hexatomic. Besides the above classification of these bodies according to their *atomicity*, they are further divided into *primary*, *secondary*, and *tertiary* A. A primary alcohol, when submitted to the action of oxidising agents, loses two atoms of hydrogen and forms an *aldehyde*, the aldehyde in its turn readily taking up an atom of oxygen to form an *acid*. A secondary alcohol also loses two atoms of hydrogen in the first stage of its oxidation; the body, however, which results is not an aldehyde, but a *ketone*, a substance which, on further oxidation, splits up into two acids. A tertiary alcohol absorbs oxygen at once without forming an intermediate compound, and splits into various acids. The A. are prepared by various processes, and many of them occur ready formed in nature, or are produced by simple processes from natural substances. The most important and general method of preparation consists in treating the *ether* or corresponding hydrocarbon salt with alkalis. In this manner glycerine is prepared from the different kinds of fat, which are the stearic, oleic, palmitic, or margaric ether of the hydrocarbon radical glyceryl or propenyl. The alkali removes the acid radical from the ether to form an alkaline salt (in the case of the fats these salts are called *soaps*), whilst the hydrocarbon radical takes up the hydroxyl from the alkali. Thus—

The process by which an alcohol is obtained from an ether by treatment with alkalis is called on this account *saponification*. Primary A. may be obtained by treating the corresponding aldehyde with nascent hydrogen, and secondary A. in the same manner from the corresponding ketone. Thus—

Besides these general methods of preparation, there are also special processes by which certain A. are obtained. Methyl alcohol, $\text{CH}_3(\text{OH})$, is obtained in large quantity by the dry distillation of wood. Ethyl alcohol, $\text{C}_2\text{H}_5(\text{OH})$, by the fermentation of sugar.

The process of fermentation also gives rise to other A., such as the butyl alcohol, $\text{C}_4\text{H}_9(\text{OH})$, and amyl alcohol, $\text{C}_5\text{H}_{11}(\text{OH})$, though in smaller quantity. Grape sugar, cane sugar, starch, and woody fibre are substances closely allied to the A., and exist ready formed in the tissues of plants. A., when treated with acids, become converted into *ethers*, and water is produced at the same time. This may be considered as the most characteristic reaction of the group, and is entirely analogous to the action of an acid on a metallic hydrate. Thus—

The chlorides, bromides, and iodides of phosphorus act upon the A. in a similar manner, giving rise to the chloride, bromide, or iodide of the hydrocarbon radical.

Alco'ra. a town of Spain, province of Valencia, 43 miles N.N.E. of Valencia. has manufactures of earthenware and brandy, and a good trade in fruits. Pop. 5609.

Alcornoco or **Alcornoque Bark** is the bark of several species of *Byrsonima*, a genus of plants native of tropical America. The cork-oak bark is the *A.* of Spain.

Alcove (Spanish, *alcoba*, from the Arabic, *al-kawf*, the tent), a kind of recess in a chamber where a couch or bed may be placed, at one time very common in France, but now disused.

Aleocy, a walled town in the province of Alicante, Spain, picturesquely situated on a height at an angle formed by the confluence of two streams. It has numerous cloth and paper manufactories. Of the 200,000 reams of paper produced here annually, 180,000 are used for making *papelitos* or cigarettes. Pop. 21,900.

Alcudiá, Manuel de Godoy, Duke of, a Spanish adventurer, born at Badajoz in 1767, entered the body-guard of Charles IV. of Spain, and, owing to his address and musical ability, became a court favourite and attained wealth and titles, rising to the rank of generalissimo of the Spanish forces in 1804. He fell with the Bourbons before the power of Napoleon; but he continued to enjoy the favour of Charles IV. and his queen, and was their chief adviser in their exile at Bayonne. After the revolution of 1830 he was dependent for a time upon the charity of Louis Philippe; but in 1847 his fortune and titles were restored to him, and he was allowed to return to Spain. He died at Paris, 7th October 1851. *A.* was a conspicuous figure in his time, but has left no mark on the history of his country. See *Mémoires de A.* (Par. 1836.)

Alcuin, or **Alwin**, the most cultivated, energetic, and influential scholar of the 8th c., belonged to a noble English family, and was born at York in 735. He received his education under Aelbert, then head of the monastery school at York, and when his teacher became archbishop in 766 A.D., *A.* took his place. On a journey to Rome in 781, to obtain the *pallium* for Aelbert's successor, *A.* made the acquaintance of Charlemagne at Parma, and was persuaded by him to settle in France. From 782 to 796 he resided at the imperial court, and lived in the closest intimacy with the great monarch, who successively bestowed on him the abbey of Ferrières, St Loup, St Iossa, and St Martin. The palace became a sort of school or academy, of which *A.* was the head, while Charlemagne, Eginhard and his family, with many of the principal courtiers, were the pupils. Each was known by some antique name: Charlemagne was *David*; *A.*, *Flaccus*; Angilbert, the Chancellor, *Homer*, &c. This was the origin of those royal or *palatine* schools whose fame rivalled that of the monastic or episcopal seminaries. The influence of *A.* was felt over the whole of France. A great educational revival took place. New schools were founded and old ones were enlarged and improved. After his retirement to the Abbey of St Martin at Tours (796), he established there a great library, while the school, mainly by his own efforts, became the resort of all the studious youth among the Franks. *A.* died 19th May 804. His writings are numerous, and comprise theology (exegetical, dogmatic, and polemical), ecclesiastical history and poetry, mathematics, rhetoric, and a large mass of correspondence with popes, bishops, and monarchs. They were first collected and published by André Duchesne of Tours, under the title *Alcuini Abbatis Opera, que hactenus reperi potuerunt, omnia* (Par. 1617). A better and fuller edition is that of Froben, prince-abbot of St. Emmeran (2 vols. Ratisbon, 1777). See also Lorenz, *A.'s Leben* (Halle, 1829), transl. into Eng. (Lond. 1837); Guizot, *Histoire de la Civilisation*, vol. ii. (Par. 1840); Duperron, *Quelques aperçus sur Alcuin* (Valogne, 1850); and Kaulich, *Geschichte der Scholastischen Philosophie* (Prag. 1863).

Alcyonella. This animal is included in the class *Polyzoa* (q. v.). It is therefore one of the *Mollusca*, and has no relations with the *Alcyonium* (q. v.), one of the *Cœlenterate* animals, with which, however, in name it is apt to be confused. These animals form compound masses, including large numbers of animals, and are found in fresh-water ponds or streams. As in most fresh-water *Polyzoa*, the tentacles surrounding the mouth of each little animal—or *polypide*, as it is termed—are arranged in a crescentic or horse-shoe fashion. Hence *A.* belongs to the division *Hippocrepia* or *Phylactolamata* of the *Polyzoön* class. The tentacles are very numerous, numbering sixty or more. The entire mass of an *A.*—of which the common species is

the *A. stagnorum*—is usually found adhering to the leaves of aquatic plants. It presents the appearance of a dark-green mass of jelly-like consistence, from amid the substance of which hundreds of little polypides, the head of each surmounted by a crown of tentacles, may be seen protruding. The polypides are said to number about 1600 on each square inch of the mass. The tentacles are fringed by minute vibratile filaments termed *cilia*, and their functions are those of drawing particles of food towards the mouth, and of probably assisting in the breathing of the animals. A perfect digestive system exists. No heart, however, is developed. Each little member of the colony can produce ordinary eggs, from which a primitive polypide is developed, and this gives rise by budding to the compound mass. Other eggs in bodies, termed *statoblasts* or *winter ova*, are also found. These latter remain within the body of the organism during the winter, and on being liberated in spring give origin to embryos, which by budding develop the compound forms.

Alcyonidium, a genus of animals included in the class *Polyzoa* of the sub-kingdom *Mollusca*. These animals have no relations with the *Alcyonium* (q. v.) or 'dead man's finger' polype, which belongs to a much lower group of the animal world (*Cœlenterata*). These widely-different forms were, and still are, often confused. The *Alcyonidia* belong to the *Infundibulata* section of the class *Polyzoa* (q. v.), which section includes those forms possessing tentacles arranged in a circular manner round the mouth.

Alcyonium, a genus of polypes or *Cœlenterate* animals forming the type of the order *Alcyonaria*, and popularly known under the names of 'dead man's fingers' and 'cow's paps.' These names have been applied to this organism from the resemblance it presents in outward appearance to lobate, fleshy, or finger-shaped masses, each of which masses consists of a colony of several hundred polypes, united to form a composite organism. The common species is the *A. digitatum*, frequently dredged on our coasts, and which is attached in its normal state to mussel-shells, stones, and other objects. On looking at the fleshy mass when in the living state, its surface is seen to be studded over with little star-shaped polypes, the appearance of which can be more satisfactorily investigated by aid of a hand-lens. Each individual polype possesses eight fringed tentacles surrounding the mouth—the little organisms bearing a resemblance to sea-anemones, which familiar animals indeed constitute the type of the class in which the *Alcyonaria* are included. The polypes possess the power of retracting themselves within the common body-substance of the organism, to which the term *cœnosarc* has been applied. This process of retraction is effected by invagination of the polypes—a process imitated by pushing in the finger of a glove upon itself. Externally, the *cœnosarc* is of leathery or coriaceous consistence, and within this a softer tissue is contained, through which a system of canals is distributed, these canals being simply internal prolongations of the bodies of the little polypes. Through the canal-systems the various members of the colony are brought into communication with each other; and a continual circulation and interchange of nutritive fluids takes place through the tubes, the growth and nourishment of the entire colony being thus provided for. The *cœnosarc* is strengthened by spicules or crystal-like bodies of lime scattered throughout its substance. These calcareous spicules are of cruciform shape, and represent the *coral secretion* of the organism; which secretion, although of rudimentary nature, is yet of essentially similar type to the more perfect corallum of other forms. The order *Alcyonaria*, indeed, includes the red coral of commerce, and other familiar kinds. The internal structure of each polype is essentially that of the sea-anemone. The mouth, surrounded by its tentacles, leads into a stomach-sac, which is incomplete inferiorly, and is continued into the canal system which permeates the entire mass. The stomach is connected to the walls of the body by vertical partitions or *mesenteries*, which number four, or some multiple of that number. The entire compound mass or organism is formed by a process of continuous germination or budding. One single and primitive polype, produced from an egg, first attaches itself, and gives rise by budding to the compound mass. The individual polypes of the mass—or *zooids*, as they are termed—possess each the power of developing eggs, the reproductive organs being situated on the surface of the *mesenteries*. A second species of *A.* is the *A. poculum*, popularly known as

'Neptune's cap,' and found in the seas of Sumatra and Singapore. The genera *Alyonidium* and *Alyonella* are entirely different animals from the A., and belong to the *Molluscan* sub-kingdom of animals, being included in the class *Polysca* of that division. See *ALCYONIDIUM* and *ALCYONELLA*.

Aldeb'aran, the Arabic name of the most brilliant star in the Hyades, a group of five in the head of Taurus. It nearly forms a straight line with the three bright stars in the belt of Orion.

Al'dehyde, or **Acetic Aldehyde**, is a substance prepared by the partial oxidation of common alcohol or spirits of wine, and differs in composition from the latter in containing two atoms less hydrogen, whence its name (*al*-cohol, *dehyd*-rogenatum). It is also related to acetic acid, the latter containing an atom of oxygen more than the A., or an atom of oxygen in place of the two atoms of hydrogen in alcohol.

A. is best obtained by heating a mixture of bichromate of potash, alcohol, and dilute sulphuric acid in a retort connected with a good condensing apparatus; a somewhat violent action takes place, and the A. being a very volatile substance distils over. In this process the bichromate of potash gives part of its oxygen to the alcohol, which is thus converted into A.

A. is a colourless, mobile liquid of penetrating odour, lighter than water (sp. gr. .805), and soluble in all proportions in water, alcohol, and ether. It boils at 21° C., and is readily inflammable. It decomposes by long boiling, and indeed suffers change if kept for some time in sealed tubes, becoming converted under the latter conditions into polymeric substances called *paraldehyde* and *metaldehyde*. The chemical properties of A. are similar to those of others of its class, and are described in art. **ALDEHYDES**.

A. is employed in the manufacture of certain Aniline Colours (q. v.), and is one of the ingredients of sweet spirits of nitre.

Aldehydes are substances which resemble in their reactions common or acet aldehyde. The two distinctive characteristics of these bodies are—first, that they readily take up an atom of oxygen, and pass into the corresponding *acid*; second, that they combine with nascent hydrogen to form the corresponding *alcohol*. If 'R' designate any monatomic hydrocarbon radical, the relations in composition between the alcohols, A., and acids may be represented as follows:—

In the case of acet-aldehyde the radical is methyl, CH_3 ; the corresponding alcohol, common alcohol, or spirit of wine, and the acid, acetic. Thus—

There are two general processes by which these substances may be obtained. The one consists in oxidising the corresponding alcohol (usually by heating it with sulphuric acid and bichromate of potash). Thus—

The other in submitting a mixture of formate of potassium or sodium, and the potassium or sodium salt of the corresponding acid, to dry distillation, when the aldehyde and carbonate of potassium or sodium result.

Some A. occur in nature, or are produced from natural substances by simple processes. *Benzoic aldehyde*, or oil of bitter almonds, $\text{C}_6\text{H}_5 - \text{COH}$, is produced when crushed almonds are

moistened with water and allowed to ferment. *Cinnamic aldehyde*, $\text{C}_9\text{H}_7 - \text{COH}$, is the principal constituent of oil of cinnamon or cassia. *Cuminic aldehyde*, $\text{C}_9\text{H}_{11} - \text{COH}$, occurs in oil of cummin and in that of the water-hemlock. *Salicylic aldehyde*, $\text{C}_6\text{H}_5\text{O} - \text{COH}$, in the flowers of the meadow-sweet. *Angelical aldehyde*, $\text{C}_8\text{H}_7 - \text{COH}$, in oil of chamomile.

Besides the action of oxidising and reducing agents on the A., they possess other properties in common. All of them form crystalline compounds with bisulphite of soda, and also with ammonia—reactions which supply the chemist with a means of detecting and purifying an aldehyde. Chlorine and bromine replace an atom of hydrogen in the A., and form the chloride or bromide of the corresponding acid radical.

The alkali metals evolve hydrogen when heated with an aldehyde, and form a kind of salt.

Acet aldehyde. Potassium. Potassium-aldehyde. Hydrogen.

Alder, the common name for *Alnus*, a genus of trees belonging to the natural order *Betulaceae*. The common A. (*A. glutinosa*) is the only species indigenous to Britain, and attains, in favourable situations, a height from 40 to 60 feet. Its wood when first cut is white, but becomes of a bright orange-red colour on exposure. Although soft and light, it is very durable under water. Its branches are much used for charcoal in the manufacture of gunpowder. The bark contains tannin and dye, and is frequently used by fishermen to stain their nets. A. is the badge of the clan Chisholm. Berry-bearing A., Black A., Red A., and White A. are popular names given to plants belonging to totally different natural orders.

Alderman (originally Ealdorman, i.e. older or elder man), the title of a civil magistrate, or of the assessor of the principal civil magistrates in an English or Irish municipality. For a notice of the special functions of those anciently invested with the title A. of all England, or of the King's A., see **ANGLO-SAXONS**.

Alderney (Fr. *Aurigny*, Lat. *Aurinia*), one of the Channel Islands (q. v.), lies about 7 miles from the coast of Normandy and 60 from England, in N. lat. 49° 45', W. long. 2° 13'. It is separated from Cape La Hague by the Race of A., a dangerous channel in coarse weather. The island is about 4 miles long, 1½ in breadth, and has a circuit of 12 miles. The coast to the S.E. is wild and precipitous, but slopes gently towards the N., where has been constructed an extensive breakwater and harbour of refuge. The climate of A. is healthy, and the soil inland is rich and well cultivated. The island is famous for its breed of cattle. The inhabitants are of French origin, but English is the language generally spoken. The 'town,' so called, occupies the centre of the island, and contains a church supposed to have been built in the 12th c., which some time ago was replaced for purposes of worship by a building in the early English style. A. is a dependency of Guernsey, under the British government; and the civil power is exercised by a judge appointed by the crown, and six *jurats* elected by the people. It has a court of justice, and a local legislature composed of the judge, jurats, and 'twelve' popular representatives (hence called *douzainiers*), who, however, have only a deliberative power. Pop. (1871) 2738.

Aldershot Camp, originally (1855) formed on a wide heath on the frontiers of Surrey, Hants, and Berks, to afford facilities for manœuvring our regiments in brigades. The lessons of the Franco-Prussian war of 1870-71 proved that immense strides had been made in military science in Germany. The wonderful improvements in field artillery, resulting in greatly increased range and precision, and the introduction of breech-loading rifles in line regiments overturned at once the formerly-existing theory and practice of military drill. It became evident that the famous 'square,' as presenting an admirable compact target for artillery playing from a great distance, was a formation that must never again be had recourse to in warfare. It

further appeared that, as an arm of the service, cavalry was now rendered almost useless, except for the performance of special and occasional duties, acting as scouts, reconnoitring, out-flanking field artillery, and attacking the battery at a sudden dash, and in the pursuit of a retreating force. But the 'charge,' in the old sense of the movement at least, must, it was clear, be given up. A line of infantry armed with breechloaders could empty the saddles of any number of cavalry before a collision could take place; and even in the event of the 'charge' being delivered, the bayonet must be held invincible. The means by which victory in the field is now achieved having changed completely within the last few years, important changes had to be introduced in military drill. Chief among these is the infantry 'advance in loose order,' a movement intended to have the advantages, with others in addition, of the Prussian 'swarm.' For the necessary evolutions (see MILITARY DRILL) great space is required, and the camp at A. affords unusual facilities for practising them. A. is divided into the N. and S. Camp by the Basingstoke Canal. The troops are housed in excellent barracks, while a town is springing up in the neighbourhood. The extent of ground used for military exercises is 4144 acres, and the camp can accommodate 20,000 men. The number of troops encamped here on January 1, 1874, was 10,601, with 2198 horses and 48 guns.

Aldine Editions, so called from the name of the printer, Aldo Manuzio (q. v.), of Venice, were wont to be much sought after by book-collectors. Some of them are *editiones principes* (first editions) of Greek and Roman classics, others give collated texts of Italian authors, while all are beautifully and correctly printed. Aldo Manuzio, an enthusiast in typography, had nine different kinds of Greek types made, and fourteen of Roman, and was the first to use *italics* in his 8vo *Virgil* (1501). He likewise introduced the custom of having fine-paper copies in addition to those on ordinary paper. The *Epistola Græca* (1499) furnished the earliest instance of this. He died in 1515. His son Paolo (died 1597) was also an enthusiast, but more with respect to the Latin than the Greek classics. During the century that the A. press continued in operation it printed 908 separate works. The mark is an anchor round which a dolphin twines, and the motto is *Sudavit et aluit*. About 1502 counterfeit Aldines began to be issued at Lyon and Florence. Renouard, a Paris bookseller (who died in 1853), formed a very complete collection of genuine Aldines, of which he has given a catalogue in his *Annales de l'Imprimerie des Aldes, ou Histoire des trois Manuce et de leurs Éditions* (Paris, 1803; 3d ed. 1834). The name A. was given by Pickering to a beautifully-printed edition of the British poets, and has been retained in the revised issue by Bell & Daldy (Lond. 1870).

Aldobrandini, a distinguished Tuscan family, settled at Florence in the 12th c. During the middle ages it was particularly known for its attachment to the Guelph party, and furnished the Church in later times with a succession of ecclesiastical dignitaries. The most eminent of its members were—**SILVESTRO A.** (born 1499, died 1558), a politician and juriconsult, one of whose sons was Pope Clement VIII.; **GIOVANNI A.** (born about 1525, died 1573), a son of Silvestro, a cardinal of the Church, and a writer on jurisprudence; **TOMASO A.** (born 1540, died early in the 17th c.), also a son of Silvestro, a fine scholar, whose translation of the *Lives of the Philosophers*, by Diogenes Laertius, was published after his death by his nephew, Pietro A., Archbishop of Ravenna, himself an accomplished writer; **CINZIO-PASSERO A.**, died about the beginning of the 17th c., the son of a sister of Pope Clement VIII., became a cardinal in 1593, and was a great friend of Tasso, who dedicated to him the *Gerusalemme Liberata*; **PIETRO**, brother of Cinzio-Passero, also rose to be a cardinal, and as papal legate in France, settled the differences between Henry IV. and the Duke of Savoy; another brother, **FRANCESCO A.** (born 1546, died 1601), embraced the military profession, and distinguished himself in fighting against the Turks in Hungary; **SILVESTRO**, son of Francesco, obtained the dignity of cardinal in his fourteenth year. The family became extinct in 1681 by the death of Octavia, daughter of **GIOVANNI GEORGIO A.**, Prince of Rossano.

Aldrich, Henry, D.D. (born in 1647, died in 1710), was educated at Westminster School and Christ's Church, Oxford. He was a man of varied accomplishments—a logician, a musi-

cian, and an architect. His treatise on logic (*Artis Logice Compendium*) still maintains its ground at Oxford; his musical compositions comprise specimens both sacred and secular. Among the latter are, *Hark, the Bonny Christ Church Bells*, and *A Smoking Catch*. His architectural skill is attested by Peckwater Quadrangle, Christ Church, Trinity College Chapel, and the Church of All Saints. He also wrote several tracts on the real presence.

Aldrovand'i Ulissi, a naturalist, born at Bologna, 11th September 1522, appeared first as an author in a treatise on the statuary of the ancients (1556), but subsequently devoted himself to the study of botany. In 1560 he succeeded to the chair of natural history, and formed a valuable collection of specimens for a work which he had projected on that science, and of which thirteen volumes were published, six under his own direction, and seven under that of his colleagues after his death in 1607. Many of his specimens are still to be found in the Public Museum of Bologna. The Botanical Garden of that city also owes its establishment to A. The opinion, sanctioned by Bayle, that he died in utter poverty, the result of expenditure on pursuits connected with his favourite science, is proved by Fantuzzi, from an examination of the archives of Bologna, to be groundless. On the contrary, he appears to have been treated by the Senate with the greatest liberality. Though chargeable with being sometimes unnecessarily minute in unimportant details, all his writings are marked by fulness of knowledge and the most reverent spirit. A complete list of his works is given in the *Nouvelle Biographie Générale*. See Fantuzzi's *Memorie della Vita d'Ulissi Aldrovandi* (Bologna, 1774).

Ald'stone, or **Alston Moor**, a market town in Cumberland, lies near the confluence of the Neut and S. Tyne, in a hilly district, 29 miles S.E. of Carlisle. The chief manufactures are thread and flannel. The once highly-productive lead mines in the vicinity are now comparatively exhausted. Pop. (1871) 2627.

Ale, a fermented liquor prepared from the pale dried malt of grain, usually barley. The word, which is the modern form of the Anglo-Saxon *eale*, is probably from the Danish *øl*, malt liquor. It is now used indiscriminately with beer, but this term may include both porter and A. In England the name A. is mostly restricted to the pale, highly-hopped varieties of the beverage originally prepared for export, while in Scotland it is chiefly applied to the sweet and alcoholic liquors, which are known in the market as Scotch ales. See BEER and BREWING.

Al'eman, Mateo, the author of *La Vida y Hechos del Picaro Guzman de Alfarache* (*The Life and Adventures of Guzman de Alfarache*), was born at Seville in 1550, and served with honour as one of the comptrollers of finance under Philip II. of Spain. Retiring from office, he betook himself to literature. His great work (published in 1599), the hero of which is a scamp and rogue who goes through various scenes and situations, is a caustic and humorous satire on the idle, dissolute manners of his age, and is written in the choicest Castilian. It was translated into all the principal languages of Europe previously to the author's death, the date of which is unknown, but which took place in Mexico. The best edition is that by Aribau in the *Biblioteca de Autores Españoles*, t. iii. (Mad. 1846). Three editions of an English translation by Mabbe, Magdalen College, Oxon., appeared in 1622-23, 1630, and 1634 respectively.

Aleman'ni (lit., *all-men*), the name borne by a military league of German tribes, of which the Teneteri and Usipi were the most important. They made their earliest appearance in the beginning of the 3d c. in the valley of Main, and soon after began to threaten Gaul. The first Roman that inflicted on them serious defeat was Maximinus, who in 236 A.D. drove them back over the Rhine, which they had already crossed. In a second invasion of Gaul they were again defeated by Posthumus, who pursued them into Germany, and strongly fortified the Roman frontier along the Main and the Upper Danube. Part of Posthumus's defences remain to this day. After the death of the Emperor Probus (282) the Burgundians, pressing from the N.E., forced them inside the Roman fortifications, when they settled in the region between Mainz and Lake Constance, but in the 4th c. they had spread as far W. as the Vosges Mountains, and as far S. as the Swiss Alps. Julian

signally chastised them in 357 A.D., but it was not till the time of Clovis that they were finally subdued (496), and compelled to acknowledge the sovereignty of the Franks. In the course of the 5th c. the league of the A. began to be called Suavi or A. and Swabians. Under the Franks the Alemannic territory was formed into a duchy, the eastern part of which has specially borne the name of Swabia since the time of the Emperor Henry IV. The proximity of the A. to the kingdom of the Franks accounts for the name of *Allemands* and *Allemagne* which Frenchmen use to denote Germans and Germany.

Alembert, Jean le Rond d', a celebrated mathematician and philosopher of the 18th c., was born in Paris on the 16th November 1717. He was the illegitimate son of a Madame de Tencin, by whom he was abandoned on his birth on the steps of the church of St Jean-le-Rond, where he was found by a policeman, who intrusted him to the wife of a glazier named Rousseau. Subsequently his father, a M. Destouches-Canon, a provincial *commissaire d'artillerie*, made him an allowance of 1200 francs a year. Entering the College Mazarin at the age of twelve, he soon began to show high mathematical talent; but at the conclusion of his college course, with a view to self-support, he tried to study first law and then medicine. The effort, however, was vain, and ultimately he devoted himself absolutely to science. In 1739 he published his *Mémoire sur le Calcul intégral*; in 1741 he was admitted a member of the Academy of Sciences; in 1743 appeared his *Traité de Dynamique*, and in 1746 his *Théorie Générale des Vents*, which gained the prize of the Academy of Berlin. This was followed by many other learned and scientific works, which so raised their author's fame that in 1752 Frederick II. of Prussia offered him the presidency of the Academy of Berlin. A., however, could not be induced to leave France, and when Catherine II. of Russia, ten years afterwards, also invited him on munificent terms to superintend the education of her son, he again refused. As editor of the mathematical section of the famous French *Encyclopédie* he has an enduring place in the history of literature. A. was never married, but a strong attachment existed between him and a Mademoiselle Espinasse, whose death was a deep affliction to him. He died 20th October 1783. A.'s literary works were collected and published first by Bastien in 1805, and afterwards in a more complete form by Bossange (Paris, 1821, 5 vols. 8vo), but his scientific works have not been collected. Condorcet's *Eloge* contains an eloquent and acute estimate of his philosophical and literary merits.

Alem'bio. A kind of still used by the alchemists. See DISTILLATION.

Alemte'jo (beyond the Tagus), the largest province of Portugal, stretches across the entire breadth of the country, and is 150 miles from N. to S.; area 9982 sq. miles. It is diversified by mountains, valleys, and plains, and is watered by the Tagus, Guadiana, and Saado. Dense forests cover the mountains of the N.; at their base is found in abundance wheat, rice, maize, the vine, citron, and pomegranate; but the plains in the S. are sterile and marshy tracts nearly destitute of vegetation. Goats, sheep, and swine are reared in large numbers; also asses, mules, and horned cattle. There are few manufactures; and even agriculture is very backward. The chief towns are Evora, the capital, Elvas, Portalegre, Beja, Estremoz, and Mertola. Pop. (1871) 331,341.

Alençon, on the Sarthe, chief town of the department of Orne, France, 75 miles S.W. of Rouen, and 92 miles W.S.W. of Paris. There are manufactures of woollen and linen fabrics, hosiery, and lace. Two industries have much declined—the production of A. point-lace, and the cutting of quartz-crystals in imitation of diamonds. Pop. (1872) 13,434.

Dukes of A. The first duke was Pierre, son of Louis IX., died without issue in 1283, when the title passed to the house of Valois, in the person of Charles, who fell at Crecy, 1346. The fourth duke, Charles, commanded the French vanguard at Pavia (1525), when his flight occasioned the disastrous overthrow of the French. Various members of the royal family of France have held the duchy, the last being Louis XVIII. The present duke (1875) is Ferdinand Philippe, son of the Duke of Nemours, born 12th July 1844.

Allep'po, the capital of a vilayet of the same name, Asiatic

Turkey, on the small river Koik or Nahr-el-Haleb, between the Orontes and the Euphrates. The name A. is an Italian form of the Arabic *Haleb*, which is in turn a corruption of the original Greek name *Chalybon* or *Chaleb*. Under the Romans the place was known as Bercea, but on its conquest by the Arabs in 638, it resumed its ancient designation. The town is partly surrounded by a wall built by the Seljuk Turks, who made A. their Syrian capital (998–1117). Girt with plantations of pistachio-nut-trees, above which rise countless cupolas and minarets, A. is one of the most beautiful of Eastern cities. It was partly destroyed by an earthquake in 1822, but has since been rebuilt. A. has a large trade in silks, skins, cotton, tobacco, wine, and oil. It is a station of the Indo-European telegraph, and its ports are Iskanderoon and Latakia. Pop. (*Almanach de Gotha*, 1875) 70,000.

Alé'sia, a town of ancient Gaul, near the site of which stands Alise, 24 miles N.W. of Dijon. In B.C. 52, 80,000 Gauls shut themselves up in A. under Vercingetorix; but after a vigorous resistance the place was obliged to surrender to Cæsar, who made Vercingetorix prisoner. The Normans destroyed A. in 864.

Alé'sius, Alexander, whose family name was **Alane**, one of the earliest Scottish reformers, and a fine theological scholar, was born at Edinburgh in 1500, studied under Joannes Major at St Andrews, and was for some time a canon of the Augustinian priory there. Converted to Protestantism by Patrick Hamilton, whose martyrdom he witnessed, A. soon drew upon himself the hatred of the monks by the aggressive style of his preaching, and found it advisable, about 1530, to escape to the Continent. After wandering about in various countries, he settled at Wittenberg in 1531, and became very intimate with Melancthon, who held his talents and judgment in great respect. In 1535 he passed over to England, carrying with him a copy of Melancthon's *Loci Communes* as a present for the English king. He was well received, and was permitted to lecture on theology and Hebrew at Cambridge University. The persecuting statute known as the 'Six Articles' forced him in 1539 to return to Germany. In 1540 he became a professor of theology in the University of Frankfort-on-the-Oder, and in 1543 was transferred to that of Leipzig, where he spent the rest of his life. His death took place 17th March 1565. Although almost forgotten now, he was highly honoured in his own age, and really deserves remembrance. Bishop Bale dedicated to him and Knox that part of his biographical work which celebrates the 'illustrious' worthies of Scotland. His writings are numerous, but are confined to the departments of exegetical and polemical theology.

Alessan'dria, the chief town of a province of the same name in N. Italy, situated near the confluence of the Bormida and Tanaro. It was founded in 1168 by the Lombard Republics, and designed as a fortress to defend the passage of the Bormida and Tanaro against Frederick I. It was originally called Cæsarea, and received its present name in honour of Pope Alexander III. After the battle of Marengo, 1800, it was ceded to the French, who held it for fourteen years. During the Lombardo-Venetian rebellion, 1848–49, A. formed the headquarters of the Piedmontese. It is now one of the strongest fortresses in Europe. Apart from the garrison, it has (1872) 57,079 inhabitants, with considerable trade in linen, woollen, and silk fabrics.

Alessandria della Rocca, a town in the Sicilian province of Girgenti. The commune of which it forms part has a population of 5214.

Alé'tris, a genus of N. American plants belonging to the order *Hamodornaceæ*. *A. farinosa*, which is a perennial plant about ½ feet high, is called the colic root or star-grass. It is a very intense bitter, and has been used both as a tonic and a stomachic.

Aléu'rites, a genus of Euphorbiaceæ plants containing only one species, *A. triloba*, or the candleberry-tree. It grows to a height of about 30 feet, and is cultivated in almost all tropical countries for the sake of its fruit, which contains two seeds resembling walnuts. The kernels, when dried, are stuck on a reed, and used as candles by the Polynesian islanders. When pressed, they yield a quantity of pure oil, which is used as a drying oil for paint. It has been imported into Britain, but not to any extent. The cake, after the oil has been expressed, is

employed as a food for cattle. The roots of the tree yield a dye, which is used by the Sandwich Islanders.

Aleutian Islands, or the **Catherine Archipelago**, a chain of about 150 islands in the N. Pacific, lying between the peninsula of Alaska in America and Kamchatka in Asia. They form an arc, lying in 55° N. lat., and are about 600 miles long. Behring's Island, Unalaska, Umnak, and Unimak are the largest. The W. islands belong to the United States (see ALASKA), the E. to Russia. They are all rocky and volcanic, several volcanoes being still active. Vegetation is scanty, and consists of bushes, lichen, mosses, and grasses. Birds, foxes, dogs, and reindeer are numerous. The inhabitants, of Kamchatkan origin, were converted to Christianity by Russian priests. They number about 10,000, and trade in fur and fish.

Alexander the Great, son of Philip of Macedon, and Olympias of Epirus, through whom he traced his descent from Achilles, was born at Pella, B.C. 356. His education was most thorough, and was specially distinguished by the remarkable influence exercised over him by the philosopher Aristotle. He was his father's pupil in the art of war, and his first military distinction was achieved at Chæroneia, B.C. 338. The murder of Philip, B.C. 336, called A. to the throne under circumstances well fitted to test his powers to the utmost. He put to death Attalus, who aspired to the throne. He marched S., and was appointed by the submissive Greeks his father's successor as the champion of Greece against Persia. He promptly returned N., crossed the Helms, and advanced as far as the Danube, subduing the various barbarous nations. Meanwhile the Thebans, deceived by a rumour of his death, revolted; but 'the great Emathian conqueror,' descending by rapid marches, took fearful vengeance upon them, and thus struck terror into the rest of Greece. Thebes was wholly destroyed, with the exception of the house of Pindar, most of the inhabitants slain, and the rest sold as slaves. A. now threw all his energies into the expedition against Persia, and crossed the Hellespont, B.C. 334, with an army of 35,000 men. The first campaign, in which he was opposed by the able Memnon, was distinguished by the battle of the Granicus, and the capture of Halicarnassus; and at its close occurred the famous cutting of the Gordian knot. In B.C. 333 he met Darius, who had collected nearly 600,000 men, on the plain of Issus, and defeated him with great slaughter. A. now turned aside to subdue Phœnicia, where the only opposition was offered by Tyre, which resisted his attacks for seven months, and which he punished fearfully for its obstinate defence by putting to death 8000, and selling into slavery 30,000 Tyrians. Gaza followed the example, and shared the fate, of Tyre. A. next marched into Egypt, where he was welcomed by a people weary of the Persian yoke. In B.C. 331 he founded and named after himself the city of Alexandria, forming the wise project of making it, from its conspicuous advantages, the point of union of Europe, Asia, and Africa. After visiting the temple of Jupiter Ammon, A. returned to Asia to encounter once more the hosts of Darius. A great battle was fought, B.C. 331, in the plains of Guagamela, A. completely defeating the Persians, and pursuing them for 50 miles to Arbela, after which the battle is commonly named. A. was now master of Asia, and assumed the position and manners of an Eastern despot; but unhappily his success was followed by a marked deterioration of character, which was early manifested in the burning of Persepolis. He pursued Darius into Media, and through the deserts of Parthia; but the Persian king was murdered by Bessus, satrap of Bactria, B.C. 330, and, by A.'s commands, was buried in the royal tomb at Persepolis. A. now determined to destroy Bessus, who had assumed the title of King of Persia, and he succeeded in his design, B.C. 329, after having pursued him across the Oxus into Sogdiana, whence subsequently A. advanced beyond the Jaxartes. Before this, A. had put down the revolt of his satrap Satibarzanes, and by putting to death Parmenio, his faithful general, had again stained his name. In B.C. 327 he married Roxana, subdued Sogdiana, and commenced his great invasion of India. A. entered the Punjab, defeated Porus, a native king, on the Hydaspes, subdued the Cathæi, and was preparing to cross the Hyphasis, when his exhausted troops refused to advance further. Most reluctantly he led them back to the Hydaspes, where a fleet had been prepared, in which they sailed down the Hydaspes, and the Acesines, at whose confluence with the Indus he sent Craterus with a third

of the army into Carmania. A. pursued his voyage to the mouth of the Indus, whence he despatched Nearchus with the fleet along the Persian Gulf, while he himself led the rest of the troops through the desert of Gedrosia, where they suffered severe privations. The three detachments of the army were united in Carmania, whence they advanced to Susa in two divisions, commanded respectively by A. and Hephæstion. Here he married Statira, the eldest daughter of Darius, and, during a period of repose, strove to amalgamate his Greek and Persian subjects. At Opis he quelled a serious mutiny of his Macedonian veterans, and here, too, his favourite Hephæstion died. For a year before his death he resided at Babylon, revolving many new schemes. He was suddenly attacked by fever, and after an illness of eleven days, died B.C. 323. A.'s character was disfigured by intemperance, pride, and passion; but his great career of conquest materially aided the advance of science and of civilisation. He first opened up the resources of the East to the enterprise and cupidity of Europe; the spread of the Greek tongue ensured the more rapid diffusion of Christianity; and the kingdoms into which his immense empire was broken up on his death, enjoyed for centuries the benefits of settled government. The chief ancient authorities for A.'s life are Arrian, Quintus Curtius, and Plutarch. The opposite views of his character are well stated in the last volume of Grote's *Greece*, and in the second series of Freeman's *Essays*.

Alexander Severus, the cousin and adopted son of the Roman emperor Elagabalus, was born A.D. 205 or 208. Previous to his adoption his name was Bassianus. Refusing to share in the brutal amusements of the emperor, he sought the society of the learned. He became a favourite of the people and of the soldiers. By the latter, after their assassination of Elagabalus, A. was made emperor A.D. 222, the choice being ratified by the senate and the people. Among his chief counsellors were the illustrious lawyers Ulpian and Paulus; but he appears to have been largely guided by his mother Julia Mamaea, a superior woman, to whom he was mainly indebted for an excellent education. His first military expedition, which was against Artaxerxes, King of Persia, was successful. During his second, which was against the Germans on the Rhine, he quarrelled with the unruly Prætorian guards, and was assassinated by them A.D. 235. A. was a man of fine and just character, and of singular purity of life.

Alexander is the name given to eight popes, of whom the 2d (1061-73) was notable for his piety and zeal for the reformation of clerical abuses; the 3d (1159-81) for his great struggle with the German emperor Frederick I., and the 7th (1655-67) for his scholarship and love of literature. But the most widely known of the whole is A. 6th, probably the worst pope, and one of the worst men, that ever lived. He was of Spanish origin, and was born at Valencia in 1431. His proper name was Rodriguez Lenzuolo, to which he afterwards added Borgia, the name of his mother. He was elected Pope in 1492, having been made a cardinal by his uncle Calixtus III. At the time of his election he had four children by his mistress Vanozza; the most famous, or infamous, of whom were Cæsar, made a cardinal, and Lucretia. Hostile at first to the house of Aragon, then reigning in Naples, A. nevertheless received its head, Charles VIII., with honour in Rome, promising to assist him, and giving him his son the cardinal as a hostage. But his foreign and internal policy was one of unparalleled perfidy, cruelty, and greed. Bent on the destruction of the great families of Colonna, Orsini, and others, and on the acquisition of their estates, he effected his purpose by intrigue, poison, and assassination. He made himself master of the Romagna by the same means. A. died 18th August 1503, having, it is said, accidentally swallowed poison intended for his guest the Cardinal of Corneto. It was under his pontificate that Savonarola was burned in Florence for heresy. A minute account of the horrible details of this pontificate is to be found in Burchard's *Specimen Historiæ Arcanæ et Anecdota de Vita Alexandri VI.* (Hann. 1697), and in Tomasi's *Vita de Cesare Borgia*. See also Masse's *Histoire du Pape Alexandre VI. et de César Borgia* (Paris, 1830).

Alexander I., King of Scots, son of Malcolm Ceanmhor, succeeded his brother Edgar in 1107, and reigned seventeen years. During his reign Cumbria, embracing the south-western provinces of Scotland, was governed by David, the younger brother

of the king; and while the integrity of the kingdom was thus maintained on the S., it was also vigorously asserted in the N., where the descendants of Macbeth had fomented an insurrection. The Maormors of Ross and Merne were pursued to their strongholds beyond the Moray Firth, and punished with a severity that (according to Wyntown) won for the monarch the surname of the 'Fierce.' A. died 27th April 1124. Like all the children of St Margaret, he was distinguished by his respect for the Church and the interests of culture. He established the bishopric of St Andrews,—though it was not till 1128 that the first bishop was consecrated,—laboured hard for the endowment and Catholic revival of the Scots Church, and founded the monastery of St Columba on the island of Inchcolm.

Alexander II., King of Scots, born in 1197, succeeded his father, William the Lion, in 1214. The contest with England for the possession of the Northumbrian and Anglo-Cumbrian provinces which he had inherited from his father, was continued either by arms or negotiation throughout the whole of his reign. In 1222 a joint commission was instituted by the two countries to define their respective monarchies, and in 1237 an agreement was made whereby A. received certain manors in Cumberland and Northumberland, not in sovereignty, but in feudal property; and finally, in 1244, the menacing armies of both countries were again upon the Border, to be peacefully dispersed, however, after the ratification of the 'treaty of Newcastle,' in which, says Burton, 'no reference seems to have been made to homage on the part of the King of England, or to possessions south of the Border on the part of the King of Scotland, but each engaged not to abet the enemies of the other, and not to make war on the territories of the other without just provocation.' A. died in 1249 in Kerrera, an islet in Oban Bay, whither he had gone to assert his supremacy over the Lord of Argyre and the Isles. He was twice married, first to a sister of Henry III. of England, by whom he had no issue, and secondly to a French lady of the noble house of Coucy.

Alexander III., son of the preceding, was crowned King of Scotland 13th July 1249, and was married on Christmas-day 1251, when scarce ten years of age, to Princess Margaret of England, daughter of Henry III. The only event that disturbed the prosperous and peaceful character of his reign, viz, the invasion of Scotland by Haco, King of Norway, took place in 1263. Driven ashore at Largs, the invaders were signally defeated and compelled to retreat to their fleet, already disabled, and soon afterwards to be annihilated by tempests on the N.W. coasts. In 1266 the successor of Haco ceded the Isle of Man and the Western Isles to the Scottish king, and in 1281 the friendship of the two countries was cemented by the marriage of Margaret, the only daughter of A., to Eric of Norway. A's prosperous reign closed in ominous gloom. His daughter Margaret, the Queen of Norway, died in 1283, leaving an infant daughter, 'the Maid of Norway' (q. v.); his only son, Alexander, died a few months afterwards; and he himself, while riding in the dark along a cliff near Kinghorn, on the coast of Fife, was thrown from his horse over a rock and killed, 12th March 1286. No greater calamity could have befallen the nation. Wise, valiant, and politic; honoured by his nobles, and loved by his commons, A. was rapidly developing a civilised industry in the country. But the anarchy that followed in the struggle of selfish ambitions was at least partially redeemed by the patriotism of Wallace and the policy of Bruce.

Alexander I., Emperor of All the Russias, was the son of the Emperor Paul and of Maria, daughter of Prince Eugene of Wurtemberg, and was born Dec. 23, 1777. His education was directed by his grandmother, the Empress Catharine II. Catharine was succeeded in 1796 by her son Paul, whose mad reign was ended by assassination on 24th March 1801. For the first quarter of the 19th c. the history of the reign of A. is the history of Europe. At his accession Russia was at war with England. This war was ended by a treaty signed at St Petersburg, 17th June 1801. The distraction of foreign relations, however, never seems to have prevented A. from energetic endeavours to develop the internal resources of his vast empire, and to improve the social condition of its people. He founded or remodelled seven universities; he founded more than 2000 schools, and over 200 gymnasia. He devoted large sums to the printing of useful works, and liberally

rewarded literary and scientific merit. He abolished many barbarous usages of Russian law, and brought the legal system of the country more into harmony than it had been with European civilisation. He extended the trade and promoted the manufactures of the empire by wise and liberal alterations of its commercial laws, by extension and improvement of roads and other means of carriage, and by opening commercial pursuits to all ranks of his subjects, and by advantageous treaties regarding trade with foreign powers.

In April 1805, A. made a treaty of alliance with England and Austria against France. This league, known in history as the Third Coalition, soon resulted in war, but the capitulation of Ulm, and the frightful disaster of Austerlitz, paralysed the allies. In the coalition between England and Prussia against France which followed this war, A. formed an alliance with Prussia, but again before he reached the field he found his ally crushed by Napoleon. He joined his force to the remnant of the Prussian army which escaped from the field of Jena, but the defeats of Eylau and Friedland in 1807 compelled the allies to make with Bonaparte the humiliating treaty of Tilsit. By this treaty A. bound himself to join France against England. In 1808, in deference to the same authority, Russia declared war against Sweden, and took possession of Swedish Finland. The commercial suffering entailed on Russia by the war with England made its continuance intolerable to the former power; an offer of an offensive and defensive alliance from England and Sweden was accepted, and war once more declared by A. against France. The events which followed are perhaps the most momentous in the history of modern Europe. Russia brought into the field an army of 900,000 men. Napoleon left France to invade Russia with an army of half a million. A. swore that he would make no treaty while the French were in Russia. 'Should St Petersburg be taken,' he said, 'I will retire to Siberia.' During the war A. showed the greatest courage, and, on the downfall of his terrible foe, he behaved to France with a magnanimity which caused him to be received with enthusiasm when the allies took possession of Paris in 1814. In 1815 he visited England along with the King of Prussia. From England he crossed to Holland, and on 24th July 1815 he re-entered his own capital, in which he was welcomed with enthusiasm. In March 1818 he opened the first Polish Diet at Warsaw. He then visited Moscow, Odessa, and the Crimea. He revisited the Crimea in the autumn of 1825, for the benefit of his own health and of that of the empress, but was seized by a fever at Taganrog, where he died 1st December 1825. See Webster's *Travels in the Crimea, Turkey, and Egypt*. See also Mde. de Choiseul-Gouffier's *Mémoires Historiques sur l'Empereur Alexandre et la Cour de la Russie* (Paris, 1829); Voigt's *Alexander I.* (Zerbst, 1830); Sonntag, *Alexander in Paris* (Riga, 1814).

Alexander II., Emperor of Russia, son of the Emperor Nicholas, and nephew of Alexander I., was born 29th April 1818. He has, not less than Alexander I., devoted himself to furthering the culture and developing the resources of his empire. He has had the wisdom and the courage to take a step which forms an epoch in the history of Russian civilisation. By ukase of 3d March 1861, the serfs—about 23,000,000, it is believed—were declared to be free. He has shown practically a strong desire to purify the legal administration of the country, having on various occasions rebuked and punished functionaries found guilty of corruption. He has been a liberal patron of science and literature; especially is the literature of Finland indebted to his patronage, he having founded a chair for the cultivation of the language and literature of that province. The foreign policy of A. II. has been conciliating, but firm and astute. In the N., during the life of his father, his policy conciliated the Finns, and weakened their love of independence. As emperor, he has conciliated the Poles by measures lenient but firm in their expressed resolution to maintain the integrity of the empire. Availing himself of the position of Russia during the Franco-German war of 1870, he has nullified the results of the Russian defeat in the war of 1854-55 with England and France. In Asia his policy has caused some jealousy to be felt by the former country, especially in the war of 1873 against the Khan of Khiva. A. was married in 1841 to the Princess Maria, daughter of the Grand Duke of Darmstadt.

Alexander Nevski, born at Vladimir A.D. 1219, was the son of the Grand Duke Jaroslav of Novgorod. He and his

brother Alexander bravely but unsuccessfully, in the absence of their father, resisted the attack of the Mongols. He became Grand Duke on the death of his father in 1247; remaining, however, a vassal of the Mongols, or Tartars, to the end of his life. He, however, successfully defended his western frontier against the Teutonic knights, the Danes, and the Swedes, and received the surname of Nevski for a great victory over the latter on the Neva in 1246. A. was canonised by the people on his death in 1263. Peter the Great honoured his memory by building a splendid convent on the spot where he won his great battle.

Alexander of Hales (Lat. *A. Halensis*), a great theologian of the middle ages, surnamed *Doctor irrefragabilis*, flourished in the first half of the 13th c., but the date of his birth is not known. He was of English origin, but completed his academic studies at the schools in Paris, where he settled as a lecturer on philosophy and theology, and had already attained celebrity when, in 1222, he suddenly entered the order of the Minorite Friars. This event has been surrounded by writers of the 15th and later centuries with fabulous circumstances, but in reality we are totally ignorant of the causes that led to his decision. His subsequent life might lead us to suppose that he was naturally predisposed to studious labour and solitude. At any rate, having once entered, he never left his convent walls, but gave himself up unreservedly to the service of the Church in the realm of theological literature. He died 27th August 1245.

A.'s famous, and, in truth, his only authentic work, is the *Summa Universa Theologia*, composed at the request of Pope Innocent IV., and after undergoing the ordeal of an examination by seventy doctors of divinity, ordered to be used, by his successor Alexander IV., in all the schools of Christendom. It is divided into four parts. The first treats of the divine attributes and of the Trinity, and contains a development of the doctrine of Petrus Lombardus relative to the Word, the procession of the Holy Spirit, the foreknowledge, omnipotence, and will of God. The second treats of the creation, of the various kinds of creatures, angelic, spiritual, material, of the nature of a rational soul, of the first estate and fall of Adam, of physical and moral evil, of sin, of the means of cultivating and extending the virtues of religion. In this last connection come out some of those opinions which entitle us to consider A. as the great Ultramontane thinker of the middle ages. He would grant no toleration to infidels or slaughterers, and is of opinion that they ought to be deprived of their only earthly goods; he would free subjects from their oaths of fidelity for seven years if they are disobedient to the laws of the Church. His defence is chiefly concerned with the Incarnation, and the 30,000 Tyrians that arise out of it. When discussing the spiritual fate, of Tyre. A. lodged in the Church, he claims for it—that is, for the Church, that it is the supreme authority in the world. It judges kings founded and temporal rulers, but is itself judged of God alone. The fourth part is devoted to the sacraments of the Church, and the pope's authority repeatedly finds opportunities to affirm the supremacy and infallibility of the Pope. Such being the character and aim of the work, it is not wonderful that it should have excited papal admiration, and become a perpetual text-book in the schools and colleges of the Roman communion. A. still shares with Thomas Aquinas, Bonaventura, and Duns Scotus the control and direction of Catholic thought, and his ideas govern at this moment the policy of the Vatican. The principal editions of the *Summa* are those of Nuremberg (1482), Basel (1502), Venice (1576), and Cologne (1622). The other writings attributed to A. do not require mention.

Alexanders, sometimes written *Alisanders*, is the common name for *Smyrniolum Olusatrum*, one of the *Umbelliferae*. It was formerly grown as a pot-herb in Britain, where it is now naturalised in many places. The plant has aromatic and pungent qualities, and the fruit is carminative.

Alexandri, Vasilio, a Rouman poet and patriot, born at Jassy in 1821, educated at Paris, where he took the degree of Bachelor of Letters, and on his return to Moldavia in 1839, became a leader of the 'Young Roumanian Party,' which sought to revolutionise the country by the introduction of Western, and particularly French ideas, and which at the same time was strongly animated with a national sentiment, and a desire to be rid of the rude dominance of Turkey. In 1844 certain pieces which he composed for the Jassy theatres, some in French and others in Rouman—*Georges de Sadagoura, Jassy en Carnaval, La*

Pierre de la Maison, La Noce Villageoise, Mde. Kirilina à Jassy, Mde. Kirilina en Province, &c.—excited great enthusiasm. Compromised by the Moldavian revolutionary movement of 1848, he withdrew for some months to Paris, where he pled hard through the press for the independence of the principalities. After his return he published a fine collection of Rouman ballads (*Ballades Populaires de la Roumanie*, 1852-53), which he had begun to compose ten years earlier, and which gave another great impetus to the national feeling. The death of his father in 1855 having put him in possession of the family estate, he at once liberated all his serfs, an example that was soon largely followed, and paved the way for the universal emancipation decree of Prince Gregory Ghika. His patriotic song *The Hour of Union* (1856) materially assisted in diminishing the reciprocal jealousy of the Moldavians and Wallachians in bringing about the union of the principalities. In 1857 appeared *Le Collier Littéraire*, a miscellaneous collection of pieces in prose and verse.

Alexandria (Iskanderieh), a celebrated city and seaport of Egypt, is situated on the Mediterranean coast, about 14 miles W. of the Canopic mouth of the Nile.

The modern city is built upon a peninsula (the ancient isle of Pharos) and the isthmus connecting it with the mainland. It is the great commercial emporium of Egypt, is an important station on the overland route to India, and is connected by railway with Cairo and the Suez Canal. A. carries on a very extensive trade, exporting corn, cotton, wool, gum, rice, &c., and importing cotton, woollen, and silk goods, hardware, timber, coal, and drugs. Pop. (1870) 238,888, comprising Arabs, Turks, Jews, Copts, and many Europeans.

The ancient city, which was of great size and magnificence, was founded by Alexander the Great in 332 B.C., and built upon the mainland. Under the Ptolemies it advanced rapidly, and became the centre of commerce, science, and art. The Romans obtained possession of it about 30 B.C., after which it gradually declined. Towards the close of the 3d c. it became a chief seat of Christian theology. It was captured by the Arabs in 638 A.D., and by the Turks in 868 A.D. The discovery of a passage to India by the Cape of Good Hope in 1497 gave the last blow to its trade, and in 1778 it had only 5000 inhabitants. Under Mehemet Ali, who saw its naval and commercial importance, it began to revive, and it is now making great strides in wealth, importance, and population.

In its palmiest days A. is estimated to have contained about 600,000 inhabitants. Among its principal buildings were the Museum, the Serapeion, or temple of Serapis, the palaces of the Ptolemies, the Theatre, &c. Its famous library (see ALEXANDRIAN LIBRARY) contained, some say, 700,000 volumes. The chief remains of the ancient city are the cisterns, catacombs, and Pompey's Pillar.

Alexandria, a town in Dumbartonshire, situated on Leven Water, near Loch Lomond, $\frac{3}{4}$ miles N. of Dumbarton. It has extensive cotton-printing works, and is a station on the Dumbartonshire Railway. In the neighbourhood is Bonhill, the residence of the Smolletts. Pop. (1871) 4650.

Alexandria, a port of Virginia, U.S., on the navigable river Potomac, about 100 miles from its entrance into Chesapeake Bay, and 7 miles below the city of Washington. It occupies a central position, and is connected by railway with Richmond, Pittsburg, and Baltimore. A. is accessible to ships of the line. The most important manufacture is cotton, and there is also a flourishing trade in corn, maize, and tobacco. Pop. (1870) 13,570.

Alexandrian Age. Ptolemy Soter, on ascending the throne of Egypt, was ambitious that his kingdom should succeed to the intellectual fame of Greece, and gathered round him the sages of the world, with the view of making his capital the seat of a great school of literature, philosophy, and science. He commenced the Library and his son founded the Museum, whose porticos and lecture-rooms were thronged by the men of letters whom the king maintained. The intellectual centre thus created continued in activity for about a thousand years; this period falling into two divisions, the first extending from 323 to 30 B.C., and the second from 30 B.C. to 640 A.D. During the first period the energies of the A. school were devoted to poetry, criticism, and science. The poetry (with the exception of the Idylls of Theocritus) was the poetry of a court atmosphere and an artificial age. The most noted poets were Callimachus,

I. Lycophron, Theocritus, and Apollonius Rhodius. To the arduous and invaluable labours of the critics, of whom the most distinguished were Zenodotus, Aristophanes of Byzantium, Aristarchus of Samothrace, and Alexander of Aetolia, we owe the comparatively complete state in which the texts of the greatest Greek books have come down to us. The physical and mathematical school was founded by Euclid, and under Eratosthenes, Hipparchus, and Archimedes greatly advanced the sciences of geometry, astronomy, geography, and mechanics. The philosophical fermentation which marked the second period of the A. A. resulted from the contact of Greek philosophy with the Sacred Scriptures. On the one hand, the Jews (of whom Philo was the most distinguished) developed a system by which their religious ideas were logically set in the principles of Greek thought; on the other, the Alexandrians strove to reconcile the dogmas of the new religion with their own philosophy. The former movement was named Neo-Platonism, the latter Gnosticism.

Alexandrian Codex, an important manuscript text of Holy Scriptures, probably executed in the first half of the 5th c. The writing is continuous, in uncial characters of very elegant and clear form, without accents or breathings except in the beginning of Genesis. The Old Testament portion is simply the text of the Septuagint, but the New Testament text is specially valuable for the exegesis of the epistles. It was sent to England in 1628, as a present to Charles I., by the Patriarch of Constantinople, who affirmed that it came from Egypt, and is now in the British Museum.

Alexandrian Library, 'the first such institution which the world had ever seen,' was originated by Ptolemy Soter (at the suggestion, it is said, of Demetrius Phalereus), organised by Philadelphus, and increased by their successors, particularly by Euergetes, who by unscrupulous stratagems enriched it with most valuable Greek MSS. It was situated partly in the Bruchium, or royal quarter, and partly in the vast temple of Serapis, of whose 400 columns Pompey's Pillar now alone remains. The library contained 400,000 volumes, or, according to another authority, 700,000 volumes. The most remarkable addition to its number was the Pergamos Library, of 200,000 volumes, presented by Antony to Cleopatra, which repaired the total loss of the old library of the Ptolemies during Caesar's Alexandrian war. The library was included in the general destruction of the Serapeum by Theophilus in 391 A. D.; and its remains, of the extent of which it is impossible to form a just estimate, were finally destroyed by order of Omar in 640 A. D.

Alexandrine Verse is a rhyming measure of twelve syllables, first used in the *Romance of Alexander* (circa 1155), and so called either from that poem or from Alexander of Paris, one of its four authors. Drayton's *Polyglotton* is the only English poem written wholly in this measure; but the line has been frequently used to complete the stanza, as in the *Fairy Queen* of Spenser, or to form the last line of a triplet or passage, the continuous impulse of which may by its use at once find expression and attain repose—

'Waller was smooth; but Dryden taught to join
The varying verse, the full resounding line,
The long majestic march, and energy divine.'

Alexandrovsk, the capital of a district in the government of Vladimir, Russia, on the line of a railway between Moscow and Jaroslavl. The czar, Ivan II., Vasilievitch, had a summer palace at A., and established here the first printing-press in Russia. It has considerable manufactures in woollens, iron, and pebble. Pop. (1867) 5810. There are several places of the same name in Russia, of which the largest is a town on the Dnieper, 48 miles below Ekaterinoslav, with a considerable export trade. Pop. (1867) 4601.

Alexei Michail'ovitch, second Russian czar of the house Romanov, was born in 1630. He succeeded his father, Michael Feodorovitch, in 1645. Certain evil counsellors, whom the youthful czar was surrounded occasioned an insurrection shortly after his accession. It was suppressed, but his chancellor, Plessow, lost his life in it. Troubles also arose from the claims of two impostors named Ankudinov and Demetrius. These being supported by Poland, a war consequently arose between the two countries. In this the Russians were successful, the Polish commander Radzivil being defeated

at Sklovo. Peace was effected by the intervention of Austria, Poland, for money, ceding to Russia the provinces of Smolensk, Kiev, and the Ukraine (1667). In a subsequent war with Sweden A. was unfortunate, but he made peace without loss of territory. He died January 29, 1676. A.'s rule was liberal and civilising. He anticipated the policy of his son Peter the Great, by bringing workmen from Holland and England; he opened up relations with China, and built a fleet on the Caspian Sea.

Alexei, Petro'vitch, eldest son of Peter the Great, was born at Moscow in 1695. Of a disposition as resolute as his father, he lacked his father's largeness of social and political views, consequently they came into collision regarding the reforms proposed by the emperor. This resulted in A.'s exclusion from the throne, in his throwing off his allegiance and flying to Naples. Induced by false promises to return, he was thrown into prison and condemned to death. Some of his partisans were executed. A. himself was found dead in prison. He is reasonably supposed to have been assassinated. By his wife, Charlotte, Princess of Brunswick-Wolfenbüttel, he left a son, who succeeded to the throne as Peter II.

Alexius Comnenus, a sovereign of the Byzantine empire, was born at Constantinople A. D. 1048. His father was John Comnenus, brother of the Emperor Isaac. Raised to the throne by the soldiers (1081), he displayed a military genius and a capacity for ruling under circumstances of surpassing difficulty, which showed that they had chosen wisely. Already had the Turks established their sway from Persia to the Hellespont. On the N. the empire was menaced by hordes of barbarians from beyond the Danube. On the W. it was assailed by the daring valour of the Normans, under Robert Guiscard; while on their way to Palestine the wild warriors of the first crusade had encamped round the gates of Constantinople. Through these complex dangers A. steered his vessel with a bold and skilful hand. The inherent weakness of the Byzantine empire made the preservation of its integrity impossible; but to A. belongs the merit of having delayed its destruction. He died in 1118. His daughter Anna has written his biography in a spirit of filial piety.

Alfieri, Vittorio, Count, an illustrious Italian poet, born at Asti, Piedmont, 17th January 1749. After varied travel he settled at Turin in 1775, and applied himself assiduously to remedy the defects of his education. In 1777 he met at Florence the Countess of Albany (q. v.), to whom, after the death of her husband, it is said, he was privately married. A. was in Paris during the excesses that accompanied the Revolution, and though an ardent lover of freedom, contracted an intense hatred to the ferocious anarchists who led the movement, which found vent in his *Misogallo* (1790-98). He commenced to learn Greek in 1797, at the age of forty-eight, and by rigorous and methodical study soon became familiar with the Greek poets. He finally settled at Florence, where he died 8th October 1803, and was buried in the church of Santa Croce, between the tombs of Michael Angelo and Macchiavelli. A beautiful monument, the work of Canova, was raised over his tomb by the Countess of Albany. A. effected a revolution in the dramatic literature of Italy, and may be said to have created its classic tragedy. He published 21 tragedies and 6 comedies, besides *Abel*, partly a tragedy and partly an opera, and designated by himself 'tramelogedia.' His works have often a political aim. His language has been blamed as harsh, his verse as wanting in ease, and his characters as devoid of fancy. But he inspired the Italian mind with a nobility of thought to which it had long been a stranger. After his death the Countess of Albany had a collected edition of his works published at Pisa in 35 vols. 4to, 1805-15, of which 13 vols. contain his posthumous works, and which also includes an autobiography (*Vita di Vittorio Alfieri scritta da esso*). There are numerous translations of his writings into French. See also *Vie de Victor Alfieri, écrite par lui-même, et traduite, par M***** (Paris, 1809 and 1840), and Teza's *Vita Giornali, Lettere di A.* (Flor. 1861.)

Alfon'sine, a town in the province of Ravenna, N. Italy, about 4 miles N.W. of Ravenna. It lies in a low, fertile plain which stretches to the Adriatic. Pop. of commune, 6741.

Alfon'so I. (Henriquez). King of Portugal, was the son of Henry of Burgundy, Count of Portugal, and was born in 1180, or, according to others, in 1094. Ascending the throne in 1128,

he turned his arms against the Moors, and in 1139 defeated five of their kings at Ourique (since called *Cabeça de Reis*, 'heads of kings'), and assumed the title of King of Portugal, which the Pope confirmed in 1145. He took Lisbon in 1147, Alcazar-de-Sal and Evora in 1158, and Santarem in 1171, annihilating the Moorish garrison. He defeated Yusuf-ben-Jakub at the same place in 1184. A. instituted the orders of Avis and St Michael, and established the law of succession, &c. He died at Coimbra in 1185.

Alfonso VI., King of Portugal, second king of the house of Braganza, was born in 1643, and ascended the throne as a minor in 1656, but the government remained in the hands of his mother, Louisa de Guzman, a woman of great judgment, till 1662, when he was induced to remove her from office. So scandalous, however, were his debaucheries, that in 1667 he was forced by his wife Marie d'Amale, and his brother Don Pedro, to abdicate. He died in 1683 at Cintra. During his reign the war between Spain and Portugal, which had lasted for twenty-six years, was terminated by a treaty which secured the independence of the latter country.

Alfonso III., surnamed *El Magno*, 'the Great,' King of Leon, Asturias, and Galicia, was born in 848, and succeeded his father, Ordoño I., in 866. Having slain Count Froila, who had seized the throne, he fought and frequently defeated the Moors. He repopled Burgos, and added to his domains from Portugal and Old Castile. His son Garcias rebelling, he imprisoned him; but his wife and nobles conspiring, he abdicated in Garcias' favour. He died at Zamora in 912. There is attributed to this king a Latin chronicle, treating of the history of Spain from its invasion by the Moors to the time of Ordoño.

Alfonso V., the Magnanimous, King of Aragon, Naples, and Sicily, was born in 1385, and succeeded his father in 1416. By an agreement made with Queen Joanua he claimed Naples at her death (1435), but was attacked by the Italian States and taken prisoner by the Genoese, who defeated his fleet. Being sent to Milan, the duke befriended him, and he was enabled to conquer Naples. He died in 1458.

Alfonso X., surnamed *El Sabio*, or 'the Wise,' also the Astronomer-King of Leon and Castile, was born in 1226, and succeeded his father, Ferdinand III., in 1252. After fruitless and expensive efforts to secure his election to the throne of the German empire, he turned his attention to the Moors. These he totally defeated in 1263, taking from them Xeres, Medina-Sidonia, San-Lucar, and a part of Algarve. His second son, Sancho, de-throned him in 1282, and after a vain attempt to reinstate himself, A. died at Seville in 1284. A. was the most learned prince of his day, and was the author of some poems, a work on chemistry, one on philosophy, &c. He finished the code of laws commenced by his father, called *leyes de las Partidas*, and caused to be constructed, at a cost of 40,000 ducats, the famous Alphonsine Astronomical Tables, of which the most recent edition is that of the Madrid Academy of Sciences (1807). His poetical writings have been published by Sancho in his *Collecion de Poesias Castellanas Anteriores al Siglo XV.* (Mad. 1779-90.)

Alfonso XII., King of Spain, was born at Madrid, November 28, 1857. He is the only son of five children of the deposed Queen Isabella II. and Don Francisco de Assisi Maria Fernando, Infant or Prince of Spain, and King Consort after his marriage in October 1846. Queen Isabella, who was driven from Spain by the revolution of September 1868, renounced all claim to the throne in favour of her son, while residing at Paris, June 1870. The political education of the young king has been carefully directed by Señor Canovas del Castino, and he has studied in France, Austria, and in England, where he passed two years at the Military Staff College at Sandhurst under the name of the Marquis of Covadonga. While he was being thus suitably educated, the Bourbon partisans in Spain were unremitting in their efforts to bring about a restoration. Since 1868 many forms of government had been discredited or dissolved, and the nation was wearied, depressed, and terrified by the continuance of the Carlist war. The dictatorship of Marshal Serrano, while provoking widespread discontent with the Republic, gradually strengthened the cause of A., who, at Madrid on the 31st December 1874, was proclaimed King of Spain 'without conflict and without bloodshed.' He landed at Barcelona 9th January 1875,

assumed the government, and everywhere received an enthusiastic welcome from the people. The new ministry contained a strong liberal and anti-Ultramontane element. King A. declared himself 'a good Spaniard, a good Catholic, and a good liberal.' In January 1878 he was married to his cousin, the Princess Marie de Mercedes, who died before the summer was over.

Alford, Henry, D.D., a meritorious poet and a fine biblical scholar, was born in London in 1810. He was educated at Trinity College, Cambridge, where in 1831 he published *Poems and Poetical Fragments*. This was followed in 1835 by *The School of the Heart and other Poems*. *Chapters on the Greek Poets* appeared in 1841. The first volume of the *Greek Testament*, his greatest work, and a credit to English scholarship, was published in 1844, and the whole was completed in 1861. He was the author of *A Plea for the Queen's English*, and of several volumes of sermons. At first a vicar in Leicestershire, he was removed to London in 1853, and appointed Dean of Canterbury in 1857. He died January 12, 1871. See *Life, Letters, &c.*, of Henry Alford, D.D. (Lond. 1873.)

Alfred the Great, youngest son of Æthelwulf, and grandson of Egberht, King of the West Saxons, born at Wantage, Berkshire, in 849, succeeded his brother Æthelred I. on the throne at the age of twenty-two. Within six years of his accession the Danes had completely overrun his kingdom, and A., unable to make further resistance, was compelled to take refuge in the forests. As soon, however, as his people had recovered sufficient spirit to renew hostilities, he built a fort in the marshes of Somersetshire, the site of which is still known as Athelney (the 'prince's isle'), and to this his followers repaired. Hence he made numerous successful sallies, and finally, in 878, at Eithandun, he completely routed the Danes, and their king, Guthrun, with thirty of his followers, submitted to baptism. A *Witenagemot* was then held at Wedgemore, when a treaty was drawn up by which the Danes acknowledged themselves to be vassals of A., and received E. Anglia, and parts of Essex and Mercia. At a later period the Danes of Northumbria, who were not Guthrun's men, also submitted to A. Thus the whole of the E. coast of England, for a considerable distance inland, continued in their possession, and was long known as the *Danelagh*, or the region under Danish law and rule. A. now constructed a fleet, to keep alive the old seafaring spirit of the English race; set himself to repair the ravages of war by rebuilding cities and encouraging agriculture and the arts; established or remodelled many useful institutions, and had a code of *dooms*, or laws, compiled, for which he compelled respect by a rigid administration of justice. He gave liberally to the poor and to the Church, founded monasteries, and encouraged learned men, English and foreign, to instruct his people. Taught in his youth by a wise and affectionate mother (Osburga) to love the scanty literature of his native tongue, he subsequently, through his friend and biographer Asser (q.v.), learned Latin sufficiently well to be able to translate into English several valuable works, of which the most important are the *De Consolatione Philosophiæ* of Boethius, the *Regula Pastoralis* of Gregory the Great, the *Historia Mundi* of Orosius, and an anthology from the *Soliloquies* of St Augustine. Some of these, more particularly the works of Boethius and Orosius, are freely handled, and in some parts largely increased by original matter from the pen of A. himself. He was also in all probability the instigator and first patron of that famous chronicle commonly called the *Anglo-Saxon Chronicle*, which covers, and more than covers, the whole period of pure English history. Asser attributes to him an original work, an *Enchiridion*, or *Manual*, fragments of which are preserved in William of Malmesbury. In other ways he was a zealous and unwearied civiliser. His seamen explored the Baltic in the interests of geographical science as well as of trade; he sent embassies to Rome, to Jerusalem, and even, it is said, to India; order was wisely maintained at home, while his domestic relations with his God-fearing wife Elswitha were singularly tender and true. The tranquillity of his kingdom was disturbed in 893 by a formidable invasion of the Danes led by Hæsten, but the English on every occasion proved their superiority, and the invaders were forced to retire. A. died 27th October 901, the purest-souled, the most sincere, and the most unselfish monarch that ever ruled in England. See Asser's *Vita Alfredi*, and Reinhold Pauli's work, translated by Thorpe (Bohn, Lond. 1857).

Alfreton (A.S. *Alfredingstun*, 'King Alfred's town'), a market town in Derbyshire, 12 miles N.N.E. of Derby. It is a station on the Erewash Valley Railway, and has considerable iron-works, pot-... stocking-weaving. Pop. (1871) 3680.

Alga marina, a commercial name for Grass Wrack (q. v.).

Algae—the Sea-weed family—a large and important natural order of cryptogamic cellular plants, embracing 283 genera and upwards of 2000 species. They occur principally in salt and fresh water, and exhibit a great variety of forms. The order has been divided into the following sub-orders: 1. *MelanospERMEEA*, sea-weeds of an olive-green or olive-brown colour. 2. *RhodospERMEEA*, those of a rose-red, purple, or red-brown colour. 3. *ChlorospERMEEA*, those of a grass-green colour. The plants of the order are found in all parts of the world. The lowest forms, such as the diatoms, are microscopic, and closely approach the lowest forms of animal life, while the higher forms attain a large size, one species of the Pacific measuring from 500 to 1500 feet in length. *Sargassum bacciferum* is the gulf-weed which is found floating in great quantities in the oceans on each side of the equator; it forms the *Mer de Sargasse* of mariners. *Protococcus nivalis* is the red snow of Arctic regions. The colour of the Red Sea is owing to the abundance of a species of sea-weed. *Chondrus crispus* is called Carrageen or Irish-moss. Kelp is obtained by burning sea-weeds, and iodine is also procured from them. *Rhodomenia palmata* is eaten raw under the name of Dulce, and *Laminaria digitata* as Tangle. The edible swallows' nests of the East are formed by a species of *Galidium*. *Nostoc edule* is much used in China as an ingredient in soup.

Algar'di, Alessandro, an Italian sculptor, born at Bologna in 1598, studied under Caracci, and finally settled in Rome, where he was first employed by Cardinal Ludovici to restore ancient statues. Among his original works are a Magdalene and a St John for the church of St Sylvester; a bronze statue of Pope Innocent X.; and, above all, a colossal bas-relief representing Pope Leo forbidding Attila to enter Rome. This last is his *chef-d'œuvre*, and one of the greatest works of the kind ever executed. A. died at Rome in 1654. His most serious fault as a sculptor is a desire to produce by heavy masses of marble effects that are only possible in painting.

Algaroba, or **Algarobilla**, the name under which the pods or fruit of *Prosopis dulcis* and *Ceratonia siliqua* are imported. The latter is commonly known as Carob (q. v.).

Algarobilla, the seeds and husks of *Prosopis pallida*, a tanning material imported from Chili.

Algaroth. Powder of A. is the oxychloride of antimony, SbOCl.

Algarotti, Francesco, Count, an Italian poet and litterateur, born at Venice, 11th December 1712. In 1747 he became the chamberlain of Frederick II. of Prussia, who had previously made him a count. He had also a patron in Augustus III. of Poland. He died at Pisa, March 3, 1764. His *Saggi sopra le belle Arti* ('Essays on the Fine Arts') evince taste, and his letters are not without cleverness and ingenuity. In Carlyle's *Friedrich* (vol. iii. p. 39) there is a very lively and piquant sketch of A. Friedrich's sister considers him 'one of the first *beaux-esprits* of this age,' but to Carlyle himself he is not 'supremely beautiful,' though 'full of elegant logic,' of 'speculations on the great world and the little, on nature, art, papistry, anti-papistry, and the opera,' which he takes up 'in an earnest manner, as capable of being a school of virtue and the moral sublime.'

Algarvê, the smallest province of Portugal, lies at its southern extremity, stretching from the Spanish frontier to the Atlantic Ocean. It is a wild, mountainous territory, little fitted for cultivation, but its plains and valleys are prolific of the finest fruits of the S. A range of mountains, of an average height of 4000 feet, forms the northern boundary, terminating in an abrupt precipice at Cape St Vincent. The chief town is Faro (pop. 8500). The principal occupation is fishing, and the inhabitants are re... the best sailors in Portugal. Area, 2730 sq. miles; p... (71) 188,422.

Algebra, *al gebr wal mokhbala*, supplementing and equalising is now the most potent arm of mathematical analysis. Sir W. R. Hamilton, the prince of modern mathematicians, has

defined A. as the science of pure time, in contradistinction to geometry, which he regards as the science of pure space.

Until the time of Descartes, A. was merely a kind of arithmetic, with letters substituted for numbers, and having the same significations for +, −, ×, ÷, √, as arithmetic. All the mathematicians before this epoch were engaged upon methods of solving equations of the first, second, third, and fourth degrees. See EQUATIONS. Descartes, however, applied A. to geometry, thus representing curves by equations; and he regarded + and − as merely the inverse of each other, × and ÷ as the reciprocals of each other. Reasoning from the interpretation of + and − as steps, and × and ÷ as operations of rotation, Sir William R. Hamilton was led to the conception of that powerful calculus Quaternions (q. v.). By such symbolical interpretation, negative and imaginary quantities receive definite significations. See IMAGINARY QUANTITIES. A. was introduced into Italy in 1202 through the medium of the Arabs, who seem to have received it from the Hindus. It made rapid progress in the hands of such men as Tartaglia, Cardan, Ferrari; and at a later date, in the Western countries, Stifelius, Recorde, Vieta, Girard, Descartes, and others, brought it to something like its present state of perfection. The algebraical geometry of Descartes gave the science a great impulse, and such men as Fermat, Newton, Moivre, Taylor, Euler, Lagrange, Fourier, De Morgan, Hamilton, &c., have contributed much to its extension and power. The different subjects treated of in text-books of simple A., of which Colenso's, Kelland's, and Todhunter's may be cited as among the best, will be found under their respective headings, such as Equations, Evolution, Involution, Permutations, Probabilities, Surds, &c.

Algebraic is applied to expressions or equations consisting of a finite number of terms, and involving only the common operations of simple algebra. Such quantities as $\sin. x$, $\log. x$, a^x , &c., which are expressible only by infinite series, are distinguished as *transcendental*.

Algebraic Geometry. See GEOMETRY, ANALYTICAL.

Algeciras, a town in the province of Cadiz, Spain, situated on the W. side of the Bay of Algeciras, directly opposite Gibraltar, from which it is distant 5 miles across the bay and 10 by the coast. It was the port by which the Moors entered Spain in 711, and was only retaken from them by Alfonso XI. (1344), after a siege of twenty months. The town is picturesque but dilapidated, and possesses only to an insignificant extent its once important trade in corn and brandy. Pop. 14,230.

Algeria (Fr. *Algérie*), a country on the N. coast of Africa, bounded N. by the Mediterranean, E. by Tunis, W. by Morocco, and S. by the desert of Sahara. It has a breadth varying from 100 to 300 miles, and extends from 2° 8' W. long to 8° 32' E. long. It was subject to the Turkish empire till 1830, when it became a French possession. The area is about 173,000 sq. miles; pop. (1872) 2,414,218, of whom 2,123,045 are Mohammedans. A. is part of the fertile fringe that skirts the vast barren plateau of N. Africa. It is divided into the provinces of Algiers, Oran, and Constantine, and rises from the coast in three great terraces. The first, and by far the most fertile, is that hemmed in by the Atlas Mountains, which run parallel to the coast-line; beyond lies the 'date-country,' with its vast *sabhas*, or heathy plains, stretching to the base of another mountain chain; and in the extreme S. is the edge of the vast desert of Sahara. The productive strip along the coast, a region of rich valleys and smiling plains, is known as the Tell, and was formerly one of the granaries of Rome. Here the climate is tempered by the sea-breeze; but inland the heat is very great, and the *simoon*, or hot wind, frequently sweeps down from the interior. The chief towns are Algiers, Bona, Constantine, and Ilemzen. The only river of note is the Shelif, about 230 miles long. There are large forests of oak, cedar, pine, and pistachio-nut trees; the southern oases are famed for their dates; and in the Tell cereals and olives flourish, and roses are cultivated for the manufacture of perfume. The country is rich in iron, lead, copper, and manganese. In the mountains lions, panthers, and leopards are found; serpents and venomous insects also abound, and the locust is a great enemy to cultivation. The once famous breed of Numidian horses is now almost extinct; the other domestic animals are the ox, sheep, goat, and camel. The inhabitants of A. are chiefly Kabyles and Arabs, but besides Europeans there

are also Moors, Negroes, and Jews. There are four languages spoken—Berber, Arabic, Turkish, and the Negro dialects of Sudan. Berber is the speech of the aboriginal Kabyles, but Arabic characters alone are used in literature. Little Turkish is now spoken since the rule of the Turk has been superseded by that of the Frank.

The kingdom in early times was divided between the Moors, or Mauri, who occupied the west, and the Numidians, who inhabited the eastern portion. Its prosperity was greatly advanced by the Romans, who founded several flourishing cities along the coast; but about the year 440 it was overrun and devastated by the Vandals. Meanwhile Christianity had established itself in Africa, and continued to be the religion of the country till the sweep of Arab conquest in the 7th c. instantaneously and completely effaced it, substituting in its place a Mohammedan faith, which has ever since prevailed. The Zeiri, an Arabian prince, built the city of Algiers in 935, and firmly established the new dominion. The dynasty of Zeiri was succeeded in 1148 by that of the Almohades (q. v.), which ruled till 1269, when the land fell into the hands of numerous petty chiefs. The Moors and Jews, driven out of Spain by Ferdinand the Catholic in 1492, crossed over to A., and were followed by an expedition under Cardinal Ximenes, which took Algiers in 1509. The city was rescued by the help of Horuk or Harude Barbarossa, a formidable Turkish pirate, who afterwards treacherously murdered the reigning emir, and prepared the way for the Turkish dominion by proclaiming himself Sultan of Algiers. The new ruler was attacked by another Spanish force, suffered several defeats, and was finally captured and beheaded in 1518. Instantly his brother was chosen successor, and with the assistance of a Turkish army the Spaniards were repelled, but the land was henceforth under Ottoman allegiance, and the sultan was represented by a formidable body of janissaries. The cruel despotism of the Turkish soldiery put an end to order and industry, and in its lawless state A. became the home of pirates and freebooters from the Levant. For three centuries Algerine corsairs swept the seas, extorted black-mail, and defied the powers of Christendom. In vain Spanish, French, English, and Dutch fleets assailed and punished the inveterate nation of desperadoes; nothing seemed capable of curbing their wild and rapacious spirit. During the French Revolution the constant presence of strong fleets in the Mediterranean put a stop to their piratical exploits, but matters were soon again on the old footing. In 1815 the Americans defeated the Algerine fleet near Carthage, and in the following year England forced the dey to recognise an international law abolishing at one blow piracy and Christian slavery. But no sooner was A. thus bound over to keep the peace than her corsairs again burst forth, venturing as far N. as the German Ocean. An incident happened at this period, however, which led to the overthrow of the Moslem power. In 1827 Hussein, the reigning dey, struck the French consul during a public audience. A squadron was despatched under General Bourmont to resent this insult, and in 1830, after a tedious blockade, Algiers capitulated to France. The French took possession of the town, captured the fleet, and seized the treasury, which contained over £2,000,000 in money. The dey was allowed to retire to the Balearic Isles, and the Turkish janissaries were mostly removed to Asia Minor. Beyond the precincts of Algiers, however, the country was still unsubdued, and in the remote fastnesses the Kabyles and Bedouins, transported with fierce hatred and religious zeal, were already arising in rebellion. After the conquest of Algiers, the French made no effort to conciliate the peculiarities of the native character, and the soldiers were allowed to behave with extreme licence. Even the mosques and burying-places were often desecrated in destructive levity. Such conduct roused the Marabouts (q. v.), who went through the country preaching a *jad*, or 'holy war,' against this new form of military despotism. The infuriated tribes flocked to the standard of Abd-el-Kader (q. v.), who proved an able and impetuous leader. The French were now forced into a sanguinary war, waged with varying success for many years, by which their territory was finally extended to its present limits. After the most terrible defeats, the dauntless Kabyles again and again broke into insurrection, resisting all attempts to establish permanent authority. They literally ignored being beaten, and carried on the struggle in a series of fierce skirmishes, by which the French saw all their schemes of colonisation frustrated. The subjugation of A. only began to seem possible on the capture of Abd-el-Kader in 1847, so completely

was the restless emir identified with the national cause. But year after year the war continued intermittently, and the descendants of the old Numidians have been rather exterminated than subdued. In 1865 the Emperor Napoleon visited A., and issued a proclamation, in which he tried in vain to propitiate the Arabs. Two years later a severe famine accomplished what had so long baffled French tact and generalship: the Arabs withdrew, all warfare was at an end, and the country was left undisturbed till 1870. In the following year the greater part of the forces was withdrawn for the Franco-Prussian war, and the Arabs, seizing the chance, again revolted, but were quelled by General Durieu. The insurgents were sentenced to pay an indemnity of £1,440,000, and a portion of their land was conferred on the immigrants from Alsace-Lorraine, who had refused to become German subjects.

The French loss since the occupation of A. is estimated at 150,000 men, and the total expenditure at £120,000,000. In 1872 the revenue of A. was £1,246,559; expenditure, £1,529,884. Besides other benefits, the French have conferred a blessing on A. by the 'boring' of artesian wells in the parched oases of Sahara. The Arabs, who in vast numbers visited the first of these wells, regarded the work as a miracle, and the priests solemnly pronounced it the 'Fountain of Peace.' A railway now connects the city of Constantine with the sea, and a telegraph cable was laid in 1870 between Bona and Marseilles. In 1874 the construction of another railway, greatly needed by the increasing trade and traffic of the province, was begun in Oran. The total exports of A. in 1870 amounted to £4,978,250; imports to £6,907,628. The chief exports are esparto grass, wool, cereals, oil, tobacco, wine, and perfumes. Alpha fibre, or esparto grass, for making paper, was exported to Great Britain alone in 1873 to the value of £218,715. The iron and copper mines employ (1875) over 3500 workers; and one of the largest copper mines was sold in 1874 to an English company. The French language is now taught in Mohammedan schools, and the colonists, guarded and watchful after their terrible experience, are at last no longer looked on as a race of inexorable tyrants. As civilisation gains ground, and education spreads, the defiant attitude of the Arabs must gradually disappear; trade and industry will then enjoy full scope for development, and A. will doubtless prove to France a fresh, vigorous, and wealthy accession. See official *Exploration Scientifique d'A.* (1844, 31 vols.), and *Statistique Générale de l'A.*, *Années 1873 à 1875* (1877).

Alghero, or **Algheri**, a fortified seaport on the W. coast of the island of Sardinia. During the Spanish possession of Sardinia, A. was a favourite residence of Charles V. It is a busy town, with a considerable trade, chiefly in wine, tobacco, anchovies, skins, and coral. Pop. 8419.

Algiers (Fr. *Alger*, Sp. *Argel*), the capital of Algeria, on the Mediterranean, situated on the face of a hill which rises abruptly from the sea. The town was founded about 935 by Zeiri, an Arab prince, who named it *Al-jesira*, i.e., the island. It was long the capital of the Turkish deys, and was finally captured by the French in 1830. A. is the residence of the governor-general, the seat of the supreme courts of the colony, and the see of a Catholic bishop, with a cathedral, a naval arsenal, a college, several schools, a museum, a theatre, and beautiful public gardens. It has also a fort and a capital haven. A. is rapidly indeed becoming a French city in character and appearance. The lower half of the town has been almost rebuilt, and is laid out in boulevards, colonnaded streets, and handsome squares. The Moorish town, or Arab quarter, occupies the upper part of the slope, and contains many mosques, sanctuaries of saints, and sacred tombs. The houses are massive and flat roofed, and are built in the form of a hollow square, with galleries running round the interior, each house usually accommodating many families. The narrow tortuous streets, often not more than six feet wide, are only traversed by foot-passengers and donkeys. The trade of the port for 1873 in British vessels alone amounted in exports to £129,700; in imports to £140,220. Pop. (1872) 48,908.

Algo's Bay, an inlet about 20 miles broad, near the eastern limit of Cape Colony, S. Africa. It affords good anchorage, and is memorable as the landing-place (1820) of the first band of British colonists. It receives the rivers Ewir, Sunday, and the Baasher, at whose mouth is Port Elizabeth (q. v.), the flourishing emporium of the eastern province of the colony.

Algon'quins, an aboriginal race of N. America, once extending over all the northern part of the United States, and embracing the famous tribes of the Delawares, the Creeks, the Ottawas, and the Pottawatomies, but now numbering only 200 warriors included in the tribe of the Chippewas.

Al'guacil, or **Alguazil** (from the Arabic *al-wazil*, the power), an inferior officer of justice in Spain corresponding to the English bailiff or constable.

Alha'gi, an Arabic name given to a genus of plants belonging to the natural order *Leguminosa*, found principally in Southern Asia and Western Africa. In Persia and Bokhara a substance is procured from certain species called Manna (q. v.)

Alha'ma (Roman, *Astigia Juliensis*), a town of Andalusia, Spain, 25 miles S.W. of Granada. It is picturesquely perched on a cliff overhanging a deep ravine, through which rushes the Marchan, while above towers the Tejada to a height of 8000 feet. Its recovery from the Moors in 1482 led to the conquest of Granada, of which it was the land-key. The hot baths of A. are still frequented, and many interesting Roman and Moorish remains are yet to be seen. Pop. 7400. The name A. means in Arabic, 'the bath.' There are many other towns of the same name in Spain. The largest of these, noted for its warm mineral waters, lies 17 miles S.W. of Murcia. Pop. 5200.

Alham'bra (Arabic, *Kal'at al hamra*, the red castle), the name given to the remains of the palace of the Moorish kings of Granada. It is enclosed by a wall flanked with towers, dating probably from 1019, while the palace was begun by Ibnu-l-ahmar in 1248. It is the finest existing specimen of Moorish

Alhambra.

architectural art. The walls of the *Court of the Lions* are covered with arabesques, and 128 columns of white marble support the arches of the corridors. The winter palace was removed to make room for that of Charles V., which was never finished. See **ABENCERRAGES**.

Alhaurin' el Gran'dé, a town of Granada, Spain, 17 miles W. of Malaga. It lies in a valley renowned for fertility, and is a favourite retreat of the Malaga merchants. There are marble quarries and lead and antimony mines in the vicinity. Pop. 5514.

Ali, the fourth calif of the Arabs, was born at Mecca A.D. 602. His father, Abu-Taleb, was the uncle of Mohammed, and A. was the first convert that his cousin made. His enthusiastic allegiance to his kinsman, as well as his many brilliant personal gifts, gave him the first position after the Prophet himself in the new religion of Islam. If we are to accept what is told of him in the Eastern chronicles, never did knight of the Round Table or paladin of Charlemagne display more chivalrous devotion or invincible courage. He was with Mohammed in his solitary retreats, and in all his early dangers from the hatred of the Koreish. Pronounced the bravest of the brave after the battle of Bedr, he received in marriage Fatima, the daughter of the Prophet. He was foremost in the assaults on Medina and Khaibar, and indeed on every occasion covered himself with glory. Mohammed returned the affection of his ardent cousin. 'You are to me,' he once said, 'as Aaron was to Moses.' It is

probable that the Prophet meant to name A. as his successor, but dying without an expression of his will, three califs obtained the honour of the califate before him. This was mainly owing to the enmity that had sprung up between A. and Ayesha, the last and the favourite wife of Mohammed. At length, in 655, he was proclaimed calif, but his election was challenged by the party of Ayesha, and to enforce his authority it was necessary for him to appeal to the arbitration of the sword. In short, a civil war broke out, but at the *battle of the Camel* he completely crushed his enemies. But a far more formidable opposition soon arose, headed by Moawiyah, governor of Syria, and by Amru, the conqueror of Egypt. A. drew his support from Irak and Persia. Fierce and bloody battles ensued, in which A. was generally successful; but at last it was resolved to terminate the strife by a treaty of peace, and to endeavour to discover from the Koran which of the two was the rightful calif. By a scandalous trick A. was set aside, but his partisans refused to ratify what they considered an iniquitous decision, and the struggle would doubtless have burst out anew had not A. been assassinated in the mosque at Cufa, 23d January 661, by some fanatical Arabs who wished to recover their old independence, and who had sworn to put Moawiyah and Amru to death also. A. was not only a brilliant warrior, but a man of poetic genius. The best edition of his 'sentences' is that of Fleischer, *Ali's hundert Sprüche Arabisch und Persisch paraphrasirt* (Leipzig, 1837).

Ali, better known as **Ali Pasha**, an Albanian chief, surnamed *Arsian*, 'the Lion,' was born in 1741 at Tepelen. After the death of his father, who had been robbed of the greater portion of his possessions by the neighbouring chiefs, his mother—a woman cruel, vindictive, and unscrupulous—secured the succession for A., then fourteen years of age. In his youth he was subjected to the hardships incident to a life of predatory warfare; but becoming accidentally possessed of wealth, he raised a body of troops, by whose aid he recovered Tepelen. He now commenced to intrigue at the Porte, and was secretly commissioned to kill Selim Pasha of Delvino, receiving in return the lieutenantcy to the Pasha of Derwend. Instead of repressing the *klephtis* (robbers), he shared in their booty; and being deposed by the Porte, he regained its favour by well-timed bribery. In the Turkish war of 1787 against the Austrians and Russians he distinguished himself highly, and was appointed to a pashalic in Thessaly. He cleared the roads of robbers, and usurping the pashalic of Janina, he was confirmed in it by the Porte for the vigour with which he had extinguished anarchy and restored order. He attacked and subdued the Sulhotes, but with circumstances of unspeakable cruelty. He was now made governor of Rumili, where his rule was just, if not beneficent. In 1807 he allied himself with Napoleon, hoping through his influence to obtain Parga, a hope not realised till ten years later, by the favour of England. His power being now securely established, and his dominions largely extended, he caused the commanders of the Greek militia, of whose aid he had hitherto availed himself, to be assassinated. His extortions became intolerable, and the sultan, in 1820, ordered his deposition. Being compelled to abandon Janina, he surrendered on the condition that his life and property should be spared; but he was beheaded, 5th February 1822. He was a man of singular ability, and, though crafty and cruel, tolerant of religious differences. The part he was enabled to play gives us a singularly clear idea of the moral and political condition of the Ottoman empire at the close of the 18th and beginning of the 19th c.

Alia, a town in Sicily, 30 miles S.E. of Palermo. It lies picturesquely on the brow of a hill near the mountain stream Fiume Torto. Pop. 5425.

Aliakoo, an Indian tree, *Menecylon tinctorium*, the leaves of which are used for dyeing yellow.

Alibi, elsewhere. In criminal prosecutions the term is used to denote the defence of the accused when he tries to show that he could not have committed the offence charged against him, because, at the time stated in the indictment, he was not at the alleged place of committal; that is, 'he was elsewhere.' If proved, the defence is in some cases conclusive in favour of the accused; but, as offering much temptation to give false evidence, the plea of A. requires the closest scrutiny from judge and jury. When a witness speaks pointedly as to time, he should be

severely examined as to his reasons for having noted and remembered it so exactly. There are many crimes in which allegation of place of committing is immaterial, such as forgery. In these, proof of A. is of no effect.

Alicante, the capital of a maritime province of the same name, Spain, lies in a bay of the Mediterranean, 85 miles S. of Valencia. It is a large seaport with strong fortifications, and is overlooked by a castle 400 feet above the sea. The exports are chiefly cotton and linen fabrics, soda, ropes, corn, oil, silk, and the dark-coloured A. wine (*vino tinto*). The Moors besieged A. in 1331, and the French in 1709. It was bombarded by the Cartagenan insurgents October 1, 1873, but the old citadel and forts were much too strong for the ironclads of the Intransigentes, which retired crippled and exhausted after an action of two days. Pop. (1870) 31,500.

Alicata, or **Licata**, a seaport on the S. coast of Sicily, 26 miles S.E. of Girgenti, at the mouth of the river Salsa. It is terraced on a hill rising abruptly from the sea, and is overhung by a grand old fortress. It is supposed to occupy the site of the ancient *Phintias* (built 280 B.C.), to which the captive inhabitants of Gela were transferred. Several famous battles of the Carthaginians, Sicilians, and Romans were fought in the town and its vicinity. Large vessels cannot come within a mile of the harbour; but there is considerable trade in fruit, sulphur, soda, and wines. Pop. 14,338.

Alien. The citizen of one state resident in another is an A., unless naturalised. Children of a British subject born out of the British dominions are nevertheless held to be subjects of the British crown, unless the father is under the penalties of high treason or felony; or is in the service of a foreign state at war with Great Britain. It does not affect this privilege that the mother of the child so born is a foreigner; but the child must be from birth legitimate.

The influx of foreigners into England consequent to the French Revolution, led to the passing of several Acts of Parliament, known as the Alien Acts. The object of these was to check and regulate the foreign influx. This is now done under the Peace Alien Act of 1836.

The general rule is that an A., not being an enemy, may, except in the case of British ships, acquire a right to personal property in Great Britain. But in Scotland he cannot acquire or succeed to real property (heritage). These disabilities may be removed by Act of Naturalisation, by Letters of Denisation, or by naturalisation by certificate from a secretary of state. An Act of Naturalisation is an Act of Parliament conferring to considerable extent on the foreigner the privileges of a natural-born subject. The Act cannot be got until the applicant has resided for seven years in Great Britain.

Letters of Denisation are letters-patent issued by the crown, conferring to some extent the privileges of a British subject. Naturalisation by certificate is by Act 7 and 8 Vict. c. 66. It chiefly confers privileges on aliens with regard to succeeding to, devising, or purchasing real or personal estate in Great Britain. An alien is not by any of these forms of naturalisation protected by the British crown against obligations incurred to his native country previous to naturalisation. Thus, a naturalised Frenchman returning to France, and being there held liable to military service, will not be freed from the obligation on the ground of his being a British subject. A British subject resident in a foreign state may, according to our law, divest himself of his nationality, and become a subject of that state. But residence abroad does not of itself cause loss of British nationality.

Align'ment, in military language, means the arrangement of troops 'in line,' or of tents of a camp on a rectilinear plan.

Aliment, or, according to some writers, **Alimony**, is a term of Scotch law, signifying all that is required to maintain life, or its pecuniary equivalent. Those who are unable to support themselves are, in certain circumstances and in respect of certain relationships, entitled judicially to enforce a claim for A. As no superfluity is included, an alimentary allowance is not attachable by arrestment (q. v.).

Alimentary Canal is a tube commencing at the mouth and terminating at the anus. Its upper end is in relation to the base of the skull, the succeeding portions traverse the neck, thorax, abdomen, and pelvis, but by far the greater part is contained

within the two latter cavities. The first part consists of the organs of mastication, insalivation, and deglutition, and include the mouth, with its appendages, the teeth and salivary glands, the pharynx, and œsophagus, or gullet. The next portion includes the part more especially connected with digestion, absorption, and defecation, and includes the stomach and intestines, small and great. The digestive tube is lined throughout by mucous membrane, which is supported by layers of fibrous and muscular tissue. The length of the A. C. varies in different animals. It is shorter in carnivorous and omnivorous than in herbivorous animals. A special description of the various parts will be found under the headings Mouth, Pharynx, Œsophagus, Intestine, Small and Large.

Alimony is, in English law, a term denoting the allowance which may be sued for or given to a married woman on separation from her husband. See ALIMENT.

Aliquot Part is a number which is contained in another number an exact number of times without remainder. Thus, 5, 3½, 2½, &c., are A. parts of 10, being contained in this last number two, three, and four times respectively.

Alisma'ceæ, a small order of monocotyledonous aquatic plants embracing 5 genera and about 60 species. The water plantain (*Alisma plantago*) is an ornamental plant by the margins of rivers and lakes in Britain. Species of *Alisma* and *Sagittaria* (arrow-head) have a fleshy rhizome which is eatable. Several Brazilian species of *Sagittaria* are very astringent, and their expressed juice has been employed in the preparation of ink.

Alisma plantago.

Alison, Rev. Archibald, author of the *Essays on Taste*, was born at Edinburgh 13th November 1757, studied at Glasgow and Oxford, and having taken orders, was appointed vicar of Kenley, in Shropshire. Leaving England in 1800, A. accepted the senior charge in an Episcopal chapel in Edinburgh, and died there 17th May 1839. The *Essays on the Nature and Principles of Taste* (1790, 2d. ed. 1811) uphold the 'association' theory of Æsthetics (q. v.), and are elegantly written. It was the appearance of the second edition that called forth Jeffrey's celebrated critique in the *Edinburgh Review*.

Alison, Sir Archibald, Bart., historian of modern Europe, was the son of the preceding, and was born at Kenley, Shropshire, in 1792. After studying with distinction at Edinburgh University, he joined the Scotch bar in 1814. In this year, when the allied sovereigns met at Paris, A. visited the French capital, beheld Talma playing 'before a pitful of kings,' and conceived the great idea of writing an account of the events which led to this brilliant and singular congress of monarchs. In the realisation of this idea, which took the form of *The Modern History of Europe from 1789 to the Restoration of the Bourbons in 1815* (10 vols., 1839-42), and a continuation entitled *The History of Europe from the Fall of Napoleon to the Accession of Louis Napoleon* (9 vols., 1859), the remainder of his life may be said to have been occupied. He qualified himself rigorously for his task, and visited the scenes of the principal battles he describes. His work, which has a world-wide popularity, and has been translated into Arabic and Hindustani, as well as into most of the European languages, is useful, readable, though not vivid, and in the main trustworthy, though often inaccurate in detail. To none of his minor works does any living interest attach itself. A. died May 23, 1867.

Alison, William Pulteney, M.D., brother of the historian, born in 1790, studied at the University of Edinburgh, and took his medical degree in 1811. He was the author of several works in sociology and medicine, and was professor of the practice of medicine in Edinburgh University from 1832 to 1855. His principal works are—*Outlines of Physiology and Pathology*

(1833), and *Dissertation on the Reclamation of Waste Land* (1850), in which he advocates the utilisation of the labour of paupers and criminals. A. died September 1859.

Al'wal, a village in the N.W. of India, on the Sutlej, near Ludianah. It was the scene of a brilliant victory of the British, under Sir Harry Smith (28th January 1846), over a Sikh force of superior numbers.

Alk, a gum-resin obtained from *Pistacia Terebinthus*, a tree of Southern Europe, Northern Africa, and Asia.

Alkalest. See ALCHEMY.

Alkalies. Originally the word alkali was used to denote that part of the ashes of plants soluble in water. Later its meaning became greatly extended, all substances which effervesced when treated with an acid being called A. At the present day the name of alkali is restricted to a few substances possessing closely analogous properties. The only important A. are potash, soda, and ammonia, or, as they were previously called, the vegetable, mineral, and volatile alkali. The chief characters of the A. are as follows: They are without exception soluble in water. They neutralise acids, forming salts. The carbonates of the metals which they contain are soluble. They exert a peculiar action on vegetable colouring-matters. Tincture of litmus, which has been reddened by acids, is restored to its original blue colour. Purple cabbage infusion and blue vegetable colours generally are coloured green, and yellow turmeric dark brown. They exert a corrosive action on organised bodies, have a peculiar soapy taste, and precipitate most metals (as hydrates) from solutions of their salts.

With the exception of ammonia, the A. may be regarded as compound of water with the oxide of a metal; Potash, for example, as oxide of the metal potassium and water, K_2O, H_2O ; soda as a compound of oxide of sodium and water, Na_2O, H_2O .

Chemists of the present day, however, take a different view of the constitution of these bodies, regarding them as derived from water by the replacement of an atom of hydrogen by an atom of metal. Thus—

HOH	KOH	$NaOH$
Water.	Potash.	Soda.

With respect to the alkali Ammonia, its solution behaves in some respects like the hydrate of a metal. Nevertheless the hydrate has never been isolated. The A. are used in the arts and in medicine. See POTASH, SODA, and AMMONIA.

Alkalim'etry is the name of the process for determining free alkali in a solution. The process is that of acidimetry reversed. A standard solution of acid is made, and from the quantity of it which is needed to neutralise a measured quantity of the alkaline solution, the quantity of alkali is readily calculated. See ACIDIMETRY.

Alkaloids are a group of organic compounds containing carbon, nitrogen, and hydrogen as invariable constituents, a few only contain, in addition, oxygen and sulphur. Some are prepared artificially, and do not occur in nature; others exist ready formed in the tissues and organs of plants and animals; a few of the latter have also been prepared artificially. Their properties are closely allied to those of the alkalies. They neutralise acids, forming well-marked salts. They often show an alkaline reaction, that is to say, colour turmeric brown, and restore the blue colour to reddened litmus. Many of them are invaluable as medicines, and some are largely employed in the arts as colouring-matters. Subjoined is a list of some of the more important members of this group of bodies. See Watt's *Dictionnary of Chemistry*.

Name.	Formula	Source.
Aconitine	$C_{34}H_{47}NO_7$	<i>Aconitum Napellus</i> .
Aniline	C_6H_7N	Benzol.
Atropine	$C_{17}H_{23}NO_3$	<i>Atropa Belladonna</i> .
Brucine	$C_{23}H_{26}N_2O_4$	<i>Strychnos nux vomica</i> , <i>S. ignatii</i> , <i>S. columbrina</i> .
Caffeine or Theine	$C_8H_{10}N_4O_2$	Tea, coffee, &c.
Chinchonine	$C_{20}H_{26}N_2O_8$	Chinchona bark.
Morphine	$C_{17}H_{19}NO_3$	Opium.
Narcotine	$C_{23}H_{33}NO_7$	
Nicotine	C_5H_7N	Tobacco.
Quinine	$C_{20}H_{24}N_2O_8$	Chinchona bark.
Strychnine	$C_{21}H_{22}N_2O_3$	<i>Strychnos nux vomica</i> , &c.

Alkanet, name given to different species of boraginaceous plants belonging to the genera *Achusa* and *Alkanna*. *A. tinctoria*, a native of Southern Europe, and cultivated in France and Germany, is the source of A.-root or Alkanna-root, from which is obtained a valuable reddish-brown dye. It is used in giving a crimson colour to perfumery, oils, pomades, salves, soaps, &c. It is also employed in dyeing wood in imitation of rosewood, and for colouring spurious port wine. *Achusa sempervirens*, Everlasting A., is a naturalised plant in Britain. *A. officinalis*, Common A., has been used as an emollient. Imports of A. to Britain are from 10 to 12 tons annually.

Alkan'na (see ALKANET), also applied to a colouring-matter called Henna (q. v.), prepared from *Lawsonia alba*, a dwarf Indian shrub.

Alkmaar, a town of N. Holland, stands on the Helder Canal, 25 miles N.N.W. of Amsterdam by railway. It has a fine Gothic town-house. In 1799 the Duke of York surrendered his army at A. after being twice defeated by the French. It exports 9,000,000 lbs. of cheese annually—probably more than any other town in the world. There are considerable manufactures of sail-cloth and parchment. Henry of A., a famous Dutch poet of the 15th c., was born here. Pop. (1870) 11,427.

Alla Breve, a musical term, having its origin in the fact that the *breve*, the longest note in old music, was twice as long as the longest note at present used, and signifying that each note is to be played or sung as if it were only half its written length.

Allah (Ar. *al* and *ilah*, the worthy of adoration), the Arabic name of God, now in use in all countries to which the religion of Mohammed has spread. The Prophet's conceptions of the character of A. are essentially Judaic, and rise high above the prevailing grossness of Oriental fancy, but they also express his antagonism to the Christian mystery of the Trinity, and are, so to speak, a dogmatic declaration of monotheism: 'There is no God, but the God (Allah). This only true, great, and highest God has existence of himself is eternal, *not begotten and begets not*, is sufficient of himself, fills the universe with his infinity, is the centre in which all things unite, visible and invisible lord of the material and spiritual worlds, creator and ruler, almighty, all-wise, all-good, merciful, and whose decrees are irrevocable.'

Alla'habad ('city of God'), an ancient and renowned city in British India, N.W. Province, chief city of the district of A., at the confluence of the Ganges and Jumna, about 500 miles W.N.W. of Calcutta, and 75 W. of Benares. It is regarded, from its situation, with pious veneration by the Hindus, who annually visit it in great numbers for the purpose of ablution in the sacred streams on which it stands. The native part of the city is generally mean and unattractive, though there are some ancient monuments of great beauty. The European quarter is greatly superior. A. possesses barracks for the European, and cantonments for the native, troops, in connection with which are numerous fine villas and bungalows. The chief buildings are the fort, built by the Sultan Akbar in 1583, at the junction of the rivers, the Great Mosque, and the Sultan Khosru's Caravanserai. The situation of A. makes it of great commercial importance, and it is the seat of an extensive trade in cotton. It is a station on the Grand Trunk Road and East Indian Railway. Pop. (1871) 105,926. By treaty in A. in 1765, Bengal, &c., was ceded to the English. It became memorable during the mutiny of 1857 as the scene of a massacre of English officers by native troops. The insurrection was promptly suppressed by Colonel Neil, who marched from Benares.

The division of A., in the N.W. Province of British India, is bounded N. by Oude and Agra, E. by Behar, S. by Gundwana, W. by Malwa, is about 270 miles in length and 120 in breadth, and has an area of 13,421 sq. miles. Pop. (1871) 5,468,955. It is watered by the Ganges, Jumna, and Goomtee, and is one of the most productive and populous districts in India. Among its products are cotton, indigo, sugar, opium, coffee, grain, and fruits.

Allaman'da, a genus of handsome climbing shrubs, natives of S. America, and belonging to the natural order *Apocynaceæ*. They are prized in gardens for their gorgeous profusion of rich golden flowers. The best known species are *A. Aubletii*, *A.*

Schottii, and *A. nerifolia*. An infusion of the leaves of *A. cathartica* is used as a remedy for colic.

Allan, Bridge of, a picturesque village in Perthshire, on the Allan, 3 miles N.W. of Stirling. Its sheltered position and mineral (saline) wells have made it a great resort of invalids, for whose accommodation there are good lodgings and capital hotels. Pop. (1871) 3055.

Allan, David, sometimes styled the Scottish Hogarth, was born at Alloa, February 13, 1744. In 1755 he was sent to the academy of the Foulises at Glasgow to learn to be a painter, and in 1764 he went to Rome. Here in 1773 he gained the gold medal of the Academy of St Luke for an historical composition, the 'Origin of Painting,' which was engraved by Cuneo, and is A.'s best picture. In 1777 he visited London as a portrait-painter, and in 1786 was made master of the Art Academy at Edinburgh, where he died, August 6, 1796. His most popular designs are his illustrations of Ramsay's *Gentle Shepherd*.

Allan, Sir William, historical painter, born at Edinburgh in 1782, entered the School of Design, where Wilkie was his fellow-student, and afterwards studied at the Royal Academy. Dissatisfied with his success in London, he went to St Petersburg, and remained there nearly ten years, making occasional journeys to the Crimea, &c., where he gathered materials for after use. Returning to Edinburgh in 1814, he exhibited his 'Circassian Captives,' which fixed his reputation as an artist, though his works did not at first command a ready sale. A disease of the eyes compelled him to desist from painting for a time, during which he visited the S. of Europe and Asia Minor, and on his return he painted his 'Slave-market at Constantinople.' In 1826 he was elected A.R.A., and became R.A. in 1835. In 1838 he was chosen president of the Scottish Academy, and succeeded Wilkie as her Majesty's Limner for Scotland in 1841, when he was knighted. He died 22d February 1850. The fidelity, skilful composition, and vigour of his works merit the highest praise. His illustrations of Scottish history are well known through engravings.

Allantois is a bag or sac found in the embryo. It arises from the termination of the alimentary canal, which, at this early period of development, is shut, and it subsequently becomes differentiated into the bladder, the urachus (a tube passing from the bladder to the umbilicus), and into a bag situated outside the abdomen. In batrachians, such as frog and toad, the A. never extends beyond the abdominal cavity; in scaly reptiles, and in certain mammals, it surrounds the body of the fœtus, lining the outer covering of the ovum called the chorion; in most mammalia the extra-abdominal portion is small, and uniting with a portion of the chorion, forms the organ known as the placenta, by which the fœtus is connected with the mother. The function of the extra-abdominal portion of the A. is to nourish the early fœtus, and also to act as a respiratory membrane.

Allegha'nies. See APPALACHIANS.

Allegha'ny, a river of N. America, rises in Pennsylvania, about 5 miles from Lake Erie, with which it is connected by a canal. It joins the Monongahela at Pittsburg, and forms the Ohio, next to the Missouri, the largest affluent of the Mississippi. The A. is navigable for 200 miles above Pittsburg, and is part of perhaps the longest steamboat channel in the world, stretching from Lake Erie to the Gulf of Mexico, a distance of about 2400 miles.

Allegheny, a flourishing city of Pennsylvania, U.S., on the river Alleghany, opposite Pittsburg, and 350 miles S.W. by W. of New York by railway. It communicates with Pittsburg by five fine bridges, and has forty-five churches, of which fifteen are Presbyterian, nine Methodist, and ten Roman Catholic. There are three theological seminaries, various benevolent institutions, the Western Penitentiary, a fine public park, a soldiers' monument (costing 40,000 dollars), a public library, tramways, and extensive waterworks. The manufactures are cottons, woollens, iron, steel, locomotives, machinery, leather, salt, white-lead, &c. The city is rapidly increasing. Pop. (1870) 53,180.

All'giance is the fidelity due by every natural-born and naturalised subject to the crown. Temporary A. is also due to the crown by foreigners resident in the kingdom. 'True A. to the sovereign' is sworn by all who take the Oath of Abjuration (q. v.).

Allegory, a figure of speech which represents trains of thought by visible images, and which may be described as a continued metaphor. It was popular, especially in the East, from an early period, and the 80th Psalm, containing the comparison of Israel to a vine, is a famous and well-sustained example. Spenser's *Fairy Queen*, Thomson's *Castle of Indolence*, Swift's *Tale of a Tub*, Addison's *Vision of Mirza*, and particularly Bunyan's *Pilgrim's Progress*, are well-known allegories. A. may be exhibited in the fine arts, or on the stage, with as much effect as in language. In religious literature, *Allegorical Interpretation*, which gives a higher and more spiritual significance than appears in the letter, was once popular. Its use was of great antiquity, though generally associated with the Alexandrian and Jewish schools. Philo-Judæus among the Jews, and Origen among Christian writers, were much addicted to A., Origen asserting that to those who understood them literally the Scriptures were of little use.

Alle'gro (Ital. *lively*), a musical term indicating that the piece of music so marked is to be played in somewhat quick time, and in a spirited and lively manner. In a composition of several movements each is commonly distinguished by the time which is marked upon it; in this way A. is often used as a substantive, as the A. of a symphony, &c.

Allen, Bog of, a morass of vast extent in the centre of Ireland, covering part of King's County and Kildare. It is bounded by the Shannon on the W., and comes within 17 miles of Dublin on the E., having an area of about 240,000 English acres. All attempts to reclaim the bog have failed, the depth of peat found in it being 25 feet. The rivers Barrow and Boyne rise in this swamp, which is also traversed by the Royal and Grand Canals.

Allentown, a town of Pennsylvania, U. S., on the W. bank of the Lehigh river, 50 miles N. of Philadelphia, is the centre of a district rich in iron ore and anthracite. It has numerous iron-works, and is connected with the capital by a canal and railway. Pop. (1870) 13,884, chiefly Germans.

Alleyn, Edward, actor, was born 1566, and died 1626. He is noted as the friend of Shakespeare, but still more as the generous founder of Dulwich College (q. v.), the building of which was commenced in 1613, and its charter granted in 1619. His wife and he lived there on his own foundation. By his will he endowed twenty almshouses in London. See Payne Collier's *Memoirs of Edward Alleyn* (Lond. 1841), also the *Alleyn Papers* (1843).

Allia, a rivulet falling into the Tiber, 11 miles N. of Rome, supposed to be identical with what is now known as the *Scolo del Casale*.

Alliaceus Plants, those having the smell of garlic, such as species of *Allium* (q. v.), and plants allied to them.

Allia'ria, a genus of Cruciferous plants having a garlic odour. *A. officinalis*, called garlic-mustard, sauce-alone, and Jack-by-the-hedge, is a common biennial hedge-bank plant in many parts of Britain. Some authors have placed it in the genus *Erysimum*, and others in *Sisymbrium*. It is occasionally used as a pot-herb, and seems worthy of cultivation for its nutritious qualities. Its powdered seeds have been employed to provoke sneezing.

Allice, or **Common Shad**, a species of shad—the common shad (*Clupea alosa*)—which fish is included in the *Clupeidae* or Herring family. See SHAD.

Allier, a department in the heart of France, sloping from the highland region of Auvergne N. to the Loire. Area, 2830 sq. miles; pop. (1872) 390,812. It formed part of the old province of Bourbonnais. The soil varies in quality, but is generally fertile, and though agriculture is not scientific, the cereal produce is considerable. Cattle-breeding is an important industry, and both red and white wines are grown. The numerous streams, all of which flow into the Loire, are stocked with fish. The mineral wealth of A. is great, especially in iron, coal, marble, granite, and chalk, and there is also some manufacturing activity. The mineral springs of Vichy are celebrated. Capital, Moulins.

Allier, a river of France, from which the department takes its name, rises at an elevation of 4380 feet in the mountains of Lozère, a western spur of the Cevennes, flows in a northerly direction through Haute-Loire, Puy-de-Dôme, and Allier, pass-

ing the towns of Brioude, Issoire, and Moulins, and falls into the Loire a little below Nevers after a course of more than 200 miles, for nearly two-thirds of which it is navigable.

Alligation is a rule in arithmetic which treats of the solution of questions, such as these: Given the prices per pound and the quantities of the ingredients of any mixture, what is the price per pound of that mixture? In what proportion must the ingredients (the prices of which are known) be mixed in order to produce a known mixture? Any good treatise on arithmetic or algebra will give the methods for the solution of such.

Alligator, or Caiman. This reptile forms a genus of the order *Crocodylia*, and presents differences both in structure and distribution from the more familiar crocodiles. The head is short and flattened, the teeth number from thirty-six to forty-four in each jaw, and the fourth (or canine) tooth of the lower jaw is received into a distinct pit or cavity in the palatal surface of the upper jaw, and is therein concealed when the mouth is closed. The upper jaw, in old specimens, may be quite perforated by these lower teeth. The hind limbs are not fringed as in the crocodiles, and the feet are only imperfectly webbed. The alligators are more terrestrial in habits than the crocodiles. They are chiefly nocturnal animals, inhabiting muddy swamps, and lying concealed during the day. The food consists mainly of fishes, but also includes higher animal fare. The eggs are

Alligator, or Caiman.

deposited in the mud or sand, and are hatched by the sun's heat, although the females are said to hover about the spot and to jealously guard the welfare of their progeny. In length, alligators vary from 3 to nearly 20 feet, and several distinct species are known. They chiefly inhabit the tropical regions of America, but occur in both divisions of that continent. The *A. Mississippiensis* is the most familiar form, this species inhabiting the Southern States of the Union. The Caiman found in Guiana (*A. palpebrosus*), and the Spectacled *A. (A. sclerops)*, so named from the osseous rings surrounding the eyes, are also familiar to naturalists. These animals take the place in America of the crocodiles of the Old World; although species of crocodiles also occur in the New World. The flesh is eaten by the Indians and negroes, and an oil is extracted from the fat of some species. In the Eocene deposits of England *A.* fossil remains occur.

Alligator Apple, a W. Indian fruit, the produce of *Anona palustris*. It has narcotic principles, and is not eaten. See CUSTARD APPLE.

Alligator Pear, a highly-esteemed W. Indian fruit. See AVOCADO PEAR.

Alligator Wood, a timber imported from Cuba, obtained from a species of *Guarea*.

Alliteration, in composition, is the recurrence of the same letter at the beginning of successive words. Its nature and function are accurately described in a familiar verse of Pope's, which is also a felicitous illustration of the thing—

'Apt alliteration's artful aid.'

Among the Teutonic nations *A.*, and not rhyme, was the distinctive feature of verse. English verse down to the Norman Conquest was exclusively alliterative, and even after English had assumed a somewhat modern form *A.* still maintained its place. The author of *Piers Plowman*, who was a contemporary of Chaucer, uses it. So long as it was the characteristic mode of English versification the rule was that two words of the first hemistich of a verse should begin with the same letter, and one of the second, and that these words should be emphatic. After the triumph of rhyme *A.* became a mere adornment, and was used capriciously, according to the taste or want of taste of the writer. In Spenser's *Fairy Queen* it is superabundant, and in some of the prose writers of the same century it is employed with ludicrous elaboration; e.g., 'The chickens of the church,

the sparrows of the spirit, and the sweet swallows of salvation.' When Alexander Scott addresses Queen Mary of Scotland thus:—

'Fresh, fulgent, flourist, fragrant flower formose,' &c.,

A. degenerates into a painful blemish, but when used with skill and an ear for melody it has an exquisite effect. Coleridge furnishes a faultless specimen—

'The fair breeze blew, the white foam flew,
The furrow followed free.'

So naturally do men employ *A.*, that it has affected many colloquialisms in all languages, e.g., through thick and thin, house and home, house and hall, &c., and it often gives the chief point to witty and satiric writings—as when it was said of Cardinal Wolsey—

'Regot by butchers, but by bishops bred,
How high his haughty honour holds his head.'

Allium, a genus of bulbous plants belonging to the natural order *Liliacea*, and remarkable for their pungent odour. The species are numerous, very few of them ornamental, but several are cultivated as esculents, such as the Chive (*A. Schoenoprasum*), the Garlic (*A. Sativum*), the Leek (*A. Porrum*), the Onion (*A. Cepa*), the Kocambole (*A. Scordoprasum*), and the Shallot (*A. ascalonicum*). There are nine species indigenous to Britain. *A. ursinum*, Ramsons, or broad-leaved Garlic, is common in most woods, and occasionally in damp pastures. When eaten by cows, it gives a strong garlic odour and taste to their milk. *A. vineale*, Crow-garlic, also a common British species, acts in the same way.

Allium ursinum.

Alloa, a seaport, Clackmannanshire, Scotland, on the N. bank of the Forth, 7 miles below Stirling. It is an old town, but of late years has been greatly improved. It is a station on a branch of the Stirling and Dunfermline Railway, and is connected with the Scottish Central by a steamboat ferry across the Forth. *A.* has a good harbour, a dry and wet dock, and the total shipping registered at the port in 1874 amounted to 5527 tons. There are extensive manufactures of whisky, ale, glass, woollens, pottery, and machinery, and near it large coal-pits. The chief exports are coal, ale, and glass; imports, fax, linseed, wool, and iron. *A.* House, the ancient seat of the Earls of Mar, in the vicinity of *A.*, was burned in 1730; the tower, 89 feet high, built in the 13th c., is still standing. Pop. (1871) 9362.

Allocution, properly any formal address, but originally applied to the address of a general to his troops. It is now generally restricted to the addresses made by the Pope to the College of Cardinals on matters of ecclesiastical or political importance. These are in reality official utterances.

Allodium, or **Allodial Tenure**, is a term used in contradistinction to *feudal*, or *feudal tenure*. The right to all personal property is allodial. In England, with regard to real property, the fundamental legal maxim is, according to Blackstone, that 'the king is the universal lord and original proprietor of all the lands in his kingdom; and that no man doth, or can, possess any part of it but what has, mediately or immediately, been derived as a gift from him, to be held upon feudal services.' In England, therefore, allodial tenure does not exist. This universality of feudal tenure was recognised in England shortly after the Norman Conquest, when all the principal landholders submitted to the yoke of military tenure. The military services to be rendered by the proprietors have long ago fallen into desuetude, and the legal tenure has become a fiction; yet a chain of titles, if complete, is always found to have its last link in the paramount superiority of the crown. See FEUDALISM. The only allodial tenures of real property in Great Britain are the Udal rights in Orkney and Shetland, which formerly belonged to Denmark, in which country, though feudality is the general rule of tenure, it is not universal.

Allopathy. See HOMŒOPATHY.

Allot'ment of Land. This is an English law expression. It signifies a grant of a portion of land too small to be worth a formal conveyance. Under the General Enclosure Act, it is allowed to be made to any one in actual possession; but the grant does not injure a title previously existing. Commissioners are appointed to make these allotments. The system was not much used till the year 1830, when a great deal of agricultural distress prevailed in England. It is said to have acted beneficially; to have diminished crime in agricultural districts, and to have improved the character of the peasantry.

Allotropy is a term used in chemistry to designate the property possessed by certain substances of existing in two or more distinct states, the chemical and physical properties of the same substance differing in each of the states in which it exists. Phosphorus is an excellent example of an allotropic element. Common phosphorus is a colourless or slightly yellow, semi-transparent solid, at ordinary temperatures, much resembling wax in consistence and appearance. Its specific gravity is 1.826. It fuses at 44° C., and boils at 290° C. It has a powerful affinity for oxygen; so great, indeed, that in warm weather phosphorus often ignites if exposed to the air, from the heat developed by its rapid oxidation. It is luminous in the dark, perhaps from the same cause. It is very readily inflammable, igniting at a temperature of 60° C. It is soluble to a considerable extent in bisulphide of carbon, and also in many oils, resins, and essences. It is one of the most active irritant poisons known. If this variety of phosphorus be heated in an inactive atmosphere, such as nitrogen or carbonic acid, to a temperature of 250° C., every one of its properties become modified or altered. It now presents the appearance of a dark red or chocolate coloured, perfectly opaque, odourless mass. Its specific gravity has increased to 2.1. It ceases to emit light in a dark room, does not ignite by friction, nor till heated to a temperature above 270° C. It has lost its power of dissolving in those substances which dissolve ordinary phosphorus, and fuses first at a temperature of 250-270° C. Being insoluble, it does not act as a poison. The causes of A. are not understood.

Alloway Kirk, a small ecclesiastical ruin on the Doon, near Ayr, the scene of the *diablerie* described so inimitably in Burns's *Tam o' Shanter*. The cottage where Burns was born is in the vicinity of A. K.

Alloy, or Alloy, in law, denotes the inferior metals mixed in the gold and silver of our coinage. It is used to pay the expense of coinage, and to make the gold or silver more fusible. The A. in gold coin is silver and copper; in silver coin it is copper alone. The standard of gold is 22 carats pure, and 2 of A. in the pound troy. The standard for silver is 11 oz. 2 dwt. pure, to 18 dwt. of copper A. The pound of standard gold is coined into the value of 44½ guineas. A poundweight of standard silver is coined into 62 shillings.

Alloys are made by fusing together different metals in various proportions. The physical properties of an alloy differ as a rule very considerably from those of the metals of which it is composed, and it is owing to this fact that A. are of so much importance in the arts and manufactures, for comparatively few metals possess properties which fit them for use in the pure state. Gold and silver, for instance, are not sufficiently hard to be used for coins; if employed for this purpose in the pure state, they would rapidly wear away from the constant attrition to which they are subjected. They are therefore alloyed with a small quantity of copper, which has the effect of producing comparatively hard and resisting metals well suited for purposes of currency. Although the properties of individual metals may be well known, it is not possible to foresee the properties of the A. which may be formed by fusing them together. It is known, however, that brittle metals form brittle A., and that the alloy of a brittle with a malleable metal is also brittle; further, that the fusing-point of an alloy is always below the mean of its ingredients; *fusible metal* is a familiar and striking example of this.

The properties of an alloy depend not alone on the metals of which it is composed, but also on the proportions in which these are present; thus, tin forms A. with copper, which, as they increase in percentage of the former metal, are known respectively as bronze, gun-metal, bell-metal, and speculum-metal.

With regard to the chemical nature of A., it becomes a question whether they should be classed amongst the mixtures or compounds, for they partake of the properties of both. It seems probable that some A. are really chemical compounds, whilst others are merely *solutions* of metals in these. Subjoined is a list of the more important A., with their percentage composition:—

Bronze	Copper 95	Tin 5
Gun-metal	Copper 90	Tin 10
Bell-metal	Copper 78	Tin 22
Speculum-metal	Copper 66	Tin 34
Brass	Copper 64	Zinc 36
Aluminum bronze	Copper 90	Aluminum 10
Hard solder	Brass 66	Zinc 34
German silver	Copper 51	Zinc 30.6, Nickel 18.4
Britannia metal	Brass 25	Tin 25, Antimony 25, Bismuth 25
Pewter	Tin 80	Lead 20
Plumber's solder	Tin 66	Lead 44
or	Tin 50	Lead 50
Type-metal	Tin 25	Lead 50, Antimony 25
Fusible-metal	Tin 25	Lead 25, Bismuth 50

All-Saints' Bay, a magnificent natural harbour in the province of Bahia, Brazil. It is 37 miles long, 27 broad, and contains several islands. The town of Bahia (q. v.) lies just within the entrance.

All-Saints' Day, or Hallowmas, a festival of the Church of Rome in honour of *all saints* who have not a separate day assigned them in the calendar. It was instituted in 835 by Gregory IV., and fixed to be held on November 1st, probably because that was the date of the celebration of one of the four great festivals of the northern pagans. The preceding night, called the Eve or Vigil of A., was even more than the day itself distinguished by popular usages, such as the kindling of bonfires, bell-rings, &c.

All-Souls' College, Oxford, founded in 1437 by Henry Chichele, Archbishop of Canterbury, for a warden, forty fellows, two chaplains, and clerks. A professorship of 'International Law and Diplomacy,' and another of 'Modern History,' have been endowed with the revenues of ten suppressed fellowships. The remaining thirty are open. The college holds the patronage of nineteen benefices of the yearly value of £7925. In 1875 it had 115 on its books.

All-Souls' Day, a festival of the Church of Rome, instituted in 993, or 998, by Odilo, Abbot of Clugny, and celebrated on the 2d of November. Its object is, by supplication and almsgiving, to relieve souls in purgatory; and the occasion of its institution is said to have been the report to Odilo that a hermit in Sicily had often heard the devils complaining of the number of souls released from suffering by the prayers and almsdeeds of the pious. In the W. of England it was customary to bake a soul-cake on All-Souls'-Day, and for neighbours to share it with one another. There children still go *souling*, which consists in singing certain verses, and importuning for small gifts.

Allspice, the name given to the dried berries of *Eugenia pimenta* and *E. acris* of the W. Indies, from their having the combined flavour of cinnamon, nutmeg, and cloves. Called also Jamaica Pepper and Pimento (q. v.) Carolina A. is the bark of *Calycanthus floridus*, which is used as cinnamon.

Allston, Washington, painter and poet, was born 5th November 1779, at Waccamau, S. Carolina. On graduating from Harvard (1800) he devoted himself to art, studying first at Charleston, then in the Royal Academy, London, and finally at Rome, where he was intimate with Thorwaldsen. In 1811 he again visited England, and carried off the 200-guinea prize of the British Institution for his *Dead Man raised*

Allspice.

by *Elisha's Bones*. He was elected an A.R.A. in 1819. He excelled as a colourist, being in this respect a successful imitator of Rembrandt. His poem, *Syllabi of the Season* (Lond. 1813), was much admired. A. died 8th July 1843, at Cambridge Port, Mass.

Alluvion. This is a legal term signifying the land gained from the sea. By English law this belongs to the owner of the soil on which the A. takes place, provided it does so gradually, as it commonly does, by the slow accumulation of sand and earth drifted ashore by the waves. A sudden and considerable gain, however, to the shore from the sea is held to belong to the crown, unless it has given a charter to a subject *cum littore maris*, in which case the A. belongs to the grantee. In Scotch law the A. in both events belongs to the owner of the adjacent shore. Where a river in Scotland dividing two properties insensibly changes its course, it is still held to be the boundary; but if the change be sudden and material, it will no longer be held to be so, the law allowing equitable alteration. *Alluvio* is the Scotch law-term for the gradual change, *Avulsio* for the sudden.

Alluvium (Lat. *ad*, to, and *luere*, to wash), a term originally applied to ante-Deluge deposits, but now given to deposits of sand, mud, gravel, &c., which are washed down by a stream, and which form the banks and lowlands about its mouth.

Allygurrh, an important fort, the military headquarters of a district of the same name in India, situated about midway between Agra and Delhi, being 74 miles S. of the latter by rail. It occupies a strong position in the midst of a morass, and commands the road from Agra to Meerut. It was taken by the British in 1803. During the mutiny (1857) it was held by the insurgents for a considerable time, almost severing the communication between the S.E. and N.W. A. lies a little N. of the town of Coel (q. v.)

Al'ma, a small river in the Crimea, rises near the Tchadir Dagh, flows westward, and enters the Black Sea midway between Sebastopol and Eupatoria. It is celebrated in connection with the battle in which the Russian forces, under Prince Menschikoff, were driven from a strong position, and totally routed by the allied armies of England and France, commanded by Lord Raglan and Marshal St Arnaud, 20th September 1854.

Almack's, a suite of assembly-rooms in King Street, St James's, London, built in 1765 by one M'Call, and much patronised by ladies of rank. They are now known as Willis's Rooms. The name A. is said to be an inversion of M'Call.

Alma'da, a town in the province of Estremadura, Portugal, 2 miles S. of Lisbon, near the mouth of the Tagus. It is noted for its figs, and near it is the Adissa gold mine. Pop. 5500.

Almaden' del Azoque (Arab. 'the mine of quicksilver'), a town in La Mancha, Spain, situated in a glen of the Sierra Morena, on the railway between Ciudad Real and Badajoz. It is the *Cisapona Celcorix* of the Romans, and possesses the richest quicksilver mines in the world. Managed by the firm of Rothschild, these mines yield 2,000,000 lbs. of metal annually. Pop. 7400.

'Almagest', the Arabic name of the great work of Ptolemy the astronomer (q. v.)

Almagro, a town in New Castile, Spain, 13 miles E.S.E. of Ciudad Real. It possesses a beautiful church of the 16th c., and is an important agricultural town, with considerable manufactures, chiefly in lace, soap, pottery, and brandy. Pop. 8600.

Almagro, Diego d', a Spanish adventurer, who took part with Pizarro (q. v.) in the conquest of Peru, was born (according to Herrera) in 1475, at Aldea del Rey. At an early age he emigrated to the New World to push his fortunes, and by one means or another had acquired, in the course of years, considerable wealth. In 1525, at the age of fifty, he joined Pizarro in his famous expedition from Panama, which resulted in the conquest and subjugation of the vast empire of the Incas by a handful of daring and unscrupulous cavaliers. The story of the perils and hardships they endured while feeling their way S. along unknown shores, and among hostile savages, invests with a halo of romance careers that otherwise display mere criminal ambition

and sordid greed. The first three years (1525-28) had been spent in the discovery of the way to Peru, after which they returned to Panama, and Pizarro proceeded to Europe to obtain from Charles V. the necessary authority for what remained to be done. In 1531 the adventurers, empowered by royal sanction for the work of rapine, set sail from Panama a second time, Pizarro first, and A. soon after. The latter only arrived when the capture of Atahualpa (q. v.) had been achieved, but he is partly responsible for the unjust sentence which condemned the Inca to death. By the letters-patent of Charles V., dated Toledo, 26th July 1528, A. was made governor of all the land S. of Peru. This meant that he must undertake the conquest of Chili, which he did with less than 600 men, and would probably have carried out his enterprise successfully had he not, after two months' stay in the new region, been summoned back to Peru by the startling news of an Indian revolt, the massacre of many Spaniards, and the beleaguering of the brothers of Pizarro in the city of Cuzco. A. defeated the Peruvians with great slaughter, and compelled them to raise the siege; but when the brothers of Pizarro, between whom and himself enmity existed, refused him admission into the city, he forced an entrance by night, captured his adversaries, and proclaimed himself master of Cuzco. A force sent against him by Pizarro was completely routed, but in a second engagement in the plain of Cuzco, 26th April 1538, the troops of A. were almost annihilated, and A. himself was made prisoner, and shortly after strangled. His son, also called Diego d'A., a youth of great bodily vigour, prowess, and military skill, formed a party to revenge his father's death, and on the 26th June 1541 succeeded in assassinating Pizarro. He caused himself immediately to be proclaimed Governor of Peru, and obtained a partial recognition; but on the 16th September 1542 his partisans were utterly crushed by the royal army in the plain of Chupas, and A., captured on the field, was immediately beheaded. See Herrera's *Historia general de los Hechos de los Castellanos en las Islas y Terra firme del mar Oceano* (Mad. 1601-12), Zarate's *Historia del Descubrimiento y Conquista del Peru* (Antw. 1555), and Prescott's *Conquest of Peru* (1847).

Almalik', or **Elmaley**, a prosperous town in the vilayet of Konia, Asiatic Turkey, on the Myra, 25 miles from its mouth, and 40 S.W. of Adalia, surrounded by the lofty Massanghis Mountains. It contains a large bazaar, and a market much visited by European merchants. The thrifty and industrious inhabitants are chiefly employed in the factories, mills, dye-works, and tanneries of the town. Pop. 11,000.

Al'ma Ma'ter (Lat. 'nourishing mother'), a university, in relation to its students. *Alma* was applied by the Latin poets to such goddesses and natural objects as were *beneficent* to men.

Almanac, derived from the Arabic article *al*, and *manah*, to count, is, in the modern acceptance of the term, an annual publication containing important and interesting information on a great variety of topics, political, religious, commercial, agricultural, astronomical, social, &c. The origin of almanacs goes back to the times of the Alexandrian Greeks, but there is no record of the date of their introduction into Europe. Probably they were in use from an early age in connection with astrology; but the earliest mention of them belongs to the 12th c., when we meet with the name of Solomon Jarchus, who published one in 1150. Purbach published one from 1450-61, and his pupil Regiomontanus brought out the first printed A. in 1475; but by far the most wonderful A.-maker of the middle ages was Nostradamus (q. v.)

In the 16th c. Henry III. of France prohibited the printing of *almanacs* containing political predictions, prophecies being, at that time, their great feature, Nostradamus particularly shining in the prophetic department. The *Almanach Ligeois*, first published in 1636, and still flourishing, is perhaps the most lively and ingenious of these venerable quackeries. In England, until the present century, all almanacs were full of this prognosticating stuff. They were almost all published by the Stationers' Company, which, though deprived in 1775 of the monopoly for the publication of such periodicals, which had been granted it by James I., managed to buy up most of the other similar publications. The first A. bereft wholly of astrological rubbish was the *British A.*, published in 1828 by the Society for the Diffusion of Useful Knowledge; and so marked

was its success, that the Stationers' Company brought out a rival and similar periodical, viz., the *Englishman's A*. The heavy stamp-duty of 15d. the copy imposed upon almanacs in Britain was abolished in 1834.

Oliver and Boyd's New Edinburgh A., which now consists of 800 pages, was originally called the *Edinburgh A.*, and was first published in 1683 as a rival to the *Prognostications* published at Aberdeen in the beginning of the 17th c. Similar in nature, but even more extensive than *Oliver and Boyd's*, is *Thom's Irish A.*

Among other important national almanacs, we may mention the French *Almanach Impérial*, the Belgian *Royal A.*, the Prussian *Royal A.*, and the American *A*. The *Almanach de Gotha* has more of a cosmopolitan character, containing some information about almost every country.

The *Nautical A.*, first projected by Maskelyne, the astronomer-royal, and published by the government in 1767, is the most important and useful astronomical publication in Britain, and is now published three or four years in advance. Similar, and equally excellent, are the French *Connaissance des Temps*, and the Berlin *Ephemeris*.

The name *A*. is also applied to antiquated carved calendars, used by the Scandinavian nations, in which certain days, such as feast-days and saints' days, were represented by symbols.

Alman'sa, a town of Murcia, Spain, lies 43 miles E. of Albacete, on the Madrid and Alicante Railway. Pop. 7300. It is gradually improving, and has manufactures of brandy, leather, soap, linen, hempen, and cotton fabrics. The battle of A. (April 25, 1707), in which the English and Spanish allied troops were defeated by a superior force of the French, was one of the most important of the succession wars of Spain.

Alman'sûr (Abu-Jafar-Abdallah-ben-Mohammed, surnamed *al-Mansûr*, i.e., 'whom God helps'), born about 712, was the second calif of the house of the Abbasides (q. v.), and reigned from 754, when he succeeded his brother, till his death, October 18, 775, during a pilgrimage to Mecca. He rid himself of his rivals to the throne by the most cruel and treacherous means. His energies were severely taxed to crush successive revolts in various provinces of his empire; but his main efforts were directed against the Mussulman sectaries, whom he hoped to crush by imprisoning their leaders. Popular odium was excited against him, and he found himself besieged in his own palace. When relieved, he withdrew to the banks of the Tigris, where, in 762, on the site of the ancient Seleucia and Ctesiphon, he founded Bagdad. Two rival califs proclaimed themselves, the one at Medina and the other at Bassora, but they were crushed by Isben-Mousa, the general and cousin of A. The leading features of A.'s character were ingratitude, intolerance, and avarice. The latter characteristic, however, enabled him to leave in the treasury at his death a sum equivalent to £28,000,000 sterling. But he was a friend to letters, and had translations made of the Greek and Latin authors into Arabic, or some other of the languages spoken in his dominions. Plato, Herodotus, Homer, and Xenophon were translated into Syriac; medical and botanical works into Persian; Euclid from the Syriac, and the fables of Bidpai from the Persian, into Arabic. The translator of the latter work was, for a departure from orthodoxy, ordered by A. to be burnt alive.

Alm'sa, the name of a number of towns in Hungary, the chief of which is in Zombor, Woiwodina, 16 miles W. of Maria Theresienstadt. It has a population of 7938, nearly all Roman Catholics.

Almazo'ra, a town in Valencia, Spain, 4 miles S. of Castellon de la Plana. It lies in a fertile plain, 3 miles from the mouth of the Mijares, and manufactures paper and linen and woollen fabrics. Pop. 5150.

Almeida, a strong fortress in the province of Beira, Portugal, near the Spanish frontier. It was taken by Spain in 1762, but subsequently surrendered. The French, under Marshal Massena, captured it (1810) from the British; but it was recovered in the following year by Wellington, and restored to Portugal. Pop. 4500.

Almeida, Don Francisco d', Portuguese Viceroy of the Indies in the beginning of the 16th c., was the seventh son of

the Count of Abrantes, and first won reputation as a soldier, fighting for Ferdinand and Isabella of Spain against the Moors. Appointed Viceroy of the Indies by Emmanuel I. of Portugal in 1505, he sailed for Asia, deposing by the way the King of Quiloa, on the Mozambique coast, and installing another in his place. Along the W. coast of India he effectively asserted the Portuguese supremacy, and, carrying out the aim of his expedition—to extinguish the commerce of Egypt and Venice in the East—he destroyed the Egyptian fleet near Diu, in Cambay. During his administration the Portuguese discovered the Maldives, Ceylon, and Madagascar. After violent altercation with Albuquerque (q. v.), who was sent out to supersede him, and whose authority he at first refused to recognise, A. resigned the viceroyalty, and set out on his return to Europe, November 1508, but was killed by an arrow-wound in a miserable encounter with natives in the Bay of Saldanha, March 1, 1510. A. was brave and disinterested. The court of Spain went into public mourning when the news of his death reached Europe.

Almeria (Arab. 'the conspicuous'), a seaport and capital of a province of the same name in Andalusia, Spain, on the Bay of Almeria. It is the ancient Murgis, or 'great port,' of Eastern traffic, and in the time of the Moors was the most flourishing city in the kingdom, next to Granada. It is now, however, a place of little importance, but it still retains part of its once prosperous trade in wine, cochineal, lead, red silk, and grapes. In the vicinity are numerous hot springs and extensive lead mines. Pop. 29,426.

Almado'var del Campo, a town in La Mancha, Spain, 22 miles S.W. of Ciudad Real. It stands on a spur of the Sierra Morena, at the base of which flows the Vega. Agriculture is the chief employment. Pop. 5620.

Almo'hades, an Arabic word, importing 'Unitarians,' assumed by a dynasty that ruled in Africa and Spain in the 12th and 13th centuries, to assert the superior orthodoxy of their worship. Their founder, Mohammed Ibn-Toumert, born in the Atlas, came forward at first as a religious reformer, and led a very ascetic life. His influence becoming formidable, Ali, King of Morocco, proceeded to check it; but by the assistance of the Arabs and Berbers, Mohammed made himself master of Morocco, Fez, and Tunis. The A. subsequently conquered portions of Spain and Portugal. Abd-ul-Mumen, formerly the lieutenant, became the successor of Mohammed. The dynasty was splendid and powerful till their great defeat by the Spaniards at Tolosa in 1212. Their power in Spain was finally subverted in 1257, and in Africa twelve years later.

Alm'ond. The A.-tree (*Amygdalus communis*) belongs to the natural order *Rosaceæ*, and the sub-order *Amygdalæ*. It was originally a native of Barbary and Morocco, but by long cultivation it has become distributed over almost all the warmer temperate countries of the Old World. There are two varieties of the tree—viz., *dulcis*, yielding the sweet A., and *amara*, yielding the bitter A. The chief kinds of sweet A. are the Valencia, the Italian, and the Jordan; the latter come from Malaga. They are often sold with their brittle endocarps adhering, under the name of shell almonds. The seeds are used medicinally as well as for dessert, but are very indigestible. About 500 tons are annually consumed in Britain. Bitter almonds are imported from Mogadore. They are principally used for the expression of the fixed and distillation of the essential oil contained in them. They are also employed for flavouring purposes, but ought to be used with great caution, as they possess a poisonous principle similar in its effects to prussic acid. About 300 tons are imported into Britain annually. The essential oil of almonds is a virulent poison. This oil does not exist naturally in the A., but is formed by the chemical agency of water, on some of its constituents.

Almonds, Essential Oil of. In bitter almonds there is present a crystallisable body named amygdalin, which is not found in the sweet varieties. The influence of amygdalin on another constituent of almonds, emulsin, causes the formation of the essential oil of A. To develop the essential oil, for it is not present in the natural condition of the kernel, the cake of bitter A. from which the fixed oil has been extracted is macerated in water and submitted to distillation, when the essential oil

forms and comes over. The essential oil consists of a hydride of benzoyl mixed with hydrocyanic acid, benzoic acid, and one or two other substances. It occurs in commerce as a golden-yellow limpid liquid, with an agreeable odour, an acrid, bitter taste, and highly poisonous qualities, on account of the hydrocyanic acid it contains. The kernels of various stone fruits, as well as the leaves of the laurel, *Prunus laurocerasus*, yield the essential oil. It is largely used by perfumers for scenting soap, the flavour of Noyau is owing to it, and it is used in the preparation of puddings, &c. Under the name of essence of mirbane, a chemical preparation, nitrobenzol, having the flavour of essential oil of A., is frequently substituted for the genuine oil, especially in perfuming soap.

Almonds, Fixed Oil of. Both sweet and bitter A. contain a proportion of fixed oil in their composition, the sweet variety having about 54 and bitter A. containing 28 per cent. The oil is precisely the same in both varieties, and may be extracted by pressure. Almond oil contains only a small proportion of the solid constituent margarin, and therefore remains fluid to a very low temperature—25° C. It is a soft yellow oil, with a bland, nutty flavour when fresh, but quickly becomes rancid. It is used in pharmacy chiefly for the preparation of ointments, and generally it is available as a substitute for olive oil.

Alm'oner, the name given at first to a member of a religious order, and afterwards to an ecclesiastic attached to the court of a sovereign, prince, or nobleman, and whose duty is the distribution of alms. In England the *Lord High A.* dispenses the bounties of the sovereign, and is always a high dignitary of the Church.

Almo'ra, the chief town of the British district of Kumaon, India, 87 miles N. of Bareilly, and 155 N.E. of Delhi. It stands on a mountain ridge 5337 feet above the sea, near the source of the Kosila, a tributary of the Ramgunga. It is a military station, and has prospered greatly since it came into British possession. Pop. (1872) 6151.

Almoravides, or **Morabethun**, an Arab dynasty in Africa and Spain in the 11th and 12th centuries A.D. The name, which means 'the champions of religion', was applied to a sect of Mohammedan proselytes originally founded by Abdallah-ben-Yassim, who, descending from the western slopes of the Atlas under Abubekr, conquered Fez and Morocco, and crossing into Spain, under Yussuf-ben-Taxfin, subdued it to the Tagus on the W. and to the Ebro on the E. But the Almohades (q. v.) soon deprived them of their rapidly-acquired possessions both in Africa and Spain, and destroyed their great empire in 1148. The terms *Maravedi* (q. v.) and *Marabitts* (q. v.) still keep their rule in remembrance.

Al'mug or Al'gum Tree. The plant referred to under these names in the Old Testament (1 Kings x. and 2 Chron. ix.) is supposed to be *Santalum album*, the sandalwood of India. The wood, which is fragrant, was brought from Ophir (probably some part of India) by Hiram, and was used to form pillars for the temple and for the king's house, as well as for harps and psalteries. It is employed in China for incense.

Almuñecar (Arab. 'the gorge'), a seaport in Andalusia, Spain, 31 miles S. of Granada. It lies in a rich valley, which, under Moorish cultivation, yielded cotton and sugar. These products have been lately revived, and sugar-refining is one of the chief industries. Pop. 5000.

Al'nus, a genus of trees belonging to the natural order *Betulaceæ*. See **ALDER**.

Aln'wick, the county town of Northumberland, near the mouth of the Alne, on the highroad between Newcastle and Berwick-on-Tweed, 34 miles from the former, and 30 from the latter. It is said to have been founded by the Romans, but its origin is really unknown. In the middle ages it was strongly fortified to resist the frequent attacks of the Scots, and vestiges of its walls and gates still remain. The modern town has a handsome corn exchange and town-hall, but its trade is unimportant. It is the election town for the N. division of the county, and a station on the North-Eastern Railway. At the N. entrance to the town stands A. Castle, the magnificent baronial residence of the Dukes of Northumberland. Pop. (1871) 6218.

Aloe, a Latinised form of an Arabic name, given to a genus of succulent plants belonging to the natural order *Liliaceæ*. The species are abundant in all warm countries, and are very tenacious of life. The most important product of the plants is the drug called Aloes (q. v.) The juice of A. was formerly used in embalming dead bodies. Fibre is also obtained from several species. American A. belongs to a different genus and order of plants. See **AGAVE**.

Aloe Fibre, or Pita Flax. See **AGAVE**.

Aloes, or **Bitter Aloes**, the inspissated juice from the leaves of various species of aloe, used in medicine as a powerful purgative. The substance has a dark resinous lustre, and a disagreeable, exceedingly bitter taste. The finest A. come from the island of Socotra; and from Barbadoes, in the W. Indies, another variety, classified as hepatic of dark, according to the colour, is received. The other commercial source of A. is Cape Colony, but its produce is chiefly used in veterinary practice. Messrs T. and H. Smith, of Edinburgh, have introduced into pharmacy a body termed aloin, extracted from A., having similar properties, but possessing the advantages of a definite chemical compound.

Aloes Wood, or **Lign Aloes**, called also Eagle Wood, or Agallochum, is *Aquilaria Agallochum*, a tree of tropical Asia, belonging to the natural order *Aquilariaceæ*. It is believed to be the aloes referred to in the Bible. The wood contains a resin and an essential oil, which is separated and used as a perfume. The Orientals burn the resin in their temples for the sake of its fragrance, and it is also used medicinally. Herodotus states that it once sold for more than its weight in gold.

Alope'cia is partial or general baldness. It is more common in the male than in the female sex. Occasionally there is congenital absence of hair. Baldness in most cases is indicative of loss of vital power, the hair follicles participating in the general weakness of the nutritive functions; but sometimes it is the direct result of disease, such as syphilis. When the baldness is circumscribed into distinct patches, it is called *A. areata*. If the hair follicles have been absorbed or destroyed, baldness is incurable.

Alopecu'rus, a genus of grasses. See **FOXTAIL**.

Alora, a town in the province of Malaga, Spain, 18 miles N.W. of Malaga, on the Guadalherce. It has a ruined Gothic castle, and lies in a district where oil and capital wine are produced. The chief employments are agriculture and the making of soap and sulphate of soda. Pop. 8370.

Alost, or **Aalst** ('to the east'), a walled town of Belgium, on the Dender, a tributary of the Scheldt, 16 miles W.N.W. of Brussels by rail. It is the old capital of E. Flanders, and has some beautiful buildings. The unfinished church of St Martin is a magnificent structure, and contains a celebrated picture by Rubens, 'St Roch beseeching our Saviour to stay the Plague of A.' A. is the birthplace of Thierry Martens, who here (1475) set up the first printing-press in Belgium. It is an active centre of trade, and has extensive iron and copper foundries, distilleries, breweries, cotton-mills, print-works, and bleach-fields. Pop. 19,700.

Aloysia, a genus of plants in the order *Verbenaceæ*, to which the lemon-scented verbena (*A. citriodora*) of gardens belongs. The plant, although a native of Chili, thrives well in the open air in Ireland and the S. of England.

Alp, Alb, a mountain chain between the Neckar and the Danube, otherwise called the Rauhe or Swabian Alp, 60 miles long and 12 broad, with an average height of fully 2000 feet, is a plateau, with several intersecting valleys, and belongs almost wholly to Württemberg. The system is calcareous, and abounds

Aloe.

in remarkable cavities. Wine and fruit are produced in considerable quantities in the valley, but the plateau is barren.

Alpaca (*Atacama Paco*). The A., or paco, of Peru forms a species or variety of Llama (q. v.), which genus represents the Eastern camels in the New World. By some authorities the A. is regarded as a distinct species, and is named as above; by others it is accounted a mere variety along with the vicugna (*A. vicunia*) and the guanaco (*A. guanaco*). The A. is of smaller size than the llama, and although never employed as a beast of burden, is yet largely bred and domesticated in Peru for the sake of its long silky wool, large quantities of which are imported into

Alpaca.

this and other countries for the manufacture of various fabrics. In size it resembles a large sheep, the neck being more elongated, however, its eyes larger, and its movements more lithe and active. The colour is in general a yellowish brown, but it varies to grey or even white, or may exhibit a hue almost approaching black. Its habitat is in the mountainous tracts of Peru and Chili, but it occurs both to the N. of these limits and southwards to Patagonia. The alpacas are gregarious in habits, and in a wild state are timid and wary. Attempts to naturalise the A. in Britain, and Europe generally, have not been successful, chiefly on account of the want of sufficient enterprise. As in all the llamas, no humps exist, and the toes are completely separated. The A. wool is chiefly manufactured at Bradford in Yorkshire. In 1863 Peru furnished 2,772,836 lbs., whilst New Granada exported 622,889 lbs., and other S. American countries 6857 lbs.

Alp Arslan ('brave lion'), whose proper name was Mohammed Lhaz-ed-Din-Abu-Chuja, was the second Seljukide sultan, and was born in Turkestan about 1028 or 1030. He ascended the throne of Khorassan in 1053, on the death of his father Daoud, and ten years later succeeded his uncle, Togrul Beg, the first of the Seljukide sultans. The military force belonging to his great dominion he employed first (1064) in suppressing a revolt in Azerbaijan, where he defeated the rebel chief Kutulinish near the city of Rei; he then (1065) followed on a course of victory and conquest into Transoxiana. He next (1067-68) proceeded against the Greeks, by whom the Turks had been several times driven back beyond the Euphrates. A fierce battle was fought between the towns of Van and Erzeroum in August 1071. The Greeks were defeated, and their gallant emperor, Romanus IV., surnamed Diogenes, taken prisoner. The ransom he paid was equivalent to £1,000,000 sterling, with an annual tribute of £160,000. A. was assassinated 15th December 1072 by Jussuf Cothul, commander of the fortress of Berzem, in Turkestan.

Alpes, Basses ('Lower Alps'), a frontier department in the S.E. of France, formerly part of Provence, with the Hautes A. on the N. and the A.-Maritimes in the S.E. Fruit grows abundantly in the S., and the wines are celebrated, but in the N. the surface is nearly barren. The chief town is Digne (pop. 3720), which, like Gréoulx, has hot springs. The B. A. produces lead and green marble, and is watered by the Durance. Area, 2680 sq. miles; pop. (1872) 139,332.

Alpes, Hautes ('Upper Alps'), a frontier department of France, occupies the S.E. part of Dauphiné. It is the highest department in France, and is traversed by the Cottian Alps, which, in Mount Pelvoux, reach an altitude of 14,000 feet. The soil is wretched, and the climate severe for France. Unless in some southern valleys, it yields only potatoes, rye, oats, and barley. It is rich, however, in lead, copper, iron, and anthracite. The chief town is Gap (q. v.) Area, 2136 sq. miles; pop. (1872) 118,898.

Alpes-Maritimes, a department in the extreme S.E. of France, separated from Italy by the mountain range of the same name. In the mountainous country to the N. immense flocks and herds are reared, and especially a celebrated breed of goats. In the fertile southerly valleys flourish the vine and olive, and also oranges, lemons, and figs, while tobacco is successfully cultivated. Many of the inhabitants, along the shores of the Mediterranean, are engaged in the tunny, anchovy, and sardine fisheries. The silk-worm is extensively reared, and there is considerable manufacture of perfumes and bijouterie.

The capital is Nice (q. v.) The A. was formed by the union of a portion of the department of Var with Nice, formerly a part of Sardinia, ceded to France in 1860 by the treaty of Zurich. Area, 1680 sq. miles; pop. (1872) 199,037.

Alphabet is a term applied to the collection of symbols which are used to express the various sounds that occur in a language. It is derived from *alpha, beta*, the names of the two first letters in the Greek language, and therefore corresponds exactly to our A B C.

There can scarcely be a doubt that pictures were first employed to indicate words; that these pictures became more and more indistinct in the lapse of time, but still remained symbols of words; and that it was only at a later stage that the sounds of words were analysed into their simplest forms, and separate symbols employed for each. Indeed, at the present day some languages have symbols only for words. In Chinese this is the case, and in that language there are upwards of 50,000 different symbols. A fourth of these is obsolete, and a half of the remainder rarely occur, or are mere variations and antiquated forms. There are 204 signs employed to indicate the pronunciation of the words to which they are attached, called keys or root-signs. The hieroglyphics of Egypt were also originally pictorial and indicated words.

The symbols of our A. are derived from the Phœnician. Some scholars think that the Phœnician A. itself was derived from the Egyptian hieroglyphics by a process of decay or loss. Substantially the same symbols as the Phœnician are used in Hebrew, Syriac, Arabic, Greek, Latin, Coptic, Gothic, German, English, and several other languages. The names of the letters show that they were originally pictures. In the case of the first, for instance, an ox would be represented, but it is possible that only such portions of the ox would be given as would be necessary to identify it. The symbol would indicate the sound of the word denoting the animal, then possibly only the first syllable of the word, and finally only the first letter.

Each A., and indeed each letter, has a history of its own. We leave the fuller account of the letters to the articles on each letter. Here we have to notice that the A. varied at different periods in the number and symbolic force of the letters. Thus there can be no doubt that the forms of the Hebrew letters now used belong to a late period. We know that the Greek A. has lost some letters and gained others. The *Digamma*, for instance, disappeared. In the earlier Greek inscriptions H is the rough breathing, and the long vowels *Eta* and *Omega* do not occur. In fact, tradition stated that the Greeks derived only sixteen letters from the Phœnicians, and that letters were added in at least two subsequent periods. Though this tradition is not strictly accurate, since it is quite apparent that more than sixteen letters were derived from the Phœnicians, it is correct in regard to the additions. In the Latin A. the letter C represented the two sounds of *k* and hard *g* at the time of the Decemvirs, and it is possible that the two sounds were so uttered as not to be clearly distinguishable. In the process of time K passed out of use, occurring only in a few words. C was employed for the *k* sound, and a new symbol, *g*, was introduced to express the hard *g*. This new symbol first appears in a Latin inscription dating shortly after 290 B.C. At the time of Cicero there were twenty-one letters in the Latin A. The letters *s* and *y* were regarded as foreign, and used only in transferring Greek words into Latin.

The names given to the letters by the Phœnicians were not representatives of the sounds. The Greek names were borrowed from the Phœnician. The practical Romans seem to have been the first to name the letters from the sounds. The vowels they called by their powers, as we do, *a, e, i, o, u*. To *f, l, m, n, r, s, x*, they prefixed the sound of *c*, and called them *cf, cl, cm, cn, cr, cs, cx*. The last was also called *ix*. The vowel *e* was added to *c, g, p, b, t, d*, thus giving them the names *ce, ge, pe, be, te, de*. *k* and *h* were named *ka* and *ha*, and *q, gu*. We have increased the number of the letters by making two letters of *i, j* and *j, v*, and two of *u, u* and *v, w*. If we examine the A. by the light of its history, it seems probable that the order of the letters in the A. was based on a classification of sounds. The first letter was a breathing, and still is in Hebrew, but a vowel in Latin and Greek. Then come in Hebrew and Greek the three *media* *b, g, d*, and we have seen that the *c* of the Latins originally stood for

the *g*. Then came another breathing in Hebrew, formed into the vowel *e* in Greek and Latin. Then followed the three aspirates in the same order as the *medie f, h, th*. The *f*, or *Digamma*, disappeared from the Greek, the *h* became the symbol for the long *e*, and another symbol, *χ*, was used for *ch*. In Latin the *g* was inserted, as mentioned above, and the *th* was not adopted. In Hebrew and Greek a sibilant was introduced into the group. Then comes another breathing in Hebrew, and the vowel *i* in Greek and Latin. This is followed by the liquids *l, m, n*. The *k* seems to be of later introduction in all the three languages; a sibilant appears in Hebrew and Greek. Then comes another breathing in Hebrew, represented by the vowel *o* in Greek and Latin. And this was followed by the three tenues in the same order as the aspirates and *medie p, k, t*. In the Greek the letter representing the *k* sound has disappeared. It had the name of *Koppa*, and is found in early inscriptions. It takes the form of *q* in Latin. The insertion of the liquid *r* and the sibilant *s* may have been later. Some points of this explanation may be open to question, but enough is absolutely certain to show that the invention of our *A*, followed a principle.

No language that exists has an *A* that accurately expresses all the sounds contained in it. Various efforts have been made in modern times to attain this result, and Mr Bell has been remarkably successful in his 'Visible Speech.' But this object will be found discussed under PHONETICS.

Alpheius, the modern Rofia, the largest river of the Peloponnesus, rises in the S.E. of Arcadia, and after flowing through Elis, past the famous scene of the Olympic games, falls into the Ionian Sea. As it disappears several times in the limestone mountains of the country which gives it birth, it gave rise to a beautiful myth, which has been immortalised by the muse of Shelley. *A*, the river-god, becoming enamoured of the nymph Arethusa, pursued her from Greece to Sicily without intermingling his waters; and as at Ortygia (Syracuse) a copious fresh-water spring entered the sea close to where another spring bubbled up under the salt water, these were fabled to be *A*. and Arethusa.

Alpine Clubs are societies intended to promote, by means of travel and field-work, a scientific investigation of the great European mountain system. The first of these clubs was that founded in London in 1858, and which has issued several interesting and important works, the chief of which are—*Plaks, Passes, and Glaciers* (3 vols., Lond. 1859-62); the *Alpine Guide* (3 vols., 1863-67); and the *Alpine Journal*, published since March 1863. The independent publications of leading members, being professedly due in part to the influence of the club, may also be here referred to, as *Glaciers of the Alps* (1860), and *Hours of Exercise in the Alps* (1871), by Professor Tyndall; the *Playgrounds of Europe* (1871), by Leslie Stephen; and *Scrambles in the Alps* (1871), by Edward Whymper. The English Alpine Club was followed by the establishment of similar societies in Austria (1862), Italy (1863), Switzerland (1863), and in Germany (Munich, 1869).

Alpine Farming. The mode of farming pursued in the wilder regions of the Alps shows that the peasants are not only very industrious, but by no means devoid of practical knowledge. Doubtless it is intuitive, but no better mode could be proposed or practised by the most skilled farmers in Europe. Except in the valleys of the Alps arable husbandry is impossible, so that pasturage and haymaking are the only sources of profit open to those who depend upon the soil for sustenance. At the lower levels of the mountainous range, above the flat country, the land is broken up by the plough in order to make hay, which is to serve for the winter fodder of cattle. These are pastured in summer in a rotative way, which is very judicious. Summer begins in May, when the cattle are placed upon the lowest of the three stages forming alpine pasture-grounds. They crop the herbage upwards, through the Middle Alps to the Upper Alps, where they finish about the end of July, and they are thus always kept in a progressive state. Then the animals, having cropped this higher grass, are marched down the hill again, eating as they come, and after about twenty weeks' absence arrive at the place of starting, when the hay, top-dressed by their own manures, is ready for them. This has been gathered in the interval of their mountainous feeding. Hay has been cut on ledges which even the

adventurous goat fails to reach, and thrown over precipices to be picked up below. The milk of the cows is converted into cheese. Huts at various stages exist for the cattle-tenders, whose start in spring and return in autumn are signalled by popular festivals.

Alpine Plants. This appellation is generally given to those plants found at a considerable elevation on mountains, or those which occur near the snow-line. This line varies much in different countries, according to the latitude. On the mountains near the equator many plants are met with at an elevation of 12,000 to 15,000 feet above the level of the sea, which have a resemblance to those met with on the Swiss and German Alps about 6000 or 7000 feet, as well as those on the low hills of Lapland, and those found on the sea-shore in Siberia. The zone of *A. P.* in Central Europe ranges from 4500 to 9500 feet above the sea, and is characterised by dwarf rhododendrons, such as *R. hirsutum*, the rose of the Alps, blue gentians, saxifrages, &c. On the Scottish mountains this zone is from 2500 to 4000 feet. Its flora is marked by such plants as the drooping bulbous saxifrage (*S. cernea*), a species only found on Ben Lawers, in Britain, the rock whitlow-grass (*Draba rupestris*), the alpine forget-me-not (*Alyssotis alpestris*), the alpine speedwell (*Veronica alpina*), the trailing azalea (*A. procumbens*), the alpine gentian (*G. nivalis*), the alpine sedge (*Carex frigida*), discovered as new to Britain in 1874, and the round-leaved Woodsia (*W. hyperborea*). Many *A. P.* are much restricted in their distribution, and some are even confined to a single locality, such as *Hypericum coris*, a species of St John's wort, found on the Wiggis mountain in Switzerland, and *Salix Sauteri*, a dwarf willow on a mountain at the head of Glen Callater, in Scotland, where it was discovered in 1874.

Alpinia, a genus of plants belonging to the Ginger family. See GALANGALE.

Alpnach, a village in the canton of Unterwalden, Switzerland, on a bay of Lake Lucerne called Lake *A.*, near the base of Mount Pilatus. It was notable for the 'slide,' 2500 feet long, by which, in former times, timber was conveyed from the hill-top. Pop. 1600.

Alps (Celtic, *alb* or *alp*, a craggy height, probably connected with Lat. *alb*, *albus*, white, see ALBANY), the greatest mountain system of Europe, resting upon a basis of 90,000 sq. miles. They extend from the valley of the Rhone in France on the W., to the plains of Hungary on the E.; on the N. they include a large part of Switzerland and the upper regions of the Danube, and on the S. are bounded by Italy and the Adriatic Sea. They stretch from the 6° to the 20° E. long., and while in some parts touching 43° N. lat., lie principally between the parallels of 46° and 48° N. lat. The length of the main chain is about 692 miles, the breadth varies greatly.

Divisions—The *A.*, both in ancient and modern times, have been divided into numerous ranges bearing distinct names. The following is a convenient classification, embracing at least all the most important divisions. I. The *West A.*, including—1. The Maritime *A.*, between France and Italy, from the Mediterranean to about 44° 50' N. lat.; 2. the Cottian *A.*, to the N. of the Maritime *A.*; 3. the Graian *A.*, between Piedmont and Savoy. II. The *Middle A.*—1. The Pennine *A.*, between Lombardy and the Rhone Valley; 2. the Lepontine or Helvetian *A.*, in the S. of Switzerland; 3. the Rhaetian *A.*, in the Grisons and the Tyrol; 4. the Bernese *A.*, in Switzerland, between the Rhone and the Aar, N. of and parallel to the Pennine range. III. The *East A.*—1. The Noric *A.*, in Salzburg and Styria, Austria; 2. the Carnic *A.*, between Austria (the Tyrol and Carinthia) and Italy (Venetia); 3. the Julian *A.*, extending from Carinthia, through Carniola, to the Adriatic Sea.

Elevation.—The Middle *A.* are the most elevated, reaching in their highest summit, Mont Blanc, in the Pennine range, which is also the highest summit in Europe, a height of 15,783 feet. In the same range are Monte Rosa, 15,200; the Matterhorn or Mont Cervin, 14,780 feet, &c. In the Lepontine *A.* the St Gothard is about 12,000 feet in height. In the Bernese *A.* Finsteraarhorn is 14,000 feet, and Jungfrau 13,700. In their lowest passes the Middle *A.* have an elevation of about 6000 feet. The *West A.* vary from 4000 feet in the lowest pass to 13,500 feet. Aiguille de Chambeiron, 11,155 feet, and Grand Rioburent, 14,165, in the Maritime *A.*; Monte Viso, 12,600 feet, in the Cottian *A.*; Mont Iséran, 13,372 feet, and Mont Cenis,

11,460 feet, in the Graian A., are among the chief summits in this range. The East A. attain the height of 12,000 feet in Gross-Glockner, in the Noric A. Mont Terglu, in the Julian A., is 9370 feet. They possess passes as low as 3500 feet.

Passes.—There are in the A. at least sixty passes which can be crossed by carriages. Three railways, including that through the famous Mont Cenis Tunnel, cross them, and others are in process of construction. The chief passes are those of Mont Genève, over the Cottian A.; Mont Cenis, Mont Iséran, and the Little St Bernard, over the Graian A., all forming lines of communication between the S.E. of France and Piedmont; the Great St Bernard, over the Pennine A.; the Simplon, between the Pennine and Lepontine A., both connecting the valley of the Rhone with the N. of Italy; and the St Gothard, over the Lepontine A., in the line of route from Lucerne to Lake Maggiore; the Splügen, the Brenner Pass, and the Wormser Joch or Ortesse Pass, in the Rhaetian A., by which intercourse is kept up between Lombardy and the S.W. of Austria. The roads across the East A. are much lower and more numerous, and do not require special mention. They connect Venice with the whole S.W. of Austria.

Geology.—The oldest rock formations of the A. are generally primary crystalline. The central ranges are in a great measure composed of the crystalline rocks, gneiss, mica-slate, talcose-slate, and others of a similar kind. The gneiss often contains large crystals of felspar or albite, and among the many minerals enclosed in the mica-slate garnets are most abundant. In the Eastern A. there are vast deposits of grauwacke and clay-slate above the primary formations. An enormous mass of calcareous matter, intermixed with argillaceous schists and sandstones, rests sometimes on one, sometimes on another, of the strata already mentioned. The Julian A. consist chiefly of the Jurassic and chalk groups.

Minerals.—Gold and silver are found in the Tyrol, Salzburg, and Carinthia; silver also in Styria, Illyria. Carinthia, Illyria, and Carniola yield large quantities of iron. Copper is found both in the French and Austrian A. The Bleiberg of Carinthia produces some of the best lead in Europe. The quicksilver of Idria, in Carniola, and the rock-crystal of St Gothard are world-renowned. Anthracite coal is also found, in the greatest quantity, in the Austrian A.; and salt is generally plentiful, especially at Hall in the Tyrol, and Hallein in Salzburg.

The **vegetation** of the A. differs considerably from that of the plains beneath, and on the range itself great variety is caused by the climatic effects of the different elevations. The vine, chestnut, oak, spruce fir, beech, pine, maize, &c., all grow vigorously at the foot of the A. The vine and maize disappear, however, at an elevation of about 2000 feet. The chestnut survives for 1000 feet higher. At a height of 4000 feet the beech and oak cannot maintain themselves. At 6000 feet the spruce fir is the only tree remaining, and it is only found higher on the S. side of the system. Between 6000 feet and the snow-line (8000–9000 feet) is the region of mountain pasturage, where the Alpine Farming (q. v.) is carried on. The beauty and abundance on the A. of the flora peculiar to elevations near the line of perpetual snow is sufficiently indicated by the name Alpine Plants (q. v.), applied to this form of vegetation in any part of the world.

Animals.—The ibex or bouquetin, white hare, the wild goats (rare), and chamois inhabit the highest regions of the A., the last sometimes descending to the woods, which also contain bears, marmots, and moles. Wolves, foxes, lynxes, and wild cats are abundant still lower down. Cows and goats are the most numerous among domestic animals, and in summer are driven up to the mountain pastures already alluded to. The dogs of St Bernard (q. v.), kept for seeking travellers lost in the snow, deserve mention. Among the birds are the lammereyger, or great vulture of the A., eagles, and other birds of prey, white partridges and bustards are found below the snow-line, quails and partridges in the lower regions. The lakes of the A. contain grebes, palimpseles, and trout, though in a few there are no fish. Insects are abundant as high as vegetation extends.

Water System.—The five principal rivers whose basins make up the water system of the A. are the Rhine and the Danube, which either directly, or through their affluents, drain the Bernese, Rhaetian, and Eastern A.; the Po, which flows out of the Western A., and drains the whole plain of Lombardy; the Rhone, which receives the waters from the N. side of the

Pennine and the S. side of the Bernese A.; and the Var, which is the principal stream of the Maritime A.

General Features.—The A., in their general outline, form a grand sweep round the N. of Italy, one end of the curve being in the valley of the Rhone, the other lying in the kingdom of Hungary. Lakes border both the northern and southern bases of the mountains, and valleys of great variety of form open out in all directions. Alpine scenery is wonderfully grand and diversified. Snow-covered peaks, icy glaciers, sheer precipices, and mountain torrents lend the element of grandeur to the picture, while the softer side is supplied by the glassy surfaces of the lakes and the beautiful tints of the alpine flora. Some of the glaciers are of immense size; the Mer-de-Glace, on the northern slope of Mont Blanc, is 12 miles long, 5 miles wide, and from 80 to 180 feet thick. The summits of the A. generally taper away in the form of a peak, which, in the loftiest mountains, is covered with perpetual snow. The mountains of chalk formation are distinguished by their rounded summits.

Alpujarras (a Spanish corruption of an Arabic word meaning 'grass'), the name of a range of mountains and the surrounding region in the S.E. of Spain. The range runs W. and E. parallel to the Sierra Nevada, from Motril to the river Almería. The district extends from the Mediterranean on the S. to the Sierra Nevada on the N. The N. slope is remarkable for its splendid pasturage, but the S. part is precipitous and barren, with the exception of the valleys near the sea, which enjoy a tropical climate, and are very populous. The highest peaks have an elevation of 7000 feet. Lead, antimony, and silver are obtained. The inhabitants, who still retain traces of a semi-Moorish origin, are chiefly shepherds and vine-growers.

Alsace-Lorraine (Ger. *Elsass-Lothringen*), a German province lying between Baden and the Vosges in the S., and between French Lorraine and the river Saar in the N. It is fertile and well watered, has large manufactures of machinery, leather, sugar, paper, tobacco, and beer, and is rich in iron, lead, and other metals. It is divided into the districts of Upper Alsace, Lower Alsace, and Lorraine, with a total area of 5603 sq. miles, and a pop. (December 1, 1871) of 1,549,738, of whom about 1,350,000 are German-speaking. Lorraine is separated by the Vosges from the N. of Alsace, and lies to the N.W. of it. The chief towns are Strasburg, Colmar, Mühlhausen, Metz, and Hagenau. Alsace belonged to Germany till 1648, when part of it was ceded to France; the rest was seized (1681) by Louis XIV. German Lorraine, so-called, is only that part of Lorraine (q. v.) lying between Metz and the Vosges, where the German language has always been spoken. A. was the first part of France occupied by the Germans in the Franco-Prussian war, and was permanently ceded to the German empire by the treaty concluded at Frankfurt-on-the-Main, May 10, 1871. It was placed under military government till January 1, 1874, when it came under the immediate jurisdiction of the empire, returning fifteen members to the German parliament. Its annexation was generally resented by the inhabitants, of whom some 45,000 withdrew from the territory, declining to become German subjects. Of these, 4200 emigrated to Algeria, where they received from the French government a grant of 100,000 hectares of the best land. See Schmidt, *Elsass und Lothringen: Nachweis wie diese Provinzen dem deutschen Reiche verloren gingen* (3d ed., 1871); and Auerbach, *Wieder unser* (1871).

Åsen (the Ger. form of the Dan. *Als*), an island formerly belonging to Denmark, now included in the Prussian province of Slesvig-Holstein, lies in the Little Belt, lat. 54° 46' N. long., 9° 52' E. It is nearly 20 miles long and 12 broad, with an area of 121 sq. miles, and is richly wooded, abounding in fruit-trees. The chief town is Sonderburg (q. v.) Pop. of A. (December 1, 1871) 23,500.

Alsophila, a genus of ferns, many of the species of which form magnificent trees. They are all natives of tropical countries and islands. In Norfolk Island *A. excelsa* grows to 70 or 80 feet high, with large palm-like fronds.

Ålster, a river of Holstein, with a course of about 30 miles, at whose confluence with the Elbe is situated Hamburg (q. v.)

Alstonia, a genus of plants named in honour of Alston, at one time professor of botany in the University of Edinburgh. They belong to the order *Apocynaceae*, and are all natives of

tropical countries. *A. scholaris*, or Pali-mara, is a large Indian tree with bitter milky juice. Its bark is also intensely bitter, and is used as an astringent in bowel complaints. Its wood is whitish, even-grained, and easily worked, and used for furniture, boxes, &c.

Alströméria, a genus of plants of the order *Amaryllidaceæ*, natives of S. America. Their leaves are remarkably twisted, so that what should be the upper surface becomes the lower. Many handsome species are grown in gardens. *A. aurea*, *A. flos Martini* (the St Martin's flower of Chili), *A. ligula*, and *A. psittacina* are very showy plants. The farinaceous tubers of *A. salicilla*, of the W. Indies, as well as those of *A. ornata* and *A. pallida* of Chili, are used as food.

Altai in Turkish, **Kin-Shan** in Chinese—i.e., 'gold mountains'—is the name given to an important range in the E. of Asia, separating the Russian and Chinese empires, and the most northern of the four parallel chains that form the skeleton of the central plateau. It runs in an E. and W. direction between 84° and 100° E. long., and in about 50° N. lat. The range is intersected by wide valleys, through which numerous rivers flow. The highest peak attains the height of about 12,800 feet, far above the snow-line. The climate of the A. is less severe than might be inferred from its position, and comparatively little snow falls in winter. The A. is very rich in minerals, including gold, silver, lead, and marble. The most valuable silver mines in the Russian empire are in this range of mountains. The annual yield of gold since 1853 has been about 50,000 lbs. There are large forests of cedars, firs, larches, &c. Stags, hares, wolves, wild sheep, and bears abound. Jasper, red porphyry, and granite enter largely into its geological formation.

Altamura, a town in the province of Bari, S. Italy, and capital of a division of the same name. It lies in a rich country at the base of the Apennines, producing abundantly oil and wine, and has a fine cathedral. It is reckoned one of the most beautiful towns of Apulia. Near A. stood the ancient *Lufazia*. Pop. of commune, 17,198.

Altar (Lat. *altare*, from *altus*, high), a raised or elevated place on which offerings to a Divine Power were laid. It was a conspicuous and necessary feature both of the Jewish and heathen systems of worship. The first A. of which we read in the Bible is that erected by Noah on leaving the ark, but altars are frequently mentioned in the incidents of patriarchal life. After the giving of the law, the Israelites were commanded to make an A. of earth; and in the later history of the people we find that it became customary to build them in high places, a practice, however, condemned by the Mosaic law, probably as

Altar.

associated with the Syrian idolatries. The only lawful, authorised, and permanent altars among the Israelites were the two belonging both to the tabernacle and the temple, the A. of burnt-offering, and the A. of incense, descriptions of which are given with great minuteness in different parts of the Pentateuch. As regards shape, Jewish altars followed the Oriental type, and were either square or round, like those of the Assyrians, Babylonians, Persians, &c., while Greek and Roman altars were mostly round. The word, but not the thing passed into the language of the Christian Church. It there denoted the com-

munion-table, and does so to this day wherever the term is employed. A variety of expressions are used by the Fathers to indicate the solemnity and sanctity of the place on which were laid the emblems of the mystery of the Divine Sacrifice. It is called the mystical and tremendous table, the mystical table, the holy table, &c. Up to the close of the 2d c. it was nothing more than a simple table, at which the Agapæ or the Eucharist was shared, and on which the offerings of the congregation were placed. The recognition of Christianity as the state religion by Constantine in the 4th c. enabled the Church to import more pomp and ceremony into public worship, and henceforth altars were no longer used as supper-tables, but consecrated and set apart for eucharistic purposes, or for receiving and hallowing the offerings of devotion.

Alt'dorfer, Albrecht, painter and engraver, born at Altdorf, in Bavaria, 1488, died at Ratibon in 1538. He was probably a pupil of Albert Durer, to whom several of his works have been erroneously attributed. Alexander's battle of Arbela, now at Munich, is his masterpiece. It has not been engraved, the number and minuteness of the figures presenting exceptional difficulties. As an engraver on wood he is inferior to Dürer alone; but his works on copper and pewter are by no means of equal excellence.

Altea, a seaport of Valencia, Spain, 25 miles N.E. of Alicante. It stands on an elevation at the mouth of the Alga, and manufactures linen fabrics, soap, and ropes. Pop. 5502.

Alten, Karl August, Count von, a distinguished Hanoverian soldier, born at Burgwedel, 20th October 1764. After acting with credit at the siege of Valenciennes and at Hondschooten, and obtaining the rank of first lieutenant, he came to England, where in 1803 he was appointed to the command of the first light battalion in the German Legion. Among other services he covered Moore's retreat at Corunna (1809). He distinguished himself greatly in the Peninsular war, and in 1812 he commanded 30,000 men near Madrid. At Waterloo he contributed much to obtain the victory, and was, on his return to Hanover, appointed War-Minister and Minister of Foreign Affairs. He died at Botzen, in the Tyrol, April 20, 1840.

Altena, a town in the government of Arnsberg, Westphalia, 40 miles N.E. of Cologne. It lies in the picturesque valley of the Lenne, and is overlooked by a famous old castle. A. is noted for its extensive manufacture of small articles of hardware. Pop. 7150.

Altenburg, the capital of Saxe-Altenburg, Germany, lies about 24 miles S. of Leipzig, on the Saxo-Bavarian Railway. It has considerable manufactures in hosiery, brushes, and cigars, and an extensive book trade. The old castle of A., which stands on a precipitous rock, is celebrated as the scene of the notable event in German history known as the *Prinzenraub* (q. v.) Pop. (1872) 19,966.

Altengard, or **Alten**, a seaport in the province of Finnmarken, Norway, stands near the mouth of the Alten, 88 miles S.W. of the North Cape. It has considerable trade in fish, skins, oil, and copper. The climate is mild for so high a latitude, but there is little cultivation. An annual fair held at A. in November is largely attended by Lapps, Swedes, and Finns. Pop. about 1000.

Alten-Ötting, or **Altötting**, a village in Upper Bavaria, pleasantly situated near the river Inn. The church of St Ruprecht, built on the site of a heathen temple in 696, possesses a wonder-working image known as the *Black Virgin*, which attracts crowds of Roman Catholic pilgrims from Bohemia, Swabia, and Austria. In another chapel, called Tilly's or Peter's Chapel, the great soldier has found a resting-place. Pop. (1872) 2664.

Alteratives, a term used in therapeutics to denote certain remedies which are supposed to have the property of altering the physiological condition of tissues, organs, or secretions. It is a vague term, clouding ignorance. As examples of A. may be mentioned mercury, arsenic, and iodine.

Alter'nate, in botany, means where leaves or buds are placed on opposite sides of the axis on a different level, or where the parts of the flower A. with each other.

Alter'nate Angles, in geometry, are the interior angles formed on the opposite sides of a straight line, when it intersects two other straight lines.

Alternation of Generations, or Metagenesis. A term formerly used in zoology, emanating from Sienstrup, and employed to express the idea of the progeny of one animal differing materially from the parent, and that the young of this second generation came in turn to resemble the original parent stock. One generation alternated in this way with another, or, to use Camisso's expression, 'the young did not resemble the parents, but the grandparents.' Thus, from a fixed, tree-like zoophyte, a creature like the free-swimming medusa, or jellyfish, may be seen to be developed and detached. This progeny does not in the least resemble the parent zoophyte. And from the eggs of this medusa, a zoophyte is again produced—the zoophytic generation alternating with the medusa generation. Or, as in the case of the *Salpæ*, belonging to the *Tunicate* mollusca, a solitary salpa gives rise by budding to long connected chains of individuals, whilst the chain-salpæ produce only single and solitary forms.

The employment of the above term, and the ideas involved in it, sprang from the fact that naturalists formerly and erroneously regarded the alternating forms as *distinct* and *specific* animals. The zoophyte was thus considered as representing a distinct animal, and the mutually-reproducing jellyfish as another and specifically separate being. But closer study of these phenomena has shown that such is not the case. Only one animal form is engaged in the process—that is, the zoophyte, to cite this case as an example. The jellyfish, or medusa, is not a second or separate animal, but merely a peculiarly-developed, reproductive member, or zooid, of the zoophyte colony; and the whole process merely exemplifies a complicated series of reproductive phenomena, involving a single animal. Similarly, the chain-salpa may be regarded as the single animal form; the separate and single salpæ being merely modified zooids derived from the parent stock. The term A. of G. should therefore be discarded as erroneous, since no 'generations' of animals, as implied by the term, are involved. The process is merely one in which *true reproduction* by means of eggs—as produced by the medusa or chain-salpa—alternates with another process of *reproduction by budding*, as seen in the growth of the zoophyte, or in the budding of the single salpa.

Althæa, a genus of plants belonging to the Mallow family (*Malvaceæ*). The common marsh-mallow (*A. officinalis*, q. v.) is found in England and throughout Europe. The roots are used in pectoral complaints under the name of *guimauve*: they form an agreeable demulcent. *A. rosea*, of China, is the origin of the common garden Hollyhock (q. v.): its leaves yield a blue colouring-matter.

Altitude, in astronomy, is the angle or elevation of a heavenly body above the horizon, and is measured by means of a telescope attached to a graduated vertical circle, which rotates upon a similar horizontal circle, so as to allow the pointing of the telescope in any direction. The observed A. must be corrected for Parallax (q. v.), for Refraction (q. v.), and in certain cases for the dip of the horizon.

Al'to, the lowest class of voice among women and boys, its compass lying between the G or F below middle C, and the upper F in the treble staff. A high A. voice has a compass almost identical with that of a mezzo-soprano, but its quality is quite distinct.

Alt-Ofen, a town in Hungary, on the Danube, 2 miles above Ofen or Buda, of which it is almost a suburb. It is said to be the Roman *Sicambria* or *Aquincum*, and contains many monuments of antiquity. Pop. 16,000.

Al'ton, an old market town in Hampshire, England, 17 miles N.E. of Winchester. It lies on the Wey, in the heart of a rich hop-growing country, and is celebrated for its ale. The church of A. contains a fresco painting of Henry VI., in whose reign it was built, and is surmounted by an old Norman tower. Pop. (1871) 4092.

Al'ton, a flourishing town and port of entry in Illinois, U.S., on the Mississippi, 3 miles above its confluence with the Missouri. It is connected by railway with St. Louis and Chicago, and lies in the centre of a fertile country, rich in coal and limestone. A. has a Roman Catholic cathedral. Pop. (1870) 8665.

Al'tona, the most important city in the German province of

Slesvig-Holstein, stands on the right bank of the Elbe, and is now in reality a vast suburb of Hamburg. It has a healthy situation, and is a favourite resort of pleasure-seekers, containing numerous theatres, music-halls, gardens, and cafés. Its rich trade, forming part of that of Hamburg, extends to all parts of the world; it has also extensive tobacco-manufactories, cotton-mills, sugar-refineries, glass-works, and distilleries. It is connected by rail with Kiel, Rendsburg, and Glückstadt, and as a free port enjoys many privileges. It has attained its present importance only of late years, and is still rapidly increasing. Under the care of the late H. C. Schumacher, the observatory of A. acquired a wide reputation. Pop. (1872) 74,102.

Altoona, a city in Pennsylvania, U. S., at the base of the Alleghenies, 244 miles W. of Philadelphia. It was founded in 1849, and has extensive machine-works in connection with the Central Railway. Pop. (1870) 10,610.

Al'torf, the chief town in the Swiss canton of Uri, lies on the Reuss, 2 miles S. of the Lake of the Four Forest Cantons, at the foot of the Grunberg, on the St Gothard road. It has the oldest Capuchin monastery in Switzerland, and is notable as the scene of the shooting of the apple in the legends of Tell. Almost completely destroyed by fire in 1799, it has since been rebuilt in a modern style. Pop. (1870) 2724.

Alto-Rilievo (Ital. in high relief) denotes the degree of projection of a sculptured figure or ornament from the surface or background to which it is attached. The gradations in relief in sculpture are expressed by *alto*, *mezzo*, and *basso rilievo*.

When the object projects more than one-half of its thickness above the slab on which it is formed, or stands out in full relief without being entirely detached, the term *alto-rilievo* is employed; a slight projection is designated *basso-rilievo* (low relief); and relief to the extent of one-half, *mezzo* or *semi rilievo* (middle or half relief). The reliefs executed by the early civilised nations of antiquity may for the most part be classed as *basso-rilievi*, and are remarkable more for colossal proportions than for dignity of expression or graceful form. Sculptured slabs from Nineveh, Babylon, and Persepolis, as well as those of more recent times, amply attest the correctness of defining bas-reliefs as 'sculptured painting,' from the capability of disposing of groups of figures, and exhibiting minor adjuncts, as in a painting. *Messi-rilievi*, also from the above localities, are now in the British Museum, and display considerable boldness and freedom of execution. To the Greek nation must be accorded the honour of bringing sculpture to its highest perfection, and that nation had but reached the zenith of its splendour when Phidias and his disciples executed the reliefs which adorned the metopes of the Parthenon at Athens. These *alti-rilievi*—the finest extant—are preserved in the British Museum. Simplicity, symmetrical proportion, fulness of life and spirited action, combine to make these reliefs unrivalled and unapproachable models for all time. The importation into this country of the 'Elgin marbles,' of which the metopes of the Parthenon formed a part, afforded means of studying antique models, and gave an impetus to the modern school of sculpture. The labours of its chief exponents, Thorwaldsen, Flaxman, Canova, and others, indicate the proper path of study, and have given to works in relief their true and simple character.

Alto-Rilievo.

The term *alto-rilievo* is employed; a slight projection is designated *basso-rilievo* (low relief); and relief to the extent of one-half, *mezzo* or *semi rilievo* (middle or half relief). The reliefs executed by the early civilised nations of antiquity may for the most part be classed as *basso-rilievi*, and are remarkable more for colossal proportions than for dignity of expression or graceful form. Sculptured slabs from Nineveh, Babylon, and Persepolis, as well as those of more recent times, amply attest the correctness of defining bas-reliefs as 'sculptured painting,' from the capability of disposing of groups of figures, and exhibiting minor adjuncts, as in a painting. *Messi-rilievi*, also from the above localities, are now in the British Museum, and display considerable boldness and freedom of execution. To the Greek nation must be accorded the honour of bringing sculpture to its highest perfection, and that nation had but reached the zenith of its splendour when Phidias and his disciples executed the reliefs which adorned the metopes of the Parthenon at Athens. These *alti-rilievi*—the finest extant—are preserved in the British Museum. Simplicity, symmetrical proportion, fulness of life and spirited action, combine to make these reliefs unrivalled and unapproachable models for all time. The labours of its chief exponents, Thorwaldsen, Flaxman, Canova, and others, indicate the proper path of study, and have given to works in relief their true and simple character.

Al'trincham, a market town in Cheshire, England, near the Mersey, 8 miles S.W. of Manchester. Its healthy situation on Bowden Downs makes it a great resort of invalids. Pop. (1871) 8478.

Alum is a crystalline compound containing the metals aluminium and potassium together with sulphuric acid and water.

A. is prepared in this country from a bituminous shale containing iron pyrites, FeS_2 , interspersed throughout its mass, found in the Lower Coal Measures, and technically called *alum ore*. The chief deposits of this mineral in Great Britain occur at Whitby in Yorkshire, and near Glasgow. In preparing A. from the ore, the latter is first roasted—that is, heated in contact with air. By this roasting the iron pyrites is oxidised to sulphate of iron, FeSO_4 , and sulphuric anhydride, SO_3 , which combines with the alumina contained in the ore to form sulphate of aluminum, $\text{Al}_2(\text{SO}_4)_3$. The roasted mass is treated with water to dissolve out the two sulphates, and the solution obtained by this means evaporated to a suitable consistency, and mixed with chloride of potassium. A. and chloride of iron result, the former of which, being less soluble than the latter, is readily separated by crystallisation. A. is a colourless crystalline substance of very astringent acid taste; its solution reddens litmus. It is largely employed by dyers as a *mordant*. See MORDANT and DYEING. It is also used in preparing pigments called *lakes*. A. is used in medicine, and has been employed as an antiseptic. It is sometimes used to adulterate flour intended for making bread, as it appears to give the bread a firm consistency and white colour. *Burnt A.*, or *calcined A.*, is A. from which the water has been driven off by heat. The chemical formula for A. is $\text{Al}_2(\text{SO}_4)_3 \cdot \text{K}_2\text{SO}_4 \cdot 24\text{H}_2\text{O}$. It is, therefore, a double sulphate of aluminum and potassium. There is a large group of compounds having similar properties and composition, and known in chemistry as the *alums*. These contain, in place of the potassium in ordinary A., other metals of the *potassium* group, such as sodium, or lithium, and even ammonium (NH_4), or, in place of the aluminum, another metal of the iron group (to which aluminum belongs), such as iron itself, chromium, &c., or both the potassium and aluminum replaced by metals of their respective groups, thus:—

Ordinary A.	$\text{Al}_2(\text{SO}_4)_3 \cdot \text{K}_2\text{SO}_4 \cdot 24\text{H}_2\text{O}$
Ammonia A.	$\text{Al}_2(\text{SO}_4)_3 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 24\text{H}_2\text{O}$
Iron potash A.	$\text{Fe}_2(\text{SO}_4)_3 \cdot \text{K}_2\text{SO}_4 \cdot 24\text{H}_2\text{O}$
Chrome potash A.	$\text{Cr}_2(\text{SO}_4)_3 \cdot \text{K}_2\text{SO}_4 \cdot 24\text{H}_2\text{O}$
Iron ammonium A.	$\text{Fe}_2(\text{SO}_4)_3 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 24\text{H}_2\text{O}$

Alum Bagh ('Garden of the Lady Alum, or Beauty of the Soul'), originally a palace belonging to the royal family of Oude, about 4 miles from Lucknow, converted into a fort by the rebels during the Indian mutiny. It was taken in September 1857 by the English, while advancing on Lucknow, and in November of the same year, when their forces were withdrawn from all the other parts of Oude, it was garrisoned with 3500 men under Sir James Outram. On the 12th January 1858 the A. B. was attacked by 30,000 sepoys, and on the 21st February by 20,000; but the little garrison, cut off from all assistance, maintained a heroic defence till relieved by Sir Colin Campbell in March of the same year.

Alumina is the oxide of aluminum, and is the only compound which oxygen forms with that metal. It occurs largely in nature, and, in combination with silicic acid, is the principal constituent of the different varieties of clay soils and many rocks. In the pure crystallised condition A. is met with as *corundum*; coloured with small quantities of metallic oxides, as the *sapphire*, *ruby*, and *topaz*, and in a less pure state as *emery*; combined with water, as the mineral *diaspore*. A. may be obtained artificially by strongly heating ammonia alum; combined with water, by precipitating a solution of common alum (potash alum) by a solution of ammonia. The A. obtained by either of these methods is, however, amorphous, and not crystalline. Crystallised A. has been obtained by Deville by heating fluoride of aluminum in a charcoal crucible in which is placed a small cupel containing boracic anhydride. The oxygen and fluorine change places, gaseous fluoride of boron and crystallised A. resulting. A. is largely used as a *mordant*; when precipitated on the fibres of cloth, &c., along with a colouring-matter, it adheres closely to both of these, and thus fixes the colour on the fabric. When precipitated in presence of certain colouring-matters, it attaches itself to these, and forms pigments called *lakes*.

A. possesses both *basic* and *acid* properties, it unites with strong acids to form salts of aluminum, and with strong bases (potash and soda) to form compounds called *aluminates*. It is insoluble in water. A. may be fused before the oxyhydrogen blowpipe to a clear glass.

Silicate of A. is the basis of clay soils, most rocks, and many minerals. The *felspars*, which are the most important aluminiferous minerals, contain, in addition to silicate of aluminum, silicate of potassium or sodium. Many rocks, such as granite, gneiss, basalt, porphyry, trap, &c., contain this mineral. By the combined action of air and water on such rocks, they become gradually disintegrated, or *weathered*, as it is called, and crumble down. This change is owing to the felspar which they contain splitting up into soluble salts of potash and insoluble silicate of A. In this manner the different varieties of soil have been formed.

Aluminum, or **Aluminium**, is a white metal, and one of the 63 elements. Its compounds occurring in nature are numerous and plentiful, and indeed are among the principal constituents of rocks and soils. A. was first isolated by the German chemist Wohler, who obtained it as a grey powder by heating *chloride of A.* with potassium. A. has now become an important article of industry, and is manufactured in large quantities both in this country and in France. It is prepared commercially from a mineral called *bauxite*, from which a double chloride of A. and sodium is first obtained. On strongly heating this double chloride with metallic sodium, and some substance to act as a *flux*—usually the mineral *cryolite*—metallic A. is formed, whilst chloride of sodium (common salt) is produced as a by-product. A. is a white metal, with a slight tinge of blue, and takes a high and lasting polish. This latter property, with the great lightness of the metal (sp. gr. 2.5), renders it valuable for the manufacture of many mathematical and optical instruments, where lightness and durability are essential. A. is highly sonorous—a bar of it, when struck with a hammer, emitting a clear ringing sound. It is malleable and ductile, but becomes somewhat brittle when hammered and rolled. It melts at a temperature between the fusing-points of zinc and silver. It may be used to take castings, as it does not contract much in solidifying. It may be alloyed with most metals, but does not amalgamate with mercury. Its alloys with copper are important. *A. bronze*, largely used in the manufacture of cheap jewellery, &c., is composed of copper and about 9 per cent. of A. A. is not attacked by cold sulphuric or nitric acid, but readily dissolves in hydrochloric acid, and in boiling solutions of caustic potash or soda, evolving hydrogen in doing so.

Its most important compounds are the following:—

Oxide of A. or alumina	Al_2O_3
Double sulphate of potassium and A., or alum	$\text{Al}_2(\text{SO}_4)_3 \cdot \text{K}_2\text{SO}_4 \cdot 24\text{H}_2\text{O}$
Double chloride of A. and sodium	$\text{Al}_2\text{Cl}_6 \cdot 2\text{NaCl}$
Double fluoride of A. and sodium	$\text{Al}_2\text{F}_6 \cdot 6\text{NaF}$

Various silicates of A.

The atomic weight of A. is 27.4; its chemical symbol, **Al**.

Alum Root, the name given in America to the roots of *Geranium maculatum*, which are very astringent. A tincture is prepared from them which is used in cases of ulceration of the throat. A. R. is also applied to the root of *Heuchera americana*, belonging to the Saxifrage family, which is likewise astringent, and is used as a styptic, and as an escharotic in cancer.

Alun'no, Niccolo, an Italian painter, known as Niccolo of Foligno, in which town he settled about 1460. He was the forerunner of the Umbrian school, and produced a large number of pictures, remarkable rather for finish, truth, and exalted sentiment than for great originality. His chief works are 'The Nativity,' in the church of Foligno; 'Piety,' in the cathedral of Assisi; 'The Agony in the Garden,' now in the Louvre; and several pieces at Perugia.

Alured, or Alred, of Beverley, an English historian of Henry I.'s time. His *Annals* (*Aluredi Beverlacensis Annales, sive Historia de Gestis Regum Britannie, Libri IX.*), published at Oxford in 1716 by Hearne, from the only known manuscript, brings British history from the mythical Brutus down to the year 1128. Bale and other critics consider his work in its earlier parts a compilation from Geoffrey of Monmouth's *Deificationes Galfredi*. A. died in 1128 or 1129 at Beverley, where he had been canon of the church of St John.

Al'va, a village of Stirlingshire, Scotland, 3 miles N. of Alloa. It is romantically situated among the Ochil Hills, in a detached part of the county within the confines of Clackmannanshire. Silver was formerly found in a neighbouring glen. The inhabitants are chiefly employed in the manufacture of shawls and tweeds. Pop. (1871) 4096.

Alvara'do, a town of Vera Cruz, Mexico, at the mouth of a river of the same name. It lies near a large lagoon, and is very unhealthy. Vessels over 12 or 13 feet draught cannot enter the harbour for a bar fronting the river. Pop. 6000.

Alvara'do, Pedro de, the chief lieutenant and most trustworthy comrade of Cortez (q. v.) in the wonderful expedition which had for its aim and its result the conquest of Mexico, was born at Badajoz towards the end of the 15th c. Engaged in a preliminary expedition on the shores of the Spanish main in 1518, A. in the following year joined Cortez in his project for seizing Mexico, and took a conspicuous part in all the chief incidents of that bold undertaking. His massacre of the Mexican nobles, his conduct of the retreat from Montezuma, and in the final conquest of the imperial city, are among the most striking episodes of this extraordinary chapter of history. He afterwards subjugated several of the maritime provinces in the extreme S. of N. America, was appointed governor of Guatemala by Charles V. in 1533, and headed an adventurous expedition into Quito, which, however, he abandoned on receiving a large sum of money from the conquerors of Peru. He met his death through accident in 1541, while chastising the rebel Indians of Xalisco. A. was one of the most intrepid of that able and unscrupulous band of Spanish adventurers who wrested so much territory, treasure, and power from the dynasties of the New World. See Prescott's *Conquest of Mexico* (1843), and *of Peru* (1847).

Alvarez, Don José, sculptor, born at Priego, Cordova, 23d April 1768. In youth he laboured as a stone-mason, but at an early age he distinguished himself as a modeller in the Academy of Granada, which procured for him the patronage of the Bishop of Cordova. Charles IV. granted him a pension to enable him to prosecute his studies at Paris and Rome. His works were much admired by Napoleon, who commissioned him to design *bassi-relievi* for the Quirinal Palace; and he was the friend both of Canova and Thorwaldsen. He was a member of the Institute of France; of the Academy of St Luke of Rome; and from 1825 principal sculptor to the King of Spain. He was known among his fellow-artists as 'the Greek,' from the vigour and purity of his designs. He died at Madrid, Nov. 26, 1827.

Alveolus, the term applied to the bony sockets or pits in which the teeth of mammals are lodged. Amongst lower vertebrates, the teeth are fastened either by ligament or by bony union to the surface of the bones upon which they are borne; or they may be implanted in ridges, but not in distinct sockets. The crocodiles and alligators form the only animals, in addition to the mammalia, in which the teeth spring from alveoli.

Alwur, the capital of a state of the same name, Rajputana, India, under British administration, 94 miles N.W. of Agra. It is poorly built on a rising-ground 1200 feet above the surrounding country, and 2100 above the sea. Its chief building is the palace of the Rao Rajah. Pop. 3000. The state of A. was bankrupt in 1870, and is now under control of the governor-general, yielding the rajah a revenue of about £180,000. The natives, Mewattis, are a savage race. Area, 3000 sq. miles; pop. (1872) 778,596.

Amade'us ('Love-God'), the name of several members of the house of Savoy, the first of whom of any note was A. V. (1249-1323), who became a prince of the empire. The Savoy in London was built by his brother. His son, A. VI., died in 1383, became viceregent of a large portion of N. Italy. In 1416 Savoy was created into a duchy under A. VIII., who, two years later, was chosen leader of Piedmont, the native dynasty having died out. In 1439 he became Pope as Felix V., but nine years after he resigned this dignity.

Amade'us, Ferdinand Maria, the second son of Victor Emmanuel II. of Italy, was born May 30, 1845. Entering the army with the title of Duke of Aosta, he met with some distinction, and in 1869 he was also appointed a vice-admiral. In 1867 he married Maria, daughter of Prince Charles Emmanuelle dal Pozzo della Cisterna. After the revolution of 1868, Marshal

Palm offered him the Spanish crown, and on the 16th November, 1870 the Cortes finally elected him King Amadeus I. of Spain by a majority of seventy votes. A short and stormy reign, marked by moderation, manliness, and honesty, ended in his abdicating on the 11th February 1873. Although working hard for the good of the country which had made him king, he never succeeded in gaining popular sympathy, and an attempt was even made on his life at Madrid, July 19, 1872.

Amadis, a name common to several heroes of the romantic poetry of the middle ages, the most famous of whom was A. of Gaul, the others being represented as his descendants. Whether the Gaul of the romances meant Wales, or what is now called France, has been keenly debated; but that it was the latter country seems to be well established, for the father of A. was Perion, a mythical king of Gaul, who summons a council of the magnates of his kingdom, and among these we find representatives from Picardy and Champagne. The mother of A. was Elisena, a princess of Bretagne, and he was a love-child, an accident so common in romantic poetry that it carries no stigma with it. From the device on his shield he was known as the Lion Knight, and from his complexion as Beltenebros, the Darkly Beautiful. The chivalric romances were in general tedious, stilted, and unnatural. That of A. of Gaul, on the contrary, displays undoubted genius and a fine creative power, and excels in the delineation of character. It was a favourite with Cervantes, whose inimitable caricature of its weaker successors banished them into merited obscurity. It still has admirers, and has not only furnished materials for the drama of Spain and Portugal, but for modern epics—the *A. de Gaulle* of Creuzé de Lesser (Paris, 1813), and the *A. of Gaul* of William Stewart Rose (Lond. 1803). To those who have no access to the original, nor leisure to read it *in extenso* if they had, the extracts by De Lubert and Count Tressan will furnish an adequate idea of its style and scope.

Different nations have claimed the credit of its origin. Lopez de Vega assigned the authorship to a Portuguese lady; the Comte de Tressan held that it was composed in French in the reign of Philip Augustus; and the Spaniards have at least this credit, that the earliest extant impression is in their language, having been printed at Seville in 1526. But the romance, which in Spanish contains fourteen books, furnishes no internal evidence of a particular nationality. It is in this respect perfectly colourless. The preponderance of evidence, however, tends to fix the composition of it on Vasco de Lobeira, a Portuguese officer, who died in 1403, or, according to Sismondi, in 1325. The first four books were therefore probably written in Portuguese, and, equally with the Homeric poems, convey the impression of having been the growth of an individual mind. The Spanish translation of these was the work of Garcia Ordoñez de Montalvo, who added the fifth book, containing the exploits of Esplandian, the son of A., and an excrescence and dead weight on the original. The remaining nine books contain the exploits and adventures of eleven heroes, mostly Greek, by five independent authors. The French translators, working from Spanish originals, but frequently interpolating matter of their own, have increased the number of books to twenty-four. Translations have also been made into Italian, English, German, and Dutch. The early books narrating specially the exploits of A. were translated by Southey, who has faithfully reproduced the events and manners of the original.

Am'adou, the name given to a soft, leathery, cellular substance, obtained from several species of *Polyporus*, a genus of fungi which are found growing on trees. A. is used for tinder, but is principally valued as an excellent styptic in surgery. *P. fomentarius* and *P. igniarius* are the two species from which A. is chiefly derived.

Amal'ekites, a tribe of Edomite Arabs occupying the district between Palestine and Egypt, and the first to oppose the Israelites after the passage of the Red Sea (Exod. xvii. 7-16). Saul, and afterwards David, nearly exterminated them (1 Sam. xv. 2-9; 1 Sam. xxvii. 8-xxx.); and the 'remnant' was finally extirpated by the Simeonites (1 Chron. iv. 43).

Amal'fi, a seaport in the province of Salerno, S. Italy, situated on a steep declivity overlooking the Gulf of Salerno, 24 miles S.E. of Naples. It is the seat of an archbishop, and was formerly a flourishing centre of trade, and had at one time probably more than 50,000 inhabitants. A. claims to have been founded

under Constantine the Great, and was a republic in the middle ages. It took part in the crusades, founded the maritime laws of Italy (*Tabula Amalphitana*), and was the birthplace of Masaniello, and Flavio Gioja, inventor of the compass. It has greatly declined, but still possesses some trade. The valuable MS. of the Pandects (q. v.) was found here. Pop. (1871) 4200.

Amalgamation is often resorted to in extracting gold and silver from their ores, but before this process can be employed the metals must be in the free state. The ore containing the free metals is crushed and agitated with mercury; a fluid amalgam results, containing the gold and silver. This is subjected to pressure in bags of chamois leather, when much of the mercury is forced out through its pores, and an almost solid amalgam, rich in the noble metals, remains. On distilling this, the mercury passes off in vapour, and the gold and silver remain.

Amalgams of gold and silver are also used for gilding and plating articles of metal. The surface of the article is first carefully cleaned, then dipped into the amalgam; a portion of this adheres to it, and on heating the article thus amalgamated the mercury is driven off and the gold or silver remains. An amalgam of tin and mercury is used for silvering mirrors.

Amalgams are produced by fusing mercury (quicksilver) with other metals. From the fact that in many cases heat is given out when such a mixture is made, and that the product frequently crystallises—the crystals having a composition such as can be expressed by a chemical formula—A. are regarded by chemists as true compounds. Sodium, for instance, if dropped into mercury which has been previously heated, unites with it so energetically that sparks are thrown out in all directions, and the resulting amalgam, if it contain sufficient sodium, crystallises on cooling. A crystalline compound of silver and mercury occurs native, and contains the two metals in atomic proportion (108 parts of silver to 200 of mercury); its formula is therefore Ag_{11}Hg .

Amalia, Anna, Duchess of Saxe-Weimar, born 24th Oct. 1739, was a daughter of Karl Duke of Brunswick Wolfenbüttel. During the second half of the 18th c. she was the centre and soul of the court of Weimar, which in more than one respect resembled that of Ferrara, where Ariosto and Tasso lived. On the death of her husband, Ernst August Konstantin, whom she lost (1758) two years after her marriage, she devoted herself to the upbringing of her only son, Karl August (q. v.), the noble and true-hearted patron of German literature. Wisely and thriftily she administered the revenues of the state, and always showed herself inspired with a generous zeal for the education and intellectual culture of her subjects. Her love of literature was unfeigned. In 1775 she selected Wieland as tutor for her son, and drew to her court numbers of the most splendid geniuses in Germany, among whom may be mentioned Goethe, Herder, and Schiller. She died 10th April 1807, broken-hearted by the disaster and shame of Jena.

Amande de Terre, or **Earth Almonds**, the French name for the farinaceous tubers of *Cyperus esculentus*. See CYPERUS.

Amanita, a genus of mushroom-shaped fungi. Twelve

species are found in Britain, some of which are edible, while others are highly poisonous. *A. muscaria*, the fly-mushroom, common in birch and beech woods, especially in Scotland, belongs to the latter class, and has derived its vulgar name from a fly-poison having been prepared from it. It is very ornamental, having a brilliant scarlet cap studded over with white or yellowish warts. When partaken of, it produces a peculiar kind of intoxication. The effects are first great cheerfulness, and afterwards giddiness and drunkenness, with an entire loss of consciousness. In Siberia it is much indulged in. Czar Alexis is said to have lost his life by eating it.

Amanita.

Amara nté, a town in the province of Minho, Portugal, on the Tamega, 32 miles N.E. of Oporto. It is in a decaying con-

dition, but has a fine church of the 16th c. in the Flamboyant style. The bridge here was defended by the Portuguese against the French (1809) for several days. Pop. 5500.

Amarantha'cese and **Amaranthus**, an order and genus of plants. The order embraces 500 species. The genus embraces several showy garden plants. The best known is *A. caudatus*, or love-lies-bleeding, with its drooping inflorescence of crimson flowers. It is the *Queue de Renard* of the French. *A. hypochondriacus* and *A. speciosus* are called prince's feather. Some species of A., such as *A. blitum* and *A. oleraceus*, have been used as pot-herbs. *Celosia cristata*, the cockscomb, and *Gomphrena globosa*, the globe amarantine, belong to the order. The plants are principally mucilaginous and demulcent.

Amaranthus caudatus.

Amarapura ('the city of immortality'), now a city of the past, was the capital of the native state of Burma, situated on the left bank of the Irrawaddy, about 9 miles N.E. of the more ancient capital Ava (q. v.). When the late king came to the throne, orders were given that on a certain day A. was to be deserted, and its inhabitants to remove to a new site, where now stands the city of Mandalay (q. v.), which is now the capital, and which lies 9 miles further up the river, on a plain nearer the foot of the hills. In a temple midway between A. and Mandalay there is a colossal image of Gaudama, carried away by the Burmese when they conquered the kingdom of Arakan, and still guarded by the descendants of Arakanese captives. A. was founded in 1783, destroyed first by fire in 1810, again partly by an earthquake in 1839, and finally deserted in 1852-53. Nothing remains of the old city but a few rows of beautiful trees and some ruined pagodas.

Amara-Sinha, a famous Hindu grammarian and poet, generally supposed to have flourished B.C. 56, though Colebrooke places him as late as the end of the 5th c. In religion he was a Buddhist, and all his writings, except the *Amara-Kosha* ('Treasury of A.'), perished during the fierce persecution of the Buddhists by the Brahmins. This work is often quoted under the name of the *Trikaṇḍa*, i.e., the *Tripartite*, because it is divided into three books. It is a Sanskrit vocabulary, containing about 10,000 words relating to the moral qualities of men, philosophy, the fine arts, the peculiarities of grammar, &c. The substantives are arranged in one or more lines of eighteen syllables each, and form a sort of measure called *vaktra* or *s'loka*. It is a great authority amongst native grammarians. The Sanskrit text was printed at Calcutta in 1831, of which a French translation appeared in 1839.

Amari, Michele, an Italian historian, born at Palermo, 7th July 1806. His love for an English lady induced him to study English, which resulted in 1832 in the publication of a translation of *Marmion*. In 1837 he was transferred from Palermo to Naples, where he prosecuted his studies in history, and in 1842 published his principal work, *La Guerra del Vespro Siciliano* ('The War of the Sicilian Vespers'), translated into German by Schröder, and into English by the Earl of Ellesmere. He then applied himself to the preparation of a history of the Mussulman occupation of Sicily (*Storia dei Musulmani di Sicilia*, Flor. 1853). After the revolution of 1848, he held several important public positions. He thereafter resided in Paris, but returned to Italy, and was made Minister of Foreign Affairs under the dictatorship of Garibaldi (1850), and Minister of Public Instruction in 1863. He is an accomplished scholar in Arabic and modern Greek, and is still (1877) a vigorous student and writer.

Amaryllida'cese and **Amaryllis**, an order and genus of Monocotyledonous plants, natives of temperate and warm countries. The order embraces 350 species, many of which are ornamental garden plants. The roots of *Flammarthus toxicarius* and the flowers of the common daffodil (*Narcissus pseudo-narcissus*) are said to be poisonous. The American aloe

(see AGAVE) yields pita flax; its roots are used to adulterate *sarza*, and its juice is fermented to form an intoxicating beverage.

Amaryllis rubra.

The bulbs of the poet's lily (*Narcissus poeticus*) and of the snowdrop (*Galanthus nivalis*) are emetic. The species of *A.* are bulbous-rooted, and very showy plants when in flower. *A. Sarniensis* is the Guernsey lily, and *A. Belladonna* of the Cape of Good Hope is the belladonna lily. These, with *A. vittata*, *A. rubra*, and several other species, are common in cultivation.

Amasî'eh (anc. *Amasia*), the capital of the Turkish vilayet of Sivas, Asia Minor, on the Yesil-Irmak, nearly 80 miles from

its mouth. It stands in a mountain gorge, and is chiefly built of wood. Three bridges span the river, which is made to irrigate the gardens by means of water-wheels. A castle occupies the site of the ancient Acropolis; and the rock-hewn tombs of the kings of Pontus, who had here their residence, are still to be seen. The chief products of the neighbourhood are silk, wine, cotton, corn, tobacco, and madder. Near *A.* are silver, copper, and salt mines. Pop. 25,000. *A.* is the birthplace of Strabo, the geographer, and was long a seat of the Osmanli sultans.

Amasîs (the name is a Greek form of the Egyptian *Ach-mas*, the young moon), a king of Egypt, the successor of Apries, in whom the line of Psammetichus ended, reigned from 569 B.C. till his death, 44 years later. He especially favoured the Greeks, opened the mouths of the Nile to their commerce, took to wife a Greek lady of Cyrene, and formed a body-guard of Greeks. He is said to have been visited by Pythagoras and Solon. His reign was peaceful and prosperous, and he fortunately died before the conquest of Egypt by Cambyses, by whose orders shameful indignities were inflicted on the corpse of *A.*

Amatricé, a town in the province of Aquila, Italy, on the Tonto, 80 miles N.W. of Rome. It has greatly declined of late. Pop. 2242.

Amataja, or 'the tea of heaven,' the name given by the Japanese to the dried leaves of a species of *Hydrangea*, highly valued by them as tea.

Amaturosis is paralysis of vision, or loss of sensibility of the retina to rays of light. It may be caused by changes in the retina itself, or in the optic nerve, or in the brain. Sometimes it appears to be hereditary, but the common causes are increased pressure in the eyeball from excess of fluid, exposure to intense light or heat, the action of the direct rays of the sun, directing the eyes continuously to minute objects, the action of the poisons of fevers, and the action of certain substances, such as belladonna, stramonium, &c. It is usually an incurable condition.

Amazî'chi, a seaport town, the capital of Santa Maura, one of the Ionian Islands, and the residence of a Greek archbishop. Earthquakes are frequent. The harbour, formed by the Anglo-Ionian government, admits only vessels of light draught. Pop. 5500.

Amazon, the greatest of rivers, if length of course or extent of area drained are decisive on that point, and practically forming in itself, through its connection with the Orinoco on the N. and the La Plata on the S., the river-system of S. America, rises in numerous head-waters in Peru—one of these flowing at a distance of only 60 miles from Lima. These head-waters—the Marañon, Huallaga, Ucayali, &c.—flow N.W. through Peru, E.N.E. in a conjoined stream between Peru and Ecuador, forming three-fourths of the boundary between these countries, and first known in this region as the *A.*, and still E.N.E. through Brazil to its mouth in the Atlantic Ocean on the equatorial line, and in long. about 50° W. It is 4000 miles in length, drains 2,350,000 square miles of basin, has an inland

navigation of 50,000 miles, is 150 miles wide at its mouth, and delivers a volume of water so vast as to overlie the ocean to the distance of 50 leagues from shore. From the N. its chief tributaries are the Napo, Putumayo, Yapura, and Rio Negro, by which it is in communication with the Orinoco; and from the S. the Yavary, Madeira, Tapajos, and Xingu. The *A.* was first navigated by steamers in 1853, since which time vessels of 1000 tons pass up the river from its mouth in the Atlantic to the towns of Peru. Expensive hydraulic works and canals of communication would be required, however, to develop its navigation, and the translator of Marco's *Journey across South America* says that it is not conceivable that, from the physical impediments to its navigation, &c., this river should ever play the part in civilisation of the Nile or the Mississippi, and that 'after all, it must be a question whether the free navigation of the River Plate is not of more immediate commercial importance than the opening up of the *A.*' See *A Journey across South America from the Pacific Ocean to the Atlantic Ocean*, by Paul Marcoy (Blackie & Son, 1873).

Amazons (the etymology of the name is disputed, some connecting it with the Greek *a* privative, and *macon*, the breast, and others with the Circassian *maza*, the moon), a nation of female warriors, prominent in the adventures of Greek mythology, but probably in some sense a historical race, whose principal seat was on the Thermodon, near Trapezus, the modern Trebizond. They are said to have been governed by a queen, and once a year they met with the Gargareans in the mountains to propagate their race. The legend says that the offspring, if male, was sent back to the Gargareans or put to death, while the females were brought up, their right breasts being cut off, to facilitate their handling the bow in war and in the chase. Ephesus, Smyrna, Cyrene, Mytilene, and Paphos were supposed to have been founded by the *A.* The ninth labour of Hercules was to take from the Amazonian queen Hippolyte the girdle she had received from Mars. Another queen, Penthesilea, who brought a body of *A.* to the assistance of Priam towards the close of the Trojan war, was slain by Achilles, and (according to Plutarch) they even figure as late as the time of Alexander the Great, when their queen Thalestris paid the great conqueror a visit. Scythian and African *A.* are also mentioned. The Greek imagination was much struck with the legend of the *A.* and some of their most admired paintings on wall, vases, &c., have for their subjects the battles of the *A.* with men. See Mordtmann, *The Amazonen* (Hanover, 1857).

Ambassador, an officer sent by one state to another with authority to transact business. By the law of nations an *A.* has many important privileges. Neither he, his household, nor suite are amenable to the laws of the country to which he is sent, but are amenable to the law of the country in which they are resident. The exact limit of the privilege is not however clearly defined. In the reign of Anne, the *A.* of Peter the Great was arrested in his carriage in London for debt of £50. Peter and the foreign ministers generally demanded summary punishment of the offenders. The British Constitution did not, of course, permit of punishment without trial and conviction, but an Act of Parliament was passed to prevent the repetition of this offence to foreign nations. An *A.* loses his privilege if he commit an offence against the state in which he is resident; and for plotting against the life of its sovereign he may even be executed.

Besides the ordinary *A.*, Ambassadors Extraordinary are on special occasions accredited by one state to another. Inferior diplomatic agents are employed by Great Britain at the minor courts of Europe. These are called Chargé d'Affaires, Envoy, or Minister Plenipotentiary (q. v.).

Amato, a flourishing town in the province of Leon, Ecuador, S. America, near the N.E. base of Chimborazo. It stands 8859 feet above the sea, on a tableland which produces much grain, sugar, and cochineal. *A.* was totally destroyed in 1698 by an eruption of Cotopaxi, but has long since been restored. Pop. 10,000.

Amber is an exudation, altered by fossilisation, of many species of extinct conifers, and resembles some gum-resins in its appearance and properties. It is hard and brittle, has a resinous lustre, and varies in colour between a pale straw and a reddish orange or brown, being usually transparent, but often clouded and opaque. Its ultimate composition is carbon 78.94, hydrogen 10.53, and oxygen 10.53. By friction it becomes negatively

electrical; hence our word electricity, through its Greek name *electron*. Personal ornaments of A. were highly esteemed among the Greeks and Romans, and are still much valued in Mohammedan countries. A. is found in many parts of the globe, especially on the Prussian coast, between Königsberg and Memel, where it is dredged and dived for in the surf, and obtained by mining operations in the sandhills of the interior. The annual value from all sources in this locality averages £60,000. Manufactured A. consists chiefly of pipe-mouthpieces, beads, amulets, and other personal adornments, and is mostly disposed of through Eastern channels. The trade in raw and manufactured A. is annually increasing. The lemon opaque variety is commercially most highly esteemed.

Amber, an ancient city of Jeypoor, India, now almost deserted. It lies among high hills, on the shore of a small lake, and its temples, tombs, and ruined houses are haunted by Hindu fanatics. The palace of A. is a splendid building.

Amberg, a walled city, formerly the capital of the Oberpfalz (Upper Palatinate), Bavaria, lies on both banks of the Vils, 35 miles E. of Nürnberg, and 32 N.W. of Ratisbon. It is handsomely built, and possesses, besides several fine churches, an agricultural school, a lyceum, a library of 32,000 volumes, a museum, and an arsenal. The chief products of A. are firearms, earthenware, beer, woollens, and ironmongery. There are extensive mines in the vicinity. Pop. (1875) 13,382. Near A. the French, under Marshal Jourdan, were beaten by the Archduke Charles, 24th August 1796.

Ambergris, a solid fatty substance, of a speckled grey colour, and a specific gravity from .780 to .896, which owes its name to a fancied resemblance to raw amber (*ambre-gris*, grey amber). Its origin was long unknown, but it is now pretty clearly ascertained to be a morbid secretion, probably of the gall-ducts, of the sperm whale, *Physeter macrocephalus*, in whose intestines pieces have been discovered. It is found floating on the sea, and is frequently thrown upon the shores of Greenland, China, Japan, W. Indies, Brazil, and other tropical countries, and rarely on the W. coast of Ireland. A. possesses a peculiar, sweet, earthy odour, and is employed in perfumery in the form of powder or alcoholic solution, to mix with other perfumes, whose fragrance it is said to increase. At all times a costly product, its market value fluctuates much with the supply, and is seldom less than 20s. an ounce.

Ambo.

Amblyopia, dimness of vision, caused by a defect in the accommodative arrangements in the eye for bringing a clear image on the retina at different distances. See EYE.

Am'bo, a kind of large pulpit, with a double ascent (whence the name), from which, in the ancient Church, the Gospels and Epistles were read, and sermons occasionally preached. It usually stood at the end of the choir. The Eastern churches and the basilica churches of Rome still furnish specimens of the A. In England the rood-loft served the same purpose. The A. had many other names, as the bema, lectorium, pulpitem, analogium, tribuna, &c.

Am'boise (anc. *Ambacia*), a town in the department of Indre-et-Loire, France, lies on the left bank of the Loire, 15 miles E. of Tours by railway.

It is situated in a rich wine district known as 'the Garden of France,' and possesses an old Gothic castle, restored by Louis Philippe, in which have resided several kings of France. The

Arab chief Abd-el-Kader lived at this castle when a captive in France. The religious wars of the 16th c. began in A., where also the Calvinists were first called 'Huguenots.' Pop. (1872) 4098.

Amboise, George d', cardinal, born at Chaumont-sur-Loire in 1460, became Bishop of Montauban in 1474, when only fourteen years of age; Archbishop of Rouen in 1493, and Prime Minister of Louis XII. in 1498. Thenceforth he is the chief political force in France, and was the real author of the French policy in Italy. He made an unsuccessful attempt to mount the papal throne on the death of Pope Alexander VI., and became in consequence the bitter enemy of the next two popes, Pius III. and Julius II. His experience as a statesman was great. Loyal to his king, devoted to his country, and faithful to his order, he managed to successfully combine the duties of a Churchman with those of a politician. He died at Lyon, 25th May 1510. A biography of A. by Montagne was published at Paris in 1631, and another by Legendre at Rouen in 1724. To understand A. rightly, one must read his *Lettres au Roi Louis XII.*, published at Brussels (1712). See also Barrière de Vieuzac's *Éloge de G. d'Amboise* (1806).

Amboyna, one of the chief of the Moluccas or Spice Islands, in the Malayan archipelago, lies about 2 miles S.W. of Ceram, and is the seat of the Dutch government, to which the entire group belongs. It is nearly 32 miles long and 10 broad, and is of irregular shape. Area, 287 sq. miles; pop. 30,000. It is mountainous, well watered, and fertile, but is liable to be deluged by the heavy rains which accompany the E. monsoon. The climate is healthy, and the chief productions are cloves, sago, pepper, sweet potatoes, coffee, cocoa-nuts, and indigo. Fine timber for cabinet-work is plentiful, but clove cultivation is the principal industry. In the 17th c. the Dutch took A. from the Portuguese. Its native population speaks a Malay dialect, but is probably of Hindu origin. The capital, A., lies on a peninsula which forms the eastern side of the bay of A., and has an excellent harbour. It has been a free port since 1854, and contains two Protestant churches, an hospital and theatre, and is guarded by Fort Victoria. There is a training-school for native teachers and ministers under the care of the Netherlands Missionary Society. Pop. 9000.

Amboyna Wood, a beautifully-mottled reddish wood, obtained from *Pterispermum indicum* in the form of excrescences or wens on the stem, used principally for inlaying.

Am'brose, St., one of the great fathers of the Western Church, was born in 340 A.D., at Trèves. His father was a prefect in Southern Gaul. His mother, ardently devoted to the Christian religion, exercised a profound influence on the development of his character. A., however, was not originally intended for the Church, but for the administration of the Roman law, and the sudden revolution in his career displays a romantic singularity of circumstance. Appointed by the Emperor Valentinian governor of Northern Italy, he so won the affections of the people by the evangelical benignity of his rule, that when the Archbishop of Milan died in 374, the Christian populace, almost equally divided in their sympathies between the Arian and Athanasian forms of the new religion, could find no happier solution of their difficulties than to elect the young magistrate, whose piety and humanity had endeared him alike to both parties. It was in vain that A. protested, declared himself unworthy, and tried to engender aversion by affected severities as a judge. It was in vain that he even brought harlots to his house, in the hope that such an outrage upon decency would enable him to escape that unwelcome honour. The people cried out with mad enthusiasm, 'We take thy sin upon our heads.' At last he had to yield, was baptized, and eight days after, though merely a catechumen, was consecrated to the see of Milan.

Though the choice both of Arians and Athanasians, A. did not hesitate for a moment in regard to the creed he should adopt. By the strength and tenderness of his imagination, by the humility and ardour of his faith, he was irresistibly drawn towards the sublime dogma of the Trinity. He was not a great thinker—subtle speculations had no charm for him—but he had a strong sense of the mystery of the Godhead, and drew a practical inspiration from the sentiment of reverence which this mystery awoke in his soul. The power of A. lay in his life and work, not in his writings. All through his career we recognise the devout Chris-

tian and the heroic Churchman. No man was more trusted in the Roman empire. From the borders of Mauretania to the confines of Thrace, men came to seek his help and protection. In the confusions that followed the death of Valentinian I., he saved Italy from the horrors of war by the personal influence he exercised upon the rebel general Maximus. When the dearth that afflicted Italy in 383 tempted the Roman senate, in which the elements of Paganism were still to be found, to demand a recognition of the ancient religion, the impassioned eloquence of A. frustrated the policy of cowardice and fear. The enmity of the Empress Justina, widow of Valentinian, who leaned to the Arian party, occasioned the fiercest tumults in Milan. The life of the archbishop was in the greatest danger; but his courage saved him from martyrdom, and the imperial court finally quailed before the opposition of the invincible priest. When Theodosius appeared in Italy in answer to the appeals of A., and destroyed the party of Maximus, he had still to learn that there was one man in the empire mightier than himself. The massacre of the Thessalonians was a crime for which neither senate, nor magistrate, nor philosopher dared to upbraid him; but when he presented himself for admission to the communion-table at the church of Milan, A. sternly ordered him to withdraw until he had made public confession of his sin. The emperor felt himself constrained to obey. The return of Theodosius soon after to the East again left Italy a prey to political and social disorder; and a Frankish chief, Arbogastus, for a moment made himself master of the peninsula. He and a certain Eugenius, a rhetorician, to whom he contemptuously assigned the imperial authority, did all they could to resuscitate Paganism; but their triumph was short-lived. Theodosius swiftly returned, and annihilated their army near Aquila. Paganism was now finally proscribed. Some say, though the best criticism is against the belief, that it was in honour of this great victory that A. composed the famous *Te Deum* still sung in almost all the churches of Christendom. He died at Milan in 397, not long after Theodosius, to whom he was deeply attached, and who in turn loved A. for his courage and fidelity. The best edition of A.'s writings, which are chiefly expositions of Scripture, with treatises, from a religious point of view, on Virginity, Widowhood, the Sacraments, Penitence, &c., is that of the Benedictines (Paris, 2 vols. 1686-90).

A. is also known to us in connection with church music, which he was the first to place upon anything like a popular basis. He adopted some of the simpler parts of the Greek musical system, and used only the four of their 'diatonic modes' (since called Ambrosian modes) which correspond to the scales beginning upon D, E, F, and G upon the pianoforte, using the white notes only.

Ambrosia, in Greek and Roman mythology, was the name given to the food of the gods, and was supposed to have the power of conferring immortality on all who ate of it. Hence probably its name, which is compounded of *a*, privative, and *bratos*, mortal. The *m* is, however, part of the root, and is seen in the form *mortos*. Comp. Lat. *mors*, death, and *mori*, to die; Sans. *mri*, to die. The Sanskrit *a-mrita*, or elixir of immortality, expresses the same idea. A. was represented as sweeter than honey, and of a most fragrant odour.

Ambrosian Chant, choral music introduced by St Ambrose, Bishop of Milan, into the Western Church in the 4th c., but superseded in the 6th c. by the Gregorian Chant. It was sung antiphonally. The A. C. is still occasionally sung in the Cathedral of Milan.

Ambrosian Library, Milan, founded by Cardinal Archbishop F. Borromeo in 1602, opened in 1609, and named after St Ambrose (q. v.). The printed books number 87,000 vols., and the MSS. 15,000. Two *Doctores Bibliothecæ Ambrosianæ* make the treasures of the library accessible to visitors. The Palimpsests, and Petrarch's copy of 'Virgil,' containing an autograph account of his first meeting with Laura, are among its greatest rarities.

Ambry, or **Aumbry**, a recess in the wall of a church, or a wooden cupboard near the altar, for keeping the sacred vessels, oils, books, &c., and used in the service of the mass. In Scotland the word is still used to denote any recess containing the necessaries of housekeeping. It is probably a corruption of almonry (Old Eng. *almerie*), and must originally, therefore, have been applied to a place where alms were kept for distribution.

Ambulacral System (Lat. *ambulare*, to walk), the name given to a peculiar system of vessels or tubes ramifying within the bodies of Echinozoal animals (star-fishes, sea-urchins, &c.),

by means of which water is admitted to the interior of the body, and through dilating the tubular feet, is made subservient to the locomotion or movements of the animals.

Ambulance (a French word, from the Latin *ambulare*, to walk or march) is a name applied to a movable field hospital,

in which wounded or sick soldiers are carried from the scene of conflict. The first A. train was organised by Baron Percy, a celebrated French surgeon under the First Napoleon. Somewhat later, Baron Larrey introduced great improvements in this important department, and his methods have been adopted in various European armies. At the Crimea, the British A. corps was very inefficient, notwithstanding the recent improvements of Drs Guthrie and Smith, who devised a cart and waggon respectively. During this war the French used what they called *cacolets*, each consisting of two stretchers, hung one on each side of a mule's or pony's pack-saddle. These, which in many circumstances were far more convenient than waggons, were latterly adopted by the English.

Ambulance Cart.

Ambulance Corps, now included in the Army Hospital Corps, was organised by the War authorities during the Crimean war, and consisted of a body of men set apart for ambulance duties. Towards the close of the war, however, it was superseded by the Land Transport Corps (q. v.)

Ambuscade, or **Ambush** (the former derived from the Italian *imboscata*, concealed in a wood), means the lying in wait of a party for the purpose of attacking an enemy unaware of its presence, and, before the introduction of firearms, was a very frequent manœuvre.

Amelan'chier, the Sardinian name for the medlar, and applied by botanists to a genus of plants belonging to the order *Rosaceæ*. The common A. (*A. vulgaris*) is a small tree cultivated in Britain. *A. botryapium* is the American grape-pear or June-berry. The fruit of several species is edible.

Amelia (anc. *Ameria*), a town of Umbria, Central Italy, lies picturesquely about 7 miles N. from the confluence of the Nera (anc. *Nar*) and Tiber. It is one of the oldest towns of Italy, and the remains of its ancient walls prove it to have been a place of strength, but its name is not mentioned in history before the time of Cicero. A. is a bishop's see. Pop. (1871) 7207.

A'men, Hebrew, 'firm, faithful;' but also an adverb equivalent to 'yea,' 'verily,' 'so let it be,' and used both by Jews and Christians in their forms of worship. The early Christians responded A. at the close of the prayer offered by the presbyter. The early practice of *shouting* A. at the celebration of the Lord's Supper by each recipient of the elements gave so much scandal, that it was discontinued after the 6th c. A. was pronounced in the Greek Church after the name of each person of the Trinity.

Amend'ment, a judicial and parliamentary term. As the former, it denotes a method of correcting errors in civil and criminal actions, which has lately been much improved in England and in Scotland.

In Parliament, an A. is an alteration proposed in the draft of any bill, or in the terms of any motion. No member, except when the House is in committee, is allowed to speak more than once on the same question; but he may speak again on an A. The original motion, if seconded, is always put first from the chair, thus: 'That the words proposed to be left out stand part of the question;' if this be carried, the main question is next put, and of course agreed to. But if the question as above be negatived, the motion is put with the omission of the words which it refers to, so that the A. separately is not voted upon.

Amenorrhoe's is the absence of the monthly menstrual discharge from females. There are two kinds: (1) that in which the menses have never appeared; and (2) that in which the

meneses, after continuing for some time, have ceased. The first class of cases are due to congenital malformation, or to the habits of the individual, or to errors in the digestive process. Luxurious and indolent women are specially prone to this affection. In some of these cases there may be a vicarious discharge of blood from another organ, such as the lungs, or bowels, or skin. The second class of cases may be caused by cold caught during menstruation, wetting of the feet, bodily or mental shock, mental depression, fever, or severe bodily injury. The treatment varies according to the cause. If due to congenital defects, nothing can be done. If it be the effect of debility, tonics, more especially those containing iron, are useful. If the menstrual discharge has been suddenly arrested, warm hip or foot baths often do good. Frequently, in cases of A., purgatives containing aloes are serviceable. It is an affection requiring medical advice.

Amentia, a variety of insanity identical with the conditions termed dementia and idiocy. It is characterised negatively by the absence of all intelligence, emotions, or will. See **INSANITY**.

Amentiferae, a large and important natural order of Dicotyledonous trees and shrubs, which have unisexual flowers, and bear the male flowers in catkins or *amenta*. The order has been divided into the following sub-orders: 1. *Salicinae*, the willow and poplar tribe, natives of temperate and cold regions; 2. *Myricae*, the sweet gale and candleberry myrtle tribe, natives both of temperate and tropical countries; 3. *Casuarinae*, the beef-wood tribe, found in Australia; 4. *Betulinae*, the birch and alder tribe, natives of temperate regions; 5. *Balsamiferae*, the liquid amber tribe, balsamic trees found in warm and tropical countries; 6. *Platanæ*, the plane-tree tribe, natives chiefly of temperate regions; 7. *Cupuliferae*, the oak, hazel, and beech tribe, natives both of temperate and warm countries. Authors frequently treat these sub-orders as separate orders.

America, next to Asia, the largest of the four continental divisions of the world. Alone of these continents it stretches throughout four zones, and its shores are washed by the Northern, the Atlantic, the Southern, and the Pacific Oceans. Its extreme length cannot be accurately fixed, but from Cape Barrow in the N. to Cape Horn in the S. it is fully 9000 miles, or 130° of latitude, and its greatest breadth, from Cape St Roque in Brazil to Cape Parma in Peru, is 3250 miles, or 46° of longitude. Including the islands, the total area is estimated at 15,783,372 sq. miles, and the population at 84,312,087. Perhaps the most remarkable characteristic in the physical aspect of A. is its immensity; nature is here seen, whether in mountain, river, cataract, lake, or forest, on the grandest scale. This vast territory consists strictly of two peninsulas and an isthmus, which are named respectively North, Central, and South A. After recounting the history of A.'s discovery and colonisation, the subject will be considered separately under these three heads.

The *discovery* of A., as commonly understood, means its discovery by Columbus. It must not be forgotten, however, that the primitive races are possibly to be regarded as immigrants, and at any rate that, long before the time of Columbus, Europeans had certainly found their way hither. As early as 1000 A.D. the Scandinavians, having previously colonised Iceland and Greenland, penetrated as far S. as the State of Massachusetts, and in 1170 a Welsh prince, Madoc, is said to have landed on the coast of Virginia. But these visits (and that of Madoc is more than doubtful) neither led to permanent settlements nor to a widespread knowledge of the existence of a continent in the W. Toward the end of the 15th c., however, the great commercial importance of a sea-passage to the E. Indies beginning to be keenly felt in Europe, gave rise to an ardent spirit of discovery, and Columbus (q. v.), perhaps the most intrepid and enterprising of discoverers, announced his grand scheme of reaching India by a westward route, thereby showing indisputably his belief in the rotundity of the earth. Under the patronage of Ferdinand and Isabella of Spain, he set sail on Friday, 3d August 1492, and on the 12th of October following landed on one of the Bahamas, probably Watling's Island, which he named San Salvador. This was followed in due course by the discovery of Cuba, Hayti or Hispaniola, Jamaica, and others of the Antilles; and these islands, being regarded as part of India, received the appellation of W. Indies, a name by which they soon became permanently known. Columbus, on three subsequent visits, also explored the coast of Central A. southward from Honduras, and that of South A. from

Margarita to the mouths of the Orinoco. The success of the great discoverer soon attracted in his wake a host of enterprising adventurers, among the first of these being Alonso de Hojeda, one of whose officers, Amerigo Vespucci (q. v.), has had the honour accidentally assigned him of giving name to A. For many years the exploration of the New World was briskly pursued, other European nations besides Spain freely taking part in the glorious work of discovery. In 1498, Sebastian Cabot, a Venetian in the service of England, visited Newfoundland; in 1500 the Portuguese Gaspar Cortereal touched at Labrador, and sailed along the coast nearly to Hudson's Bay; and in 1513 Vasco Nuñez de Balbao crossed the Isthmus of Panama and beheld the Pacific or Southern Ocean. In South A., again, the Spanish navigator Pinzon (1500-14) explored the coast to 40° S. lat.; a Portuguese fleet under Cabral in 1500 accidentally discovered Brazil a few months later than Pinzon; Solis entered the La Plata in 1515, where he was slain by the natives; and Magellan discovered the strait bearing his name in 1519, and for the first time circumnavigated the globe. The route round Cape Horn was only discovered in 1610 by Schouten, a Dutch navigator, and it was not till 1851 that Maclure's expedition proved the existence of a N.W. passage. On the discovery of A. it was found to be inhabited by a vast number of peoples, differing in character, physical appearance, and language. Some of these races had reached an advanced stage of civilisation, as is sufficiently attested by the architectural remains scattered over Mexico, Peru, and the Mississippi Valley, but none possessed a written language, and all history was therefore veiled in the obscurity of tradition. See **AZTECS**, and **INDIANS, AMERICAN**.

The work of *colonisation* was begun by Spain with vigour and enterprise, but in a spirit of tyranny and aggression. Little or no resistance could be made by the inhabitants against armed bodies of Europeans, and at every point of contact they were either massacred or forced to retire. With 600 men Cortez (q. v.) conquered Mexico, and Pizarro (q. v.), with even a smaller force, destroyed the empire of Peru; and here, in the two most populous countries of A., the number of inhabitants sensibly diminished at the approach of the invader. The almost entire depopulation of natives in the Antilles creating, as it did, a universal demand for field labourers, was the immediate cause which led to the establishment of the African slave trade. The Portuguese meantime were pursuing a somewhat similar policy on a portion of the basins of the Amazon and the Parana to which they gave the name of Brazil. For some time the Portuguese and Spanish were the sole European colonists, the empire of the latter embracing one-half of both Americas. The first French colonies were those of Canada (q. v.) in 1608, and the earliest English settlement was that of Virginia in 1607. See **UNITED STATES**. The whole of A. is now under European rule, with the exception of the aboriginal state of Araucania, included in Chili, and the African republic of Hayti, the oldest of the Spanish colonies.

NORTH AMERICA extends from the Gulf of Mexico, in nearly 30° N. lat., to the Arctic Ocean, having a length of about 4000 miles, and an extreme breadth of 3100 miles. Its shape, when we exclude Mexico, is almost square, but in the S.E. the peninsula of Florida projects from the mainland, and in the N.W. the regular outline is broken by the territory of Alaska. The western coast is little indented, the only marked irregularity being the long narrow peninsula of Old California. The eastern coastline, however, consists of an almost continuous series of bays, gulfs, and inlets, which become larger and more frequent toward the N., where Davis' Strait and Baffin's Bay separate the mainland from Greenland, and Hudson's Strait leads to the immense bay of the same name occupying the centre of British A. North A. is remarkable for its two great mountain ranges, its chain of immense lakes, its extensive river systems, and its vast plateaux and low plains.

The two *mountain systems* of North A. are the Rocky Mountains and the Alleghanies or Appalachians, both of which are described in separate articles. The Rocky Mountains extend, in a triple chain, from the plateau of Mexico to the Arctic Sea, a length of about 4600 miles. The main or easterly range forms the boundary of the Mississippi Valley, and is in many parts volcanic. The range that stretches into the Californian peninsula forms the coast-line as far N. as Vancouver's Island, and at some distance from the coast-range runs an intermediate chain, interrupted by occasional gaps. Near the 40th parallel of N. latitude

the Rocky Mountains are crossed by a transverse chain, which at each point of intersection towers into a height of 10,000 feet. On either side of these snowy mountains lie the great gold-fields of California and Oregon, formed chiefly of the gravels descending from the mountain-sides. There are no recent volcanic cones S. of Oregon, but northward the mountains are frequently volcanic. The coast-range terminates in the N. in a peak called St Elias, nearly 18,000 feet high, and in the neighbourhood of Mount Fairweather some 16,000 feet high. The Alleghanies are also a triple chain, but of much lower altitude, running nearly parallel with the E. coast almost from Maine to Alabama. They are intersected at various places by the passage of the rivers, and have a mean altitude of 2500 feet.

The chief river systems are the Mississippi, the St Lawrence, and the Mackenzie. The first of these, the great 'Father of Waters,' collecting the streams of the Missouri, the Ohio, the Arkansas, and the Red River, has a drainage area of some 1,250,000 sq. miles, and a total length of about 4000 miles. Next to the Amazon, it is the largest stream in the world, and, extending for most part in temperate latitudes, it far excels the larger river in its commercial importance, affording unrivalled facilities for internal communication. Together with its numerous tributaries, it drains the great central plains of A. as far N. as the low plateau which stretches across the country near the Canadian lakes, forming the watershed between the streams flowing to the Arctic Ocean and those entering the Atlantic or the Gulf of Mexico. Beyond this same dividing range the chief river is the Mackenzie, which has a course of 1770 miles, and flows into the Arctic Ocean. The drainage of this part of the country to the N. and W. is completed by many little-known but important rivers, all of which enter Hudson's Bay, after flowing through numerous large lakes on their course. The third great river system is the St Lawrence, with its chain of immense lakes. It flows E. and enters the Atlantic after a course of about 2000 miles, having a drainage area estimated at 400,000 sq. miles. The Atlantic slope is drained by numberless rivers that take their rise in the Alleghanies, and which, though small in comparison with the Mississippi or the St Lawrence, are invaluable for industrial or navigable purposes. The only important rivers that empty themselves into the Pacific are the Colorado, the Sacramento, the Oregon, and the Fraser, all of which rise in the great western plateau.

The lakes of North A. are larger and more numerous than those of any other country in the world. The principal are the five great lakes linked together by the St. Lawrence, and these have a total area of 120,000 square miles, which alone is almost half the aggregate fresh-water surface of the globe. Lake Superior is the largest of these, having an area of 31,400 square miles, and a mean depth of about 1000 feet. It is 627 feet above the Atlantic, and 355 miles in length. The longest of the lakes, however, is Michigan, which has an area of 25,600 square miles, and a mean depth of 1000 feet, being 578 feet above the Atlantic. Lake Huron has an area of 23,800 square miles, and a depth of 1000 feet. Erie and Ontario are far inferior both in depth and dimension. A chain of great lakes also runs through British North A. in a N.W. direction, from the neighbourhood of Lake Superior to the lower reaches of the Mackenzie river, of which the most notable are Winnipeg, Winnipegosis, Deer Lake, Wollaston, Athabasca, Great Slave Lake, and Great Bear Lake. The western plateau contains Great Salt Lake.

The plateaux and low plains are as distinctive a feature in the physical geography of North A. as its great lakes or river systems. The great central plain stretches from the Gulf of Mexico to the Arctic Ocean, is watered by all the principal rivers, and has an area of over 4,000,000 sq. miles. This vast expanse is only interrupted by the plateau near the Canadian lakes, towards which the land slopes gradually from N. and S., and the elevation ranges from 700 to 1500 feet. It is extremely fertile, even in the Canadian portion, where the climate is most rigorous. In the S. the plains have the advantage of a sub-tropical climate, and are widely cultivated and richly productive. Here, also, occur the savannahs or prairies of the Mississippi, partly alluvial, and partly heathy pine-barrens. To the E., again, a wide belt of rich plains extends between the Alleghanies and the Atlantic coast-line.

The islands which may be considered as belonging to North A. are extremely numerous, and will be described under their

respective heads. The most important are—(1) the W. Indian Islands, embracing the Greater and Lesser Antilles and the Bahamas, stretching in a great curve from the coast of Venezuela towards the peninsula of Florida, and forming a dividing line between the Atlantic Ocean proper and the Gulf of Mexico and Caribbean Sea; (2) the Bermudas, about 600 miles off the coast of Carolina; (3) the islands at the mouth of the St Lawrence, namely, Newfoundland, Prince Edward Island, Cape Breton, and Anticosti; (4) Cumberland, Cockburn, Southampton, and Melville Islands; Prince Albert Land, Banks' Land, and many others of the vast Arctic archipelago. Greenland is also generally regarded as a westerly member of the latter group. The only large islands on the W. coast are the Aleutians, forming an archipelago in themselves, Queen Charlotte and Vancouver's Islands.

The zoology is varied and peculiar, and among the more notable species may be mentioned the polar, black, and grisly bears, the moose, red, Virginian, and other deer, the puma, lynx, glutton, wolf, American fox, badger, otter, racoon, opossum, beaver, ermine, bison, and prairie dog. Of birds, the white-headed and other eagles, vultures, mocking and humming birds, passenger-pigeons, &c. The alligator, tortoise, rattlesnake, black snake, and siren are prominent among the reptiles. The domestic animals of Europe have been introduced successfully, and there is abundance of all kinds of fish.

The geology of North A. has been much more fully investigated than that of the southern half of the continent, for the obvious reason that in the northern part the extension of civilisation and scientific influences has proceeded at a much greater rate than in South A. The Laurentian rocks attain a large development along the line of the St Lawrence river, from which they derive their name. These rocks, once sedimentary, are now crystalline and metamorphosed, and they contain the famous *Eozoön Canadense*, or 'dawn of life animalcule.' The Cambrian rocks of A. lie unconformably on the Laurentian gneiss, and are termed Huronian beds by Sir W. Logan. These are sandstones, corresponding to the British Cambrian beds, and contain no fossils. The Lower Silurian rocks of North A. spread over Canada and the United States. These formations contain numerous fossils of *Graptolites*, *Brachiopoda*, *Cephalopoda*, &c. The Upper Silurian rocks are well developed. In the Mississippi a Carboniferous series lies directly on the Silurian. The Carboniferous system in North A. is also well developed. The Jurassic or Oolitic rocks are represented, according to Sir C. Lyell, by sands and clays, with beds of coal and numerous plant fossils. Professor W. B. Rogers says the Richmond-Virginian coal-field, of great value, belongs to the Oolitic period. The Cretaceous or chalk rocks are represented in New Jersey by sandy and clay beds, containing chalk fossils. Dr Hector says that sandstones, clays, and shales occupy the centre of Canada, E. of the Rocky Mountains. The evidences of the Glacial Period or Ice Age are best seen in North A., where a southward movement of polar ice must have taken place. Glacial deposits occur as far S. as lat. 39°.

The political divisions, areas, and populations of North A., are as follows:—

Governments	Area in Square Miles.	Population.	Capitals.
United States (1880)	3,603,884	50,158,866	Washington.
Danish America (Greenland)	34,038	9,825	Lichtenfels.
French Possessions	82	4,750	St Pierre.
British North America—			
1. The Dominion of Canada—			
Canada East, or Quebec	293,355	1,191,516	Quebec.
Canada West, or Ontario	107,780	1,620,851	Toronto.
Nova Scotia	21,731	387,800	Halifax.
New Brunswick	27,322	285,594	Fredericton.
Manitoba	13,993	11,963	Fort Garry.
British Columbia	213,000	42,000	New West- minster.
Hudson's Bay Terri- tory, or Rupert's Land	9,934,040	85,000	York Factory.

CENTRAL AMERICA, in which we include Mexico, forms the connecting-link between the two greater divisions of the continent. It is 2500 miles long, and has in the N. an extreme

breadth of 750 miles, but gradually narrows towards the isthmus of Panama, where it is only 40 miles across. The coast-line to the W. is almost unbroken, but that on the E. contains many small bays, and is of a somewhat zigzag shape. The great tableland of Mexico, along with the volcanic mountain chain of Guatemala, connects the Rocky Mountains with the Andes. In Central A., besides mountain chains and tablelands, there is a considerable river system, but few great lakes.

The tableland of by far the greatest magnitude is that of Mexico, which begins at the narrow isthmus of Tehuantepec and stretches into North A., having a breadth at the city of Mexico of some 400 miles, and an elevation of 7500 feet above the sea. On all sides it rises abruptly, and its summit is portioned off into four separate plains by an irregular range of hills about 1000 feet high. The city of Mexico is built on one of these hills, at a point where a line of active volcanoes extends across the country. The tableland of Guatemala, continued from Tehuantepec to the isthmus of Panama, is the next in importance, and is of volcanic formation. The climate of these tablelands is extremely healthy, though that of the coast is humid and malarious.

The great mountain chains are the Sierra Potosi, the most easterly range; the Sierra Sonora, towards the W. coast; and the central chain Sierra Madre, which forms the watershed of the country, and in which lie the principal gold and silver mines. See CORDILLERAS. Popocatepetl is the loftiest peak in Mexico, being some 18,000 feet above the sea, and is an active volcano in an almost constant state of eruption. The Mexican silver mines occur where the tableland unites with the mountain chain. Between the isthmus of Tehuantepec and that of Panama there are nearly forty volcanic mountains, with heights ranging from 3000 to 13,000 feet above the sea.

The river systems are numerous, but are necessarily limited, from the narrowness of the territory through which they flow. The only important river is the Rio del Norte, which, after a course of 2000 miles, including its windings, enters the Gulf of Mexico at about 25° N. latitude. Its total drainage area is estimated at 250,000 sq. miles. There are many small lakes on the tableland at various elevations. The largest is Lake Nicaragua, which is 100 miles long and 50 broad, and has an area of 4400 sq. miles.

The zoology of Central A. includes the puma, wolf, jaguar, wild boar, black tiger, tiger-cat, ocelot, opossum, racoon, tapir, peccary, sloth, armadillo, and monkey.

The areas and population of the various countries in the following table are from the *Almanach de Gotha* for 1875:—

Governments.	Area in Square Miles.	Population.	Capitals.
Mexico	741,820	9,134,128	Mexico.
San Salvador	7,337	600,000	San Salvador.
Nicaragua	58,170	250,000	Managua.
Honduras	47,108	351,700	Comayagua.
Guatemala	40,792	1,194,000	Guatemala.
Costa Rica	21,502	185,000	San Jose.
Total	916,729	11,714,828	

SOUTH AMERICA is triangular in shape, and its vertex lies southward, like the corresponding continent of Africa in the Old World. Its greatest length is 4700 miles, its greatest breadth 3150, and its total area 7,000,500 sq. miles. It has a coast-line of 15,800 miles, and on the side of the Caribbean Sea and the Atlantic there are many bays and excellent harbours, but on the Pacific side the seaboard is almost unbroken. The continent is marked by great plains or terraces at various elevations, between the great chain of the Andes, on the W. and the lower mountains of Brazil on the E., and is watered by the most magnificent river systems in the world.

The chief islands of South A. are the Galapagos, W. of Ecuador; Chincha Island, W. of Peru; Juan Fernandez, W. of Chili; Chiloe and Wellington, W. of Patagonia; Tierra del Fuego, S. of Patagonia; Falkland Isles, E. of Patagonia; and Curaçao, N. of Venezuela. The Antilles have already been mentioned in connection with North A., but they belong nearly as much to South A., and are indeed supposed at one time to have linked the two continents together, converting the Caribbean Sea and Gulf of Mexico into landlocked seas or vast lakes.

The great mountain chain is the Andes (q. v.), which extends from the isthmus of Panama, in a triple range, as far as Bolivia, and afterwards in a single range to the extremity of the land at Tierra del Fuego. It is almost entirely volcanic, and ranging close to the western coast, it exercises a remarkable effect on the climate. The prevailing winds being easterly as far S. nearly as Valparaiso, the vapours with which they are still loaded after passing over the continent are arrested by the mountain heights, and the rain being thus all but completely diverted into the drainage of the eastern slope, the narrow strip on the western side is converted into a sandy desert. Brazil is partly intersected by an intricate and extensive mountain system.

As to river systems, the most gigantic is the Amazon (q. v.), with a drainage area of over 2,000,000 sq. miles. It rises at a great elevation in Upper Peru, receives at least twenty splendid rivers, and after a course of 4000 miles it enters the Atlantic without delta, discolouring the ocean for a distance of over 400 miles from land. Only inferior to the former is the Rio de la Plata, or Parana, which rises in Brazil, and has a course of 2150 miles. Its chief tributaries are the Uruguay, the Salado, the Paraguay, and the Pilcomayo, and it flows into the Atlantic after watering the N.W. of La Plata. It is subject to inundations, occasionally overflowing whole provinces many thousand square miles in extent. Next in importance is the Orinoco, lying towards the N. of the continent. It rises in the Andes, flows through an extensive region of impenetrable forest, is connected by a natural canal with the Amazon, and enters the Atlantic in the extreme W. of Venezuela. It drains an area of 300,000 sq. miles, and is 1500 miles long, 1000 of which are navigable. There are many other large rivers flowing into the Atlantic and the Caribbean Sea, some of which exhibit the peculiar phenomenon of *anastomosis* or interlacing; but on the entire W. side of the Andes the only river worth mentioning is the Guayaquil of Ecuador. Titicaca is the only lake of great dimensions, and is 115 miles long, from 30 to 60 broad, and at least 13,000 feet above the sea.

The tablelands in the northern part of South A., and between the parallel ridges, are of great elevation. Many are 12,000 feet above the sea, and are well-cultivated regions, containing large cities and numerous villages. The tableland of Titicaca, in the Bolivian Andes, has an area of 150,000 sq. miles, and is populous and productive, being also a great mining centre. Some of these plains were inhabited by civilised peoples long before the Spanish invasion. In the basins of the Amazon and the Orinoco, and in parts of Patagonia and Buenos Ayres, occur many low plains. See PAMPAS, LLANOS, and SILVAS.

The zoology of South A. is extensive and peculiar, embracing a fourth of all the known mammals, among which, however, are almost none of the wild animals so abundant in Africa and Asia. The most powerful of the carnivora is the jaguar, which is indeed the only formidable beast of prey in the whole continent. Of the other animals may be mentioned the great tapir, peccaries, sloths, ant-eaters, armadillos; the llama, the chinchilla, and the monkey. Many of the species are peculiar to South A., and are not found elsewhere. Among birds the most notable are various parrots, humming-birds, flamingoes, toucans, and arcaris. Chief among the reptiles are alligators and rattlesnakes.

In South American geology the Cretaceous or Chalk rocks, like the Oolitic beds, can be traced from Columbia to Tierra del Fuego. The Eocene rocks of the Kainozoic Period are also well represented. The Recent Period gives us the remains of animals belonging to orders of mammals which occupy that region in the present day, with the addition, that the fossil species present the characters of existing species greatly intensified. Thus the gigantic extinct sloths, mylodon and megatherium, the extinct armadillo-like glyptodon, the extinct llama or auchenia, &c., are all represented by less typical existing species.

The botany or vegetable kingdom in South A. has a magnificent development, particularly in the vast tropical territory E. of the Andes, the basins of the Amazon, the Orinoco, and their tributaries, where the genera and species are more abundant, the forests larger, and the forms more gigantic than anywhere in the Old World. Besides its palms, it has dye-woods of all sorts, cedar, mahogany, ebony, &c.; farther S. are the araucarias of Chili, and the beech forests of Patagonia. North A. has also a superb flora, including the pines and beeches of the Dominion of Canada; the poplars, pines, oaks, beeches, maples, and hazels of the United States; and the dye-woods, rosewood, and ebony of Mexico.

From the *Almanach de Gotha* for 1875 we take the following statistics:—

Governments.	Area in Square Miles.	Population.	Capitals.
Brazil	3,288,113	10,196,238	Rio de Janeiro.
Venezuela	493,275	1,784,194	Caracas.
Guiana, British	85,495	193,491	Georgetown.
Guiana, Dutch	46,073	52,105	Paramaribo.
Guiana, French	46,881	24,897	Cayenne.
United States of Colombia	320,747	2,910,329	Bogota.
Ecuador	248,385	1,308,082	Quito.
Peru	510,445	2,500,000	Lima.
Bolivia	536,200	2,000,000	Chuquisaca.
Argentine Republic	1,619,955	1,877,490	Buenos Ayres.
Uruguay	83,859	450,000	Monte Video.
Paraguay	56,734	221,079	Asunción.
Chili	132,645	2,003,346	Santiago.
Patagonia	364,864	5,000	Patagones.
Falkland Islands	4,741	803	Port Louis.
Total	7,748,342	25,527,054	

See Humboldt, *Examen Critique de l'Histoire et de la Géographie du Nouveau Continent* (5 vols. 1836-39); Macgregor, *The Progress of A. from its Discovery to 1846* (2 vols. 1847); Squier, *The States of Central A.* (1857); Kohl, *Geschichte der Entdeckung von A.* (1861); B. F. de Costa, *The Pre-Columbian Discovery of A.* (1867); Disturnell, *Influence of Climate in North and South A.* (1867); and Dr. Brinton, *The Myths of the New World* (1868).

America, British. A name strictly applicable only to the entire Transatlantic possessions of Britain in North, Central, and South A., but generally used as an equivalent for British North A., comprising the whole of the Dominion of Canada, together with the still unincorporated colony of Newfoundland. Although inferior in population, B. A. is equal in area to the American Republic, and greatly superior to any other of the western governments. This vast extent of territory yields the utmost variety of material products, and embraces many of the most valuable commercial and military positions in the New World. For a complete list of the British possessions in A., see the tables in the preceding article; and for descriptions of the different states, see separate articles under their respective heads.

America, Russian. See UNITED STATES.

America, Spanish. the name applied to Porto Rico and Cuba (q. v.), now all that remains of the Spanish territories, which at one time embraced the entire continent.

Americanism (comp. Scotticism), a term, phrase, or form of expression, the use of which is peculiar to America. Formerly each division of the Union had its own distinguishing forms of expression—those of the Western States having their origin usually in character stories, and in the application of the habits of animals to human devices under specified conditions; those of the New England and maritime States serving to illustrate the contingencies, expedients, triumphs, and vicissitudes of commercial life, &c. In our own time, however, so rapid and ready is railway communication over the American continent, that now true humour may be said to have no locality, and the aphorism which springs up this month in California may be found flourishing next month in New York. Dr M. Shele de Vere (*The English of the New World*, Scribner, 1873) states that 'the largest part of so-called Americanisms are nothing more than good old English words.' But the true A. is a manifestation of the humour of the country concentered in the form of a term or phrase. For the mass of Americanisms in common use the reader is referred to Bartlett's *Dictionary of Americanisms* (New York, 1848), the *English Language in America, Cambridge Essays* (1855), and J. R. Barley's *Dictionary of Americanisms* (4th ed. Boston 1877). The habits of the racoon and opossum have given rise to many specimens, some amusing, all picturesque or graphic. From the well-known habit of these of taking refuge in a gum-tree when pursued, a 'gum-game' is now the favourite word for any sly attempt to get out of a difficulty; a 'tree'd coon' is used to describe a man who has had recourse to his last expedient; and to 'bark up the wrong tree,' as the sportsman's dog occasionally does, means to go on the wrong track, or pursue an unconvincive line of argument. Many Americanisms are simply vulgarisms, ridiculous from their extravagance; thus we hear of a 'lady rubbing her gums,' i.e. wiping her goloshes, 'on the door-mat.' Me-

taphorical Americanisms, having their origin in humorous stories, date for the most part from the Western States: thus 'to acknowledge the corn' means to confess, to own a fault; 'to cave in,' to collapse, as the earth sometimes does when 'caves' are dug beneath it. To 'pull up stakes' means to pack up and be off; to 'fizzle out,' to be quenched; to 'fix one's flint,' to settle or do for; 'big-bugs' are people of consequence; 'all-standing' means without preparation; to 'hurry up the cakes' is to be active. Among Americanisms may be classed the curious Anglo-German patois in use (of necessity) by German settlers, which is so admirably exemplified in the *Ballads of Hans Breitmann* (see LELAND); but the extraordinary orthography of Artemus Ward, and of Josh Billings, Mark Twain, and others, can no more be termed a distinctive A. than the Cockney spelling of Sam Weller in the *Pickwick Papers* can be termed an Anglicism.

Amerigo Vespucci, navigator and discoverer, whose Christian name has been given to *America*, was born at Florence, of a good family, 9th March 1451. At an early age he showed a liking for the physical sciences, and in 1486 he was engaged as a factor in a Florentine commercial house in Seville. While thus employed, the passion for discovery, which, after the great achievement of Columbus, seems to have inflamed all navigators, seized A. He made four voyages to the New World in the capacity of naval astronomer, the first and second in 1499-1500, in expeditions under the auspices of Spain; and the third and fourth in 1501-4, in the service of Portugal. In 1508 he obtained the appointment of pilot-major under the Spanish government. His principal duty in this office, which he retained till his death, was to examine persons seeking licences as pilots in the use of the astrolabe and quadrant, and in the practice as well as the theory of their business. He died at Seville, 22d February 1512. In Germany a confused account of A.'s voyages was written by one Waldseemüller, who was utterly unknown to Vespucci, and who proposed that the new region should be called *Americi terra*. The name passed into geographical charts, and so established itself. But Humboldt has clearly shown (*Cosmos*, Bohn's transl., vol. ii. pp. 676-81) that A., who was a man of high character, and greatly esteemed by Columbus, was absolutely free from blame in this matter.

Aersfoort, an old town of Utrecht, in the Netherlands, situated on the navigable river Eem, which enters the Zuiderzee. It has a beautiful church, with a tower 300 feet high, and carries on an important trade in grain, and a considerable manufacture of cottons, woollens, leather, soap, and beer. In the vicinity are several tobacco plantations. A railway connects it with Utrecht and Zwolle. A. is mentioned in documents as far back as 1006, but first obtained a town charter in 1259. It is the birthplace of the famous statesman Oldenbarneveld. Pop. (1869) 13,298, of whom nearly one-half are Catholics.

Ametabol'ic Insects. This name, signifying 'without change,' is applied to indicate collectively the three lowest orders of insects, distinguished familiarly by their undergoing no *Metamorphosis* (q. v.) These forms accordingly come from the egg in much the same state as that in which they pass their adult life, the young insect not differing from the perfect being save in size. They may moult frequently during their consequent increase in size, but the absence of a defined series of changes, such as is seen in the butterfly, beetle, &c., constitutes a marked difference between these and higher insects. The A. I. are the *Mallophaga* (bird-lice), *Thysanura* (spring-tails), *Aptera* (lice).

Amethyst, a variety of quartz or rock-crystal, of a fine purple or bluish-violet colour, extensively used for cutting as a gem for personal ornament. The colour of A. is supposed to be due to the presence of a minute proportion of manganese in its composition. The finest A. comes from India, Ceylon, Siberia, and Brazil; but qualities suitable for jewellery are also found in Austria, Saxony, France, and Spain, and a vein of good colour exists at Kerry Head, in Ireland. A variety of the sapphire, of a purple colour, is known under the name of Oriental A.

Amherst, town in the district of the same name, British Burmah, about 30 miles S. of Moulmein by river. Founded in 1826 as the capital of the province of Tenasserim, and called after the Governor-General. It is now only a summer sanatorium

for the inhabitants of Moulmein, a pilot and telegraph station. The district of A., lying between the Dawna Mountains and the Gulf of Martaban, has an area of 15,205 sq. miles. Pop. (1876) 275,432. The staple products are rice and teak. The chief town is Moulmein (q. v.). In 1875-76 the exports were valued at £1,184,000; the imports at £598,000.

Amherst, a town in Hampshire, Massachusetts, U. S., on a tributary of the Connecticut, 82 miles W. of Boston. It has a considerable and increasing trade. Pop. (1870) 4635. *A. College*, one of the most flourishing colleges in America, is situated near A., and was founded in 1821. It has fifteen professors, and possesses a large library, a museum, and an astronomical observatory.

Am'iens, capital of the department of Somme, and of the former province of Picardy, France, is situated on the river Somme, in the midst of a richly-cultivated plain. It is a junction for numerous railways, and has considerable manufacturing activity, especially in textile fabrics. Its grandest building is the cathedral, a magnificent specimen of Gothic architecture, built 1220-88 by Robert de Luzarche, Thomas de Cormon, and his son Renault. It is the birthplace of Peter the Hermit, but is best known from the Peace of A., signed here March 27, 1802, between England, France, Spain, and Holland. In the war of 1870 it was taken by General Manteuffel. A. is a very old city. It was known to the Romans under the name of *Samarobrica*, and was the capital of the *Ambiani* in Gallia Belgica in Caesar's time. After many vicissitudes, it was finally brought under the authority of the French crown by Louis XI. in 1477. Pop. (1872) 54,499.

Amiot or Amyot, Joseph, a French Jesuit missionary in China, born at Toulon in 1718, sailed for the East in 1750, and died at Peking in 1794. He was the first to make known, in anything like an exact and scholarly manner, the literature and history of the Chinese, and later sinologues have liberally availed themselves of his labours. His most important works are his translation of part of the Chinese classics on military art (*Art Militaire des Chinois*, &c., Paris, 1772); *Abregé Historique des Principaux Traits de la Vie de Confucius* (Paris, 1787); *Dictionnaire Tartare-Mandschou Français* (Paris, 1789); and *Alphabet Tartare-Mandschou* (1807). Numerous essays, treatises, &c., of A. are to be found scattered through the sixteen volumes of *Mémoires concernant l'Histoire, les Sciences, les Arts, et les Usages des Chinois* (Paris, 1776-1814).

Am'leth, or Hamleth, Prince of Jütland, the original of Shakespeare's Hamlet, assigned to the 2d c. B. C., but now generally regarded as a purely mythical personage. Saxo-Græmaticus says he was the son of Horvendill and Gerutha; and that after his father's assassination by his uncle Fengo, who then married Gerutha, he feigned madness to secure his own safety. His stabbing a spy found hiding among some straw, and his reproaching his mother till she promised to aid him in avenging his father's death, and many other incidents, are reproduced in Shakespeare's play. Tradition still points out the tomb of A., and the spot where his father was assassinated.

Am'lwch, a town of Anglesey, N. Wales, 20 miles N. E. of Holyhead. It lies on the N. coast of the island, and near it are the rich copper mines of the Parys Mountain. There are several smelting-furnaces, and alum and vitriol works. A. has a large harbour, and is the terminus of the Chester and Holyhead Railway. Along with Beaumaris, Holyhead, and Llangefni it returns one member to Parliament. Pop. (1871) 2968.

Ammana'ti, Bartolomeo, a Florentine sculptor and architect, born 1511, died 1592. He decorated the Capitol with sculptures for Pope Julius III., was employed as architect by Cosmo de Medici, and completed the famous Pitti Palace. An ardent admirer of Michael Angelo, his architectural works evince magnificence of conception. His bronzes are admired for their delicacy.

Ammergau. See OBER-AMMERGAU.

Ammia'nus Marcellin'us, a Roman historian of the 4th c., and the last Roman writer who composed a secular history in Latin. According to Libanius, he was born at Antioch in Syria about 330 A. D. The greater part of the life of A. was passed in military service. He took part in the unfortunate expedition of

Julian against the Persians, and subsequently served under Valentinian Valens, Gratian, and Theodosius, who ascended the throne in 379. His last years, however, were spent at Rome in literary leisure. A.'s work, entitled *Resum Gestarum Libri XXXI.*, is reckoned a sequel to Tacitus, whose style he unsuccessfully imitates; but the first thirteen books, embracing Roman history from 91 A. D., when Tacitus stops, to 352 A. D., are lost. The remaining eighteen, however, from 352 to 378, in spite of certain lacunæ or gaps, are invaluable as the records of events of which the author was mainly an eyewitness. His geographical, archaeological, and ethnological digressions possess the greatest interest, as, for instance, his chapters on the Saracens, the Huns, the Germans, &c., and on Egypt, Persia, Pontus, and Thrace. The question has been much discussed whether A. was a pagan or Christian, but it remains undecided. The best edition of his history is that by Wagner and Erfurdt (3 vols., Leipz. 1808).

Am'mon, or Amun, a god of Egypt, holding the highest rank, and whose name signifies the unrevealed. The Greeks identified him with Zeus, and the Romans with Jupiter; hence his city, *No-Amon* (Nah. iii. 8), is translated into Greek by Diospolis. His peculiar residence was Thebes, but his worship spread to Greece and Rome, and his temples were numerous and splendid. He is confounded with two other deities, the sun-god Ra, and Kneph.

Ammon, Christoph Friedrich von, a learned German theologian, born at Baireuth, January 16, 1766, died at Dresden, May 21, 1850, is best known by his work on the *Fortbildung des Christenthums zur Weltreligion* ('Development of Christianity as a Universal Religion,' 4 vols., Leipz. 1833-40), in which he seeks to show that the highest outcome of theology is to reconcile the gradual development of the Christian doctrines of faith with the continual progress of science. Of his other works the chief are *Entwurf einer rein Biblischen Theologie* ('Scheme of a pure Biblical Theology,' 3 vols., Gött. 1801-2); *Wissenschaftlicher Entwurf der Christl. Sittenlehre* ('A Scientific Scheme of Christian Ethics,' 6 vols., Erl. 1793); *Handbuch der Christl. Sittenlehre* ('Handbook of Christian Ethics,' 3 vols., Leipz. 1823, 2d ed. 1838); *Leben Jesu* ('Life of Jesus,' 2 vols., Leipz. 1842-44); and *Die Wahre und Falsche Orthodoxie* ('The True and the False Orthodox,' Leipz. 1849). His second son, Friedrich August A. (born 1799, died 1861), was a well-known writer on medical subjects in Germany.

Ammonæ'mia is poisoning of the blood by the accumulation of carbonate of ammonia, resulting from the decomposition of urea in cases of suppression of the functions of the kidney. See URÆMIA; KIDNEY, DISEASES OF.

Ammonia is a gaseous compound of nitrogen and hydrogen. Solution of A. has probably been known from the earliest ages, but it is first mentioned by the alchemist Raymond Lully in the 13th c., who obtained it by distilling urine. The solution was called by him *Mercurius vel spiritus animalis*. Basil Valentine, in the 15th c., prepared solution of A. from sal-ammoniac, but retained Lully's name for it. Bergmann (1782) first called it A., either from A., a Cyrenaic territory, or from Ammon, a title of Jupiter. A. occurs in nature combined with acids. Air contains very small quantities of carbonate of A.; drinking-water very frequently nitrate or nitrite of A.; and free or uncombined A. is always evolved from decomposing animal matters. A. is now prepared from coal-tar, which contains considerable quantities. The tar is washed with dilute hydrochloric acid, which combines with the A. to form chloride of ammonium (sal-ammoniac), a very soluble salt, whilst the tar remains undissolved. The solution is siphoned off from the tar, evaporated to a sufficient extent, and allowed to cool, when the sal-ammoniac separates in crystals. A. is prepared from sal-ammoniac by heating the latter with slaked lime; chloride of calcium remains in the retort, whilst A. escapes as a gas. In manufactories this operation is carried out in iron vessels.

A. is a colourless gas, lighter than air (sp. gr. .59 rel. to air), and of suffocating, characteristic smell. It is exceedingly soluble in water, 1 volume of that liquid dissolving 670 volumes of the gas at ordinary temperature. Strong solution of A. is known in pharmacy as *liquor ammonia*. The characters of the solution are those of a true alkali (see ALKALI); it has a soapy, caustic taste, corrodes organic tissues, restores the blue colour to litmus reddened by an acid, and combines with acids to form important

and well-marked salts. It precipitates many metals from solutions of their salts, as hydrates (hydrated oxides), and for this reason is a valuable reagent in chemical analysis.

Solution of A. is used in medicine both externally and internally. Hartshorn and oil is a kind of soap prepared by mixing *liquor ammoniæ* with olive oil.

A. (gas) is composed of 14 parts by weight of nitrogen to 3 parts of hydrogen, and is represented by the formula NH_3 .

The salts of A. are numerous, and in many cases important. Sulphate of A. is largely used as a manure. Carbonate of A., or common smelling-salts, is a valuable medicine; its solution is known as sal-volatile. Nitrate of A. is resolved by heat into 'laughing-gas' and water. Chloride of ammonium, besides being the chief source of A. itself, is eaten by the peasants of Russia instead of common salt. The salts of A. resemble very closely the corresponding salts of potassium, and are regarded by chemists as compounds in which the group NH_4 (ammonium) plays the part of a metal. This group, however, is only known in combination.

Ammoniacum, a drug obtained from *Dorema ammoniacum*, an Umbelliferous plant, native of Persia. When the stem is punctured, the milky juice exudes in tears, and becomes yellowish on exposure, forming the gum-resin, like *Asafoetida* (q. v.) The A. is also obtained from *Ferula tingitana*, another Umbelliferous plant, found in the northern parts of Africa.

Ammonites, a race descended from Ben-ammi, the son of Lot, occupying the desert district to the E. of Gad. They waged incessant warfare against the Israelites, and were defeated successively by Jephthah, Saul, David, Uzziah, and Jotham, and, after the captivity, by Judas Maccabæus, after whose time they disappear from history, and were probably merged in the general body of Syro-Arabbians. According to Josephus, Antiochus the Great destroyed the walls of Rabbah, their capital (B.C. 198). Their chief deity was Milcom, or Moloch.

Ammonites, a family of extinct Tetrabranchiate, or 'four-gilled' cuttlefishes, or Cephalopoda, represented in a fossil state by their many-chambered shells. They form the type of the family *Ammonitidae*, which differed from the family *Nautilidae*—including the existing pearly nautilus—in possessing the *septa*, or partitions between the chambers of the shell, of a folded or complex nature. The *siphuncle*, or tube passing through the septa, and bringing the chambers into communication, pierced the septa on their external or dorsal aspects. The A. form fossils pre-eminently characteristic of the Mesozoic rocks, but they first appear in the Lower Silurian formations (*Bacrites*), and in the Upper Silurian rocks also (*Goniatites*). They became extinct at the close of the Cretaceous or Chalk Period. Baculites, hamites, scaphites, turritiles, &c., are genera included in this family.

Ammonium, an oasis in the Libyan Desert, 6 miles long and 3 broad, has a place in history as the site of a temple dedicated to Amun or Ammon, the Egyptian Jupiter, and famous for its oracle, to which pilgrims resorted from all parts of Æthiopia and Egypt. When Alexander the Great visited the spot in the course of his conquest of Egypt, the priests saluted him as the son of the god. The ruins of the temple, which was not large, still exist, and prove its Egyptian order and character, but Greek influences (from Cyrene) affected the worship at an early period. There are numerous springs and fountains in A., one of which, called the 'Fountain of the Sun,' is somewhat tepid, and at night is distinctly warmer than the surrounding atmosphere. In the time of Herodotus the inhabitants were partly Egyptian and partly Æthiopian. The soil was and is extremely fertile, producing dates in vast quantities, pomegranates, and other fruits, which are exported by caravans to Egypt and the ports of the Mediterranean. A. is still governed by its own sheikhs, who pay tribute to the Khedive of Egypt.

Ammonius Saccas, who founded the Neoplatonic School, flourished in the 3d c. A.D. In his youth he was a porter at

Alexandria, whence the appellation of *Saccas*, i.e., sack-carrier. He was born of Christian parents, but is said to have apostatized, though this is denied both by Eusebius and Jerome. His system was eclectic, and attempted to harmonise the tenets of the various schools, especially those of Plato and Aristotle. Longinus, Herennius, Origen, and Plotinus were his most distinguished pupils. He died A.D. 243, leaving no written exposition of his system.

Ammophila, a genus of grasses. *A. arundinacea*, or *Psamma arenaria*, is called marrem, sea-reed, or mat-grass, and is extensively planted both in England and in Holland to bind sandbanks, and prevent the sand being blown inland.

Ammunition, the general name given to explosive substances and projectiles used with cannon, rifles, and fowling-pieces, and comprising gunpowder and its modern substitutes gun-cotton, gun-felt, and wood-powder, shot, shell, caps, wads, bullets, &c., either apart or combined in a cartridge. In warfare A. forms one of the most important parts of the equipment of an army, whether for offence or defence, while the usefulness to mankind in general as an aid in the destruction of the more dangerous animals, and in procuring game for food, can hardly be exaggerated. The A. for the British army, navy, and reserve forces is made up chiefly in the Royal Laboratory at Woolwich, where immense quantities of all kinds required for military purposes are kept in store, and distributed to the various stations and depôts occupied by our troops at home and abroad as occasion requires. The different kinds of A. in use will be described under their proper heads.

Amnesia is a peculiar condition met with in persons suffering from certain kinds of brain disease, in which the person has entirely forgotten the meanings of words. He cannot think intelligibly in words. He may repeat words after another without attaching any meaning to them. Along with this condition the mental powers are usually considerably impaired. A. is not to be confounded with aphasia. See APHASIA.

Amnesty (Gr. *amnestia*, forgetfulness, i.e., of wrong done) is a political term denoting an act of pardon or oblivion for offences committed against the state. Sometimes an A. excludes from its operation particular individuals, who are then mentioned by name. Instances of such exclusion occur in the history of every nation that has witnessed violent changes, as in the case of William Wallace in Scotland, and of the English 'regicides' at the restoration of Charles II.

Amnion is one of the embryonal sacs developed from the external germinal layer of the embryo of a vertebrate animal, and ultimately enclosing it. See EMBRYO. It contains a fluid called liquor amni, in which the embryo floats, consisting of water holding in solution about 3 per cent. of solid matter, composed chiefly of urea, uric acid, allantoin, chloride of sodium, and sulphate and phosphate of lime. The A. surrounds not only the embryo of the mammal, but also that of birds and reptiles. Amphibians and fish, however, which are developed in water, have no A. For a description of the relations and functions of the A., see EMBRYO.

Amol, or **Amul**, a town in the province of Mazanderan, Persia, on the Heraz, 12 miles from its mouth on the Caspian. It is partly decayed, but still has considerable trade. The only notable building is the mausoleum of Mir Burzuk, a king of A. who died in 1378. A bridge of twelve arches spans the Heraz. Near A. much rice and cotton are produced, and there are here native cannon-foundries. Pop. 35,000 or 40,000, but greatly less in summer, when many of the inhabitants retire to the Elburz Mountains. A. was founded in 793 by Harûn al Rashid.

Amomum, a genus of plants belonging to the order *Zingiberaceæ*. They are natives of warm countries, and are highly aromatic. Cardamoms and Grains of Paradise Spice (q. v.) are yielded by several species of A.

Amoor, or **Amur** (believed to be a corruption of *Mamu*, the name given to it by the natives near its mouth), a great river of North-Eastern Asia, and politically interesting as in part marking the line of the Russian advance in the East. Its remotest head-water, the Kerlon (known in its lower course as the Argoun), rises in the Kentei Khan, or Great Kingan of the Chinese, and flows 970 miles N.E. to its junction with the Shilka at Ust Strelka. Here the A. proper begins, and from this point its

Ammonites (Ceratites)

lower reaches are measured. The A. flows E. and S.E., receiving from the N. the Dzeya, 540 miles, and the Bereya, 703 miles, and the Sungari from the S., 992 miles from Ust Strelka. It then flows N.E., receiving the Usuri, to its embouchure in the Gulf of Tartary, between the seas of Japan and Okhotsk. Length of A. below Ust Strelka, 1890 miles; total length from source of Kerlon, 2860 miles. It is navigable by steamboat for 2200 miles, is the highway of considerable trade, and in its lower course flows through cultivable, well-wooded lands. It drains an area of 766,000 sq. miles. By the treaty of Pekin (1st January 1861) the course of the A. was recognised as forming the boundary between the Russian and Chinese empires from Ust Strelka to the confluence of the Usuri, a distance of 1179 miles. See Collins' *Exploration of the A. River* (New York, 1858), and Ravenstein's *Russians on the A.* (Lond. 1861.)

Amoor Territories. The ukase of 31st December 1858 provides that the A. T. shall be divided into the 'Province of the Amoor,' with an area of 164,000 sq. miles, and the 'Maritime Province of Eastern Siberia,' embracing the N. portion of Sakhalin, several maritime districts, together with Kamchatka and the Kurile Islands, area 744,715 sq. miles. Total pop. (1867) 22,297, chiefly Tungus. Principal port, Vladivostok, in communication with Europe by China submarine cable in 1872. This port was a station of observation of the transit of Venus, December 1874. See Schrenck's *Reisen und Forschungen in Amoor*, 1858-67 (4 vols. 1869), and Atkinson's *Travels in the Region of the Amoor* (Lond. 1868).

Am'orites ('highlanders'), a powerful Canaanitish nation, who perhaps originally occupied the hilly regions of Judah and Ephraim; at least they are found there on their first mention in Scripture. Afterwards they may have extended themselves to the pasture-lands of the Trans-Jordanic plateau. At any rate, it was here that the Israelites first encountered and vanquished them, when ruled over by Sihon, King of Heshbon, and Og, King of Bashan. Their lands were divided among Gad, Reuben, and Manasseh. Those dwelling W. of the Jordan offered a fierce and obstinate resistance to Joshua, and were never wholly extirpated.

Amoro'so, in music, tenderly, affectionately.

Amor'pha, a genus of Leguminous shrubs, natives of N. America. The species are very ornamental. *A. fruticosa* is common in gardens. A kind of Indigo (q. v.) is prepared from its young branches.

Amorphophallus, a genus of Araceous plants. See ARUM.

A'mos, a Hebrew prophet, flourished about 800 B.C. He was a herdsman of Tekoa, near Bethlehem, which accounts for his frequent allusions to rural pursuits and natural objects. The first six chapters of his prophetic writings denounce the idolatry of Israel; the remaining three contain visions of its overthrow and final restoration. The style is clear and vigorous, and the canonicity of the book is not disputed.

Amoy, a fortified city and seaport in the province of Fukien, China, built on an island of the same name, which lies in a small bay at the mouth of the Kiu-long-Kiang, opposite Formosa, 320 miles N.E. of Canton, and 135 S.W. of Foochow. It is divided by a hilly ridge into an outer and inner town, each having a capital harbour. For upwards of a thousand years it has been an important trading-place, and it was one of the five seaports opened up by the treaty with Britain concluded at Nankin in 1841. It was captured and plundered in 1853 by the Tae-ping rebels. The town is described by Mr Fortune as perhaps the dirtiest in the world. The chief imports are cotton-twist, British long cloths, rice, beans, and peas; exports—tea, sugar, paper, grass-cloths, and gold-leaf. The value of the imports, which are almost entirely English, was (1873) £1,443,847. Pop. (*Overland China Mail*, June 8, 1872) 350,000.

Ampère, André Marie, a French naturalist and mathematician, born at Lyon, January 20, 1775. After giving for some time private instructions in mathematics at Lyon, he repaired to Paris in 1805, and soon distinguished himself by his success as a teacher in L'Ecole Polytechnique. His first publication was his *Considérations sur la Théorie Mathématique du Feu* (1802).

In 1814 he became a member of the Academy of Sciences, and in 1824 Professor of Physics in the Collège de France. He died at Marseille, June 10, 1836. His researches in electro-dynamics paved the way for the experiments of Faraday, and his contributions to natural science were numerous and valuable. It would be impossible in our limits to give a list of his essays, memoirs, demonstrations, &c. Perhaps the most important are his *Recueil d'Observations Electro-Dynamiques* (Paris, 1822), and his *Théorie des Phénomènes Electro-Dynamiques* (Paris, 1830). A's character was a singularly beautiful one. He united a passion for science with an ardour of religious faith, rare in any country, and particularly in France. A most interesting account of his life and labours appeared in the *Revue des Deux Mondes* (February 15, 1837) from the pens of MM. Sainte-Beuve and Littré.

Ampère, Jean Jacques Antoine, son of the preceding, was born at Lyon, 12th August 1800. Educated at Paris under the eye of his father, he devoted himself zealously to the study of the literatures of Germany and England, and in 1830 became a lecturer on literature at Marseille. In 1833 he succeeded Andrieux in the Collège de France, and in 1847 was elected a member of the French Academy. In addition to his purely literary works, among which may be mentioned *De la Littérature Française dans ses Rapports avec les Littératures Étrangères au Moyen Âge* (Paris, 1833), *Histoire Littéraire de la France avant le douzième Siècle* (Paris, 1839), and *Sur la Formation de la Langue Française* (Paris, 1841), he published in the *Revue des Deux Mondes*, in 1844, a well-written series of articles on his travels in Egypt and Nubia. On his return from his travels he devoted himself to the study of hieroglyphics, and acquired much facility in deciphering them. He died at Pau, March 27, 1864.

Amphibia (Gr. *amphi*, both; *bios*, life), a class of Vertebrate animals (represented by frogs, toads, newts, sirens, &c.), and distinguished by the fact of its members always possessing gills in early life, and lungs in adult life, whether the gills persist or not. The skin is for the most part destitute of scales, or other form of exoskeleton. The heart is three-chambered, and the circulation of imperfect nature. The skull is joined to the spine by two articular processes or 'condyles.' No fin-rays are ever developed. See BATRACHIA.

Amphico'elia (Gr. *amphi*, both; *kailos*, hollow), a name applied to those vertebrae or segments of the spine of Vertebrate animals which are of bi-concave shape—that is, hollowed at either end. In fishes this conformation is well seen. When two such vertebrae are articulated together, a cup-like cavity is formed by the approximation of the hollowed ends, and this form of joint gives great mobility to the spine, as required for the movements of the tail of fishes in swimming. In fishes, the cup-like cavity thus formed is filled with a gelatinous fluid, a 'universal,' 'water,' or 'ball-and-socket' joint being thus formed. In certain amphibians and reptiles, amphicoelous vertebrae are also found. This name is also applied to indicate an extinct group of crocodiles in which the vertebrae were of this description. *Teleosaurus* is an example of this latter group.

Amphictyonic Council, a celebrated council of ancient Greece. Its origin is obscure, but the common legend was that it received its name from Amphictyon, son of Deucalion and Pyrrha. Originally it assembled at Delphi, but latterly also at a village called Anthela, near Thermopylae. It was composed of representatives of twelve tribes, or, according to Æschines, of eleven; these were the Thessalians, Boeotians, Dorians, Ionians, Perrhæbians, Magnetes, Locrians, Ceteans, Phthioti, Malians, and Phocians. Demosthenes, again, excludes the Thessalians, and some other authorities include the Delopians. The objects of the council were to protect the temples, and to promote the worship of Ceres and of the Delphic Apollo, and to determine and arrange points of international law. The influence of the council appears to have been highly beneficial, by giving a national unity to the various tribes of which the Greek nation was composed. It seems also to have had a humanising effect in softening the lawless and aggressive spirit of the Greeks towards those not of the Greek name. The council survived the independence of Greece. So late as the battle of Actium, we find Augustus claiming a place in it for his new city of Nicopolis, and representatives continued to be sent at least as late as the age of the Antonines. It is even probable that the A. C. continued to drag out a meaningless existence till

the overthrow of Paganism. See Tittmann, *Über den Bund der Amphiktyonen* (Berl. 1812).

Amphipolis, an ancient city of Macedonia, situated on the left bank of the Strymon, just below its egress from Lake Kerkine (now Takino), and about three miles from its mouth. It was founded by a Thracian colony, and formed an emporium for the woods of Kerkine and the gold mines of Mount Pangæus. It received its name from being nearly surrounded by the Strymon (Gr. *amphi*, around, and *polis*, a cit.). After repeated efforts A. was taken, 437 B.C., by the Athenians, from whom it was wrested, 424 B.C., by the Spartan Brasidas. The treaty of Antalcidas restored it to Athens, but it was again captured by Philip of Macedon. The Romans made it the capital of Macedonia. It is now a mere village, occupied mainly by Turks, and bears the name in Greek of *Neokhoro*, in Turkish *Jeni-Keui*, 'New Town.'

Amphitheatre, a building used by the Romans for their gladiatorial contests and other spectacles.

Amphitheatre.

In early times it was made of timber; but accidents arising from fire and instability, amphitheatres were afterwards usually made of brick or stone. They were often very costly and magnificent; the Colosseum of Rome, still in excellent preservation, being capable of holding over 85,000 people. It was finished in the reign of Titus, who celebrated its dedication by the slaughter of 5000 wild beasts.

It is 620 feet long by 513 broad. The amphitheatres of Verona and of Nîmes in Languedoc are also noteworthy. Both are in good preservation. In England, those of Dorchester, Silchester, and Cirencester may interest the antiquary.

Amphitrite, in Greek mythology, the daughter of Nereus and Doris, or, as others say, of Oceanus and Tethys, was the wife of Poseidon, and goddess of the Mediterranean, though represented by later poets as the goddess of the ocean in general. She is sometimes figured in ancient art seated on a triton, and having a trident in her hand.

Amphiuma, a genus of Amphibian vertebrata included in the order *Urodela* ('tailed'), and distinguished by the perennial or persistent nature of the gills—or at least of the gill apertures—with which in early life, like all other amphibians, they are provided. The A. is exclusively found in N. America, and lives in the mud of shallow rivers. The limbs are of small size. The eyes are small; eyelids being absent. These forms may attain a considerable size, the *A. tridactylum* frequently averaging three feet in length.

Amphora (Gr. *amphi*, on both sides; *phero*, to carry), a large pitcher-shaped vessel, used by the Greeks and Romans, with a narrow neck and two handles, and tapering below for insertion into a stand. It was also a measure for liquids, the Greek A. being nine and the Roman six English gallons.

Amplification, in rhetoric, is the enhancing of an idea or statement by presenting it with numerous accessories, and an accumulation of details to make a stronger impression. *Exaggeration* is a vicious mode of A.

Amplitude, in astronomy, is the distance of the point at which a heavenly body rises or sets from the E. or W. point of the horizon. It also indicates the distance, angular or otherwise, between the extreme positions assumed by an oscillating or vibrating body.

Ampulla, a bottle, usually of glass or earthenware, narrow at the mouth, and swelling in the middle, used by the Romans to hold liquids, especially the oil with which they anointed their bodies after bathing. This was the *A. olivaria*. Numerous specimens are to be found in collections of antiquities.

The unguent with which the kings of France were anointed at their coronation was contained in the *A. Remensis*, believed to have been conveyed from heaven by a dove. It was shattered in the great revolution of 1789.

Ampullæ are dilatations seen in the membranous portions of the semicircular canals in the internal ear. See EAR.

Amputation is the removal or separation of a part of the body. The term is usually applied to the removal of a limb. A. may be performed by one of four methods, viz.—(1) the circular method; (2) the oval method; (3) by flaps of various shapes and sizes; and (4) by making flaps of the skin and a circular cut through the muscles. The most important are—(1.) The circular method. The skin and fat are divided by a circular sweep of the knife, and dissected upwards a certain distance, varying according to circumstances. The muscles are then cut by another circular movement of the knife, the bone is laid bare, and sawn through as high up as possible. By this method abundant covering is obtained for the bone or bones, but the cicatrix is liable to be puckered. (2.) The oval method is simply a modification of that just described, but the sweep of the knife is oval instead of being circular. (3.) Flap A. This consists of making one or more flaps for covering the bone. There are three varieties: (a.) The *double-flap A.*, in which two flaps of equal size are made by transfixing with the knife the skin and muscles, and then cutting from within outwards. (b.) The *rectangular flap*, first devised by Mr Teale of Leeds, in which a long rectangular flap is cut from that side of the limb where the parts are generally devoid of large blood-vessels and nerves while the short flap is made from the textures on the other side of the limb, the length and breadth of the longer flap being equal to half the circumference of the limb at the point of A., and the short flap one-fourth of the length of the long one. (c.) *Eye flap*, employed in such places as the shoulder or hip, where only one flap can be made. Teale's method of the *rectangular flap* is said to have the advantages of securing a perfect covering for the end of the bone, a dependent opening for suppurative discharges which may form during healing, and a cicatrix free from pressure. *Dangers of A.* The primary danger is hæmorrhage during the operation. This is arrested as far as possible by the Tourniquet (q.v.), or by manual compression by the fingers of assistants on the principal blood-vessel. After A. in unhealthy subjects, union of the flaps may not take place by what is called the 'first intention,' but there may be profuse suppuration. Sometimes, in bad hygienic conditions, erysipelas, with sloughing of the textures of the stump, may set in. The end of the limb, after removal of a portion, is called the stump. It should be formed of tissue able to bear compression, so as to admit of the use of an artificial limb. *Mortality after A.* This will be seen from the following table, from Erichsen's *Science and Art of Surgery*, vol. i. 35. It is compiled from various British, Continental, and American sources, and gives the results of over 9000 cases:—

SEAT.	CASES.	DEATHS.	PER CENT.
Shoulder-joint,	117	58	49'5
Arm,	1319	375	28'4
Forearm,	1059	109	10'2
Hip-joint,	46	19	41'3
Thigh,	3477	1224	35'2
Leg,	3006	985	32'7

This table clearly shows an increase in the mortality as the operation approaches the trunk. It is also found that age, general health, and the hygienic conditions in which the patient is placed, and also the seat of the A., whether the operation is done for disease or injury, and the time of the operation after the duration of the disease or the occurrence of the injury, materially affect the result of the operation.

Amritsar ('city of immortality'), a flourishing city and capital of a district of the same name in the Punjab, 44 miles N.E. of Lahore, on the Scinde, Punjab, and Delhi Railway. It is the sacred capital of the Sikhs, and its pool of immortality is held in greatest reverence. The multitude of pilgrims visiting A. early made it a centre of commerce, and it is now one of the richest cities in Northern India. It has a prosperous trade in shawls and Cashmere saffron, and considerable manufactures of cotton and silk goods. Pop. (1868) 135,813. The government district of A. has an area of 1556 sq. miles; pop. (1868) 832,750. It was acquired by the British in 1848.

Amster, Samuel, famous as an engraver of the works of Thorwaldsen and Raphael, and some time Professor of Engraving at the Academy of Arts, Munich, was born at Schinznach in Switzerland, 17th December 1791, and died at Munich, 18th May 1849. His chief works are engravings of a 'Magdalen,' by Carlo Dolce; of 'Alexander's Triumphal Procession,' by Thorwaldsen; of the 'Burial of Christ,' 'Holy Family,' and 'Madonna di Casa Tempi,' by Raphael; and of Overbeck's famous 'Triumph of Religion in the Arts.'

Amsterdam (the dam of the Amstel), the capital of the Netherlands, and chief city in the province of Holland, stands on the S. bank of the Ij or Y, an arm of the Zuiderzee, where the Amstel flows into it. The city, which is almost entirely built upon piles, is in the form of a crescent, and is divided by the river and canals into 90 small islands. With its abundant spires, tall masts of ships, and brick-built houses, with their gables towards the streets, A. has a striking and picturesque appearance. The two principal canals are the Heerengracht and the Keizersgracht. There are about 300 bridges, one of which, the Hoge Sluis, is about 600 feet long, and has 35 arches, 11 of which are passable by large ships. New 'dams' have also recently been constructed, forming basins with room for nearly 1000 ships. The palace, formerly the Stadhuis (town hall), is a magnificent pile, remarkable for its coronation hall, above 100 feet long, lined with white marble. Among ecclesiastical edifices the most noteworthy is the *Nieuwe Kerk* (New Church), founded in 1408, in which are the tombs of Admiral de Ruyter and the poet Vondel. A. also possesses an Exchange (finished in 1845), an Academy of Arts and Sciences, three museums (the last, the *Museum Feodor*, dating from 1866), several theatres, numerous charitable institutions, &c. It is the headquarters of the Netherlands Trading Company, a corporation whose monopoly expired at the end of 1874, of the West India Company, and other commercial associations. The manufactures of A. are very important, and include the making of damasks and velvets, cotton-spinning, sugar-refining, the cutting of precious stones, printing, type-founding, the making of plate, &c. In 1875 there entered the port 1054 vessels of 415,034 tons. The pop. of A. in 1875 was 289,982, of whom the majority are Dutch Calvinists, the remainder being Roman Catholics, Lutherans, Jews, Baptists, &c.

In the 12th c. A. was merely a fishing-village. It was walled and fortified in 1482. It afterwards became the most important commercial town in the Netherlands, and in 1622 had 100,000 inhabitants. Its commerce in 1653 had been greatly reduced by the war with England, but it again rose into prosperity in the 18th c., and down to the period of the French Revolution it continued to be one of the first marts in Europe for the products of the East and the West. The union of Holland with France in 1810, however, destroyed its foreign trade; but after the fall of Napoleon its prosperity began to revive, and it now is one of the first seats of commercial industry and enterprise. A. is also the central point of the Dutch line of fortification. The city itself can be made inaccessible by sluices, which lay the neighbourhood under water, and it is at the same time strongly defended by numerous forts.

Amulet (probably from the Arabic *hamalet*, a pendant), an image, figure, or mysterious inscription upon a stone,

metal, or other material, and carried about as a preservative against illness, enchantments, and similar evils. Such charms have always been popular in the East; and even in the West at the present day, medical preparations are regarded

by many as preventives of any bodily malady. The Emperor Caracalla, about A. D. 216, prohibited the use of them among the Romans, who made them of gems of various kinds. Necklaces and other ornaments, evidently intended as charms, are found among Druidical remains. Among well-known kinds of amulets may be mentioned the early Christian Ichthus (q. v.), the Arabian Talisman (q. v.), and the perforated coins of St Helena, the

moth. Constantine the Great. See Kopp's *Palaeographia Critica* (Mh. 1829), and Ewele, *Über Amulette* (Mainz, 1827).

Amurath or **Murad**, the name of four Ottoman emperors, at least two of whom have obtained a place in history. A. I., son of Orkhan, was born in 1326, succeeded his father in 1360, and in the same year carried the Turkish arms into Europe, and commenced those deadly and incessant attacks on the heart of the Greek empire which only ended with the fall of Constantinople. In his first campaign A. captured Adrianople, which henceforth became his European capital; and in the course of a reign of nineteen years made himself master of Bulgaria, Serbia, and all Macedonia as far as the borders of Albania. He died in 1389, on the battle-field of Kossova, stabbed by the dagger of a wounded Servian. A. was a great warrior, a man of indomitable will, and fanatically loyal to the religion of Mohamamed; but like most fanatics, he did not love science, and scholars received no favour at his court.

Amurath II., born 1404, succeeded his father, Mohammed I., in 1422, and ruled for nearly thirty years. His whole career is a laborious, but on the whole successful, struggle to establish and extend the power of the Turk in Europe. In the beginning of his reign the Greek emperor Emmanuel sought to embarrass him by restoring to freedom Mustapha, son of Bajazet, who was the legitimate inheritor of the throne. But the attempt of the latter ended disastrously, and Constantinople itself was nearly stormed by the victorious A. The suppression of an insurrection in Asia Minor, the conclusion of a treaty of peace with the Emperor Joannes, successor of Emmanuel, by which A. obtained a great number of cities on the shores of the Black Sea and on the river Strymon, the conquest of Thessalonica (1429) in Macedonia, and of Janina (1431) in Albania, were the chief incidents in the first ten years of his reign. Then followed the conflict between A. and the Prince of Serbia, fomented by the King of Hungary, which ended in the conquest of the Servian principality; but the appearance on the scene of the famous Hungarian, John Hunyades, soon changed the aspect of affairs. The Ottoman forces were driven from Belgrade, routed at Hermanstadt, at Vasag (1442), at Nissa (1443), at Yalowaz (1444), and A. was forced to conclude a peace. War, however, soon broke out afresh, and the defeat and death of the Hungarian king Vladislaus, who had invaded Bulgaria, showed that A. had lost none of his military skill. This success was followed by the reduction of Peloponnesus, the invasion of Albania—where the heroic Scanderberg for a time resisted and repelled the Ottoman arms—and by the renewal of the war with Hunyades, who was utterly routed in the great battle of Kossova (17th–19th October 1448). A. died 9th February 1451. His reign was brilliant both in arts and arms. Poetry, theology, and jurisprudence had distinguished representatives; and the sultan himself inspired his enemies with respect and his subjects with love.

Amurnath, a remarkable cave in the N.E. of Cashmere, about 500 yards long, 30 high, and 100 wide. The Hindus, who visit it in great numbers, regard it as the home of the god Siva. It contains myriads of doves, which, flying out and in, are supposed to convey to the god the prayers of the pilgrim.

Amyclæ, an ancient Laconian town, on the right bank of the Eurotas, about 2½ miles S. of Sparta, was famous in the heroic age as the abode of Tyndarus and Leda, and the birth-place of Castor and Pollux, who are hence called the *Amyclæan brothers*. A. is mentioned by Homer, and it continued to be an independent Achaean town long after the subjugation of the rest of the Peloponnesus by the Dorians, but was conquered by the Spartans shortly before the first Messenian war, after which it sank into a village, memorable only for the annual celebration of the Hyacinthia, and for the temple and colossal statue of Apollo. The Italian A., on the Campanian coast, was founded by colonists from the Laconian A.

Amygdalæ are what are known as the tonsils. They are two glands which occupy the recesses between the anterior and posterior pillars of the fauces on each side of the throat. They consist of a series of small follicles lined by epithelium, and have thick walls enclosing little capsules or shut sacs, which are filled with a greyish-white substance containing numerous free nuclei and cells. The function of these bodies is unknown. Sometimes they become hypertrophied by repeated inflammations in

young individuals of a strumous constitution. They may then be removed without any injurious consequences. The tonsils are also liable to acute inflammation, causing tonsillitis or quinsy. There is then swelling, pain, difficulty in swallowing and in articulation. The inflammation may terminate either in resolution or in suppuration. The abscess formed by suppuration may open without interference, or it may be necessary to open it by an incision. During the early stages of the affection poultices and hot fomentations are required, while salines, such as the acetate of ammonia, combined with sulphate of magnesia and spirit of nitric ether, may be given to diminish feverishness.

Amygdalæe and **Amygdalus**, the order and genus to which many cultivated fruit-trees belong, such as the almond (*A. communis*), the peach and nectarine (*A. persica*), the cherry (*Prunus cerasus*), the plum (*P. communis*), and the apricot (*P. armeniaca*). Some authors treat *A.* as a sub-order of *Rosacea* (q. v.) The plants possess hydrocyanic acid in their leaves and seeds.

Amygdaline is a crystalline compound contained in bitter almonds, and belongs to the group of bodies called *glucosides*—substances which readily take up water and split into *glucose* or grape sugar, together with other products. To extract *A.* from bitter almonds, they are first crushed and submitted to pressure between hot iron plates. By this means the oil contained in the kernel (almond oil) is got rid of, and a solid cake remains. On digesting this cake with hot alcohol, the *A.* is dissolved out, and may be obtained by evaporating the alcoholic extract. *A.* is interesting on account of the curious decomposition which it suffers when dissolved in water and mixed with a small quantity of a substance called *emulsine* or *synaptase*, a body occurring along with it in the almonds. When such a mixture is allowed to remain for some time at a moderately warm temperature, the *A.* is wholly converted into oil of bitter almonds (benzoic aldehyde), hydrocyanic (prussic) acid, and glucose (grape sugar). The emulsine acts simply as a ferment. The change which takes place may be represented as follows:—

Amygdaline.	Water.	Oil of bitter almonds.	Prussic acid.	Grape sugar.
-------------	--------	------------------------	---------------	--------------

Amygdaloid (Gr. *amygdalus*, an almond) is the name applied to rocks, always of volcanic origin, which contain oval-shaped spaces filled up with some crystalline mineral, such as agate, chalcedony, calcspar. These spaces seem to have been formed by bubbles of gas when the rock was in a molten condition.

Am'yl is the name of a *compound radical* or group of elements which can be transferred from one compound to another, and has the formula C_5H_{11} . It only exists in compounds, such as *A.* alcohol (the principal constituent of fusel oil), $\text{C}_5\text{H}_{11}(\text{OH})$; acetate of *A.* (oil of jargonelle pear), $\text{C}_5\text{H}_{11}(\text{C}_2\text{H}_3\text{O}_2)$; nitrite of *A.*, $\text{C}_5\text{H}_{11}(\text{NO}_2)$, &c. When attempts are made to isolate it, like others of its class, it becomes doubled, and forms a body called di-amyl or decane, $\text{C}_{10}\text{H}_{22}$.

Am'yloid Degeneration. The tissues of the body are liable to undergo various degenerations, the chief of which are the fatty, the calcareous, and the *A.* This kind of degeneration presents two varieties: (1.) In the brain, prostate gland, and other organs, small bodies are found presenting a striking resemblance to starch corpuscles, giving a distinct blue colour with iodine. These bodies are called *corpora amylacea*. In these cases the starchy or *A.* matter lies between the elements of the tissues, but in the next variety (2) the tissues themselves become changed into *A.* matter. This latter form is seen chiefly in the smaller arteries, the middle coats of which become thickened and translucent. With iodine this kind of *A. D.* gives a yellowish-red colour, but the cautious addition of dilute sulphuric acid after the iodine produces a blue tint. *A.* matter is nearly related to albumen. Its presence in the body produces symptoms varying according to the organ attacked. In some cases, it is the liver, in others the kidneys; in a third class it is the vessels which are involved. It is an incurable condition. Life may be prolonged, but by no known resources of the medical art can the *A.* matter already formed be removed, nor can the formation of more be prevented.

Am'yot, or **Amiot**, **Jacques**, a French scholar and man of letters, was born at Melun, 30th October 1513, studied at the Collège de France, where he was noted alike for his poverty and his learning; afterwards became Professor of Latin and Greek in the same institution, was made Abbé of Bellocane by Francis I., Bishop of Auxerre in the reign of Charles IX., and died 6th February 1593. *A.* is deservedly celebrated for his translations from the classics, of which incomparably the most important is his version of Plutarch. Others are *Sept Livres des Histoires de Diodore Sicilien* (Paris, 1554), *Histoire Ethiopique d'Héliodorus* (Paris, 1545), and *Amours Pastorales de Daphnis et Chloe* (Paris, 1559).

Amyridæeæ, an order of Dicotyledonous trees and shrubs found in tropical countries. They abound in a resinous juice, which, from its fragrance, is of great importance. Several kinds of Frankincense, Myrrh, Elemi, Bdellium, Tacamahac, and Balm of Gilead (q. v.), besides various other balsams and resins, are obtained from plants in the order. *A.* embraces 27 genera and upwards of 50 species, but very little is yet known of many of them.

Ana, added to the names of persons, denotes a collection of their memorable sayings, as *Scaligerana*. There are many such works, as *Walpoliana*, *Johnsoniana*, &c. Such titles originated in France. *A.* is often used alone as a noun, and means *anecdotes*.

Anabaptists, a name that has a distinct historical application, but which literally denotes those who 'baptize again,' i.e., who reject infant baptism as unscriptural, and require all new adherents coming from other denominations to submit to the rite a second time. In Britain and the United States, the designation applied to such Christians is Baptists (q. v.), who repudiate, however, all connection with the *A.* of the Continent.

One of the least happy effects of the German Reformation was to kindle visionary and fantastic ideas in weak minds. A notable instance of this was Thomas Münzer (q. v.), who may be considered the originator of the Anabaptist sect—at least in Germany. At first an orthodox preacher of the Reformation, he began about 1520 to plunge into a wild and irrational mysticism. His opinions gained for a time a footing in Switzerland, where, however, the disorderly fanaticism of his followers was such that the reformers were forced to persecute the new sect. Zwingli took no part in the severities inflicted on the *A.*, but it would scarcely be possible to blame him if he had. Men who despise human law when it conflicts with their own inward excitement, which they call the 'Spirit of God,' who consider themselves bound to immediately substitute the 'kingdom of God' for the existing state of society, who believe in a community of goods, &c., are in reality rebels against civil order, and cannot be dealt with as mere speculative theorists. That the Swiss *A.* were fanatics of this sort is not disputed. Had they contented themselves with declaring that 'it was of no more avail to baptize a child than to baptize a cat,' no one could approve of their punishment any more than he could admire their language, but they went far beyond eccentricities of doctrine or diction, and were prepared, in the frenzy of an unintelligible faith, to turn the world upside down. Zürich and St Gall were the chief scenes of their temporary success (1522-26). But it was in Germany that the Anabaptist movement excited the greatest sensation, and caused the direst mischiefs. Münzer's language in his wanderings through the country, after he abandoned the cause of Luther, inflamed the peasantry, who had been in a political ferment for years past. Four or five insurrections had already broken out since the beginning of the 16th c. The Reformation itself had increased the agitation, and now Münzer threw gunpowder on the burning coals, and the explosion forthwith took place. The 'Peasant War' (q. v.) is part of German history. It is only necessary here to state that the violence of the *A.* precipitated it in the S. W. of Germany, while in Thuringia it was personally carried on under the leadership of Münzer himself. The atrocities that marked both the beginning and the end of the insurrection were something horrible; nor did they cease with the capture and execution (1525) of the arch-rebel and heretic. Crushed in Saxony and Franconia, it spread through Westphalia, Holstein, the Netherlands. Itinerant preachers everywhere kept alive the flame of fanaticism in ignorant breasts. We may note particularly Melchior Hoffman, a furrier by trade, who appeared in Kiel in 1527, and in Emden in 1528. He made a bishop out of a

Haarlem baker named John Matthiesen, whose disciples established themselves in Münster, and by the help of violent partisans, obtained the control of the city, which soon after became a rendezvous for all the turbulent and sanguinary chiefs of the new movement—the burghers Knipperdolling and Krecting; the Leyden tailor, Bockhold; Kippenbrock, the Amsterdam book-binder; and Matthiesen himself. When Matthiesen was slain during the siege of the city by the Bishop of Münster, Bockhold and Knipperdolling became the front or head of the anarchy. The churches were destroyed, Münster was transformed into a 'New Sion,' or 'New Jerusalem'; Bockhold became its 'king' (1534), and the prophecy began to be fulfilled that the 'saints' shall govern the earth. The result was a moral delirium that passed into a fierce licentiousness, which was only ended by the capture of the city (1535) and the execution of the leaders.

But the A. were not exterminated. With the fall of Münster and the disappearance of the half-crazed fanatics who had brought disgrace and disaster on the sect, a new era began. Some of Bockhold's disciples abandoned, or perhaps never entertained the mystical monstrosities of their master, and in Holland and the Low Countries of Germany communities of A. were gradually established who had nothing in common with the wild followers of Münster. The man who was most instrumental in bringing about this wholesome change was Menno Simons (see MENNO), who sought to build his system on a basis of Scripture, and who may be considered the founder of the Continental Baptists. His principles are set forth in his *Fundamentbuche von dem rechten Christlichen Glauben* ('Principles of the True Christian Faith,' 1556); and the *Taufgesinnte* (Dut. *Doopsgezinden*), or Baptist communities, of Germany and the Netherlands at the present day, regard Menno's book as authoritative on points of doctrine and worship. For an account of the history, opinions, and present condition of the sect, see the general article BAPTISTS.

Anabas, a genus of fishes included in the order *Teleostei*, allied to the mullets, and forming the type of the family *Anabotidae*. The most celebrated species of this genus is the 'Climbing Perch of India' (*A. scandens*), which derives its name from its habits of leaving the water, and of moving about on land; whilst it has also, but without verification, been supposed to climb trees. It possesses a peculiar arrangement of the head-bones for retaining a supply of water to moisten the gills.

Anabas scandens.

Anabasis (Gr. 'ascent'—i. e., from a lower country to a higher). Two Greek works have this title: (1) The A. of Xenophon, a narrative of the expedition of the younger Cyrus against his brother Artaxerxes, and of the retreat of the 10,000 Greeks from the plain of Mesopotamia through the highlands of Armenia to the shores of the Black Sea; and (2) the A. of Arrian, narrating the campaigns of Alexander the Great.

Anableps (Gr. *anablepō*, to look upwards). This group of fishes belongs to the order *Teleostei*, and forms a nearly-allied division to the well-known *Cyprinidae* or carps. The representative species is the *A. tetraophthalmus*, or 'four-eyed loach,' of the rivers and fresh waters of Guiana. It derives its popular name from the peculiar appearance of the eyes, the cornea and iris of each being divided into four portions by cross-bands of the conjunctiva or outer membrane of the eye.

Anacardiaceæ, an order of Dicotyledonous trees and shrubs, natives of tropical countries. Between 300 and 400 species are included in the order. Many of them abound in a resinous, or milky, poisonous juice, used as varnishes, &c., such as black Japan lacquer, Mastiche or Mastic, Sylhet, Martaban, and Chian turpentine. Their fruit, however, is often edible, as the Mango, Hog-Plum; and Cashew-Apple (q. v.) *Rhus*, including the different species of Sumach (q. v.), belongs to the order.

Anacardium, a genus of plants belonging to the order *Anacardiaceæ*. See CASHEW-NUT.

Anach'aris, an aquatic plant called *A. canadensis*, belonging to the natural order *Hydrocharidaceæ*. Although a native of America, it is now common in many parts of Britain. It was detected for the first time in Ireland in 1836, and in Scotland in 1842. How it was introduced is not known. It is of remarkably rapid growth, and has interfered much with navigation in some rivers and canals, such as in the Cam and Trent, and the canal near Edinburgh. Its stems are very brittle, and when broken into pieces, each piece takes root, and becomes independent. The plant is dioecious, and only the male form has been observed in Britain. Water-fowl, especially swans, are fond of it as food.

Anacharis.

Anacharsis, a philosophic Scythian who flourished in the 6th c. B.C. Love of travel brought him to Athens, where he arrived, it is said, just when Solon was giving the city a new code. With the great legislator he became very intimate, though he does not appear to have been much impressed with his practical ability as a statesman. The fame of his visit lasted down to later ages, and Diogenes Laertius, Plutarch, Athenæus, and Lucian have preserved many of the subtle sayings attributed to him. He is said to have been killed on his return, from a fear that he might attempt to introduce the Greek mysteries into Scythia. The nine letters attributed to him are not authentic. The book known as *Voyage du Jeune Anacharsis en Grèce*, written by Jean Jacques Barthélemy, though deformed by anachronisms, exhibits scholarship and taste. It has been translated into English, and has attained well-merited popularity. Without doubt, it gave Becker the idea of both his *Gallus* and his *Charicles*.

Anachronism (Gr. *ana*, upwards, and *chronos*, time), literally an error in chronology, by which an event is spoken of as taking place earlier than it did; but the distinctive peculiarity of an A. does not consist in a mere error of date, but in the transference of particulars from an age to which they belong to another in which they could have no place, so that in reality the event or circumstance is not only spoken of as taking place earlier than it did, but earlier than it could have done. Thus Chaucer, in his *Knights Tale*, represents Theseus, the Greek hero of antiquity, as a mediæval duke, who conquers the Amazons by his 'chevalrye,' whose courtiers keep the 'May,' who holds 'tournaments,' who invokes the saints of a church which was not yet in existence, and whose knights have 'Prussian' shields, and other wondrous impossibilities in the way of armour. The whole literature of the middle ages swarms with anachronisms, the product partly of grotesque ignorance and partly of tasteless indifference.

Anacreon, a Greek lyric poet, a native of Teos, born about 560 B.C., and when still a youth emigrated with his family to Abdera, on the coast of Thrace. Thence he removed to Samos, where he enjoyed the patronage of Polycrates. In 521 B.C. he went to Athens, and there met with Simonides. He died B.C. 475, on a voyage from Abdera to his native isle, at the age of eighty-five, having been choked by a grape-stone. His poems, graceful and melodious, celebrate love and wine, but only a few of the lyrics bearing his name are genuine. Moore's English translation is well known. The best French translations are those by Madame Dacier et Longpierre, by MM. Gail, and by De Saint Victor et Veissier-Descombes. There are excellent editions of A. by Brunck (Strasb. 1786), Fischer (Leipzig. 1793), Boissonade (Paris, 1823), and Bérgek (Leipzig. 1834).

Ana'ylus, a genus of plants of the natural order *Compositæ*. See PELLITORY OF SPAIN.

Anadyomene ('emerging'), a name of Aphrodite, best known in connection with the painting of Apelles, in which the goddess is represented rising from the sea, and wringing her hair with her hands. The picture, for which Phryne is said to have sat, belonged to the Coans, from whom Augustus bought it for the remission of 100 talents of taxes.

Anæmia is a condition of the body characterised by deficiency of certain constituents of the blood. The coloured corpuscles, instead of being in the proportion of 130 to every 1000 parts, as in health, are reduced to 70 to 50 parts; the albuminous matter in the blood is also diminished. The blood may be said to be in a watery condition. The person has a pale, sallow countenance, with blanched lips and gums. There is great disturbance of the general health—indigestion, flatulence, constipation, languor, and debility. The thyroid gland in front of the larynx is often enlarged, a condition usually associated with prominence of the eyeballs. Not unfrequently there is oedema, or swelling of the ankles and legs. This condition is treated most successfully by the administration of salts of iron, nourishing food, and fresh air. A. sometimes occurs as a symptom of other diseases. Any disease which affects the formation of healthy blood will produce A.

Anæsthesia. By this term is meant total or partial loss of sensibility, or power of feeling. When any part of the body is touched, certain nerves are affected which are called sensory nerves. These nerves convey impressions to the brain, where there is the consciousness of the impression or *sensation*. Sensibility, therefore, depends on the anatomical and physiological integrity of the sensory nerves and of the brain. If the function of either be interfered with, there must be disturbance of sensibility. (1.) *The Nerve.* If the sensory nerve be subjected to excessive irritation, there is a feeling of pain. If, on the other hand, we lower the sensibility of the sensory nerve artificially, impressions may not be felt which in ordinary circumstances might be acutely painful. When a sensory nerve is divided, there is no feeling in the part which it supplies. (2.) *The Brain.* This organ receives the influence transmitted by the sensory nerve, and consciousness of the impression is the result. The impression, however, is not perceived by the mind as being in the brain, but is always referred to the extremity of the sensory nerve. For example, the prick of a pin in the toe is referred to that part, although the changes immediately antecedent to consciousness occur in the brain. It will now be evident that if the functions of that part of the brain in which consciousness occurs be interfered with, sensibility must be likewise affected. If unduly excitable, impressions will be felt as painful which are usually not so, while, on the other hand, the sensibility of the brain may be so lowered, or even destroyed, as to cause diminished consciousness, or total unconsciousness. It will now be seen that A. may depend on paralysis of the sensory nerves, or on some condition of the brain which renders it incapable of perceiving external impressions. Accordingly we find that A. may be local or general. It is local when the sensory nerve supplying the part is cut across, or when the sensibility of the nerve is destroyed by extreme cold, or by the actions of certain drugs. It is general when the brain is affected by disease, or is under the influence of such substances as chloroform or ether, which have the property of suspending for a time the functions of the brain. During profound sleep, when part of the brain is inactive, and in the paroxysms of the insane, when the mind is preoccupied by its own wild imaginations, there is a degree of A. which prevents the individual from perceiving impressions in other circumstances painful. A. may be the result of disease, or it may be artificially produced. In both cases it may be general or local, complete or partial.

From early times men have searched for drugs which could remove or prevent pain, more especially in surgical operations. Indian hemp, opium, mandragora, and essences of herbs believed to be sleep-producing have been employed. A. has also been effected by pressure on the nerves, and by pressure on the neck, so as to cause obstruction to the circulation of blood in the brain. In 1800 Sir Humphry Davy suggested the use of protoxide of nitrogen, or laughing-gas (N_2O). In 1828 Hickman used carbonic acid (CO_2), and between the years 1822 and 1834 various American physicians demonstrated the anæsthetic properties of sulphuric ether ($C_2H_5 \{ O \}$). Ether was first em-

ployed as an anæsthetic by Morton, a dentist in Boston, in 1846, to prevent pain during the extraction of a tooth. In the same year it was used in dentistry in England, and was first employed by Liston, an eminent surgeon in Edinburgh, in a case of amputation. In 1847, on the suggestion of Waldeie, a chemist in Liverpool, Dr J. Y. Simpson, afterwards Sir J. Y. Simpson, Bart., investigated the action of chloroform ($CHCl_3$), and found it to be an efficient anæsthetic. He quickly introduced it into obstetrical practice, and, chiefly owing to his powerful advocacy, it soon came into general use in Europe and the colonies as an anæsthetic in surgical operations. Ether, however, has always been employed in America, and is asserted to be less dangerous than chloroform. Since that date numerous substances have been tested as anæsthetics, but none have been found so safe or expeditious as ether or chloroform. It cannot be asserted that either of these is perfectly safe. Death has occurred during the inhalation of both, but as chloroform tends to weaken the action of the heart, it is credited with a larger mortality than ether. At the same time, taking into account the enormous number of cases occurring daily throughout the world in which either ether or chloroform is employed, the percentage of deaths is so extremely small as to reduce the risk of inhalation of ether or chloroform from the hands of an experienced person to a minimum. During the last few years attempts have been made to revive the old practice of producing local A. by applications of melting ice or substances which rapidly evaporate, such as a spray of ether. These methods, however, have not come into general use, because they may be followed by severe inflammation or even sloughing of the part. For a description of the various anæsthetic substances see CHLOROFORM, ETHER, INDIAN HEMP, METHYLENE, OPIUM, &c.

Anagallis, a genus of small plants of the order *Primulaceæ*. See PIMPERNEL.

Anagni (anc. *Anagnia*), a town in Latium, Central Italy, overlooks the valley of the Sacco, 37 miles E.S.E. of Rome. It is the residence of many noble families; but it cannot now be styled 'the wealthy,' as it was in the days of Virgil. In ancient times it was the capital of the Hernicans, became a flourishing municipal town under the Roman empire, was made the see of a bishop as early as 487 A.D., and continued to be a city of importance throughout the middle ages. It was the birthplace of Popes Innocent III., Gregory IX., Alexander IV., and also of Boniface VIII., who here (1303) suffered a brutal attack from Schiatta Colonna, an emissary of Philippe IV. of France, from the effects of which he died in a few weeks. The chief building of A. is the cathedral, which contains beautiful frescoes and mosaic-work of the 13th c. Pop. 6200.

Anagram (Gr. *ana*, backwards, and *gramma*, a writing) originally and literally denoted a simple reversal of the letters of a word or words, as in the German *leben* = *nebel*; i.e., life is but a cloud or vapour; but has long been applied also to any rearrangement of such letters as may secure a new meaning; e.g., Pilate's question, *Quid est veritas?* ('What is truth?') suggested to the pious anagrammatist of the middle ages *Est vir qui adest* ('It is the man who stands before you'); again, the French phrase *Revolution Française* yields, when the letters are properly transposed, *Un Corse la finira* ('A Corsican will end it'), referring to Bonaparte, with the significant addition of *veto* (I forbid).

Anahuac, an Aztec word meaning *near the water*, is the name of the ancient states that formed the nucleus of what is now known as the Mexican empire, and, though first applied only to the lofty Mexican plateau, in which are to be found a considerable number of lakes, it afterwards was employed to designate a wider area, spreading southward between the Pacific and Atlantic. See Prescott's *History of the Conquest of Mexico*, vol. i. chap. i.

Anakim, a race of giants occupying the district about Kirjath-arba, in the S. of Palestine, at the time of the invasion of Canaan by the Israelites. The name is probably derived from Anak, the founder of the race, which seems to have been divided into three tribes named after the sons of Anak—Ahiman, Sesai, and Talmi. The Israelites under Joshua exterminated them all but a small remnant, who found a refuge among the Philistines.

Anakolu'thon (wanting sequence), a grammatical term denoting the absence of logical sequence in a sentence, the construction of the latter part not corresponding with that of the former.

Anal Glands. These are follicles or pouches in the vicinity of the anus, which secrete a fluid or semi-solid matter, having usually a powerful and disagreeable odour peculiar to different species of animals. They are to be regarded as modifications of the sebaceous glands of the skin. See SKIN. A. G. are most abundant in rodents and carnivora. Nearly related in structure to A. G. are those found in certain animals in the neighbourhood of the genital organs. The beaver, for example, has glands in this region which secrete the castoreum of commerce. Musk is derived from similar glands in the musk deer. The secretion in these cases is most powerful during the exercise of the sexual functions. Other animals, such as the skunk, polecat, and badger, have glands near the tail which secrete a most offensive matter which they eject when excited, and which they use to defend themselves.

An'alogue, a term applied to any organ, structure, or part in a living being which corresponds in *use* or *function* with another part, independently of similarity or dissimilarity in *structure*. Analogy means identity in function, and is used in contradistinction to homology, which implies identity in structure. The wing of a bat, bird, and butterfly are thus analogous.

Anal'ogy, or the similarity of relations, originally referred to the determinate relations of mathematics, *e.g.*, A. between the ratio of a number to its multiple and the ratio of the sum of several numbers to the sum of their equi-multiples. Latterly A. was applied to inference based on similar though indeterminate relations, *e.g.*, A. between mother and child and Great Britain and her colonies. A. is now popularly applied to inference from one case to another which it resembles generally. Metaphor and illustration are A. in germ, but are often reasoned from as if complete, *e.g.*, 'To plady infer the human will is not free, because Christians are spoken of as 'stones builded up.' In logic A. is a probable inference where our knowledge of the compared cases, especially of their fundamental differences, is imperfect, the dependence of one property on another not being known, *e.g.*, inferences as to whether certain planets are inhabited, the conditions of life being possibly different from those on earth. Formal logic says a general conclusion, followed by a particular application, is involved in A., and gives three forms of syllogism, varying with the number of ascertained resemblances. A. has also been expressed as a rule of three, the inference being the fourth term. False A. is common in political discussion, *e.g.*, A. between heart or brain and metropolis, which begs all the questions of local government. In comparative biology A. means similarity or identity of function, similar functions being often performed by unlike organs. A. is also applied to the interpretation of Scripture, statutes, and other documents, on the assumption (true of infallible books) that the meaning is throughout consistent, and expressed in a similar manner. Great interest has attached to particular analogies, *e.g.*, Butler's A. between the moral contradictions of Nature and those of Revelation; Paley's A. between telescope lenses and the humours of the eye, the inference in the latter being that the eye was constructed by Intelligence.

Anal'ysis (chemical) has for its object the breaking up of a compound substance into its constituent elements (or into other and more simple compounds of these) with a view to the determination of its composition. A. is employed to solve two kinds of problems of constant occurrence to the chemist: (1) to discover of what elementary bodies a compound substance is formed; (2) to determine the quantities of these contained in 100 parts of the substance. The first of these problems is solved by the aid of *qualitative A.*, the second by that of *quantitative A.* To determine the qualitative composition of a substance, it is submitted to certain tests: if in the solid state, its behaviour when heated before the blowpipe often leads to the discovery of at least one of its constituents; if in a state of solution, application of *liquid tests* is resorted to. These consist of acids, alkalis, or salts, usually dissolved in water, which, when added to the solution to be examined, may occasion certain phenomena or reactions characteristic of some known sub-

stance or substances. To give an example of these methods: if a solid compound of lead be heated on charcoal before the blowpipe, metallic lead is produced, and may be easily recognised by its softness, and the black streak it leaves when rubbed on paper. If a salt of lead dissolved in water be mixed with a solution of chromate of potash, a beautiful yellow and highly characteristic compound, called chromate of lead, or chrome yellow, is *precipitated* as a powder. Sulphuric acid mixed with the lead solution causes a white precipitate of sulphate of lead; caustic potash solution also causes a white precipitate; and solution of ammonia throws down a white precipitate, which disappears on adding more of the ammonia. Any solution which behaved with the above reagents as described, might be safely said to contain the metal lead. There is another kind of qualitative A., called spectroscopic A., which during the last few years has been of immense service to science, and by means of which not only have several new elements been discovered, but even the composition of the Sun, Mars, and other heavenly bodies, has been investigated. It depends on certain properties of *light* which it would be impossible to discuss here, but will be found described in art. SPECTRUM ANALYSIS.

In *quantitative A.* the chemist seeks to separate the different elements contained in a given weight of the compound he is investigating, and to obtain them either isolated or in some known form of combination such that he can determine their amount.

Anal'ysis, in mathematics, was originally a method of solving geometrical questions by assuming, in the first place, that which was to be proved, and then reasoning backwards, as it were, until something was reached which was already known. It was therefore opposed to synthesis, which reasons directly from the known to the unknown.

Modern mathematicians, however, regard it as algebra in its widest sense. It represents known quantities by symbols, such as letters, and from the relations which these bear to one another deduces by further investigation other and required relations. Under A. may be grouped such subjects as series (finite and infinite), curves, differential and integral calculus, calculus of finite differences, calculus of variations, quaternions, &c.

Anam. See COCHIN-CHINA, the Anamese empire.

Anamir'ta, a genus of tropical plants in the order *Menispermaceae*. See COCCULUS INDICUS.

Ananas'sa, a genus of tropical plants belonging to the order *Bromeliaceae*. See PINE APPLE.

Anaphrodis'iacs are medicines generally believed to have the power of repressing the sexual feelings. Nauseants, such as tartar emetic and ipecacuanha; purgatives, such as jalap, calomel, and elaterium, large doses of camphor, hemlock, and tobacco, have properties of this kind. See APHRODISIACS.

Anap'nograph. This is an instrument invented by two French physicians, Berjeon and Kastus, for registering the amount of air drawn into the lungs in inspiration and expelled in expiration. The principle of the instrument is that the current of air moves a vertical valve made of aluminum, to the edge of which a light, vertical lever is attached, which follows accurately the movements of the valve. The end of the lever carries a pen which registers its movements on a slip of paper passed underneath it by means of clockwork. The paper is divided into squares of a size arbitrarily chosen, but representing so much air. The curve thus produced not only represents the amount of air in expiration and inspiration, as might be determined by a spirometer (see SPIROMETER), but it also indicates graphically the force of the respiratory movements.

An'archy (Gr. *a*, privative, and *arche*, government), the name given to that state of matters in a country where no government exists or exercises any authority, and opposing factions struggle for supremacy. It is of necessity a transition state, and often ends in despotism or tyranny; but in Mexico, and most of the Spanish republics of S. America, it has prolonged itself far beyond its usual duration, and seems as if it would become the chronic condition of society.

Anarrhichas. See WOLF-FISH.

Anas. See DUCK.

Anasar'ca. This term is the name given to the condition in which there is infiltration of watery or serous fluid in the meshes of the connective tissue throughout the body. It may be due to various causes, such as disease of the heart, or of the lungs, or of the liver, or of the kidneys, or of the lymphatics. It frequently follows scarlet fever in cases where, from premature exposure to cold, the kidneys have become affected. The primary cause in all cases is obstruction to the free circulation of the blood, and A. is therefore regarded by physicians not as a disease, but as a physical sign of disease in some important organ. The remedial measures are directed to removing, if possible, the cause of the obstruction, and to draining off the superabundant fluid from the textures by acting on the bowels with purgatives which cause watery stools, such as cream of tartar and jalap; and on the kidneys with diuretics, such as infusion of broom, along with acetate of potash, or sweet spirits of nitre.

Anastasi'us I. Emperor of the East, surnamed 'the Silent,' was born at Dyrrachium in 430 A.D. Of the earlier part of his life we know almost nothing. After the death of Zeno he was proclaimed emperor by the Senate, and was crowned 11th April 491, at the age of sixty-one. He owed his elevation to the widow of his predecessor, whom he accordingly married. In the eye of the Church he was undoubtedly a great heretic. He had embraced the errors of Eutychius and the Manichæans, and used his imperial authority to protect and encourage dissentients from the Catholic creed. The result was a rebellion of the orthodox party headed by Vitalian, who ravaged a great part of the empire, and ultimately forced A. to abandon his patronage of heresy. Yet A. was not without good qualities. If not orthodox, he was at least humane, and he did the state good service by suppressing the contests in the amphitheatre between men and wild beasts, by his extinction of the sale of offices, by his fortification of Constantinople, by restoring the lighthouse at Alexandria, and by useful works in various parts of the empire. He died 8th July 518, at the great age of eighty-eight.

Anastasius I. elected Pope in 398 A.D., reconciled the churches of Antioch and Rome, after a seventeen years' schism. Two epistles bearing his name are evidently spurious: the one, addressed to Nerenianus, of little mark; and the other instructing the German bishops, among other things, to prevent the Manichæans, who had been banished from Rome, from entering Germany. The first, however, was obviously written after the death of A., and the other earlier than his accession to the pontificate, and therefore would have been without authority. Some of the doctrines of Origen he pronounced heretical, for which he received the praise of Jerome. Councils sat at Carthage, Constantinople, Ephesus, and Toledo during his pontificate, though A. himself played no important part in any of them. He died 14th December 401 A.D. Other three popes took this name, none of whom, however, merit notice.

Anastasius I. elevated to the patriarchate of Constantinople, 730 A.D., by the Emperor Leo, on the faith that he should aid in the work of iconoclasm, or image-breaking. The Emperor Constantine Copronymus, whose displeasure he had incurred by following the party of Artabazus, put out his eyes in 743, and, by way of disgrace, marched him into the hippodrome mounted on an ass, with his head to the tail, but, singular to say, did not venture to depose him. He died in 753.

Anastasius, St. the apostle of the Hungarians, was a native of France, and was born in 954. His original name was Astric, and it was under this name that he entered the Benedictine monastery of St Boniface at Rouen. A. accompanied St Adalbert to Bohemia, and when the bishop was forced to leave by the hostility of the people, he withdrew along with him. Soon after he found an asylum at the court of Stephen, the first Christian prince of Hungary, who in the year 1000 placed him at the head of the Abbey of St Martin, and made him Bishop of Colozsa, from which time he dropped the name Astric, and took that of A. Stephen sent him to Rome to obtain from the Pope the title of King (he was hitherto only Duke) of Hungary. He brought back not only a royal crown for his master, but also a double cross, the symbol of saintly or apostolic merit. The whole of A.'s long life was devoted to the propagation of the Christian religion. He died 1044.

Anastat'ia, a genus of Cruciferous plants. See ROSE OF JERICO.

Anastomo'sis. When arteries or veins unite, they are said to anastomose or inosculate. If an artery be placed for a short distance, it is found to divide into branches. These branches again subdivide, or give off other branches, and so on until the vessels become so small as to be termed capillaries (from *capilla*, a hair). Sometimes A. may occur in large arteries, as those of the hand, or foot, or brain; but they are more frequent in smaller vessels. A. permits of a free communication between currents of blood, and thus promotes an equable distribution of that fluid. A knowledge of A. in the larger vessels is essential to the surgeon, because when he finds it necessary to apply a ligature to an artery supplying a limb, so as to arrest the flow of blood through an aneurismal tumour (see ANEURISM), he expects the circulation in the limb to be carried on by collateral branches, which anastomose above and below the point of ligature. He has therefore to apply the ligature at a point where great branches are not interfered with.

Anath'e'ma (Gr. something 'set up' or 'apart'), a votive offering, applied also to a sacrifice; and as animals *set apart* for sacrifice must suffer death, A. came to signify something doomed to eternal perdition. It is the strongest form of ecclesiastical curse, the person under A. having no further hope, as the ban is final. A sentence so serious can be pronounced only by a council, a pope, or with the concurrence of the provincial bishops and their metropolitan.

Anatolia (Gr. *Anatolê*, the East; Turkish; *Anadoli*), the modern name of the peninsula of Asia Minor, and of a province of Asiatic Turkey. The total length is about 700 miles, the greatest breadth 400 miles, the area about 208,000 sq. miles. It is bounded N. by the Black Sea, E. by Armenia and Mesopotamia, S. by the Levant, and W. by the Archipelago. The general appearance of the surface is that of a high plateau, supported on the N. and S. by mountain ranges parallel to the coasts. On the W., between the sea and the elevated interior, many fertile valleys open out on the Archipelago. The tableland contains numerous salt-water lakes, and is drained by rivers, the largest of which flow into the Black Sea and the Ægean. The W. coast is famed for its genial climate and luxuriant vegetation. The N. coast has also a fine, but more humid, climate, and possesses immense forests of beech, oak, ash, elm, &c. The interior has hot summers and cold winters; the S. coast is very warm. Among the vegetable productions are the olive, mulberry, tobacco, rice, numerous fruits, &c. The barren interior affords pasturage for large flocks of sheep and goats. Copper, lead, rock alum, and marble figure prominently among the minerals. The inhabitants are mainly Osmanli Turks, nomadic Turkomans and Kurds, Greeks, Armenians, and Jews. Total pop. is given in the official census (*Almanach de Gotha*, 1875) as 6,753,337.

A. is divided into nine *vilayets* or provinces: 1. Asiatic Constantinople; 2. Brusa; 3. Aidin; 4. Kastamuni; 5. Angora; 6. Konia; 7. Adana; 8. Trebizond; 9. Sivas.

Anat'omy is the science which treats of the form and structure of living beings. It is primarily divided into vegetable A., or the structure of the organs and tissues of plants; and animal A., or the structure of the organs and tissues of animals. The A. of animals, again, is further subdivided into comparative A., that branch of the science in which the bodies of various animals are dissected and compared, so as to educe general laws regarding their affinities with each other; and descriptive A., which studies minutely the situation, form, and relations of organs in a particular species of animal. Descriptive A. may be again subdivided into as many departments as there are species in the animal kingdom. Thus we have human A., or anthropotomy; and horse A., or hippotomy. Various other terms are used by anatomists, such as morphology, or the investigation of the laws of form and structure; physiological A., in which the structure of an organ is considered with reference to its function; embryology, or the gradual development of structure in the embryo; general A., or histology, which treats of the minute structure of the organs and tissues of the body, which can only be revealed by the microscope; and finally, pathological A., in which the form and structure of dis-

ceased parts are described. Comparative A. is of the highest importance to a knowledge of the science which treats of the laws of life, or biology; it is the foundation of the science of physiology, which investigates and describes the functions of tissues, organs, and of the body as a whole: and the department of human A. is intimately related to the art of healing in the three great departments, medicine, surgery, and obstetrics.

In a work like the present it is impossible to find space for even a general account of comparative or human A., but short descriptions of the various tissues and organs will be found under their several names, *e.g.*, Atlas, Aorta, Duodenum, Lung, Liver, Brain, Spleen, &c. In the same manner, a general account of the A. of various species of animals will be found under the name of the species, *e.g.*, Crustacea (Crabs), Insecta (Insects), Horse, Dog, Pig, &c.

Anatomy, History of. From the earliest times men must have had opportunities of inspecting the framework, organs, and cavities of the body when they slaughtered animals for food or for sacrifice, but centuries passed before exact anatomical knowledge was regarded as being important. The art of embalming, practised by many ancient nations, did not require more than a very superficial acquaintance with the great cavities of the body. The first Hippocrates, who flourished between the years 460-377 B.C., makes many allusions to anatomical details in his medical and surgical works, which show that he knew something of the bones forming the skeleton, but little regarding the soft parts. At this period no distinction was drawn between artery and vein, or tendon and nerve. The many distinguished disciples of the Hippocratic school had singularly confused notions of the A. of even so large an organ as the heart, proving that the art of dissection was not practised to any great extent. A. continued in this embryonic condition for many years; and the few facts known were derived from observations made on the bodies of the lower animals.

Aristotle (4th c. B.C.) was the first who cultivated A. in a systematic manner. There can be little doubt he dissected the bodies of many animals, compared the different organs and structures, and thus laid the foundation of the science of comparative A. and the classification of animal forms. The anatomical works of the philosopher of Stagira consist of fourteen books—namely, ten on the *History of Animals*, and four on the *Parts of Animals*. Aristotle corrected many of the errors of previous writers. He showed that two great vessels arise from the base of the heart. One of these he termed the *aorta*, which he traced into the abdominal cavity, carefully describing most of its branches. He noticed also the difference between the thickness of the coats of artery and vein. He still confounded nerves with tendons, and maintained that the nerves originated in the heart. Finding the veins filled with blood after death, he concluded that these vessels carried that fluid throughout the body. He appears to have known also about the general arrangements of the organs in the abdominal cavity.

Previous to 285 B.C. all anatomical knowledge was derived from dissections of animals. In this year, however, two physicians of Alexandria, named Herophilus and Erasistratus, first dissected the human body, and they may be regarded as the founders of human A. Time has not transmitted to us any of their works, but reference is made to them by Galen and others who flourished many years afterwards. These ancient physicians dissected the membranes and sinuses of the brain, and the junction of various of the latter in the occiput is still known as the *Torcular Herophili*. They made the important step of demonstrating that many of the nerves issued from the brain, showed the lacteal vessels in the mesentery (without, however, knowing their function), described the valves guarding the auriculo-ventricular orifices of the heart, and generally gave precision to many anatomical details. For nearly 300 years the discoveries of Herophilus and Erasistratus constituted the sum of anatomical knowledge; but about the year 50 B.C. a great anatomist and surgeon arose named Celsus. He devoted his attention chiefly to osteology, and described the bones, along with their foramina and articulations, with great care.

During the reign of Trajan, a Greek physician, Ruffus, made the important division of nerves into sensory and motor, and it appears he was the first who performed physiological experimentation on the living animal. He showed that compression

of the carotid artery or of pneumo-gastric nerves in the neck produced insensibility and loss of voice.

About the year 130 the celebrated anatomist Galen was born. He contributed much towards advancing A., not only by his own works, but by collecting all the knowledge acquired by previous writers. He first divided the vertebrae into cervical, dorsal, and lumbar, and generally improved on the osteological descriptions of his predecessors. He attempted to dissect and describe the muscles; and it is remarkable that many of the names given by Galen to muscles seventeen centuries ago are still retained. He made the important step in physiology of demonstrating that the arteries contained blood, not air, as had been hitherto supposed. He was also the first who asserted that the brain is the organ of the mind, and that the spinal marrow was connected with motion. His description of the brain was singularly precise, while he added much to an accurate knowledge of the pleural cavities, lungs, pericardium, heart, and the abdominal and generative organs.

For 1000 years from the time of Galen A. made no advances. This is to be attributed to two causes: (1) To the disruption of the Roman empire, and the consequent abandonment of scientific culture by the degenerate Romans themselves, while the barbarous nations were still too uncivilised to devote attention to such subjects; and (2) to the religious prejudices and scruples of the Arabian physicians, who were for a time the guardians of medicine. The Koran forbade its disciples to touch a corpse, far less to dissect a body.

About the beginning of the 13th c. Italy again became the home of science. The University of Bologna encouraged medicine and surgery, and soon the science of A. was assiduously cultivated. In 1315, Mondino, a professor of A. in Bologna, dissected two female subjects, and gave public demonstrations of the parts. About 1480, Achilleni, a disciple of Mondino, among other less important discoveries, described the malleus and incus, two small bones in the middle ear, and demonstrated that the ankle was formed of seven bones. Many other celebrated anatomists were connected with the school of Bologna, notably Berenger, who dissected above 100 human bodies. Each of these added facts to the science.

During the 16th c. A. was cultivated in France, but chiefly by dissections of the lower animals. About 1514 a young Fleming arose, named Andrew Vesalius, who left his mark on A. He was professor of A. in the universities of Padua, Bologna, and Pisa successively, and he was the first to write a comprehensive treatise on human A. He was followed by Eustachius, who described the tube leading from the middle ear to the throat which still bears his name, the muscles which move the small bones of the middle ear, and the A. of the teeth. He also published a volume of *Anatomical Engravings*, which for many years was the only atlas of A.

The Italian school at this period also furnished Fallopius—who was professor at Pisa in 1548, and at Padua in 1551—Varolius, Aldrovandus, and Coiter. All of these contributed information which assisted in rearing the superstructure of A. Most of their discoveries were of minute relations or arrangements, and they also corrected many errors of their predecessors.

About this time (1530) Fabricius of Acquapendente made the discovery of valves in the veins of the extremities, which was to have an important influence on the demonstration of the circulation of the blood some years afterwards. Hitherto it had been supposed that the arteries conveyed to the body a kind of air or spirit, while the veins distributed the blood. It was also held that the blood of the right side of the heart mixed somehow with that of the left, or with the spirit which was stored up there. A Spaniard, Michael Servetus, first showed that the septum between the two sides of the heart was impervious, and he maintained that the blood must pass through the lungs before it can go from the right to the left cavities. This man, who held many views at that time deemed unorthodox, was publicly burned, along with his works, at Geneva in 1553, a martyr to the bigotry and intolerance of the time.

We now come to the great discovery of the circulation of the blood. In 1619, William Harvey, an Englishman, demonstrated the true course of the circulation. Combining the anatomical knowledge of Fabricius of Acquapendente, whose pupil he was, with the information obtained by a well-contrived series of experiments, he demonstrated that the blood passes out from the heart by the arteries, and returns to it by the veins. For many

years he had no actual demonstration of the capillaries or intermediate vessels between the terminations of the arteries and beginnings of the veins, but he lived to see them by means of the simple microscope. It is impossible to over-estimate the value of this discovery, which affects every department of medical and surgical practice.

In 1622, Asellius, professor of A. at Pavia, discovered the physiology of the lymphatic system. The lacteals filled with chyle after digestion were first seen in a dog in 1622, and in 1627 they were seen in the body of a felon who had taken a hearty meal before execution. In 1647, Pecquet demonstrated the course of the chyle into the blood. The distinction between lacteals and lymphatics, and the discovery of terminations of the latter in the venous system, were made by Jolyffe, an English anatomist, and Rudbeck, a Swede.

Since this period the efforts of anatomists have been directed towards the more minute study of textures and the structure of organs. These efforts were much assisted by the use of the simple microscope, which was first directed to the tissues of animals by Malpighi. He first saw the blood corpuscles and the capillaries, and he investigated the minute structure of many tissues. Certain bodies in the spleen and kidneys still bear his name.

The progress of A. was much assisted by the art of injection of vessels and ducts. Ruysch, professor of A. in the University of Amsterdam in 1665, carried this art nearer perfection than any of his predecessors, and by this method he investigated the vascular arrangements in almost every part of the body. From that date A. made rapid advances, and each great master added his quota of facts. Space will not allow us to enter upon details, which are given with great fullness in the *Encyclopædia Britannica*, vol. i. art. *Anatomy*.

In recent times, the chief advances have been in the knowledge of the minute structure of the tissues. This has been promoted in two ways: (1) By the use of the compound achromatic microscope; and (2) by employing chemical and physical methods of so hardening, cutting, staining, and mounting the various tissues as to render their structure clear and distinct when placed under the microscope.

Human descriptive A. may now be considered as almost completed. It is not probable that any new organ, muscle, or nerve has escaped detection, or that there are many errors in the descriptions of anatomical writers. There is still much to be done, on the other hand, in the field of minute structure, and every month adds to our stores of knowledge. Embryological A. is also rapidly advancing, but is far from approaching completion. Comparative A. is a boundless subject, and will no doubt continuously advance through many centuries. It is now correctly regarded as the basis of scientific zoological classification.

The preceding sketch of the history of A. clearly shows the important relation the science bears to physiology, and through it to pathology and the practice of the arts of medicine and surgery. A. is the foundation on which the whole superstructure is reared, and it is important to bear in mind that every anatomical fact has a physiological significance, and consequently a bearing on the detection and treatment of disease. This is the reason why anatomical knowledge is correctly regarded as the basis of medical studies. See **PHYSIOLOGY, MEDICINE, SURGERY, HISTORIES OF**.

Anatomy (in Law). Until the year 1832 there were no sufficient legal means of procuring dead bodies for anatomical dissection. This defect led to the horrible trade of the resurrectionist, and to murder for the value of the victim's body. The system culminated in the notorious case of Burke, who was tried and convicted of murder, mainly on the evidence of his associate Hare, before the Court of Justiciary in Edinburgh in 1828.

The Act 2 and 3 Will. IV. c. 75, empowers the Home Secretary for Great Britain, and the Chief Secretary for Ireland, to grant licences to practise A. to any duly qualified medical practitioner or student of A., on written application by him countersigned by two justices of the peace, and certified by them. Inspectors are appointed by the Act to inspect schools of A., and to make quarterly returns of bodies removed for dissection. A relative may object to dissection, even though the deceased had expressed a wish for it. No body is allowed to be

removed till forty-eight hours after death, nor till twenty-four hours after notice to the inspector or to some neighbouring medical man. A certificate of the cause of death must be given by the medical attendant, or by a medical man called in after death. Anatomists are not to receive a body without a certificate; which is to be entered in a book, to be produced to the inspector when required. Provisions are made for decent interment of the body. Persons infringing the statute are liable to three months' imprisonment, or to a fine not exceeding £50. The Act is generally believed to have worked well, and to have fulfilled its purpose.

Anaxagoras, a very eminent philosopher of the Ionic school, was born at Clazomenæ in Ionia, B.C. 500. Born to wealth, he was able to give his time wholly to study. When twenty years old, he went to Athens, where among his pupils were Pericles, Euripides, and Socrates. Accounts differ somewhat as to the nature of the persecution which drove him from Athens. It seems, however, to have been superstitious. He was condemned to death, but by the eloquence of Pericles the sentence was commuted into banishment for life. He retired to Lampsacus, on the Hellespont, where he died aged seventy-two. No entire work of A.'s has come down to us, but from the fragmentary evidence we have respecting his philosophy, it appears that while much of its details was absurd and extravagant, it was in the main that of a man of subtle intellect. He held that all matter existed originally as atoms, and that these atoms, infinitely numerous, had existed from eternity; that the visible universe was the result of the aggregation of these atoms, which aggregation is, by the agency of the 'Nous'—a self-potent and all-pervading spiritual being—the most pure and subtle essence of all that is. A.'s fragments have been collected and published by Schaubach (Leipzig, 1827), and by Schorn (Bonn, 1829).

Anaximander, the friend, pupil, and successor of Thales, the founder of the Ionian school of philosophy, born at Miletus, B.C. 610, died B.C. 547. He is chiefly noted as a mathematician, and is said to have been the inventor of maps, also to have been the inventor of the gnomon, a style column for measuring altitudes, or at least to have been the first who applied the gnomon to determine the obliquity of the ecliptic. Absurd as many of his philosophic and astronomical theories may seem to us, he seems, nevertheless, to have had glimmerings of light on questions which have engaged the attention of many of the best intellects of our own time. He did not believe in creation or in generation, in the correct sense of the word. He believed that the infinite atoms, or primary matter, drew together and shaped themselves in virtue of an innate power. See Ritter's *Geschichte der Ionisch. Philosophie* (Berlin, 1821), and Schleiermacher's *Über die Lehre des A.* (Berlin, 1811.)

Anaximenes, an Ionian philosopher, and friend of Thales and Anaximander, was born at Miletus, and flourished in the 6th c. B.C. The aim of all his speculation was to find a satisfactory theory of the origin of the universe on the basis of materialism. This he considered himself to have attained in the doctrine that air was the primordial, eternally-existing element, from which by compression all things are formed, even the human soul. In the system of A. there is no necessity for a Creator.

Anaximenes of Lampsacus, pupil of Zoilus and Diogenes the cynic, is said to have been one of the teachers of Alexander the Great, and to have accompanied him on his expedition to the East. A. wrote three histories—one of Philip of Macedonia, another of Alexander the Great, and a third of Greece from the dawn of the mythic period down to the age of Epaminondas. Only a few fragments of these works are now extant, which is the less to be regretted, as they did not bear a high reputation in antiquity.

Anbury, a disease in turnips, known also as 'finger-and-toe,' on account of its presence producing excrescences somewhat resembling these two features in the human system. The origin of A. is not settled among vegetable physiologists. It is maintained by some that the cause of the malady, which renders utterly worthless the bulbs, is an insect; on the other hand, it is contended that a taint in the seed is the cause of the insect's appearance in the warts. It is certain that in all roots affected with A.

an insect is found in one of the twisted and abnormal growths from the main body. A. eats out the life of the turnip, making it worthless for feeding. A. hundred years ago A. was more prevalent than it now is. Still in recent times it has proved very disastrous to farmers, and no specific has been found out to prevent its ravages. The disease affects the turnip generally between the interval of singling and hoeing. Its presence is indicated by a flaccidity and yellowness of the leaves. It is peculiar that it does not run along the drills, but displays itself in patches here and there over the field, the driest knolls being the chief scenes of its havoc. Clay lands are less liable to be affected than light, porous soils. The principal insects found in the warts are the winter turnip-gnat (*Trichocera hiemalis*) and rove-beetles—*Oxytelus sculpturatus* chiefly. Liming and liberal manuring are recommended to avert its dangers, but neither of these operations can be relied upon as an infallible preventive.

Anca'ster, a town of Catamarca, in the Argentine Republic, S. America, lies in a mountainous region 23 miles N.E. of Catamarca. Pop. (1863) 8000.

Ancelet, Jacques-Arsène-François-Polycarpe, a French dramatic author, born at Havre, 9th February 1794, was employed in the naval department of the government service till the revolution of 1830. From his youth, however, he had a passion for poetic literature, and was incessantly versifying; but the first of his works that saw the light was *Louis IX.* (1819), a tragedy so successful that it ran for fifty nights. Less successful was the *Maire du Palais*, performed in 1823. His *Fiesque*, an adaptation of one of Schiller's pieces, was produced in 1824; *Marie de Brabant*, an epic poem, in 1825; *Six Mois en Russie* in 1827, a melange of prose and verse; and *Elisabeth d'Angleterre* in 1829. A pension of 2000 francs, bestowed by the king in 1819, was lost at the revolution of July, and although he set himself courageously to support his family by his literary industry, it is certain that not a few of his later works aimed at popularity by exhibiting a doubtful morality. Among the scores of dramas, comedies, vaudevilles, produced between 1830 and 1840, may be mentioned *Madame du Barry*, *Lamartine*, *Le Favori*, *Le Regent*, *Madame du Châtelet*, *La Comtesse d'Egmont*, *Hercule comme une Princesse*, *L'Espion*. In 1841 he was chosen by the French Academy to succeed Bonald. His *Épîtres Familiales*, published soon after, are remarkable for brilliant satire, epigrammatic point, and graceful simplicity of style. His last work was his *La Rue—Quincampoix*. A. died at Paris, 7th September 1854.

Anchor is an implement by which ships are temporarily retained in a particular spot. Before the introduction of iron anchors by the Greeks, the ancients used stones or crooked pieces of wood fastened to weights for this purpose; and at the present day such rude instruments are found among the Chinese, and even among our own fishermen.

Anchor.

The A., as employed by most civilised and European nations, consists of the following parts: The *shank*, the vertical and supporting beam of the A.; the *ring*, at the upper extremity of the shank; the *stock*, the transverse bar just below the ring; the *arms*, at the lower extremity of the shank, and branching out nearly at right angles to the stock; the *palm* or *fluke*, the flatish portion at the end of each arm, the sharp extremity of which is called the *peak* or *bill*; and the *crown*, the lowest part of the A., at the very extremity of the shank.

The most stable and natural position of an A. is evidently when the stock lies along the ground, and therefore the arms nearly perpendicular to it. As it is desired that the one arm should be forced into the ground by the pressure of the A. itself, the position of the flukes must be such as to form the angle most favourable for this purpose.

As a rule, British ships-of-war carry four anchors—the 'best bower,' the 'small bower,' the 'sheet,' and the 'spare'—though sometimes they are provided with two smaller ones—the 'stream' and the 'kedgce.'

Within late years there have been many improvements in the

forms of anchors, but perhaps the greatest novelty was that introduced by Porter, and improved by Trotman. The greatest peculiarity of Porter's patent consists in having the arms pivoted on the shank, and not fixed immovably; and there is also a projecting portion on the convex part of each arm called the *tackle*. The exposed arm, therefore, lies along the upper side of the shank, and thus there is less danger of 'fouling' by the cable becoming entangled on this arm while the vessel is swinging in a tideway. Trotman's improvements consist chiefly in making the flukes of a more convenient shape, and other similar matters of detail. Formerly, in the manufacture of anchors, a circle of smiths formed round the heated metal, and dealt blows in succession with most ponderous sledge-hammers; but now the powerful steam-hammers invented by Nasmyth have aided the operations in a wonderful degree.

An'chorage, though sometimes applied to a ship's suite of anchors, or to anchor-ground, is properly a due levied upon the captain of a ship for permission to anchor in particular anchor-grounds. As a rule, this is not required of a ship driven into port through stress of weather.

An'chor-ground is a portion of the bed of the sea or of a river suitable for anchoring in. A good A. obviously depends upon the depth and the nature of the bottom, which, if rocky, would be liable to break the flukes.

An'chorites, a class of Christian hermits who began to appear in the 3d c. The Ascetics (q. v.) at first thought it sufficient, in order to attain to a higher standard of holiness, to withdraw from worldly business and amusements, to practise fasting and celibacy, and otherwise mortify the flesh. This, however, did not long satisfy those who aspired to the highest degree of holiness; they must withdraw from mankind altogether. A. (Gr. *anachoretēs*, from *anachoreō*, to withdraw), then, were those who retired from the haunts of men altogether, to escape the contamination of the world, and to devote themselves to contemplation; some also, no doubt, being driven to this course by persecution. As distinguished from other classes of monks, A. were those who had no fixed place of abode, but passed the night, without any shelter, wherever they happened to be overtaken by the darkness. Many went without proper clothing, wore iron chains and rings on their body, and even maintained painful postures, e.g., standing on the top of a pillar (see *STYLITES*) for years. When several inhabited the same wilderness not far from each other, they were collectively called a *Laura*. A. never were numerous in Europe, probably owing to the more rigorous climate, and they disappeared altogether before the advance of the monastic system.

An'chovy (*Engraulis Encrasicolus*), a genus of fishes included in the *Clupeida* or Herring family, and which occurs abundantly in the English Channel, on the French coasts, and in the Mediterranean. The fishing extends throughout May, June, and July—that period being the spawning season. This fish averages four or five inches in length. The head is pointed, the lower jaw being of short conformation. The scales are of large size. It is chiefly used for making condiments; the viscera being simply removed, and the fishes preserved and prepared in various ways.

Anchovy Pear, the name given to a slender, tall tree (*Grias cauliflora*), a native of Jamaica, belonging to the order *Barringtoniaceæ*. Its fruits, which are russet-brown drupes, are used for pickles, and resemble the mango in taste. It is cultivated in hothouses in Britain, principally for its fine foliage.

Anchu'sa, a genus of rough-foliaged Boraginaceous plants. See *ALKANET*.

Anchylo'sis. See *ANKYLOSIS*.

Ancl'lon, a French family of Metz, who took up their residence in Prussia after the Edict of Nantes was revoked, and several of whom attained to eminence.—**David A.**, son of a distinguished Protestant lawyer, was born at Metz, 17th March 1617, and after being compelled to withdraw from his country, became French Reformed pastor successively at Frankfort, Hainau, and Berlin, where he died 3d September 1692. He was the author of several theological works.—**Charles**, his son

born at Metz, July 28, 1659, died at Berlin, July 5, 1715, wrote a considerable number of politico-religious works, of which may be mentioned *L'Irrévocabilité de l'Édit de Nantes* (1690), and *Histoire de l'Établissement des Français Réfugiés dans les États de Brandebourg* (Berl. 1690).—Louis Frédéric, grandson of the latter, was pastor of the French congregation at Berlin, where he died in 1814.—Jean Pierre Frédéric, his son, may be considered rather a Prussian than a Frenchman, and attained distinction entirely in the Prussian service, though he commenced his career as the pastor of a French community. He was tutor to the Crown-Prince of Prussia, and rose, through the confidence both of the king and the people, to high offices of state, finally succeeding Count von Bernstorff (1831) as Minister of Foreign Affairs. He died April 19, 1837. His various writings, written both in French and German, bear on statesmanship, and recommend that progressive legislation that prevents collisions between governments and the popular will, and which was the distinguishing feature of his own policy. Though thrice married, he had no children, and in him an honourable family became extinct.

Ancona, a fortified seaport and capital of a province of the same name, Italy, stands on a headland of the Adriatic coast, 11 miles N. of Loreto. It has a beautiful situation, is the see of a bishop, and retains a considerable share of the commerce for which in former times it was famed. It is said to have been founded by Syracusan refugees, driven hither (about 380 B.C.) by the tyranny of the elder Dionysius. It is meanly constructed, but contains several fine buildings. The Cathedral of St Cyriac, built in the 10th c., has the oldest cupola in Italy. A. was an important Roman naval station, and possesses an ancient mole 2000 feet long, on which stands one of the grandest triumphal arches in the world, erected by the Emperor Trajan. The town was taken by the French in 1797, but afterwards (1802) restored to the Papal see. In 1832 the French again took possession of its citadel, which they held till the Austrians evacuated the Papal territories in 1837. Ten years later it took part in the revolt of the Roman States, was bombarded and occupied by the Austrian troops, surrendered to the Piedmontese in 1860, and has since become part of the Italian kingdom. In ancient times A. was celebrated for its purple dye. Its trade is now principally in the hands of Jews, and the chief exports are woollen and silk goods, oils, cordage, bacon, and fruits. Pop. (1872) 45,741, of whom some 6000 are Jews.

Ancre, Baron de Lussigny, Marshal d', originally Concino Concini, son of a Florentine senator, went to France in 1600 with Maria de Medici, wife of Henry IV., and in conjunction with his wife, Eleonora Dori, surnamed Galiga, the queen's *femme-de-chambre*, promoted discord between the royal pair. After Henry's death he became leading favourite of the queen-regent, and was made a marshal and prime minister in 1613. Becoming obnoxious to the court and to the populace, he was assassinated in the Louvre before midday of April 24th, 1617, Louis XIII. being privy to the plot. His exhumed body, after being suspended by the feet to a gibbet, was burned before the statue of Henry IV. His wife was subsequently burned as a witch, and her son, a boy of twelve, deprived of his vast property, was expelled from France.

Anous Marc'us, according to the Roman legend, was fourth king of Rome, and grandson of Numa Pompilius, like whom he cultivated peace, and was devoted to the service of the gods. He reduced several Latin towns, and settled the inhabitants on the Aventine. In the opinion of Niebuhr, these formed the original *plebs*, while Mommsen thinks they merely swelled the numbers of a pre-existing *plebs*. He founded a colony at Ostia, built a fortress on the Janiculum, dug the 'Ditch' of the Quirites, and built the first prison at Rome. His death is assigned to the year 614 B.C.

Anda, a genus of Euphorbiaceous plants. The seeds of *A. brasiliensis* are known in Brazil as *Purga dos Paulistas*, and are used with the same effect as castor oil.

Andalusia, or **Andalucia**, a large district in the S. of Spain, comprising the two former provinces of Andalusia proper and Granada, and the eight modern provinces of Huelva, Seville, Cadiz, Cordova, Malaga, Jaen, Granada, and Almeria. It is bounded on the N. by Estremadura and New Castile, on the

E. by Murcia, on the S. by the Mediterranean and the Atlantic, and on the W. by Portugal. Area, 27,200 sq. miles. Pop. (1870) 3,264,640. The surface of A. is very mountainous, with the exception of the basin of the Guadalquivir. The mountain range called the Sierra Morena runs along its N. portion, and the Sierra Nevada borders the coast from the E. boundary to Gibraltar. The Guadalquivir flows between these ranges into the Atlantic. A. was formerly famous as the 'granary' and 'garden' of Spain; and though at present agriculture is very backward, it is still one of the most fertile districts in the kingdom. The banks of the Guadalquivir are luxuriantly productive. Maize, wheat, olives, oranges, citron, sugar-cane, figs, batatas, cactus, aloe, &c., grow vigorously, and wine and oil are abundantly produced. It is also well supplied with minerals. Its horses and mules are of superior excellence, and the Sierra Morena produces wild cattle for the bull-fights at Madrid. The climate of the S. is the hottest in Europe, but N. of the Sierra Nevada it is more temperate. The principal towns of A. are Cadiz, Seville, Cordova, Jaen, Granada, and Malaga.

The name A. has been derived from an Arabic word signifying 'the region of evening,' like the *Hesperia* of the Greeks (see Gibbon, chap. li.), but more probably it was originally *Vandalitia*, 'the land of the Vandals,' who, after wasting Gaul, poured through the passes of the Pyrenees, and settled here early in the 5th c. The inhabitants may be considered a mixed race. At least the original Celtic element must have been greatly changed by the successive infusion of Carthaginian, Roman, Goth, Vandal, and Moorish blood. The modern Andalusians are among the most lively and imaginative people in Spain, and not deficient in industry when they have any motive for exertion. The patois or speech of the people is a dialect of Spanish coloured with Arabic terms.

A. is the *Tarshish* of the Bible, and was called *Bætica* by the Romans. Under first the Arabs, and afterwards the Moors, who founded splendid kingdoms here, arts and sciences, chivalry and commerce, greatly flourished. The four great Moorish capitals were Seville, Cordova, Jaen, and Granada. Seville and Cordova long retained their pre-eminence in literature and the fine arts.

Andamans, a small group of islands in the Bay of Bengal, forming the western extremity of the Indian Archipelago. They are covered with dense forests, and sparsely inhabited by a race of savages. An attempt by the British to colonise the A. (1793) was abandoned on account of the climate; and on the suppression of the Indian mutiny they were occupied as a penal settlement. During a visit of inspection to the prison of Port Blair in 1872, Lord Mayo (q. v.), Governor-General of India, was assassinated by one of the convicts.

Andante (Ital. 'going'), a musical term, denoting a slow, gentle movement. *Andantino* is a little less slow than A.

Andennes, a town in the province of Namur, Belgium, 2 miles S. of the Meuse. It is noted for the manufacture of paper, porcelain, and more especially of tobacco-pipes. Near A. are marble quarries, pipeclay beds, and lead, iron, and coal mines. Pop. 6458.

And'rab, or **Inderab**, a town in the new Afghan province of Turkestan, on the river A., to the N. of the Hindu Kush Mountains. It lies in the midst of orchards and vineyards, and is an important station for the commerce with India. Pop. 6500.

And'ernach, a town in the district of Coblenz, Rhenish Prussia, situated where the Rhine flows through a beautiful defile, nearly 20 miles above Bonn. It is a town of high antiquity, having arisen on the site of a Roman camp (*Antunacum*), and was a residence of the Merovingian kings. It is quaintly built, contains a fine church of the 13th c., and is still surrounded by ancient ramparts. Its trade is unimportant; but the millstones of A., quarried in the vicinity, are widely celebrated, as is also its *trass* or cement, made of pulverised volcanic tufa, and which is durable in water. Pop. (1871) 4479.

And'ersen, Hans Christian, Danish poet, dramatist, novelist, and the most popular of all story-writers for children, born at Odense in Fünen Island, April 2, 1805, was the son of a shoemaker, but showing poetical talent at an early age, he was recommended to the patronage of the king, and educated by the state. In 1830-31 he published two volumes of poems, and the romances

Agnes and the Mermaid and the *Improvisatore* were the fruit of his tour through Southern Europe in 1833-34. Of his novels and dramas, *Only a Riddler* and *The Mulatto* are respectively the best; but he struck his richest vein in his *Picture-book without Pictures* (1840), a charming volume of fanciful sketches. Subsequently he produced an almost endless series of tales, &c., which continue to please the old and delight the young of all nations, and of which may be named *A Poet's Day-Dreams*, containing the exquisite story of *The Flax*, and the beautiful autobiographic sketch, *Under the Willow-Tree*; *The Ice-Maiden*; *The Danish Fairy Legends*, embracing the famous *Ugly Duckling*, *The Will-o'-the-Wisps are in Town*, and the *Dream of Little Suk*. His *Story of my Life*, a fascinating autobiography, was finished in 1846. A. has had many translators, and as many publishers in England. One of the best editions of his collected tales is that translated by Wehnert, and published by Bell & Daldy, London, 1869. A. died August 4, 1875. In 1877 appeared at Copenhagen *Breve til H. C. A.*, a valuable contribution to the poet's biography, containing letters to A. from all kinds of persons, kings, princes, authors, &c. His mother's letters are unsurpassed in their way.

Anderson, James, LL.D., a writer on agricultural and miscellaneous subjects, was born at Hermiston, in the county of Midlothian, in 1739. Succeeding his father, who was a farmer, in the management of the farm at a very early age, he soon manifested a superior intellect, and introduced many improvements in agricultural instruments. In 1783 he removed to Edinburgh for the education of his family, and soon showed no inconsiderable talent in literary work. His first production, a series of essays on planting, appeared while he was still engaged in farm business, in Ruddiman's *Weekly Magazine* for 1771. Among his later writings may be mentioned *An Account of the Present State of the Hebrides and Western Coast of Scotland*; being the *Substance of a Report to the Lords of the Treasury* (1785); a tract on *Fisheries* (1784); and the article *Monsoon* for the *Encyclopædia Britannica*. He also published a weekly magazine called the *Bee* (1791-94) in Edinburgh; and later, at London, conducted *Recreations in Agriculture* (1799-1802). The most valuable papers in the latter were by himself; and they are evidently the production of one whose talents and originality must place him among the foremost of the founders and developers of the true science of political economy. A. died at London in 1808.

Anderson, John, F.R.S., Professor of Natural Philosophy in Glasgow University, was born in 1726 in the parish of Roseneath, Dumbartonshire. As an author, he is best known by his *Institutes of Physics*, published in 1786. As a professor and lecturer, his success and popularity were very great, not only in the university, but also in connection with his *Antilogia* class, which met twice a week for the benefit of artisans and mechanics. A. died at Glasgow, January 13, 1796, and bequeathed all that he possessed for the founding of an educational institute in Glasgow for the use of the unacademical classes.

Andersonian University, originally intended to be made up of four colleges, was, however, from the inadequacy of the funds, opened in 1796 with only a single course of lectures on natural philosophy and chemistry by Dr Thomas Garnett. The success was great; and since then the university has been greatly enlarged, there being now seventeen professors. The funds have been considerably increased by donations from private individuals, both in Glasgow and elsewhere. The chair of music was endowed in 1866 by William Ewing of Glasgow; and in 1871 a donation of £5000 was given by Mr Freeland for the general purposes of the university. In 1870, James Young, Esq. of Kelly, presented £10,500 for the establishment of a chair on technical chemistry.

Andes, the great mountain range of S. America, extends in an unbroken chain from the small river Atrato in the N., near the Isthmus of Panama, to Patagonia in the S., and is even traceable in the islands forming the Fuegian Archipelago, as far as the rocks of Diego Ramirez, about 60 miles to the S.W. of Cape Horn. Like the Rocky Mountains in N. America, the A. run close along the W. coast, so that the rivers flowing into the Pacific are necessarily very short and rapid. The length of this chain, without making allowance for the windings, is about 4500 English miles, while the breadth varies between 40 and 350 miles. Towards the W. the A. generally present a

steep slope, the ridge being from 20 to 80 miles distant from the Pacific; while towards the E. they descend by gradual stages into the broad and fertile plains of Venezuela, Brazil, and La Plata. They constitute the great watershed of the S. American rivers; and when there is a double or triple chain, the western one is the true and only watershed, and accordingly the more eastern ridges are intersected by numerous deep, narrow gorges, through which the mountain torrents flow in their eastward career to the Atlantic.

In giving a more detailed account of the characters of this gigantic range, we shall adopt the ordinary division and nomenclature, referring each portion to the particular country in which it occurs. The figures are taken from Von Kloecken's *Handbuch der Erdkunde* (Berl. 1873).

The *Patagonian A.*, from lat. 56° S. to lat. 42° S., consist of a single range of moderate elevation, the highest peaks, Yanteles, Minchinadom, and Corcobado, being respectively 8199, 7792, and 7511 feet high. Though only as much S. of the equator as Central Europe is N., the snow-line is just 3000 feet above the sea-level, and glaciers abound in the precipitous clefts of the coast.

The *Chilian A.*, from lat. 42° S. to lat. 24° S., contain many lofty and volcanic mountains, among others, Aconcagua (22,422 feet), Tupungata (20,338 feet), and the curious, truncated, cone-shaped El Descabezado (13,821 feet), on the summit of which is a plain 6 miles in diameter. The snow-line rises from 8000 to 10,000 feet above the sea-level.

The *Peruvian A.*, from lat. 24° S. to lat. 6° S., consist in the S. of two chains, which are known as the E. and W. Cordilleras of Bolivia, and which enclose the magnificent plateau of Titicaca, at a height of 12,290 feet. Immediately to the N. of this, in Peru, we have, on a plain whose elevation is 8300 feet, the mountain group of Cuzco, which is said to be thrice as large as all Switzerland. Between the 10th and 11th parallels, the ranges meet and form the tableland of Pasco, which is situated at a height of 11,000 feet; and a little farther to the N. the chain divides into three, which again unite in the knot of Lona, about 5° S. lat. The snow-line rises from 15,000 to 18,000 feet; and accordingly the higher peaks—Sahama (22,763 feet), Gualatieri (21,946 feet), Chuquibambha (21,000 feet), Illimani (21,550 feet), Pomarape (21,688 feet), Sorata (20,733 feet), and Arequipa (19,704 feet)—are covered with perpetual snow.

The *A. of Ecuador*, from lat. 6° S. to lat. 2° N., a lofty and volcanic portion of the chain, consist for the most part of two parallel ranges, uniting at various spots, and forming the tablelands of Asuay, Quito, and Los Pastos, the first at an elevation of 15,520 feet. Of the lofty peaks in this portion of the range may be mentioned Chimborazo (21,068 feet), Cotopaxi (18,811 feet), Antisana (19,282 feet), Cayambe (19,535 feet), all of which are above the snow-line, which here rises to a height of 16,000 feet.

The *A. of the United States of Colombia*, formerly *New Granada*, from 2° to 8° N. lat., separate beyond the city of Almaguer into two chains, the eastern one of which again divides into two known as the Central and Eastern Cordilleras of New Granada, which contain between them several tablelands, the principal one being that of Santa Fé de Bogota. The Pic de Tolima (18,129 feet) is stated to be the only mountain in New Granada which is capped with perpetual snow.

The geological character of the A. is very little known, especially as regards the palæontological section and the Tertiary formations, which were not recognised as of any great importance in the time of Humboldt, to whom we are chiefly indebted for most of the knowledge we have on this subject. Of stratified rocks, gneiss is found scattered through the greater part of the range, often associated with granite and mica-slate, and containing large quantities of garnet. Next to porphyry, mica-slate is of the most frequent occurrence, containing in some places beds of granular limestone, which is sometimes of so fine a texture as to resemble the finest Carrara marble. Clay-slate occurs in considerable quantity in the Secondary formations of Santa Fé de Bogota and Peru. Quartz and gypsum are also plentiful. Red sandstone is found in vast quantity, attaining a thickness of 5000 feet near Quito; and it crops up over the greater part of the llanos of Venezuela, being, however, covered by beds of limestone and gypsum towards the E. Of Tertiary formations and Secondary formations later than the magnesian limestone nothing definite is as yet known. Of the unstratified

rocks, there are granite, porphyry, trachyte, and rocks of volcanic origin. Granite is never found at great heights, but constitutes the basis of the whole S. American continent. Porphyry is of most frequent occurrence, and gives to the mountains a variegated appearance. Trachyte is a hard rock, consisting of separate crystals of glassy felspar, usually with a mixture of hornblende and mica, imbedded in granular layers of glassy felspar, and occurs through Chili, Peru, and the United States of Colombia.

The whole chain, and especially in Ecuador, is extremely volcanic; but the different volcanoes do not show any great activity, due, it has been supposed, to their immense height. The most dreaded of the S. American volcanoes is Cotopaxi, near Quito, which has been known to send its flames to a height of 3000 feet above the crater, and to emit such a dense cloud of ashes and cinders as to render the use of lanterns necessary in some of the contiguous villages in broad daylight. Closely connected with, and often accompanying volcanic eruptions, are earthquakes, which are more frequent and destructive in the A. than in any other portion of the globe. Cities and villages have been destroyed in an hour, terrible ravines have been brought into existence, and curious natural bridges have been formed spanning precipitous gorges, all through and by the agency of earthquakes.

Minerals and metals are found in great quantity—the topaz, amethyst, ruby, and most of the other gems. Gold and silver are obtained in Chili, Peru, and the United States of Colombia; mercury in Quito; platinum in the United States of Colombia; copper chiefly in Chili, but also in Peru, where it is called *anta*, which is supposed to be the derivation of the name A.; and tin in Chili.

The A. act as much as a watershed to the clouds as to the rivers, since the air at the summits of the peaks is so rare as to be almost incapable of containing water vapour, at least in any perceptible quantity. Also, as the wind is usually eastern in the tropics, and western in the temperate zones, it follows that the western side of the chain, from the equator to about the 30th parallel, will be drier than the eastern side, and *vice versa* for latitudes below the 30th parallel. This must obviously produce a decided difference between the climates of two places, on the same degree of latitude, but on opposite sides of the range.

Another consideration which determines the climate of any locality, besides its latitude and its position on the leeward or windward side of the chain, is its elevation above the level of the sea. Thus Quito, though situated almost exactly on the equatorial line, has a most agreeably temperate climate; and such is the case with many cities and villages, plateaux and valleys, in somewhat similar circumstances. Thus it is that on the slopes of the equatorial A. the beauties of nature are displayed in their greatest profusion—the variegated and lively tints of the foliaceous shrubs peculiar to the tropical and sub-tropical regions contrasting finely with the more sombre hues of the flora characteristic of the temperate and alpine zones.

While travelling through the A., one is not so much struck with the lofty grandeur of the individual peaks—which, when viewed from the plain at their base, do not appear in nearly the same gigantic proportions that Mont Blanc does from the Vale of Chamouni—as with the valleys and passes, flanked in many cases by precipitous walls rising to a height of 4000 or 5000 feet. The passes are very characteristic, usually following the course of the mountain torrents; or, if that is impracticable, surmounting them by bridges, or cutting a path along the shoulder of the overhanging height. Their elevation is also a noticeable character, the pass of Antarrangra, in Peru, being 16,199 feet high, and thus higher than Mont Blanc by 389 feet. For particular and detailed information, the reader is referred to Humboldt's *Personal Narrative*; Temple's *Travels in Various Parts of Peru*; Pöppig's *Reise in Peru, Chili, und auf dem Amazonen-Strom*; and Mrs Somerville's *Physical Geography*.

And'ira, a genus of plants belonging to the order *Leguminosae*, natives of tropical America except *A. inermis*, which is the cabbage-tree or cabbage-bark tree of the W. Indies, the bark of which is anthelmintic.

And'iron, or **Handiron**, a kind of fire-dog, often richly ornamented, in use in mediæval times for burning wood, and still to be seen at the open hearths of some old mansion-houses.

Andkhuy, a town of Afghanistan, on the river Jihun, 70 miles W. of Balkh. It was taken from Bokhara in 1840 by Mohammed Khan, who left it in ruins. It rapidly recovered, however, and in 1863 contained nearly 2000 houses, and 3000 kibitkas or tents. Pop. some 15,000, chiefly Turkomans. A. was once capital of a khanate of the same name.

Andorra (Fr. *Andorre*), a small state, situated in a rugged valley in Catalonia, Spain, having the French department of Ariège on the N. It is enclosed on all sides by mountains, except where the Balira issues to join the Segre. It is about 20 miles by 24 at its greatest width, with an area of 154 sq. miles. The pop. has been estimated at from 4000 to 12,000. Cap. Andorra; pop. 2000. It was declared a neutral territory about 790 by Charlemagne, for services rendered to him against the Spanish Arabs. The government is vested in a council of twenty-four members, who elect a syndic, in whom the executive centres. Two *viguier*s, or judges, are appointed, the one by France, and the other by the Bishop of Urgel, whose jurisdiction dates from 819 A.D. Of these *viguier*s, the former must be a native of France, and with them is associated a civil judge, elected alternately by France and by the bishop. The resources of the district, agricultural and mineral, are great, but are not developed. Cattle-rearing is the chief occupation of the inhabitants. There is, however, a small export trade in wood, charcoal, iron ore, wool, and cheese; but the imports are confined to the strict necessities of life, for the Andorrans are determined foes of luxury, and are even opposed to all change, their manners and customs having remained unaltered since the time of Charlemagne.

Andover, a market town of Hampshire, situated on the river Anton, 13 miles N.W. of Winchester, and a station on the South-Western Railway. The original form of the name was *Andafaran* ('the passage or ferry across the Ande'), but it was not a place of note before the Norman Conquest. A. received its first charter from King John. It has a handsome town hall, and a church in the Early English style. The chief occupations are malting, tanning, and the traffic in timber with Southampton. The Weyhill fair, held near A., grew out of a Michaelmas revel to be one of the most important fairs in England. It begins 10th October, and lasts a week. Pop. (1871) 5501.

Andover, a township of Massachusetts, U.S., on the Merrimac river, 21 miles N. of Boston. It was incorporated in 1646, and is famous as an educational centre. The Phillips Academy of A. was founded in 1778, and has a revenue of \$12,000; there are also, besides many schools, a celebrated theological seminary for the Congregational body, and the Abbott Female Academy. A. possesses considerable flannel, linen, and shoe-thread manufactures. Pop. (1870) 4873.

Andral, Gabriel, a distinguished French physician and medical writer, was born November 6, 1797, at Paris, where he became professor of pathology in 1830, and in 1839 succeeded Broussais in the chair of pathology and therapeutics. Three years later he became a member of the Institute; and, after a brilliant career, both as a physician and a lecturer, he died at Paris, February 5, 1851. His principal works are *Clinique Médicale* (1824-27, 2d ed. 1840, 5 vols.); *Précis d'Anatomie pathologique* (3 vols., 1829); *Cours de Pathologie interne* (1836, 2d ed. 1848); *Notes et Additions au Traité de l'Auscultation Médiate de Laënnec* (1837); besides several papers before the Academy, especially a series of researches *Sur les Modifications de Proportions de quelques Principes du Sang* (1842).

André, Major John, an officer in the British service during the American War of Independence, who met the fate of a spy on being taken while engaged in the questionable work of such a functionary, was born in London 1751, and entered the army 1771. Joining the British forces in America, he was employed to treat with the unfaithful American general Arpold for the surrender of the fortress of West Point, with the magazine of the American army. A., in disguise, had had an interview with the traitor Arnold within the American lines, from which he was returning when he was arrested, and the plans of West Point and the papers referring to its proposed betrayal being found upon his person, he was condemned to death as a spy, and hanged accordingly at Tappan, in New York State, 2d February 1780.

And'res, Johann Valentin, a German Protestant divine

and philosopher, born near Tübingen, August 17, 1586, and died June 27, 1654, at Stuttgart, where he was court chaplain. The main tendency of the theology, science, and philosophy of the age was scholastic, and this he set himself strenuously to oppose. His wit and humour were not less remarkable than his learning. He has been credited by some with having restored at least, if not founded, the order of the Rosicrucians, and this opinion seems to derive some support from his own confession that he was the author of the *Chymische Hochzeit Christiani Rosenkreuzis* (1616). He was, however, an uncompromising assailant of anything approaching mysticism, and of nothing more than of Rosicrucianism itself. Herder has been his chief expounder. His best known works are his *Menippus s. Satyricorum Dialogorum Centuria* (1617), *Mythologia Christiana* (1619), and *Gastliche Kurzwelt* (1619). See Hossbach, *A. und sein Zeitalter* (1819).

Andrew's, a genus of dark-foliaged, split-fruited mosses, named in honour of Andrea, a Hanoverian naturalist. There are nine species found on rocks in Britain.

Andre'ossy, Antoine François, Comte d', the great-grandson of François Andreossy, who assisted Riquet in constructing the canal of Languedoc, was born at Castelnau-d'Aud, March 6, 1761. He entered the army in 1781, and after the French Revolution broke out, he rose rapidly, serving with great distinction under Napoleon as an artillery officer and military engineer. In 1799 he was appointed Minister of War, and after the treaty of Amiens he was ambassador at London, and subsequently at Vienna and Constantinople. In 1814 he communicated some valuable memoirs to the Institute at Paris on the subject of hydrostatics. A. was also possessed of considerable literary talent, and wrote, among other works, *L'Histoire Générale du Canal du Midi* (Paris, 1800); *Campagne sur le Mein et la Rednitz, &c.* (1802); *Voyage de l'Embouchure de la Mer Noire* (1818), with atlas; *Mémoire sur et qui concerne les Marchés Ouvrés* (Paris, 1826); and *Mémoires sur les Dépressions de la Surface du Globe* (Paris, 1826). A. died at Montauban, Sept. 10, 1828.

Andrew, a disciple and afterwards apostle of Christ, was, like his brother Simon Peter, a Galilean fisherman. Little is mentioned of him, and of his apostolic labours nothing. Eusebius assigns Scythia, Jerome Greece, and Nicephorus Thrace, as the scene of his labours. He is said to have suffered martyrdom at Patras in Achaia on a *crux decussata* (X). For a notice of the *Acta Andreae*, see APOCRYPHA.

Andrew, St. or The Thistle, a Scottish order of knighthood, named after the patron saint of Scotland, was founded by James V. in 1540, and consisted originally of the sovereign and twelve knights. On the death of James in 1542 the order was discontinued, but was renewed by James II. of Great Britain in 1687, when eight knights received the order. Queen Anne increased the number to twelve in 1703; and George IV. added four more in 1827.

The decorations worn by the knights consist of a collar of sixteen thistles interlaced with sprigs of rue, a gold medal, and a star, worn on the left shoulder, consisting of a St A.'s cross of silver, in the centre of which is a thistle surrounded by the motto 'Nemo me impune lacessit,' and rays of silver. The knights have the letters K.T. placed after their names. For details, see *History of the Orders of Knighthood of the British Empire*, by Sir N. H. Nicolas.

St Andrew's Cross.

An'drew, St. The Russian Order of, founded by Peter the Great in 1698, and confined to persons of the highest ranks, has for its badge a cross of enamelled blue, with, among others, the Russian motto meaning 'For Religion and Loyalty' inscribed upon it.

An'drews, Lancelot, an English prelate, and a theologian of great erudition, born in London in 1555, and educated at Pembroke Hall, Cambridge, of which foundation he became a fellow 1576. Secretary Walsingham gave him several pieces of preferment, and in 1589 he was elevated to the mastership of his college. Queen Elizabeth made him one of her chaplains in ordinary, and Dean of Westminster; and King James appointed him

one of the ecclesiastical commissioners at the conference at Hampton Court, and he assisted in translating the first twelve books of the authorised version of the Old Testament. In 1605 he was promoted to the see of Chichester, translated to that of Ely in 1609, and made a privy councillor. In 1617 he attended the king to Scotland, to aid him in his attempts to induce the Scotch to substitute Episcopacy for Presbytery; next year he was translated from Ely to Winchester, where he died 27th March 1625. Singularly meek as a man, as a Churchman he had exalted views of ecclesiastical authority, though he abjured the Roman Catholic claim for the independence of ecclesiastical assemblies of the civil power, and wrote two replies to Cardinal Bellarmine in defence of his views.

An'drews, St., an ancient Scottish city, on St A. bay, N. coast of Fife. According to Fordun (book ii. ch. 46, 47), it owes its origin to the Abbot Regulus, a Greek saint, who in the 4th c. was ordered by the angel of the Lord to carry the relics of the apostle into the N.W. corner of the 'earth,' and in consequence, after shipwreck on the coast, landed in the N. of Fife at a place then called Mucross, or 'Swine's Wood,' afterwards Kilrymont, and finally St A. in honour of the saint. At an early period the see of a 'Scoto-Irish' bishop, and the establishment, in the time of Alexander I., of a priory of Canons Regular, of which the last prior was Regent Moray, gave increased importance to St A. as an ecclesiastical centre. The cathedral, begun in 1162, and consecrated in 1318, was in 1559 wrecked by a mob. Of the first cathedral, completed in 1144, there still remains a square tower 108 feet high. The university, founded in 1411 by Bishop Wardlaw, consists of three colleges—St Salvator (1456), St Leonard's (1512), and St Mary's, a theological institution founded by Cardinal Beaton (1537). The castle, associated inseparably with the fate of Beaton, has long been a ruin. St A. may be regarded as the cradle of the Scottish Reformation, and here occurred the martyrdom of Patrick Hamilton (1528) and of George Wishart (1546). The modern town is celebrated for its educational institutions, the chief of which is Madras College, founded by Dr A. Bell, and is a favourite sea-bathing and golfing place. St A. is a royal and parliamentary burgh, and unites with Easter and Wester Anstruther, Crail, Cupar, Kilrenny, and Pittenweem in sending a member to Parliament. Pop. (1871) 6316. See Lyon's *Hist. of St A.* (1843).

An'dria, a town in the province of Bari, S. Italy, so called from a number of caverns (*antra*) in its vicinity. It was besieged and burned in 1799 by the troops of the Parthenopean republic (q. v.) The grand Cathedral of A. was founded in 1046. The chief trade is in almonds, for which the plain of A. is famed. Pop. (1872) 34,030.

An'drieux, François Guillaume Jean Stanislas, a French dramatist, born at Strasbourg, 6th May 1750. He was originally an advocate, and held several high state appointments, but was removed from office (1802) by Bonaparte, and obliged to adopt literature as a profession. In 1814 he became a professor in the Collège de France, and was subsequently appointed perpetual secretary to the Academy, in which capacity he greatly assisted in the production of the famous *Dictionnaire*. He produced numerous dramas, full of grace and spirit, the best of which are *Molière avec ses Amis*, *Le Vieux Fat*, and the tragedy of *Brutus*. A. died in Paris, 10th May 1833. His *Œuvres Choieses* were published in 1862.

Androg'ynous (Gr. *andr*, a man; *gune*, a woman), a term applied to those organisms which unite in themselves male and female organs of reproduction. This designation is thus synonymous with *hermaphrodite* and *monaxious*.

Androm'ache, daughter of Eteion, King of Cilician Thebes, and wife of Hector, by whom she had a son, Scamandrius. She is unquestionably the finest female creation in the *Iliad*. The parting between her and Hector, in the 6th book, is portrayed with an exquisitely simple pathos. On the fall of Troy she fell to the lot of Neoptolemus, the son of Achilles, to whom she bore three sons. She afterwards became the wife of Helenus, the brother of Hector, and had a son to him, named Cestrinus. Racine, in his *Andromaque*, represents her as faithful even to the memory of Hector, thus ignoring the post-Homeric legend.

Androm'eda, daughter of Cepheus and Cassiopeia, King and Queen of Ethiopia. The latter having boasted that A. excelled the Nereids in beauty, these prevailed on Neptune to

inundate the country, and to send a dreadful sea-monster to destroy men and cattle. When the oracle of Ammon declared that the wrath of the monster could be appeased only by the sacrifice of A., Cepheus chained her to a rock, where she was found by Perseus, who slew the monster, unchained A., and made her his wife. Minerva placed her among the stars; hence Milton's phrase in *Il Penseroso*, the 'starr'd Ethiop queen.'

Androm'eda, a genus of plants belonging to the Heath order (*Ericaceæ*), and containing many species which are trees and shrubs. *A. polifolia* is the only species native in Britain. It grows in bogs, and possesses acrid, narcotic properties which prove fatal to sheep, as *A. Mariana* of the United States, and *A. ovalifolia* of Nepal, are to sheep and goats. The leaves of *A. fastigiata* are used as tea in some parts of India.

Andron'ous. Three Byzantine emperors were so named.—**A. I.**, the Byzantine Alcibiades, and the last of the Comneni who governed the Eastern Roman empire, was born in 1110, and was famous for his manly beauty, the vigour of his body, his dauntless spirit, and his dissolute conduct. The story of his chequered career, as told by Gibbon, reads like a wild romance, but is strictly true. In his youth, while following the retreat of the Byzantine army through Asia Minor, after the death of the Emperor Joannes, he was made prisoner by the Seljukide Turks. On his release he went to Constantinople, 'where,' says Gibbon, 'his virtues and his vices recommended him to the favour of his cousin; he shared the perils and pleasures of Manuel; and while the emperor lived in public incest with his niece Theodora, the affections of her sister Eudocia were seduced and enjoyed by A.' Manuel gave him the command of Cilicia, where A. first displayed his disposition to treachery, by entering into a correspondence with the King of Hungary and the Emperor of Germany. He was in consequence arrested, and imprisoned at Constantinople for twelve years. His escape is a succession of marvels; but at length he reached Kiev, the residence of Jaroslav, Grand Duke of Russia, whom he induced to unite with the Emperor Manuel in the invasion of Hungary, and distinguished himself at the siege of Zemplin. After several seductions, he fled with Theodora, widow of Baldwin, King of Jerusalem, first to Damascus, and finally settled among the Turks in Asia Minor. Theodora and her two children having been carried captive to Constantinople, A. implored and obtained the mercy of the emperor, but was ordered to Oenoe, in Pontus. In 1182, after the death of Manuel, he was summoned by the Patriarch and patricians of Constantinople to become first guardian and then colleague to the young Emperor Alexius. His administration of the provinces was wise and vigorous; but repeated instances of cruelty towards his personal enemies stirred the crowd against him, and he was, at the age of seventy-three, put to death with dreadful tortures, September 12, 1185.—**A. II.**, eldest son of Michael Paleologus, born 1260; ascended the throne 1283; driven from it in 1328 by his grandson, **A. III.**, who died in 1341.

Andronicus of Rhodes, a Peripatetic philosopher, at the head of that school in Rome about B.C. 58. None of his writings have been preserved; but to him we owe the preservation of many of Aristotle's works.

Andronicus Oxyrrhæstes, so called from Cyrrha in Syria, his birthplace, built at Athens the octagonal marble 'Tower of the Winds,' so named from its entablature representing the winds in bas-relief. The building probably belongs to the period after Alexander the Great.

Androp'ogon, an extensive genus of grasses. See LEMON-GRASS.

And'ros, the most northerly island of the Cyclades, in the Greek Archipelago, separated by Doro Channel, 6 miles broad, from the island of Eubœa (mod. Negropont). It is 21 miles long and 8 broad, and is mountainous, but very fertile, producing silk, wine, lemons, oranges, and pomegranates. Pop. about 16,000. The chief town, A. (pop. 5000), lies on the E. coast, and exports much silk. The island has had a chequered history, both in ancient and mediæval times. After the establishment of the Latin empire of Constantinople, it passed into the hands of the Venetian Dandolo, whose successors kept possession of it till 1566, when they were forced to surrender it to the Turks. See Hopf's *Geschichte der Insel A. und ihrer Beherrscher in dem Zeiträume von 1207–1577* (Vien. 1855).

Andu'jar, a town in the province of Jaen, in Andalusia, 104

Spain, lies on the Guadalquivir, at the foot of the Sierra Morena. It is unhealthily situated, the inhabitants are chiefly employed in agriculture, and the town is famed for its delf-ware. The convention of Baylen was signed at A., and also the decree of the Duc d'Angoulême in 1823, when he assumed for the French authority over Spain. Pop. 12,650.

Anegad'a, an island of coral formation, girt with dangerous reefs, lies furthest N. of the Lesser Antilles, about 19° N. lat., and between 64° and 65° W. long. It is known as 'the drowned island,' from its flat, desert appearance. Its sparse population is chiefly supported by numerous wrecks which occur on the coast. It belongs to England. Area, 13 sq. miles; pop. about 200.

Anemom'eter (Gr. *anemos*, the wind, and *metron*, a measure) is an instrument intended to measure the force or velocity of the wind, and is very important in the science of meteorology. It may be constructed either to measure the force or pressure of the wind upon a surface of given area, or to give the velocity of aerial currents directly. To the former type belongs Lind's A., which shows the pressure of the wind by the difference of level of the two surfaces of a liquid placed in a siphon-shaped

Anemometer.

tube, which has one of its legs (which point upwards) bent horizontally, so as to permit the wind to enter. The mouth of the tube is kept pointing in the direction of the wind by means of a vane. The instrument invented by Osler measures the force by its effect upon a brass plate of given area. When the plate is pressed back, a pencil, in the observing-room below it, is pushed forward to a proportional amount by means of a combination of springs. This pencil impresses a mark upon a sheet of paper, which is slowly moved along with uniform velocity by means of clockwork, so that the force of the wind at any time is represented by the ordinate of that part of the curve traced by the pencil, which corresponds to that particular time. Another pencil in connection with the vane records the *direction* of the wind; and a third pencil, connected with a rain-gauge, registers the quantity of rain which has fallen.

The anemometers of Whewell, Robinson, Casella, and Gordon measure the velocity of the wind directly by means of fans or hemispherical cups, fixed in such a manner upon horizontal rods that the rate of rotation round a central vertical axis is proportional to the velocity. Upon the axis is an endless screw, which communicates the rotary motion to index-wheels.

Anemone, a genus of plants of the order *Ranunculaceæ*, or Buttercup family. There are numerous species, chiefly found in temperate climates. Many of them are grown in gardens for their handsome flowers. By cultivation their stamens are often changed into petals. *A. nemorosa* is the common wood A. or wild-flower of Britain; *A. pulsatilla*, the pasque-flower, found in England. *A. ranunculoides* has yellow flowers, while those of *A. Apennina* are blue; both are naturalised in some parts of Britain. These species, along with the more showy *A. Japonica*, Japan A.; *A. hortensis*, star A.; and *A. coronaria*, poppy A., are commonly cultivated. *A. hepatica*, or *Hepatica triloba* of some authors, is one of the most ornamental early spring plants on rockwork, and in flower borders.

Anemone nemorosa.

Anemone, Sea, the name applied to the members of the family *Actiniada*, a group which forms the typical example of the class *Actinomorpha* of the Coelenterate sub-kingdom or type of animals. The name was doubtless first applied to these animals from a fancied resemblance they presented in their expanded state to certain groups of flowers; this idea being strengthened, no doubt, by the brilliancy of the hues and colours these forms present. They are very familiar inhabitants of all our rock pools, and are specially well adapted for an aquarium life. The body of each consists of a cylinder of soft flesh, with double walls. This body is attached by its lower extremity to the rocks, whilst the upper and free extremity bears the central mouth, surrounded by numerous arms or tentacles. These structures in the A. are present in multiples of five or six, and are of simple tubular conformation. They are hollow processes, perforated at their tips, and communicate internally with the body-cavity. The mouth leads into a stomach sac, which, as in all Actinozoa, is of incomplete nature, in that it is open inferiorly, and communicates freely below, with the general cavity of the body. The stomach is retained in position by a series of vertical partitions which extend between the stomach and body-walls, these partitions receiving the name of *mesenteries*. Like the tentacles, they exist in multiples of five or six. When one of these animals is touched or irritated, it discharges the water contained in the interior of the body through the mouth and tips of the tentacles, and by retracting the latter within the body, converts the formerly expanded and flower-like structure into a conical mass of coloured flesh. From this retracted state it again evolves itself after a period of rest. As in all other Coelenterate animals, the tissues of sea-anemones are provided with little stinging cells, known as *thread-cells*, *cnidae*, or *nematocytes*. By aid of these cells, the prey upon which these animals feed, and which consists of crabs and other crustaceans, shellfish and other small animals of the sea-shore, is paralysed, or otherwise rendered helpless to struggle against its fate. These thread cells may produce a stinging sensation if brought in contact with the soft mucous membrane of the human body, although they are apparently too feeble to pierce the ordinary skin. Although generally rooted, the anemones possess the power of moving about in a slow manner, through movements of the foot-like disc by which they are attached to rocks. The young are produced from eggs, and sometimes may be seen to escape in a fully-formed condition, but of small size, from the parent A.'s mouth. These animals may be cut or divided in various ways, with the result of artificially propagating them. Very many genera and species are known, and they are very generally distributed throughout the seas of the world. The *Actinia mesembryanthemum* is the most common species of all. The genera *Sagartia*, *Bunodes*, also include familiar forms. Mr Gosse's beautifully-illustrated work, *Actinologia Britannica*, or the *History of British Sea-Anemones*, will form a trustworthy guide to a further knowledge of these interesting forms.

Aneroid Barometer (Gr. *a*, privative; *nēros*, moist), invented by M. Vidi of Paris, consists essentially of a cylindrical box, about 3 inches diameter, in which a vacuum has been made, and

Aneroid Barometer.

whose outer surface is corrugated so as to multiply the points on which the atmospheric pressure is exerted. This box is prevented from altogether collapsing by having its upper surface connected by a rod to a lever of the second kind, which is kept in position by means of a strong metallic spring. If the atmospheric pressure change, the dimensions of the box, and therefore the position of the lever, are proportionately effected, and by a mechanical combination of levers and axles, this motion is transmitted, as one of rotation, to a hand moving in front of a dial, as in the common wheel barometer.

The A. D., besides being possessed of a great degree of sensi-

tiveness, has the advantage of being extremely handy for travelling purposes, since it is usually fitted in a small cylindrical box about five inches in diameter and two inches in depth. Before use, however, it should always be compared with a mercurial barometer, and set by means of a screw at the back.

An'eurism. An A. is a dilatation of one or more of the coats of an artery, producing a sac or bag, in which a clot forms. Such a tumour may interfere with the functions of neighbouring organs by pressure on important nerves or blood-vessels, and there is also the danger of hæmorrhage from rupture of the wall of the sac. In the event of hæmorrhage into a cavity of the body, such as the thorax or abdomen, death may suddenly take place. If, on the other hand, the A. ruptures externally, the individual may quickly bleed to death, or become exhausted by repeated hæmorrhages. An aneurismal tumour is recognised by the distinct pulsation it gives with each stroke of the heart, and by a peculiar blowing sound heard when the ear is placed over it.

Three forms of A. are usually described: (1) True A., in which all the coats of the artery dilate, and unite in forming the walls of the sac; (2) False A., in which the inner and middle coats of the artery are alone ruptured, and the wall of the sac is formed by the outer coat and adjacent tissues; and (3) Mixed A., in which the three coats having first dilated, the inner and middle ones subsequently rupture from distension. When the blood burrows between the middle and external coats, the A. is sometimes said to be dissecting.

Aneurismal tumours are usually caused by a sudden strain rupturing the inner coat, which has been previously weakened by degenerative changes. Hence they are more common in men than in women, and amongst those whose occupation exposes them to severe and sudden muscular exertion while the body is in a cramped position. Grooms, sailors, miners, hammermen at the forge, are specially liable to the disease.

The treatment of A. is both medical and surgical. The medical treatment is rest, remedies to lessen the force of the heart's impulse, and to favour complete solidification of the clot within the aneurismal sac. The remedy most relied on for the latter purpose is iodide of potassium, given in doses of from five to thirty grains three times a day. The surgical treatment consists of ligaturing the vessel above or below the A., compression by instruments, flexion of the limb, digital compression of the tumour, arrest of the flow of blood by acupressure, coagulation of blood within the sac by galvanic puncture, or by the injection of coagulating fluids. Regarding details as to these methods of treatment, reference may be made to surgical works, such as *Erichsen's Surgery*, vol. ii. p. 31.

Angeliology is that part of anatomy which treats of the structure and distribution of blood-vessels.

Angel, a gold coin formerly in use in England, and ranging in value from 6s. 8d. to 10s. It derived its name from having on its obverse side a figure of the archangel Michael piercing the dragon. Angels were first coined in the 15th c., and continued to be coined till the period of the Commonwealth.

Angel Fish, or **Monk-Fish** (*Squatina angelus*), a genus of fishes included in the Shark order (*Elasmobranchii*), and forming the type of the family *Squatinida*. It gains its popular name from the expanded pectoral or ventral fins, which give to the body a hooded or winged appearance. The average length is five feet or more. It occurs around the British coasts, and in European seas generally. The head is broad and rounded. No anal fin exists, and two spiracles or breathing-pores exist on the top of the head. The skin is covered with small placoid scales. An allied species, *S. aculata*, occurs in the Mediterranean.

Angelica, a genus of Umbelliferous plants, natives principally of temperate regions. Some of the species were formerly regarded as possessing angelic virtues, hence the name. They were used as a remedy against poison, plague, infection, witchcraft, and enchantment. They are not now regarded for their virtues. *A. sylvestris* is a common species in Britain, found in damp woods, and even high on the mountains, and forms a picturesque feature to the landscape. The garden A. belongs to a different genus. See *ARCHANGELICA*.

Angelica-Tree, the English name for *Aralia spinosa*, sometimes also called toothache-tree. See *ANALIA*.

Angelo, Michael. See *BUONAROTTI*.

Angels (Gr. messengers), in the theology of Scripture, a race of spiritual creatures higher than men, who exist for the service of God in heaven and on earth. As they are only casually introduced in Jewish and Christian history, we cannot venture to form any complete theory of their nature and work. There is nothing in their recorded appearances requiring us to believe that there is any essential difference between their nature and that of human beings; but there is a popular notion that they constitute a distinct order of creatures, and that they possess attributes which will always separate them from men even in the spiritual world. The work which contains the most complete (though imaginative) exposition of the angelic system is the *Hierarchia Celestis*, ascribed to Dionysius the Areopagite (q. v.), a composition probably belonging to the 6th c. Dionysius divides this hierarchy into nine orders: thrones, cherubim, seraphim, dominations, virtues, powers, principalities, archangels, and A. proper. Gregory the Great, and the Church generally, adopted his classification. Traces of such distinctions are visible in the writings of St Paul (Rom. viii. 38; Eph. i. 21, &c.), and are undoubtedly part of that rabbinical lore in which he was well trained, and which he did not feel called upon to reject when it did not conflict with his Christian faith. Canonical Scripture mentions only two A. by name, Michael and Gabriel; but in the Apocrypha we meet with Uriel, and in the writings of the Talmudists with many more.

As Scripture is silent regarding the origin of A., there has been nothing to check the licence of speculation, and early Christian literature is full of notions that rest on nothing. Some, as Gregory the Great, imagined that A. existed before the material universe, others that they had been created on some one of the six days—Augustine, e.g., supposed on the first. Tertullian, Tatian, and indeed most of the Fathers, conceived them as possessing refined and ethereal bodies, a view subsequently endorsed by the Church at the second synod of Nice (787). The idea of *guardian A.*, which is still a half-belief in all Christian countries, was undoubtedly adopted by the Jews from their heathen neighbours—probably from the Greeks. No trace of it occurs in the old Hebrew Scriptures. Philo reduced it to a system. At an early date it passed over into the Christian Church. It is plainly stated in the *Shepherd of Hermas*, who assigns to man a good and a bad angel. Clemens Alexandrinus affirmed that cities and provinces were placed under the protection of A., which is certainly a reproduction of the Hellenic myth of a *genius loci*, or of the Latin myth of the *Lares publici*. This doctrine naturally led to the worship and invocation of A., which appears to have been in partial operation as early as the middle of the 4th c., for it was condemned about that period by the Council of Laodicea. St Ambrose distinctly recommended their invocation, Augustine, Theodoret, Gregory the Great, and others opposed it, but the practice of dedicating churches to A., which was favoured by bishops and emperors, confirmed the people in their belief that A. heard and answered prayer, and in spite of repeated explanations and qualifications, it may be considered part of the religious convictions of the Greek and Roman communions to the present hour.

Angermanland (pron. Ongermandland), a former division of N. Sweden, now chiefly comprised by the Län of Westernorrland (q. v.)

Angers (anc. *Andecavum*), the capital of the department of Maine-et-Loire, France, situated on the navigable river Mayenne, 161 miles S.W. of Paris. It is the see of a bishop, and possesses a grand cathedral of the 9th c. in the Roman basilica style. It was the seat of a university, founded 1246, which has recently given place to a superior academy. Lord Chatham and the Duke of Wellington studied for some time at A., and it was the birthplace of David, the sculptor. The chief employments are sail-making, cotton-spinning, and stocking-weaving; there is besides a considerable trade in corn, wine, brandy, hemp, and honey. There are extensive slate quarries in the vicinity. Pop. (1872) 51,525.

Anghia'ri (anc. *Castrum Angulare*), a town in the province of Arezzo, in Tuscany, N. Italy, near the Sovara, a branch of the Tiber. The Florentines gained a victory over the Milanese here in 1440. Pop. of commune, 6941.

Angina Pectoris is the name given to a severe paroxysmal, suffocative pain in the chest, in the region of the heart, accom-

panied by extreme anxiety and a foreboding of impending death. The pain usually shoots towards the left shoulder. It lasts for only a few minutes. Several attacks may occur, and at last the individual dies during a seizure. The affection is symptomatic of fatty disease of the wall of the heart, or of disease of the coats of the cardiac blood-vessels. Little can be done during the attack, except to apply warm poultices over the heart, and give internally diffusible stimulants, such as ammonia, ether, wine, and brandy. The inhalation of a few drops of nitrite of amyl often gives great relief.

Angioleucitis. This is a disease consisting of inflammation of the lymphatic vessels. The neighbouring lymphatic glands are usually also involved. A. is seen in the case of punctured dissection-wounds, from the absorption of some poison derived from decaying animal matter; in abscesses and carbuncles occurring in unhealthy persons, from absorption of foetid pus; and in erysipelatous inflammations. The symptoms are intense pain along the lymphatics, which are felt as hard cords under the skin, inflamed and painful glands, shivering, sickness, fever, debility, and mental depression. The inflammation may terminate in suppuration, or it may gradually disappear. In some cases, blood-poisoning may occur to such an extent as to cause death. The remedies are rest, application of hot fomentations or poultices to the part, nutritious food easily assimilated, such as beef-tea or soups, the moderate use of alcoholic stimulants to combat depression, and stimulant tonics, such as carbonate of ammonia along with Cinchona bark, given every three or four hours, in doses proportionate to age and the state of the patient.

Angiospermous, a term used in botany to those Dicotyledonous plants having their seeds in a seed vessel, while Gymnospermous is applied to those having seeds produced without a seed-vessel, as in pine-trees and cycads.

Angle (Lat. *angulus*, a corner) is the measure of the opening between lines or planes which meet. Suppose one of two lines, originally coincident, to rotate uniformly like a hand of a watch, the other being fixed. At the end of a quarter of a revolution the A. made by the two lines is a *right A.* An *acute A.* is less, and an *obtuse A.* greater, than a right A. A *dihedral A.* is formed by two planes, and is measured by the A. between those lines in the planes which are perpendicular to the line of intersection. A *solid A.* is formed by three or more non-coplanar lines meeting at a point.

Angle Berries. Unseemly and painful excrescences, like warts, upon cattle, chiefly developing themselves upon cows, and in the belly, groin, and teats. The easiest and surest way of removing them is to tie a piece of waxed silk thread round them, and tighten the thread every day until the tumour decays and falls off. In their early stages, applications of nitrate of silver, alum, or zinc sulphate in solution, will remove them.

Angler Fish, or Fishing-Frog (*Lophius piscatorius*). This Teleostean fish is included in the Acanthopteroan division of that order, and in the family *Lophiidae*. It is frequently cast up on our shores after storms, and is sometimes called the 'sea-devil,' or 'granny-fish.' It attracts attention by the enormous size of the head, and wide opening of the mouth, which is amply furnished with teeth. The head is broad and flat, the eyes being placed on its upper surface. The body is short, and the tail tapers. Two dorsal fins exist. The pectoral fins are well developed, the ventrals being situated below them. The scales are small, and sparsely scattered over the body. The gill-aperture is placed behind the pectoral fins, and is of small size, the gill-chamber itself being large. The front of the head bears two elongated filaments, which are said to be of use to the fish in capturing its prey. It thus buries itself in the mud, and by moving these filaments about, attracts the attention of smaller fishes, which unsuspectingly approach the concealed enemy, and are thus seized. From this practice, its name of A. has been derived.

Angles (Lat. *Angli*), according to Ptolemy, were a German tribe of the Suevic family who originally occupied part of the country on the E. side of the middle course of the Elbe. Tacitus classes them, along with other and obscurer German tribes, as worshippers of Nertha, or Mother Earth. That at a later period they pushed their way northward to the corner in Slesvig which still bears the name of Angeln, is possible, but

has no decisive evidence in its favour. Some adventurers may have done this, but it is probable that the flats of N. Germany were the chief abode of the tribe at the time of their invasion of Britain. Dr Latham does not believe that any real difference existed between A. and Saxons, and there is much to be said in favour of such a view. He thinks that while the Romans, Gauls, Franks, and Britons spoke of the invaders as Saxons, these knew themselves under the name of A. If this theory were adopted, it would satisfactorily account for the present name of the country, England, *i.e.*, *Engla-land*, land of the A., though the extent of British territory conquered and peopled by this particular tribe, *viz.*, the whole of the island from the Thames to the Firth of Forth, is itself a sufficient explanation of the circumstance.

Anglesea, Henry William Paget, Earl of Uxbridge and Marquis of A., a distinguished cavalry officer, born 17th May 1768. He was educated at Oxford, and at an early age held an important command in Flanders. He afterwards served in Spain, and during the retreat to Corunna, under General Moore, his services were of great value; but it was at Waterloo that he gained his highest distinction. There he commanded the British cavalry, and lost a leg. On his return he was created Marquis of A. In 1828 he was made Lord-Lieutenant of Ireland, an office to which he was appointed a second time in 1831; but in consequence of the coercive measures forced upon him by the agitation of O'Connell, he became exceedingly unpopular. He founded the Irish Board of Education. In 1846 he was appointed Master-General of the Ordnance and made a field marshal. A. died 29th April 1854.

Anglesey, or Anglesea, an island and county of N. Wales, in the Irish Sea, separated by the Menai Strait (q. v.) from the mainland, with which it has communication by means of the Menai Suspension Bridge and the Britannia Tubular Bridge (q. v.). It is somewhat triangular in shape, the surface is flat and bare, and agriculture has only of late years received much attention. The climate is milder than that of the mainland, but in autumn is frequently misty and unhealthy. A. is the only county of Wales that is not mountainous. It is about 20 miles long, 17 broad, and 80 in circumference. Area, 193,453 acres; pop. (1871) 51,040. In 1872 there were 33,750 acres under corn, and 11,164 under green crops. The rearing of cattle is a chief occupation, and on an average about 5000 are exported yearly. There are no important manufactures. A. is chiefly formed of mica schist, with occasional limestone ranges, the other rocks being granite, various marbles, coal, and serpentine. Its lead and copper mines, opened in 1768, were the richest in the kingdom till 1800, but have since declined. The chief towns are Amlwch, Beaumaris, and Holyhead (q. v.), which, with the village of Llangefni (pop. 1222), return one member to Parliament, the county returning another. A., called by the Britons *Mon*, a 'separate' district (comp. the Gr. *mon-os*, 'alone'), a name modified by the Romans into *Mona*, was the last stronghold of the Druids, still containing many dolmens, and other interesting Celtic remains. It was conquered by the Roman general Suetonius Paulinus in 61 A.D., by Agricola in 76, and again by Egbert in the 9th c., who gave it its present name A., *i.e.*, 'the Englishman's Isle'; but the native princes succeeded in recovering their land, making Aberffraw the seat of government. In the reign of Edward I., however, it was finally brought under English rule.

Anglican or Anglo-Catholic Church is a term the application of which varies. It is sometimes used to denote exclusively the Reformed Church of England; at other times, it is applied to that portion of the Church which has existed in the island ever since the introduction and establishment of Christianity. It is occasionally restricted to the Church of England at home, though it properly embraces her Indian and colonial branches; and it is even extended, but with less accuracy, to those 'communions which follow her doctrine, discipline, and worship, though not legally associated or connected with her. For a sketch of her history, and an outline of her doctrine, see ENGLAND, CHURCH OF.

Angling is the art of capturing fish by means of a rod, line, and hook, the hook being dressed or baited for the purpose. The literature of the art is in England as old as the 15th c. In 1496, Dame Juliana Barnes, prioress of the nunnery of Lopewell, wrote a tract entitled *The Treatyse of Fysshynge with an*

Angle. This work bears to be *Emprinted at Westmestre by Wynkin de Worde. The Complete Angler* of Izaak Walton was published in 1653.

In Scotland the salmon and the trout are, as a general rule, the only river-fish which give amusement to the angler, while pike, perch, and trout usually abound in the lakes. The rivers of the midland counties and S. of England again produce a much greater variety of fish for the exercise of the angler's art. They have roach, chub, dace, gudgeon, tench, pike, and grayling. The last has of recent years been successfully introduced into the Clyde in Scotland, in which country, we believe, all the above-mentioned fish are to be found, but they are not common. The eel is common in both countries, but in Scotland detested both by the angler and the cook. Of British fish, the salmon, the trout, the grayling, and the pike afford the best sport to the angler. To them, therefore, we limit the scope of this article, reserving for future articles any remarks we may have to make on the habits and mode of capturing the others.

No other fish affords such sport to the angler as the Salmon (q. v.) when 'clean'—that is, freshly run from the sea. The chief lure employed is what we call an artificial fly, which is, however, certainly neither like a fly nor any other object in nature. Why the fish seizes it is therefore inexplicable. Some anglers suppose that it does so from irritation; and certain it is that, unlike the trout, the salmon may be induced to seize the fly by perseveringly playing it before his eyes. There can be no doubt, either, of the curious fact that certain colours and combinations of colours are more effective than others, and that the salmon of one river differ in taste for these from the salmon of another, even though both are freshly run from the sea. The salmon-fisher, therefore, will do well always to consult the local tackle-makers and authorities in arranging his pocket-book for a day's sport. The salmon-rod should be powerful, the tackle strong and secure. Hooks and lines should be examined and tested before being used. The points to be studied in A. are, the casting and working of the line and fly, the character of the water in which the fish lie and will rise to the fly, how to act when the fish rises, and how to manage him when hooked. See CASTING. The two former points can only be successfully studied under practical instruction by the river.

When a fish rises, you must not strike simultaneously, because you may probably see the fish before he has seized the fly. If, therefore, the angler cannot control his nerve, he had better not watch the spot where his fly is, lest he be flurried, and so jerk the fly out of the aim of the fish. You must wait till you feel the fish, and then simply raise the rod. A violent jerk is worse than useless, as by it you may pull the hook out of the mouth of the fish, or very likely break the line. On hooking him, do not for a moment suppose that he is surely yours; the battle has but begun. His tactics are various. He may fly down the river like an arrow, and exhaust your line; it may then happen that a deep pool, tree, or other hindrance prevents you from following down. The enthusiastic angler who can swim will probably do so sooner than be defeated. Or the game of the fish may be to make for some sharp-edged stone or rock, and there cut the line.

On hooking a fish, the angler must throw the point of his rod over his shoulder, and, in technical language, 'show the butt' to the foe. If possible, keep up with him. If he leaps or plunges, trying to break the line with a stroke of his tail, slacken instantly, but recover without delay. Keep very cool and vigilant. Never be violent, but keep a moderate pressure on the fish when he tries to recruit his strength after a run.

While from its greater strength and activity the salmon affords superior sport to that given by the Trout (q. v.), the latter, as his character has developed in our streams, is an immeasurably more cunning fish. Consequently, for his capture, much more science and dexterity are required. We limit this remark, however, to the river-trout; for the lake-trout, though as a general rule superior in size and quality to those of the river, are infinitely less wary; nor does continued fishing seem to increase their wariness as it unquestionably does very rapidly increase that of our river-trouts. The most celebrated lake-trout in Scotland, and probably in Great Britain, is that of Loch Leven in Kinross. It is almost as red in the flesh as a salmon, and beautifully formed. Those caught average a pound in weight; but they are frequently taken from one and a half to three pounds weight. They are taken with a large artificial fly, in deep, clear water, and the

govies may chance to bring home a better filled creel than the veteran in the A. art. No such result is possible in the streams of the S. of Scotland, at least when their waters are clear, when the greatest skill is required for the capture of the trout. If the artificial fly is the lure used, it must be small and very lightly dressed; but even with these requisites, in clear, deep water, where the trout has time to inspect the lure before reaching it, it will hardly deceive him. The water for the fly-angler must be ruffled on the surface, and should not be more than eighteen inches deep. The angler must know almost to an inch where the trout will be lying for the purpose of feeding, which will, as a general rule, be where he will get most food with least trouble. He will lie where a bush overhangs the stream, in a run of water under the bank, under the shelter of a boulder, or in the smooth water by the edge of the rough. To the required science, the accomplished fly-fisher must add dexterity to drop the lure lightly and naturally before the mouth of the fish, whose instinct, if he be feeding, will then lead him instantly to seize the supposed insect. But instantly also will he discover the deception, and before the unpractised angler has either seen or felt the trout, he will try to eject the hook, and will probably succeed in doing so. In the perfect fly-fisher the eyesight has been trained to detect the trout in the act of seizing the fly; a slight twitch of the wrist then almost surely hooks him. What is technically called the *rise* of the trout is the first intimation which the ordinary angler gets of his presence. This is the break on the surface of the water caused by the trout turning to go down again after taking a fly; and before making this turn, if the fly is artificial, the fish will have tried to eject it. If he has succeeded, it is plain that the strike is too late; on the other hand, if the trout has hooked himself, it is unnecessary, and if done too strongly, the hook may be pulled out of the mouth of the trout, or the line broken.

Whatever be the lure used by the trout-angler in much and skilfully fished streams, infinite care must be taken to elude the trout's eye, which is wonderfully keen and vigilant. Next to the artificial fly, worm is the lure most used in trout-fishing. For its success in clear water, the same knowledge of the haunts and habits of the trout is required as in fly-fishing. The same training of eyesight is not, however, necessary. Bait being a reality, the trout, unless alarmed, will not reject it after seizing it as it does an artificial fly. It runs off with it to its lair, causing the line as it does so to twitter. A gentle strike or pull *downwards* should then be given.

The Grayling (q. v.) is to be angled for in the same way and with much the same tackle as the trout. It is, however, less wary than the trout, and is in condition at a different season. Great care must be taken after hooking a grayling, as the flesh of the mouth is very soft, and the hook therefore comes easily out.

The Pike (q. v.), which is to be found only in still, deep water, may be taken with a variety of lures. The spoon and swivel is often effective, but we prefer a small trout to anything else. The angler should never strike in pike-fishing with bait. Time must be given for the fish to swallow the bait, which will take several minutes. Till the process is completed, the line must be held slack, as any resistance will scare the fish. The pike-hooks must be attached to wire.

In other branches of the art of A., the tackle should be of the best, and in trout-fishing of the finest. But the angler should have nothing showy either in his tackle or equipment. Nor in trout-fishing should he embarrass himself with a multitude and variety of flies. Gaudy flies are of no avail in trout-fishing, at least in the rivers of the N. The black spider is an unfailing fly all the year round. The red and dun spider are excellent, as is also a woodcock wing with a hare's ear. We should consider ourselves amply equipped for a day's fishing with three or four, or at most, six of each of these. We give no directions for dressing, because no one can learn to dress from a book. The fly-rod should be light, and not above ten or eleven feet long. The rod for bait should be sixteen feet long. The reel should be brass, and of plain construction. We earnestly dissuade all anglers from using a complex reel. The plain one never goes wrong, the complex never fails to do so, and we have seen many a day's sport ruined in consequence. Hair and silk mixed make a good reel-line. It should be dried after use. The reader is referred to *The Practical Angler*, by W. C. Stewart; *Hints to Anglers*, by Adam Dryden; *Book on Angling*, by F. Francis; and *Angler's Companion*, by Thomas Stoddart.

Anglomani'a is a noticeable predilection for English habits and institutions among foreigners. Instances of A. were the avidity with which translations of all kinds of English books were read during the 18th c. in Germany, and the rule of English 'fashions' in France on the eve of the great Revolution, when the free institutions of England excited the enthusiastic admiration of the friends of liberty.

Anglo-Saxon Language and Literature. 'Anglo-Saxon' is the term commonly, though not correctly, employed to denote the language which Englishmen spoke and wrote before the Norman Conquest. This language is simply the first historic form of English, and those who used it neither called nor supposed it anything else. But the lapse of time wrought so many changes in its form, that when it ceased to be immediately intelligible, men came to regard it as a sort of foreign tongue, and gave it the misleading name it still retains. It seems necessary, therefore, to consider the earliest form of English under this heading, though it is important always to remember what A. really is. The Low German tribes, who in the 5th and 6th centuries invaded and occupied the greater part of S. Britain, must, of course, have brought with them from the mainland of Europe their own form of Teutonic speech, with dialectic peculiarities corresponding to the geographical divergences of the invaders. These peculiarities would doubtless establish themselves in Britain, or at any rate would become the source of new distinctions there. Historical criticism favours this view, for in the earliest times we can trace the presence of two, if not more, dialects of English in use even for literary purposes. It would be interesting to know what was the exact form of English at the date of the first invasions; but not a vestige of literature survives that was committed to writing for more than two hundred years after the legendary dates of Hengst and Horsa. The composition of *Beowulf* (q. v.) may go back to the first half of the 5th c., but for us it only exists in a MS. of the 7th or 8th. We are, therefore, unable to show that the English of the 5th or 6th c. was precisely the same as any Continental dialect of Low German spoken between the Rhine and the Baltic. In fact, there are such differences between the oldest recorded forms of English and of the other Low German dialects, that one is tempted to believe that all, or nearly all, who spoke the special dialects of the English invaders must have emigrated to Britain. The nearest approach to the oldest English is seen in the old Saxon of Rhenish Prussia and Westphalia, and still more in the old Frisian of Holland. Dr Latham, in his work on the *English Language*, furnishes ample evidence of this. Of the different dialects of English presumably used in our island at this period, the two most notable were the *Anglian* of Northumbria and the *Saxon* of Wessex, of which the former is probably the more ancient in form, as it stands nearer to Frisian and Norse. It was certainly the first that was put to literary use; but the ravages of the Danes in the N. and E., and the rise of the kingdom of Wessex under *Ælfred* and his successors, gradually made the 'Saxon' of the S. the classic or standard dialect of English for the whole country, and such it remained till the tremendous disaster of Hastings destroyed its supremacy, when all the dialects of the vernacular rapidly sank into an equality of degradation and contempt.

When we speak, then, of A. or English, before the Norman Conquest, we substantially mean the dialect of Wessex, for it is mainly, though not exclusively, in that dialect that the earliest English literature has come down to us. It differs from later forms of English, not merely by the possession of a large number of words which have now ceased to be used, but still more by the possession of a system of inflections which changes the aspects of words that might otherwise have been not quite unfamiliar, and by material differences in orthography. Vestiges of the old grammatical structure are abundant in the English of the middle ages, and even yet survive; e.g., the plural form *en* (Old Eng. *an* of the 1st declension) in *children*, *brethren*, and *oxen*; *hosen*, *shoon*, *eyne* (Sc. *een*) are archaic rather than obsolete; the *s* and *es*, which is the *as* of the 3d, and the so-called irregulars, *feet*, *men*, *teeth*, *mice*, *lice*, *geese*, which have similar though not identical forms in the English of the 9th and 10th centuries. Our comparative and superlative degrees, our declension of pronouns, have not greatly changed; and the adjectival *lic* may still be recognised in the modern *ly*. But though it would be easy to show that we still liberally use the prefixes and suffixes of nouns that were in use before the

Norman Conquest, and have only modified rather than abandoned other distinctive forms, yet so much has gone, and so much has changed, that it requires a special study to master the language of *Ælfred*. The best grammars on the subject are Raak's *Angelsächsisch Sprachlehre* (Stockh. 1817; translated by B. Thorpe, 1865); Koch's *Historische Grammatik der Englische Sprache* (1863-69); Mütsner's *Englische Grammatik* (1860-65); and March's *Comparative Grammar of the Anglo-Saxon Language* (1870).

The oldest extant fragment of English literature is unquestionably the Runic verses from Cadmon's poem on the Crucifixion, which are found on the stone cross in Ruthwell churchyard, set up about 680 A.D. The form, of course, is Anglian or Northumbrian, and it may here be noted that the earliest English literature belongs to the N., and not to the S. No earlier name than Cadmon's is to be found. Bede and Alcuin were also Northumbrians. The former, indeed, wrote mostly in Latin, though we know that he was engaged on a translation of St John's Gospel at his death; while the latter carried away his learning and energy to benefit a foreign people. Other specimens of English which have come down to us from the Northumbrian region, are a second fragment of Cadmon (737), a *Psalter* (800), the *Rushworth Gospels* (900), and the *Lindisfarne Gospels* (970). By far the greatest part, however, of the pre-Norman literature of England has reached us only in the Wessex dialect, no matter in what part of the island or in what dialect it may have been originally produced. Some poems in this dialect are even older (in the opinion of several critics) than the first invasion of Britain; e.g., *Beowulf* (q. v.), a genuine Norse epic, with a certain Homeric simplicity and breadth of portraiture; the *Traveller's Song* and the *Battle of Finnsburgh*. See, however, the introduction to Arnold's *Beowulf* (Lond. 1876). The introduction of Christianity almost suppressed this fierce heathen literature, which drew its highest inspiration from the fury of battle, but its place was taken by a literature of nobler origin and a more beneficent spirit. Cadmon (q. v.), who belongs to the 7th c., is, as we have said, the earliest name in English literature, strictly so called, and his metrical paraphrases of Scripture show the new tendency of the national genius under the benign influence of the gospel. Very few, however, of the English religious poets who flourished before the Norman Conquest are known by name: only a fatherless brood of pious verses, hymns, psalms, allegories, tales, and translations of Scripture have survived, of the most notable, perhaps, are the *Judith*, the *Phoenix*, *Andreas*, *Salomon* and *Saturn*, a poem on *Death*, and an *Address by the Departed Soul to the Body*, the various pieces now generally ascribed to a 'younger' Cadmon, as the *Christ and Satan*, *Christ's Descent into Hell*, *The Day of Judgment*, &c., most of which, besides many others, can be found in the Exeter or Vercelli MS. Particular poems have been published by Fox (Lond. 1830), Thorpe (Lond. 1832), Bouterwek (Elberf. 1847), Grimm (Cassel, 1840), and the whole body of poetry belonging to this period of English history has been collected and published by Grein in his *Bibliothek der Angelsächsischen Poesie* (Gött. 1857-58). See also Thorpe's *Analecta Anglo-Saxonica*, Turner's *History of the Anglo-Saxons* (7th ed. 1852), and Kingston-Oliphant's *Sources of Standard English* (Lond. 1873).

While the oldest poetic literature of England is remarkable in point of style for its obscurity, harsh inversions, incessant ellipses, and ambitious metaphors, the contemporary prose, on the other hand, is distinguished for its straightforwardness and simplicity of structure. A student finds it rather hard to read Cadmon, but very easy to read *Ælfred*. The chief prose works are the *Civil and Ecclesiastical Institutes of the English Kings from the time of Æthelbert to that of Canute*; *Ælfred's Translations* (with additions) from Orosius, Bede, Boethius, and Gregory the Great; the *Chronicle*; the *Homilies of Ælfric* (q. v.) and his version of part of the Bible; and the Durham version of the Gospels. See Turner's *History of the Anglo-Saxons*, and Thorpe's *Analecta* (as above); also Marsh's *Origin and History of the English Language, and of the Early Literature it embodies* (1862).

Anglo-Saxons, the name commonly given to the various tribes of Low Germans who from the middle of the 5th c. began to establish themselves in parts of Britain. The accuracy of the term is disputed by recent historical writers, who maintain that it is misleading, inasmuch as it suggests what is unquestionably a false notion, viz., that the so-called A. were something else than English, whereas they were in reality English pure and simple, without any foreign admixture at all, and who further maintain

that it is absurd for us to call a nation Anglo-Saxon that called itself *Englisc* (English), only using the rare term Anglo-Saxon to denote the two tribes of Angles and Saxons. There is so much truth in this contention, that were it not for the force of usage, the probability is that the name Anglo-Saxon, which is of comparatively recent origin, would not survive a decade.

History.—The story of the first appearance of the Jutish warriors in Britain has manifestly reached us in a somewhat legendary guise; but as it rests on the venerable authority of Bede (8th c.), and of the *Chronicle* (9th c. *et seq.*), and as we have nothing definite to put in its place, we must, in the main, accept it. According to this story (*Hist. Eccl.* lib. i. c. xiv. and xv.), Vortigern, King of the Britons, unable to oppose an effectual resistance to the savage inroads of the Picts, who made havoc of the southern half of the island after the withdrawal of the Romans (410 A.D.), sent for help over seas to Germany. Hengst and Horsa arrived with an armed force in 449, and soon drove back the barbarians; but, charmed with the fertility and beauty of the land, they resolved to possess it, and having told their kinsfolk and neighbours in N. Germany how easy it would be to conquer the country, shiploads of eager warriors—Angles, Saxons, and Jutes—were soon carried across to Britain.* The records of their exploits are extremely meagre. In spite of the annalistic precision of the *Chronicle*, anything like a continuous narrative is impossible. We gather that invasions from Germany continued to take place for nearly a century, and that finally, in spite of desperate spurts of heroism on the part of the British, and gleams of unavailing triumph (of which the legend of King Arthur preserves the splendid memory), the whole country E. of the Penine and Devonian ranges passed into the hands of the newcomers. Their distribution in this region was as follows: The Saxon and Jutish peoples occupied the districts S. of the Thames as far W. as Devon or Cornwall, while the Angles (whose early supremacy is undoubted) obtained possession of the remainder, from the Thames to the Firth of Forth, and from the Severn to the North Sea. Altogether, seven states are reckoned, which are commonly spoken of as the *Heptarchy* (q. v.), viz., Kent, Sussex, Essex, Wessex, East Anglia, Mercia, and Northumbria. Three of these in succession came markedly to the front, first Northumbria, in the time of *Eadwine* (mod. Edwin, 617-633); then Mercia, in the time of *Offa* (757-796); and lastly Wessex, from the days of *Eggbriht* or *Egberht* (mod. Egbert, 802-838), who was the first prince that really deserved the name *Bretwalda* ('wielder of Britain'), because he brought all the English states under his power. He conquered all the Saxons and Jutes, and became liege-lord of the East Angles, Mercians, and Northumbrians, whose kings were compelled to become his 'men' or 'vassals.' The supremacy of the Wessex dynasty continued, except during the Danish interregnum (1017-42), down to the period of the Norman Conquest; but the first of this line who was the sole ruler of England was *Æthelstan* (925-940) (see *ÆTHELSTANE*), ever after whom the country continued to be a monarchy.

Laws, Constitution, &c.—Each state of the Heptarchy had doubtless its special laws and customs brought over from Germany, or developed in Britain. *Æthelbert* reduced to writing the traditional legal usages of the Kentish Jutes; *Ina*, King of Wessex, *Offa*, King of Mercia, and other sovereigns, from time to time published their 'dooms' or judgments; but *Ælfred* was the first who was in a position to legislate for the whole, or at least the greater part, of the English nation. A great reformer, he was essentially conservative, and in his new code or collection of dooms he mainly contented himself with reproducing in an amended form the work of his predecessors, adding few statutes of his own, because, as he modestly put it, he did not know how those who came after him might like them.

Speaking generally, it may be said that the various English states were from the first a group of united monarchies, and, after their consolidation into one, this character continued to mark them as strongly as before. The *Cyng* ('king') was, no doubt, descended from Woden, and therefore of divine origin, but he was not absolute. He was guided by a kind of parliament called the *Witena-gemót* ('meeting of the wits' or 'wise'), which he had the power to summon, but not to dismiss. All

* In *Words and Places*, by the Rev. Isaac Taylor, there is a curiously interesting chapter on the *Anglo-Saxons*, in which he seeks to show that numerous other German tribes or families besides those mentioned in the text must have taken part in the conquest and colonisation of Britain.

freemen had the right to attend. So long as England was cut up into numerous small states, it might be possible for a considerable number of freemen to take part in the proceedings; but after England became a monarchy the thing was impracticable, and the Witenagemot would only be attended by the great nobles and prelates. The powers of this assembly were very considerable. It elected the king, and, with his consent, it made laws or treaties, and appointed or removed the officers of state.

The office of king was always elective. If a deceased king's son was too young to succeed his father, or otherwise unfit, the Witan would pass him over, and choose an older or an abler kinsman. Thus Ælfred succeeded Æthelred, though Æthelred left a son behind him. The aristocracy was composed of (1) the *æthelings* ('princes'), the members of the royal family, or those related to them by blood or marriage; (2) the *caldormen* ('eldermen' or 'senators'), governors of shires, or even of subordinate states, sometimes called, with reference to their military functions, *heretogas* ('army leaders'), and latterly, owing to Danish influences, *eorlas* ('earls,' Dan. *jarl*), with whom may be classed the great prelates of the Church—bishops and abbots; (3) *thengas* (from *thengian*, to serve), a class of lesser nobles or landholders, like the vassal gentry of the feudal ages. All landholders were under an obligation to serve in the *fyrd*, or militia (from *faran*, to go on march; literally, therefore, the body that may be summoned to 'go' upon an expedition), and to repair fortresses and bridges. The common body of freemen were called *corlas* ('churls,' Lowl. Sc. *carles*; Ger. *kerlen*), and it was in contradistinction to this name that the term *eorlas* ('earls') was applied to the better-born freemen. Another element in the population, though not in the state, was the *threlas* ('thralls'), or *thowas* ('slaves'), who were naturally most numerous along the Welsh border. In the greatest matters the king and the nobles acted for the nation, but in smaller matters the people governed themselves pretty thoroughly. Thus each 'shire' had its local parliament (*Schiregemot*), over which the *aldorman* presided like the modern lord-lieutenant of a county, but he could decide or carry nothing without the concurrence of the thanes and the representatives of townships. With him were latterly associated the *Schirgerifa* (sheriff) and bishop. Again, the 'shire' was subdivided into *hundredu* ('hundreds'), each of which had its subordinate court, and the 'hundreds' were in turn subdivided into *teothunga* ('tithings'), so called because they must contain ten freemen, heads of families, who were responsible for each other and for the wellbeing of the district. This still lingers among us under the name of the 'parish vestry.'

Religion.—When the English first came to Britain, they were heathens, and continued such for 150 years. The fierce struggles going on between them and the Britons in every part of the island put missionary operations on the part of their defeated and embittered adversaries out of the question; and indeed, if one may judge from *Gildas*, British Christianity itself was not in a very healthy condition at the time. Woden (Dan. *Odin*) and Thunder (Dan. *Thor*), incarnations of valour and strength and violence, were the gods most deeply revered by the invaders. Their worship was set up in the conquered isle; it rooted itself deeply amidst the storms of strife, and became a patriotism as well as a faith. The memory of the heathen deities is still preserved in the names of the days of the week, and other traces of the old religion still lurk in the words we use and the customs we follow. But in the year 597 a Roman abbot, Augustine, with a band of forty monks, landed in the isle of Thanet, at the very place where Hengst and Horsa had landed a century and a half before. Pope Gregory had sent them to preach the gospel to the new race that peopled the country, and, if possible, to build up anew, under holier auspices, the fabric of Roman authority. Circumstances favoured the attempt. The King of Kent, into whose territories they came, had married a Christian princess, Bertha, daughter of the Frankish King of Paris, who was permitted to practise the rites of her religion in her new home. Gregory counted rightly enough on her influence. Hardly a year had passed when her husband Æthelberht accepted the new faith, and was baptized. His thanes rapidly followed his example. But Æthelberht was at this moment the most powerful ruler in England. He was *Bretwalda*. The other kings acknowledged him as their 'over lord.' His daughter Æthelburh married Eadwine, the great King of Northumbria, and carried with her Paulina, a follower of Augustine. By his

zeal the northern English were also converted to Christianity. Nothing in Bede is so beautiful as the story of this conversion. Under Peada, King of the Mercians, a heathen reaction took place which for a while threatened the very existence of Roman Christianity. But help came from an unexpected quarter. Oswald, the successor of Eadwine, had in his youth found a refuge in the Scoto-Irish monastery of Iona, and when he had recovered Northumbria, and restored its greatness, it was Celtic monks from this lonely isle that kindled anew the flame of religion in his dominions. The labours of Aidan (q. v.) and his disciples of Lindisfarne have been generously recorded by Bede, but the most glorious triumphs were those of the Northumbrian Cuthbert (q. v.). Gradually heathenism died away under the ceaseless propaganda of Celtic and Roman missionaries. A conflict arose between the two, trivial in itself, but involving the question of the supremacy of Rome or Iona. It was decided (664), in a synod held at the Abbey of Whitby, in favour of the former. The Irish monks withdrew from Lindisfarne, and the Church in England was built up under Roman supervision. It owes its distinct organisation as an ecclesiastical institution mainly to the Greek monk Theodore of Tarsus (668-690), but it was perhaps first effectually brought into harmony with Rome by the policy of St Dunstan (q. v.) in the 10th c. Even to the last, however, it retained something of national independence, and at the Norman Conquest it was found necessary to put foreign prelates at its head. See Kemble's *Saxons in England* (2 vols. 1849), Lappenberg's *Geschichte von England* (Hamb. 1834-37), Freeman's *History of the Norman Conquest* (1867-75), his *Old English History* (Lond. 3d ed. 1875), and J. K. Green's *Short History of the English People* (Lond. 1875).

Angola, a country or territory in Lower Guinea, subject to Portugal, bounded on the S. by the river Coanza, and on the N. by the Danda. It is naturally divided into three regions: (1) A flat stretch of coast generally barren, except along the banks of rivers, where, however, there is a fulness of tropical productions, sugar-cane, coffee, palm oil, manioc, banana, &c.; (2) a hilly plateau, about 2500 feet above the sea, remarkable for its immense forests; (3) an eastern region, at first higher than the second, but gradually sloping to the broad Quango Valley, where the soil is fertile as the bottoms of the Mississippi, but lies fallow, as the Portuguese, instead of developing the natural wealth of the country, devote themselves to trading in wax and ivory. A great variety of wild animals abound in the interior, which is almost unexplored. The country is rich in copper, iron, and silver. The Portuguese discovered A. in 1486, and have held it ever since, except from 1641-48, when the Dutch were masters of the capital and part of the colony. The colonists are still few in number, and confined in isolated forts and settlements named *feiras* or fairs. The entire population is estimated at 240,000, of whom 238,000 are negroes, belonging to the great Bunda race, and marked by considerable culture. Many can both read and write, thanks to the Jesuit missionaries, who have long been at work here. The capital is São Paulo de Loando (q. v.). The name A. is often applied to the entire W. African coast from Cape Lopez to São Felipe de Benguela. See Lopes de Lima, *Ensaio sobre a Statistica das Possessões Portuguezas na Africa Occidental e Oriental*, &c. (Lisb. 1844); Tams, *Die Portug. Besitzungen in Westafrika* (Hamb. 1845); Valdez, *Six Years of a Traveller's Life in Western Africa* (2 vols. Lond. 1861).

Angon, a kind of spear in use among the Angles, Franks, and other Teutonic peoples, either for thrusting or hurling. The shaft was made of wood, but was almost wholly covered with iron. At the head were two barbs.

Angora (anc. *Ancyra*), the capital of a Turkish vilayet of the same name in Asia Minor, pleasantly situated on the river Fingiri, 220 miles E.S.E. of Constantinople. It was founded, according to tradition, by Midas, the son of Gordius, and after the irruption of the Gauls into Asia Minor, it became the chief town of the Tectosages about B.C. 277, and subsequently the capital of the Roman province of Galatia Prima. Occupying a position favourable for commerce, it early became the emporium for the Eastern trade. The Christian Churches of Galatia held three councils at A. in the 4th c., and it was the scene of a fierce battle between the Turks and Tartars (1402), in which the Sultan Bajazet was defeated and taken prisoner by Timur. The chief monument of antiquity is the white marble temple of

Augustus, containing the famous *Monumentum Ancyranum*, recording the deeds of the emperor. This valuable inscription was discovered by Busbecq, 1553, and the latest copy of it is contained in Hamilton's *Researches in Asia Minor*. A. is the chief residence of the Armenian Catholics in Asia Minor. One of the chief employments is the preparation of Oriental morocco leather from the skin of the celebrated A. breed of goats. Pop. (*Journal Officiel de la Répub. Française*, 1874) 38,138, chiefly Turks and Armenians.

Angora Goat (*Capra Angorensis*), a variety of goat inhabiting Asiatic Turkey in the districts around Angora and Beibazar. The body-colour is milky white, the short legs being black. The horns are spiral, and are spread outwards and backwards. The hair is long and silky, and is disposed in spiral ringlets or curls. It was first imported into European markets under the name of *Mohair*. In Turkey the finest robes are made from this material. Smyrna forms the chief place of export for the unspun hair, and a large quantity is also imported from Constantinople. It is chiefly employed in the manufacture of trimmings, braid, shawls, &c. Bradford and Norwich are the chief seats of this manufacture. The import in 1864 amounted to 4,737,330 lbs., valued at £650,191. The goatherds are very careful of their flocks, and frequently comb and dress the fleeces.

Angornow, the most important town in Bornu, Central Africa, near the shore of Lake Chad, 20 miles S. from the capital, Kuka. It lies in a fertile plain, and is liable to inundation. It has a great weekly market, and is the centre of an extensive trade in slaves, cotton, amber, coral, and metals. Pop. about 30,000.

Angostura, a river-port, capital of the province of Guiana, in the republic of Venezuela, S. America, lies on the Orinoco, nearly 240 miles from its mouth. It is built at a place where the immense river narrows to a width of 3134 feet, whence its name, signifying a strait. This strait marks the limit at which the Orinoco is affected by the ebb and flow of the tides. The town, which is meanly constructed, stands only 191 feet above the sea-level, and the quays are often inundated; but the climate is comparatively cool, tempered as it is by the steady trade-winds. The most important exports are cacao, indigo, cotton, tobacco, sugar, A. bark, hides, and cattle. Shoals and currents on the river make A. rather difficult of access for sailing vessels, but its position is in many respects highly favourable to commerce. A. was founded in 1764, and at first was called *San Tomas de la Nueva Guayana*. In 1819 the congress met here which declared Venezuela part of the great republic of Colombia—a lofty conception of Bolivar's, in whose honour A. was called *Ciudad Bolivar*. Before the war of independence A. was prosperous, and though it suffered much in the struggle, it rapidly recovered after peace had been restored; but of late years its progress has been greatly retarded by civil disturbances. Pop. 7000.

Angostura Bark. This bark, which is used as a tonic and febrifuge, is obtained from *Galipea officinalis*, a tree found in Guiana, and belonging to the natural order *Rutaceae*. *G. Cusparia* also yields a variety of A. B. It is not much used in Britain. A false, poisonous A. B., that of *Strychnos Nux vomica* (q. v.), was at one time substituted for the genuine bark, which occasioned serious accidents, and led some of the Continental governments to prohibit its use.

Angoulême, capital of the department of the Charente, France, on the Charente. Pop. (1872) 22,109. It has manufactures of paper, earthenware, and linen and woollen fabrics, a college, and a natural history museum. Wine and saffron are products of the district. A. is the old *Iculisma* of Aquitaine, and has been the seat of a bishop since 379. Chlodwig took it from the West Goths in 507, and laid the foundations of a cathedral. Soon after it became important, and during the whole of the middle ages played an important, indeed a foremost, part in French history. Marguerite of Navarre, authoress of the too notable *Heptaméron*, was born in the ancient castle of A., a fragment of which is still standing.

Angoulême, the titular name of more than one great historic family of France. The first Comte d'A. is said to have been one Turpin (839-863), whose last male descendant was Adé-

mar, who died about 1218. His daughter Isabella, widow of John, King of England, married Hugues X. Comte de Marche. After the death of Hugues XIII. (1303), the counties of A. and Marche were united to the crown of France by Philippe le Bel. Louis, Duc d'Orléans, who died in 1407, second son of Charles V. of France, received the county of A. as an appanage. His grandson Charles, who died in 1496, was the father of François I., who was Comte d'A. before his accession to the throne in 1515. He immediately raised the county into a duchy, and gave it to his mother, Louise of Savoy. The title of Duc d'A. has been since borne by Charles, third son of François I.; by Charles IX.; by Charles of Valois, natural son of Charles IX.; by Louis Emmanuel, son of Charles of Valois; and by Louis Antoine, eldest son of Charles X.

Angoulême, Louis Antoine de Bourbon, Duc d', and afterwards Dauphin of France, was the eldest son of the Comte d'Artois, subsequently Charles X. of France, and was born at Versailles, 6th August 1775. When the Revolution broke out he retired to Italy, where he devoted himself to military studies. In 1792 he received the command of a body of French emigrants in Germany, but his campaign proved a failure, and he withdrew into private life till the allies entered France in 1814. The time was spent at Holyrood, on the Continent, and latterly in England. On the recall of Louis XVIII. he was appointed lieutenant-general of the kingdom, but from want of military experience, and perhaps incapacity, found himself unable to cope with the Bonapartist movements that followed the return of Napoleon, and was obliged to surrender himself a prisoner 15th April 1815, but soon regained his liberty. In the Spanish war of 1821 he was nominal commander. In July 1830 he signed an abdication of his claims to the French throne in favour of the Duc de Bordeaux, his nephew, and again accompanied his father into exile. After a year or more spent at Holyrood he went to Austria, and died at Gorz, 3d June 1844.

Angoulême, Marie-Therese-Charlotte, Duchesse d', daughter of Louis XVI., born 19th December 1778. After long imprisonment she was exchanged for some French prisoners held by the Austrians, and lived at Vienna. On the 10th June 1799, she was married, at Mittau, in Courland, to the Duc d'Angoulême, her cousin, whom she much surpassed in vigour and quickness of intellect. Napoleon pronounced her 'the only man in her family.' She died 19th October 1851.

Angra, the capital of the Azores, lies on the island of Terceira, and has a good harbour. It is strongly fortified, exports wine, flax, and grain, and is the seat of the Bishop of the Azores. The Portuguese governor-general resides at A., and the town contains a military college and arsenal. Pop. 12,000.

Angri, a town in the province of Salerno, S. Italy, 17 miles N.W. of Salerno. It lies amid vineyards and cotton plantations. Pop. 6921.

Anguilla. See EEL.

Anguilla, or **Little Snake**, one of the most northerly of the Leeward Islands, about 60 miles N.W. of St Christopher, with an area of 35 miles, and a pop. (1871) of 2773, chiefly blacks. It belongs to England, is under the governor of St Christopher, and is governed locally by a stipendiary magistrate. It exports some cotton, tobacco, and sugar.

Anguis. See BLIND-WORM.

Anhalt, a state of the German empire, formerly an independent principality, lies on the Elbe, Mulde, and Saale, almost surrounded by Prussian Saxony. Its surface is level and fertile. There are manufactures of woollen, hardware, &c., but the inhabitants, who are generally Protestants, find their chief employment in agriculture, producing wheat, tobacco, wine, flax, and hops. There are mines of iron, copper, and lead. Area, 880 sq. miles; pop. (1875) 213,689. A. dates as an independent principality from the 13th c. Formerly divided into four duchies, it consisted from 1793 to 1853 of three, A. Köthen, A. Bernburg, and A. Dessau. In 1853, A. Dessau and A. Köthen were united under the title of A. Dessau-Köthen; and in 1863 the two, A. Bernburg and A. Dessau-Köthen, were also united, and now form the sovereign duchy of A. The capital is Dessau.

Anhydrous is a term used in chemistry to express without

water. A. bodies may be those which contain no water as an impurity, or those which are not combined with water. Thus A. alcohol is pure or dry alcohol, free from admixture with water, whereas A. sulphuric acid, or sulphuric anhydride, SO_3 , is quite a different body from hydrated sulphuric acid or oil of vitriol, H_2SO_4 or $\text{H}_2\text{O}_2\text{SO}_3$, which contains the former body combined with water.

Aniline is a liquid substance containing carbon, hydrogen, and nitrogen. Itself of little interest except to the chemist, A. has nevertheless of late years become of immense commercial importance on account of the numerous and beautiful dyes which have been prepared from it. See ANILINE COLOURS. A. was first obtained by distilling indigo with caustic potash, and derives its name from this circumstance, the Portuguese for indigo being *anil*. It is now, however, solely prepared from benzene or benzol, a liquid composed of carbon and hydrogen, occurring in considerable quantities in gas-tar, and separable from that substance by Fractional Distillation (q. v.) See BENZOL. The benzol is first treated with nitric acid, when nitro-benzol, or essence of mirbane, results.

The nitro-benzol is then treated with iron-filings and acetic acid, and is converted by this process into A. The chemical change which the nitro-benzol suffers consists in a *reduction* or loss of oxygen by that body, and the partial replacement of the oxygen thus removed by hydrogen.

The A. is purified by distillation. A. is a colourless liquid when quite pure, of an oily consistence, and slightly heavier than water (sp. gr. 1.02). It boils at 182°C . It may be subjected to intense cold without freezing. It possesses a peculiar and characteristic odour, of a somewhat ammoniacal character.

Exposed to the air, A. rapidly darkens in colour, and is eventually converted into resinous products. It produces a yellow stain when dropped on wood; but its most characteristic reaction is the violet colour produced when it is mixed, even in minute quantity, with a solution of chloride of lime. A. is poisonous, and its vapour, if inhaled, is said to produce a kind of intoxication which is exceedingly dangerous. It is inflammable, soluble in all proportions in alcohol and ether, but only to a small extent in water. In its chemical characters A. is closely related to ammonia, and belongs to the group of bodies called *amines*, substances derived from ammonia by the partial replacement of part, or the whole, of their hydrogen by hydro-carbon radicals. In the case of A. the radical is called 'Phenyle,' C_6H_5 , and in consequence A. is named by chemists *Phenyl amine*.

A. combines with acids to form salts analogous to the ammonium compounds, and these for the greater part are solid crystalline substances, almost without exception colourless. The relation in composition between the salts of A. and ammonia will be best understood by an inspection of their respective formulae.

Sulphate of ammonia.

Oxalate of ammonia.

Sulphate of aniline.

Oxalate of aniline.

Aniline Colours. The aniline or 'gas colours' have now almost superseded other dyes, on account of their wonderful brilliancy, diversity of colour and shade, and the ease with which they are fixed on the fabric. They are the origin of an enormous industry both in this country and on the Continent—an industry still on the increase—and are not only remarkable from an industrial standpoint, but equally on account of the beautiful researches into their nature and composition which have been made by some of the most eminent chemists of the day. Originating from a substance long regarded simply as a chemical curiosity, and without practical use or importance, they furnish an admirable illustration of the value of abstract inquiry, and of the services of modern chemistry.

It had been known to chemists for some time that aniline, when treated with chloride of lime (bleaching powder), gave rise to a beautiful violet colour, but this fact was not turned to practical account till the year 1856, when W. H. Perkin succeeded in extracting and purifying the colour thus produced, and found that it was capable of easy fixation on silken and woollen fabrics. This was the first aniline colour prepared, and was patented by its discoverer under the name of *mauveine* or aniline violet. Two years later Hofmann succeeded in isolating the base of a red colour, which he called *rosaniline*; and a process for its commercial manufacture was shortly afterwards discovered by Verguin. By acting on rosaniline with the iodides of ethyl and methyl, Hofmann also succeeded in obtaining beautiful violet colours (Hofmann violets) and a green dye (iodine green). Since then, blue, black, yellow, brown, and grey dyes have been prepared from aniline, and at the present time almost every colour in the rainbow can be produced from this one substance.

The more important of the aniline dyes, with their mode of manufacture, are as follows:—

Aniline Violets—Mauveine, Aniline, Rosolan, Violine or Tyraniline. This colour is prepared on the large scale by treating sulphate of aniline with a cold dilute solution of bichromate of potash, and allowing the mixture to remain for about a day undisturbed. The colour separates as a black precipitate, which is washed with water, then treated with naphtha to remove resinous by-products, and dissolved for the dyer's use in spirits of wine, methylated, or pyroxylic spirit. Aniline violet appears to be the sulphate of a base called mauveine, having the formula $\text{C}_{22}\text{H}_{21}\text{N}_3$.

Aniline Red—Rosaniline, Fuchsine, Azaline, Solferine, or Magenta—is produced by the action of oxidising agents on impure commercial aniline, which contains in addition to aniline, *toluidine*, a substance very similar to aniline in properties, and, in fact, homologous with it. The presence of toluidine is essential to the production of rosaniline, pure aniline producing by itself no red dye. A. R. is now almost solely prepared by the action of arsenic acid on commercial aniline (though corrosive sublimate, chloride of tin, nitric acid, chloride of carbon, and other bodies have been employed instead). The two substances are heated together for from four to ten hours, after which the resulting mass is boiled with very dilute hydrochloric acid, and to the solution thus obtained soda is added in slight excess. This occasions the precipitation of the red colour, whilst the by-products and impurities remain in solution. The precipitate is washed with water, and, dissolved in acetic or hydrochloric acid, forms the roseine of commerce. A. R. consists either of the acetate or hydrochlorate of the colourless base rosaniline, $\text{C}_{20}\text{H}_{19}\text{O}_2$, which combines with most acids to form coloured salts. These salts, when viewed by reflected light, have a green metallic lustre, like the wings of the rose-beetle, but by transmitted light they are red. Treated with nascent hydrogen, rosaniline takes up two atoms of that element to form another colourless base, called *leukaniline*, $\text{C}_{20}\text{H}_{21}\text{N}_2$.

Aniline Blues. By treating rosaniline with the iodides of methyl and ethyl, three atoms of hydrogen are replaced by the hydrocarbon radicals (methyl or ethyl), and beautiful violet

colours are produced. *Trimethyl rosaniline*, $C_{20}H_{18}(CH_3)_3N_3$, and *triethyl rosaniline*, or rather the hydrochlorate or acetate of these bases, are known in commerce as Hofmann's violets. By treating rosaniline with aniline, one, two, or three atoms of hydrogen may be replaced in the former substance by the radical phenyl (C_6H_5), and blue dyes are produced. Salts of monophenyl rosaniline, $C_{26}H_{18}(C_6H_5)_3N_3$, are known as *violet imperial rouge*; of diphenyl rosaniline, $C_{32}H_{17}(C_6H_5)_2N_3$, as *violet imperial bleu*; and of triphenyl rosaniline, $C_{38}H_{15}(C_6H_5)_3N_3$, as *bleu de Lyons* and *bleu de Paris*.

Aniline Green. *Iodine Green* is prepared by the further action of iodide of methyl (CH_3I) on trimethyl rosaniline, and has the formula $C_{20}H_{18}(CH_3)_3N_3(CH_2I)_2$.

Aldehyde Green is prepared by treating sulphate of rosaniline with aldehyde and bisulphite of soda. Little is known of its composition.

Aniline Grey is obtained by treating mauveine with aldehyde and sulphuric acid.

Aniline Brown is obtained by treating acetate of rosaniline with hydrochlorate of the same base.

Aniline Black is obtained by heating together chlorate of potash, aniline, hydrochloric acid, chloride of copper, sal-ammoniac, acetic acid, and starch paste. The colour first appears after exposure of the fabric dyed with it to light. It is almost indelible.

Aniline Yellow. Salts of a base called *chrysaniline*, $C_{20}H_{17}N_3$ —which differs from rosaniline in containing two atoms less hydrogen—are employed as yellow dyes. This base occurs among the resinous by-products of the manufacture of rosaniline, and is extracted from these matters by subjecting them to a jet of steam, when it is dissolved out. The picrate is usually employed by the dyer.

There are numerous other dyes employed in commerce, but the above are the most important. It should be remarked that the A. C. are fixed at once on silk and woollen materials without the use of a mordant, a simple immersion in their solutions being sufficient. Vegetable tissues do not so readily take up these colours, a previous dressing with size being necessary.

Animal and Animal Kingdom. The exact definition and limitation of the A. world is a matter of extreme difficulty, since many of the *Protozoa*, or lower plants, very closely approach, in appearance and structural details, the *Protozoa*, or lower animals. The higher groups of the A. and plant series are distinctly separable; but even in the case of these higher forms many striking points of similarity may be found. Animals and plants collectively constitute the *organic series* of natural objects. Minerals, and objects destitute of life, on the other hand, constitute the *inorganic series*. The possession of life, therefore, at once divides natural objects into these two great groups. Form alone will not separate animals from plants. Some animals (e.g., flustræ or sea-mats, zoophytes, &c.) are essentially plant-like in all the details of outward conformation, and in many respects of functional activity also. Between the lower plants and animals mere form affords no guide whatever. *Power of motion* will not enable us to distinguish between animals and plants, since many animals (e.g., sponges, oysters, corals, zoophytes, sea-mats, &c.) are in their adult state rooted and fixed, whilst many of the lower plants move freely about, and some higher plants possess powers of movement in their parts and branches (e.g., sensitive plant, moving plant, &c.) The *chemical composition* of animals and plants exhibits so many points of similarity and identity, that on this third head no exact differences are apparent. *Chlorophyll*, the green colouring-matter of plants, is found in many A. tissues (e.g., infusoria, hydræ, &c.) *Cellulose*, a characteristic vegetable product nearly allied to starch, is found in the tissues of sea-squirts—molluscan animals. *Glycogen*, or A. starch, is found in the liver and placenta of mammalia. And besides these examples of an interchange of chemical products between animals and plants, we also find that no one chemical product or element can be said to be thoroughly characteristic of one or other kingdom. *Nitrogen* is more abundantly, but by no means exclusively, found in animals; and *carbon* bears a similar relation to plants. The bodies of both are made up of protoplasm, a substance composed of carbon, hydrogen, nitrogen, and oxygen. The *intimate or microscopic structure* of animals and plants, also, fails to distinguish between these groups. The tissues of both are either cellular, fibrous, or molecular—or beyond the latter we

find the elementary matter of both animals and plants to consist of protoplasm.

The *nature and mode of assimilating the food* constitutes the sole means whereby we are enabled clearly or satisfactorily to separate animals from plants. The food of plants consists chiefly of *inorganic* matter. Animals require *organic* material for their food, and animals are therefore dependent either directly or indirectly upon plants for their support. Plants convert their inorganic food (consisting of gases, minerals, water, &c.) into organic products—such as starch, gum, sugar, &c.; whilst animals convert their organic food into products of *inorganic* kind. Animals require *oxygen* gas for their support; plants similarly require *carbonic acid*. Animals receive their food *within* the body, and assimilate it within the internal parts and tissues. Plants, on the contrary, digest their food in the *outer* surfaces or tissues of their bodies—such as the leaves, root, &c.; and only after being there elaborated is the product of digestion, or *sap*, sent to circulate through the tissues. The presence of a *nervous system* is not a characteristic of animals. Not only do many animals of comparatively high organisation want a nervous system, but plants appear in some instances to possess analogous means for the exhibition of irritability. See also ZOOLOGY, and articles relating to A. and plant life.

Animal Chemistry, the department of chemical science devoted to the analysis of animal tissues, and to the investigation of the chemical actions involved in the life processes and vital functions of animals. The elementary tissues of animals, or the protoplasm of which their bodies, like those of plants, are composed, consist of the four *essential* elements—*carbon*, *hydrogen*, *oxygen*, and *nitrogen*. It may be safely assumed that these elements are present wherever living tissues exist; and to these may be added the very general presence, in small and minute quantities, of *sulphur* and *phosphorus*. Silicon, fluorine, chlorine, sodium, potassium, calcium, magnesium, iron, and, more rarely, lead, copper, aluminum, and manganese, are the chief accidental elements found in the analysis of animal tissues. It is characteristic of animals and plants that their elements rarely if ever exist free or uncombined. On the contrary, their elements generally combine in high proportions to form intricate and complex compounds. The compounds of animal bodies are divisible into the *nitrogenous* or *azotised*, and the *non-nitrogenous* or *non-azotised*. The former (sometimes called *gelatinous* and *albuminous* compounds) are represented by the *gelatin* of the bones, cartilages, and soft tissues generally of the body; by the *chondrin* of cartilage; by *albuminous matters* or *proteids*; by the *fibrin* of blood, lymph, and chyle; by the *casein* of milk; by the *syntonin* and *myosin* of muscles; by the *horny matter*, or *keratin*, of nails, hoofs, and hair; by the *mucus* of membranes; by the *pepsin* and *albuminous ferments*; and by the *colouring-matters* of the blood, bile, and other fluids. The *non-azotised* or *non-nitrogenous* compounds are represented by *fatty* or *oily* substances, containing *olein*, *stearin*, and *palmitin*; by the *cholesterin* of bile, blood, and nervous tissue; by the *lactic* and *formic* acids; by *animal glucose*; by *sugar of milk*, &c. The *inorganic* compounds of animals include water—which forms about two-thirds by weight of the human body—phosphorus, sulphur, silica, chlorine, and the other elements already enumerated. The processes of digestion, &c., it must also be remembered, include *chemical* as well as purely *vital* aspects. See DIGESTION, &c. Respiration, or breathing, thus also involves chemical considerations, in the interchange of oxygen and carbonic acid gases, whilst the excretions, or waste-matters of the body, have equally a chemical history of much interest.

Animal Flower. See ACTINIA and ANEMONE.

Animal Functions, the term applied to the function of *innervation*, or that included in the operations of the *nervous system*. This name is used in contradistinction to that of *vegetative* or *organic functions*. These latter consist of the functions of *nutrition* and *reproduction*, and are so named because they are common to both plants and animals; whereas the functions of the nervous system are supposed, in an ordinary sense, to be peculiar to, and to be possessed by, animals only.

Animal Heat is the heat produced by the various chemical and physical processes occurring in the living body. The chief of these are the union of oxygen with the blood in the lungs (see RESPIRATION), the formation of carbonic acid in the capillaries, the oxidation of hydrogen, sulphur, and phosphorus in the

tissues, and the formation of various chemical products during the action of the muscles and nerves. Modern research indicates that no physiological processes occur without the production or absorption of heat. The temperature of the body varies in different species of animals. As a general rule, the greater the activity of the animal the higher is the temperature of its body. The following are the temperatures, in degrees Fahrenheit, of a few well-known animals: Man, 98.4°; the ox, 99°; the sheep, 100°; the horse, 97°; the dog, 99.3°; the cat, 98.6°; the bat, 102°; the gull, 100°; the common hen, 102.99°; the pigeon, 106°; the falcon, 107°; the chaffinch, 107°. It will be seen that the temperature of birds is higher than that of mammals, with the exception of the bats, which have a higher temperature. The temperature of cold-blooded animals, such as toads, frogs, and serpents, is not more than a few degrees above that of the medium in which they live. Warm-blooded animals, on the other hand, maintain a remarkably constant temperature, which rarely varies within the limits of one or two degrees without indicating disease. This occurs although the temperature of the medium in which the warm-blooded being lives may vary through a very wide range. For example, the temperature of man, amidst the snows and ice of the Arctic regions and under a tropical sun, is found to be invariably in health from 98° to 99° Fahrenheit. These facts show that the body has the power of maintaining its temperature uniform, a condition essential to the health of warm-blooded animals. This equalisation of temperature is regulated chiefly by the functions of the skin. When exposed to a high temperature, above 98°, the sweat-glands of the skin secrete a fluid which, by its evaporation, produces a cooling effect. The higher the temperature in an atmosphere not saturated with aqueous vapour, the greater the amount of perspiration converted into vapour. These facts explain how it is that warm-blooded animals are able to live in a temperature much above blood-heat, provided the atmosphere be dry, as in an oven. Cases are on record in which men were able to endure a temperature of from 200° to 220° Fahrenheit for a short time. On the other hand, such a temperature would be unendurable, and would quickly destroy life, if the atmosphere were saturated with aqueous vapour. In these circumstances there would be no evaporation, and the body would become superheated.

The temperature of the body is also, no doubt, regulated to a considerable extent by the equable distribution of warm blood through the body. This is effected by the action of a special system of nerves termed the sympathetic system, which govern the size of the arteries. See SYMPATHETIC SYSTEM OF NERVES.

A. H. has in recent times been studied by the physician and surgeon with reference to the diagnosis and prognosis of disease. The thermometer is now of equal value with the stethoscope. It has been found by careful observation that even a slight permanent increase in the temperature of the body indicates a morbid condition; and if a rise of from 2° to 5° persists, the patient is regarded as being in a very dangerous condition. The explanation of this is, that morbid changes which may elude not only the sensations of the patient, but also all the powers of observation and diagnosis of the physician, are at once detected by the thermometer. The use of the instrument enables the physician to watch the progress of the case. With obscure chest symptoms a permanent rise of 2° or 3° may indicate pulmonary disease. In fever the temperature may rise towards night and abate towards morning, while a rise towards morning would be a sign of grave omen. It is the practice now, in all well-regulated hospitals, and in private life, to have a chart or table by the bedside of the patient, in which the temperature of the patient is recorded four times daily. In fevers, with acceleration of the pulse and respiration, in active consumption, in pyæmia, or poisoning of the blood by putrid infection, and in acute inflammatory diseases, temperatures of 104°, 106°, and even 110° have been noted. On the other hand, in asthma, in which the blood is imperfectly oxygenated in the lungs, the temperature is below 98.4°. In the stage of collapse in Asiatic cholera, the heat of the body may fall as low as 80° or 67°, that is, 15° to 28° below the normal temperature. The approach of death is usually indicated by a fall of temperature, with evaporation of profuse perspiration. It is remarkable that in some cases of cholera and yellow fever the temperature after death undergoes an actual elevation.

Animal Magnetism is a term applied to describe the influence one person may exert over another, controlling his ideas

and actions, which has been attributed to the influence of a particular principle similar to that at one time believed to reside in a magnet. It was supposed to be transmitted from one person to another through the medium of the nervous system, and some went so far as to speak of a magnetic fluid or emanation which existed in large quantity in certain individuals, and which they could impart to others by an effort of will. The existence of any fluid or emanation has never been demonstrated, and the phenomena attributed to its influence may be readily accounted for by well-known psychological processes.

In some circumstances, the mind becomes wholly occupied with one idea or train of thought, to the exclusion of all other considerations. This idea may be so powerful as to prompt to voluntary acts. If this state occur during sleep, it is termed dreaming if movements do not occur, and somnambulism if the impulse be so strong as to cause the individual to speak or to get out of bed and walk about. But similar conditions sometimes exist during waking hours, and are known as the states of reverie and abstraction. In these conditions the order of the thoughts and feelings are not regulated by the will, and are determined either by previous ideational states or by new impressions on the senses. If determined by previous ideational states, the individual is oblivious to external sensory impressions; if by new sensory impressions, the individual may be readily prompted to acts by the suggestions of another. Both of these conditions may occur naturally, and are manifested to a greater or less extent by persons who are, in common language, called absent-minded. But it is remarkable that they may also, in certain persons, be excited artificially. When this occurs, we have the phenomena attributed to A. M., mesmerism, and electro-biology, all terms used to express false theories. See ELECTRO-BIOLOGY, MESMERISM. When a person is in this condition, suggestions whispered into his ear by others are at once followed by corresponding acts. In like manner, suggestions may be conveyed by the other senses. Persons so affected are for the time entirely under the will of the operator, and so intense in some cases is the abstraction, that even painful impressions on the skin are not felt. To this condition the late Mr Braid of Manchester gave the name of *mono-ideism* or *hypnotism*, and he proposed to introduce it into medical practice in cases of sleeplessness, and ~~an~~ to produce anaesthesia, or painlessness, during surgical operations, or as a relief to suffering in painful maladies. It has been found, however, that the cases are comparatively few in number that can be benefited in this way. It is well the public should know that the phenomena of A. M. are purely physiological, and not to be accounted for by any occult principles of fluids or forces. For details regarding these conditions, see *Principles of Mental Physiology*, by William Carpenter, M.D., &c., chaps. xiv.-xvi. (Lond. 1874.)

Animalcules. This name has been popularly applied to indicate all animal forms of small or microscopic size, which are generally found inhabiting water. Zoologically, however, it is important to clearly distinguish between various groups and kinds of small animal organisms. Thus the Infusoria (q. v.) form animalcules of a low type of organisation, and are included among the Protozoa. These exist in immense numbers in fluids or infusions of decaying animal or vegetable matter, and are believed to be therein propagated from their germs or ova, which, borne in immense numbers by the atmosphere, fall into such fluids, and there develop into animalcules. These, again, are to be carefully distinguished from the *Rotifera* (q. v.), or wheel-animalcules, which inhabit the waters of pools, &c. The 'wheel-animalcules' are of much higher organisation than the preceding forms, and are included in the sub-kingdom *Echinozoa* or *Amnolida*. They were, in the early days of microscopic inquiry, classified with the Infusoria, until better microscopes and higher powers showed their superior structure. Included in a heterogeneous manner with the Infusoria, Rotifera, and other small organisms, under the name of 'animalcules,' many Protophyta, or lower plants, many *Algae*, &c., were formerly arranged. But the more careful pursuit of microscopic inquiry has separated out these varied forms, and allocated them to their proper divisions in the animal and plant worlds. The term 'animalcule' can only now be used in a general sense, and as such is never employed in zoology, unless the special kind of animalcule or organism be also designated. We thus speak of *Infusorian* animalcules or of *Rotiferous* animalcules, &c. The Infusoria

are found in a fossil state, and exist in certain formations, along with the remains of *Diatomacea*, *Foraminifera*, &c.

Animals, Cruelty to. In England and in Scotland, injury done to an animal, being the property of any one, has always been held as an offence against the law; but until our own time the injury has been punishable by law solely as an offence against the right of property. It is now recognised that a certain class of animals are entitled to be legally protected from needless pain for their own sake; and in so protecting them, we believe that we are improving the morality, and consequently the happiness, of mankind. By 12 and 13 Vict. c. 92, the over-driving or ill-treatment of any 'domestic animal' renders the offender liable in a fine of £5. A curious question recently arose under this clause of the Act. The keeper of a menagerie was proved to be systematically ill-treating a hyena, and the point was, could a hyena be regarded as a 'domestic animal'? otherwise, it was not protected by the Act. It was contended that though hyenas in general were not domestic, this one, as the inmate of a caravan, was so. The point was not decided. The Act makes a variety of other humane provisions against baiting animals, and causing them to fight, and for their slaughter and conveyance.

Animals, Worship of, a species of idolatry common among some of even the most polished nations of antiquity, and still practised by barbarous tribes. It owes its origin to the mystery which surrounds a form of life differing from the human, to the natural reverence men have for power, and to a desire to penetrate the future, a knowledge of which some animals were supposed capable somehow of communicating. The gods were frequently symbolised by animals, and the doctrine of the Metempsychosis (q. v.) aided in generating and strengthening the idea of animal-worship. Peoples diverging widely in race, locality, and culture agreed in holding kindred notions on this subject. The instance of animal-worship of which we have the fullest details is that of the worship of the bull Apis by the ancient Egyptians. Apis was the emblem of the soul of Osiris, originally a sun-god; and the golden calf of the Israelites was simply a memory of Egypt.

Anima Mundi ('the soul of the world'), a name given by some ancient philosophers to a supposed intelligent, immaterial force, which was the source of all forms of life. In later times, the doctrine merged into Pantheism.

An'ime, a kind of resin obtained from the W. Indian locust-tree (*Hymenaea Courbaril*), which is used as varnish. The name A., however, is also applied to similar resins obtained from different sources.

Anion. See ANODE.

An'ise, an annual plant, called by botanists *Pimpinella Anisum*, belonging to the order *Umbellifera*. It is cultivated in many parts of Europe for its fruit, which is used as a condiment, and in the preparation of certain kinds of liqueurs under the name of A.-seed. It contains a volatile oil. The plant in all its parts is aromatic. In Italy a beverage is used called A.-water, flavoured with A.-oil. The word *Anethum*, which has been translated A. in the New Testament (Matt. xxiii. 23), appears to be the plant known as Dill (q. v.). Star A. is the fruit of a small tree belonging to the natural order *Magnoliaceae*. See ILLICIUM.

Anjou, a former province of France, with an area of 3080 sq. miles, now forms the department of Maine-et-Loire, and part of Sarthe, Mayenne, and Indre-et-Loire. Its ancient inhabitants were the Celtic *Andegavi*. On the break up of Charlemagne's dream of a Holy Roman Empire, it became a sovereign county, under Ingelger, in the 9th c. In 1060 it passed to the powerful house of Gatinais. One of this family, Godfrey, Count of A., married Matilda, daughter of Henry I. of England, and founded the line of the Plantagenets. His son, Henry II., retained A. as a possession of the English crown; but it was taken from King John (1204) by Philip Augustus of France. St Louis gave it to his brother Charles, who was the founder of the elder house of A., which gave kings to Naples, Sicily, and Hungary. In 1328 it was annexed to the French crown by Philip VI.; but in 1356 King John gave it to his second son Louis, who thus became the founder of the younger house of A. Meanwhile it had been raised from a county to a duchy. After several other

changes, it was finally annexed to the French crown (1474) by Louis XI. The honorary title Duke of A. was long maintained in the royal family; the last who bore it was the grandson of Louis XIV., afterwards Philip V. of Spain. See Kitchin's *History of France* (Clar. Pr. Ser. 1873).

Ankarström, John Jacob, born in 1761, was the son of a Swedish gentleman who had served with distinction in the army. He was first a court page, and afterwards a captain in the king's body-guard. Having been accused of treason, he was discharged in 1783 for want of proof; but he harboured a grudge against his sovereign for harsh treatment dealt him during his trial, and eagerly entered into the designs of that portion of the Swedish nobility who were discontented with Gustavus III. for his attempts to restrict their privileges. The assassination was planned as early as 1790, and was effected by A. on the 15th of March 1792. He was beheaded on the 29th of April, after having been publicly flogged for three days in succession, and never showed any contrition for his crime.

Anklam, a town in the province of Pomerania, Prussia, 44 miles N.W. of Stettin, on the Peene, 4 miles from its mouth. It is connected by railway on the one side with Stettin, on the other with Stralsund and Greifswald. A. is a considerable port; shipbuilding is an important industry; there are also breweries, factories, soap-works, and tanneries. A., which is a very old town, was a member of the Hanseatic League from 1319 to 1638. During the wars of the 17th and 18th centuries it was repeatedly destroyed, and at the end of the Seven Years' War (1762) it was dismantled. With the rest of Swedish Pomerania, it finally came into the possession of Prussia in 1815. Pop. (1872) 11,440.

Ankle. The A. is part of the lower extremity, including the lower part of the leg and the upper part of the foot. It contains a joint, termed the A.-joint. The bones entering into its formation are the lower end of the tibia and fibula, and the astragalus. These bones are firmly united by powerful ligaments. The movements at the A.-joint are those of flexion and extension. A small amount of lateral motion is also allowed in the condition of complete extension, but there is none in flexion.

Ankle, Surgery of. In disease of the bones or soft tissues of the foot, it may be necessary to amputate at the ankle-joint, an operation first executed by Syme. In this operation the bones of the leg are disarticulated from the astragalus, and a soft covering for the stump is taken from the heel. A modification of this operation was introduced by a Russian surgeon, Pirogoff, in which the posterior part of the bone of the heel (as *calcus*) is left in the flap.

Dislocation of the ankle frequently occurs, and is almost invariably connected with fracture of the lower end of the fibula or of the internal malleolus, the lower process of the tibia. The foot may be pushed to either side, forwards or backwards, but the most common displacement is outwards. The dislocation is easily put right by traction into the proper position, and the after-application of leg-splints with lateral foot-pieces. Compound dislocations of the ankle-joint are very serious, and in many cases portions of bone have to be removed before the parts can be brought into proper position.

Fractures may pass through the bones forming the ankle-joint, exciting inflammation. Wounds of the ankle-joint are usually attended by great constitutional disturbance.

Lastly, the ankle-joint may be weak from a relaxed state of the ligaments. In these cases elastic ankle supports, bandages, or even pasteboard supports may be required.

Ankobar, the capital of the kingdom of Shoa, Abyssinia, near the river Habesh, on a tableland 8198 feet above the sea. It is chiefly composed of huts, the only stone building in the town being the royal palace. The court resides here during part of each year on account of the agreeable climate. A. is fortified with a wooden palisade. The adjacent country is densely wooded. Pop. about 10,000.

Ankylo'sis is what is commonly known as stiff joint. It is the result of inflammation which has destroyed the cartilaginous surfaces of the bones or the ligaments connecting the bones together. Nature effects repair by causing the parts to become cemented together, and also produces more or less complete

consolidation of the parts around the articulation. It is of two kinds: the incomplete, in which the capsules or fibrous bands connecting the bones are thickened or shortened, but not to such an extent as to produce absolute immobility; and the complete, in which the osseous surfaces become fused together by direct bony union, so as to render the joint completely immovable. Surgeons do not usually interfere with ankylosed joints, but in some cases the fibrous bands may be divided and the connections forcibly separated. In some cases, amputation may have to be resorted to where the ankylosed joint is inconveniently fixed, resists attempts to put it in a better position, and causes atrophy of the limb.

Ann, or **Annat**, in Scotland, is the right of a minister's executors to one-half the stipend beyond what is due to the estate of the deceased minister; it is divided equally between the widow and children, for whose support it is provided. The minister therefore cannot assign it away by deed or bankruptcy. The feu-duties on which the price of a glebe may be invested form part of A.

Anna Carlovna, Regent of Russia (1740-41), born in 1718, and was the daughter of Karl Leopold, Duke of Mecklenburg, and of Katharina, sister of Anna Ivanovna (q. v.), Empress of Russia. The latter had named as her successor Ivan, son of A., to please her favourite Biron (q. v.), whose object was to secure the regency. This he did, but in a few weeks he was overthrown. A. then proclaimed herself regent, but she proved quite unfit for the position. A conspiracy was formed in 1741 for raising Elizabeth, daughter of Peter the Great and of Catharine, to the throne. It succeeded; and A. and her husband, Anton Ulric, Duke of Brunswick-Wolfenbüttel, whom she had married in 1739, were condemned to imprisonment for life in Cholmogory, a town on an island in the Dwina. Here she died, 18th March 1746. Her husband died in 1780, having been thirty-nine years in prison.

Anna Comnena, daughter of the Byzantine emperor Alexius I., was born 1st December 1083. A brilliant education in eloquence, poetry, philosophy, and mathematics secured her a reputation probably beyond her merits, but to her passion for literature she added a passion for political power. Aided by her mother, the Empress Irene, she endeavoured to induce Alexius to disinherit Calo-Joannes, his eldest surviving son. Failing in this, she formed a conspiracy against the life of her brother, in which her husband Nicephorus Bryennias refused to join. She again failed. Her brother treated her with great magnanimity. He spared her life, and though he deprived her of her property, he soon afterwards restored it to her. Henceforth she contented herself with supremacy over the *beaux esprits* of the imperial court. In 1137 her husband died, when she retired into a convent. Her *Alexiad*, a biography of her father, written in Greek (*Anna Comnena Alexiados, Libri XIX.*), was finished in 1148, and she died the same year. While it professes infinite regard for truth, and to proceed on careful inquiry, the style, which is affected, and the perpetual eulogy of Alexius, hardly sustain these assertions. Nor does the character of A. C. lead us to expect from her truth and impartiality. Yet the work is one of the most interesting in the whole series of the Byzantine historians, and is indispensable to a full conception of the first crusade.

Anna Ivanovna, Empress of Russia, born 25th January 1693, was the second daughter of Ivan, the elder half-brother of Peter the Great. In 1710 she married Frederick William, second Duke of Courland, but became a widow in the following year. On the death of Peter II., 19th January 1730, the throne of Russia was offered to her by the supreme council, conditionally on her acceptance of seven articles, which changed the despotism of Russia into a limited monarchy. A. accepted these articles, but shortly after so doing she convoked the senate in her palace, and declared her promises null, as having been fraudulently obtained, and proclaimed herself 'Autocrat of all the Russians.' For some time her policy was humane and peaceful, but having fallen under the influence of her paramour Biron—an avaricious and cruel man—it became quite the reverse. The cruelty and bloodshed attributed to Biron almost exceeds belief. A. died 28th October 1740, leaving the throne to her grand-nephew Ivan under the regency of Biron (q. v.) See ANNA CARLOVNA. Man-

stein, *Mémoires* (Lyon, 1778), and Schtschebalskij, *Wstupleni na Prstol Imp. Anny* (Mosk. 1859).

Anna, St., according to tradition, the wife of St Joachim, and the mother of the Virgin Mary, is first mentioned in the writings of St Epiphanius (4th c.); yet already in the 8th c. she was invoked throughout the whole Church, and she still claims a day in the Catholic (26th July) and in the Greek (9th December) calendars. The legend of St A. states that her body was brought from Palestine to Constantinople in 710, and since then many churches boast to have relics of her person. In her honour was founded a religious brotherhood early in the middle ages, which was revived under Jesuit influences after the Reformation, and still exists.

An'naberg, a town of Zwickau, Saxony, on the Sehm, 18 miles S. of Chemnitz by rail. It lies 1800 feet above the sea, and near it are silver, tin, cobalt, and iron mines. A. is famed for its lace and silk ribbons. In the neighbourhood are fine saline springs. Pop. (1872) 11,693.

Annals, the records of one or more years arranged chronologically, a term derived from the *Annales Pontificum*, drawn up at Rome by the *Pontifex Maximus*, and the subsequent A. of Fabius Pictor. The A. of Tacitus is the first work to which the term is applied in precisely the modern sense. There is a valuable work in the English tongue, commonly called the *Anglo-Saxon Chronicle*, which is strictly annalistic, though not so called.

Annambosé, a small seaport on the Gold Coast, Africa, 10 miles E. of Cape Coast Castle. The Ashantees attacked it (1807), and killed two-thirds of the inhabitants. It is protected by a British fort, and the gold trade, the only industry of the place, is on the increase. Pop. about 5000.

Annan, a seaport town and royal burgh in Dumfriesshire, on the river A., about a mile from its entrance into Solway Firth. It is a place of great antiquity, and was the residence of the Bruce family. The town is well built; its environs are studded with villas; and the river, here spanned by a bridge, is celebrated for salmon-fishing. The chief industries are cotton-weaving, tanning, and bacon-curing. A. is a station on the Glasgow and South-Western Railway, and has regular communication by steamers with Liverpool and Whitehaven. It was the birthplace of the famous preacher Edward Irving. Along with Dumfries, Lochmaben, Sanquhar, and Kirkcudbright, A. returns one member to Parliament. Pop. (1871) 4631.

Annapolis, a port of entry, and capital of Maryland, U. S., on the Severn, about 2 miles above its entrance into Chesapeake Bay. It was founded in 1649 under the name of Providence, but was afterwards called A., in honour of Queen Anne. It contains several handsome public buildings, and is the seat of St John's College, founded in 1787, and of the U. S. Naval Academy, established 1845. It is connected by railway with Baltimore and Washington. Pop. (1870) 7363.

Annapolis, a small seaport of Nova Scotia, lies in a fruitful region of the same name on the Bay of Fundy. It was founded as Port Royal by the French in 1604, and is therefore the oldest European settlement on the mainland of N. America. In 1713, along with the rest of the province, it passed into the hands of the English, when it was called A. in honour of Queen Anne. A. was the capital till 1750, when the seat of government was removed to Halifax. Since then it has declined. Pop. (1870) about 500.

Ann Arbor, a town of Michigan, U. S., on the Huron river, and a station on the Michigan Central Railway, 38 miles W. of Detroit. It has a flourishing trade in agricultural produce and implements, but is chiefly notable as the seat of the State University, founded in 1837, and which has attained a high reputation. Pop. (1870) 7363.

An'notes, or **First-Fruits**. The fruits of a benefice during the first year of occupancy were for many centuries claimed by the Pope on presenting to bishoprics and abbacies, and latterly also from the inferior clergy. In England protests were frequently made, and in the reign of Edward III. the Pope offered to compound for an annual tax of one-twentieth. By the Statute of Recusants (25 Hen. VIII. c. 20, and confirming Act), the right to A., and also to tenths (an annual tax exacted from all livings by the Pope), was vested in the king and his successors.

the Pope having been deprived of his right to present by Bull. A valuation of all benefices was also made by Henry. By 2 and 3 Anne, c. 11, both A. and tenths were vested in the governors of the Bounty of Queen Anne for the augmentation of the maintenance of the poorer clergy. The collection of this fund was reformed by 1 Vict. c. 20. The annual income from A. and tenths is between £15,000 and £16,000; but from a parliamentary grant fund, amounting to above a million, invested savings, and sums received in trust from private benefactors, the governors are able to pay more than £100,000 *per annum* to the clergy. Benefices under £50 *per annum* in value are exempted from A.; and where the estates of holders of dignities, prebends, and offices are vested in the Ecclesiastical Commissioners, one-twentieth of the annual value is paid in lieu of A. and tenths. The governors augment in sums of £200 of capital, not by annual payments. Augmented curacies are declared perpetual. A private contributor to the augmentation often becomes patron. The governors have advanced large sums for the endowment of new churches in populous places on the security of the property vested in the Ecclesiastical Commissioners under the Cathedral Acts, and in loans under Gilbert's Acts. In Ireland, A., formerly payable to a Board of First-Fruits, and applied to augment stipends and repair churches, were in the shape of an annual tax transferred in 1833 to the Ecclesiastical Commissioners. Under Mr Gladstone's Act, the Commissioners of Irish Church Temporalities have recovered considerable sums advanced for erecting glebe-houses.

Annot, another name for the red colouring-matter called Anotto (q. v.)

Anne, Queen of Great Britain and Ireland, was born 6th February 1664. She was the second daughter of James, Duke of York, afterwards James II., and of Anne Hyde, daughter of Lord Chancellor Clarendon. In 1684 she was married to Prince George of Denmark. She bore seventeen children to Prince George, but only one, the Duke of Gloucester, survived infancy, and he died in 1700 in his 12th year. On the duke's death, Parliament passed the Act known as the Act of Settlement (q. v.) Under it A. succeeded to the throne, on the death of William III., on 8th March 1702, she having, with her father's permission, been educated in the principles of the Church of England. To these principles she was ever steadfast. Even her father's offer, after his accession, to prefer her in the succession to her elder sister Mary, on condition of her joining the Church of Rome, did not cause her to waver. Nevertheless, the character of A. was essentially weak, while few English sovereigns have been placed in circumstances in which firmness was more required. When the Prince of Orange landed, natural affection led her to join her father, whose favourite daughter she was; but Lord and Lady Churchill decided otherwise for her. During the War of Succession (q. v.), waged by England, the Empire, and Holland against France and Spain, A. and her court were under the rule of the celebrated Sarah Jennings, Duchess of Marlborough, and of the still more famous Duke of Marlborough. The duke's splendid victories dazzled the nation, long blind to the fact that they were barren so far as England was concerned, and bought at an enormous price. A much more important achievement in the reign of A. than the victory of Blenheim, though comparatively little thought of at the time, was the capture, during the same year (1704), by Sir George Rook, of the fortress of Gibraltar. Tired of the Marlboroughs, A. took refuge in a new favourite, a Mrs Masham, whom the Duchess of Marlborough had herself brought into the queen's household. Mrs Masham, coalescing with Henry St John, Lord Bolingbroke, and other Tory leaders, effected a change of government in 1710. The policy of the new ministry, in which the queen concurred, was to secure the succession to her brother; but the design was frustrated by the internal dissension of the Cabinet, its inability to act in harmony with Mrs Masham, and by the feeling of the nation. A. died 1st August 1714, the last of the Stuart family that occupied the throne of Great Britain. She was succeeded by the Elector of Hanover as George I. If not a great queen, A. seems to have been an amiable woman. Her reign has been made illustrious by the many great men in science and literature who lived under it. Pope, Swift, Addison, are only foremost of the numerous 'wits of Queen Anne's time,' whose exquisite gifts have led some to regard it as the Augustan age of English literature.

Anne of Austria, daughter of Philip II. of Spain, was born 1601, and married to Louis XIII. of France in 1615. Cardinal Richelieu, who cherished a deadly hatred against Austria, by representing that A. conveyed state intelligence to her native country, made the marriage an unhappy one. On the death of Louis in 1643, A. became regent, and chose for her minister Cardinal Mazarin, by whose skilful management, and vigorous suppression of the war of the Fronde, Louis XIV. mounted a firmly-established throne. She died 20th January 1666. A.'s temper was cold, her disposition grave, and her skill in the choice of instruments unerring.

Annealing is the process by which the brittleness of glass is lessened after it has been manufactured. The same process is also applied to certain metals after they are melted and suddenly cooled, or when they have been submitted to a heavy blow or long-continued hammering. The tempering of steel is also essentially a process of A. The process consists in inducing a very gradual cooling, and to effect this in the case of glass, the material has first to be raised to a high temperature. The sheets of glass or glass vessels to be annealed are placed in the A. oven, or 'lier,' which is a long chamber highly heated at the one end. They are gradually moved forward from the hot towards the cooler end, and so allowed to cool in a gradual, uniform manner. A process for the A. of glass has recently been made public by M. de Bastie, by which it is affirmed that the material acquires a remarkable toughness without injury to its transparency. It consists in heating the glass to redness and cooling it in oil, and by this means, it is said, the breaking-strain is three or four times what it would have been if the glass had been annealed by the ordinary process. A. has to be resorted to in the process of wire-drawing, stamping of medals and coins, and boiler-plate rolling; and iron castings softened by A. are called malleable cast iron. The effect of A. depends on the fact that the molecules composing a solid body, which has been highly heated or molten, and allowed to cool suddenly or irregularly, do not assume their most stable position in relation to each other. If the rate of cooling be slow, however, the molecules so dispose themselves that the body, when restored to its original temperature, is capable of resisting the maximum strain without fracture.

An'necy, a town in the department of Haute Savoie, France, has a beautiful situation on the Lake of A., 21 miles S. of Geneva. It belonged during the middle ages to the Counts of Geneva till the extinction of that family, when it was united to Savoy. With the rest of Savoy, it was transferred to France in 1860. Near it is Old A. (*An'necy-le-Vieux*), now a mere village, from which in the 12th c. it was distinguished by the name *Novum Annesium*. The chief buildings are the ruined chateau of the old Counts of Geneva, and the cathedral where are preserved the remains of St Francis de Sales. A. has considerable manufactures of linen, cotton yarn, glass, and sulphuric acid, and its bleach-fields date from 1650. In the vicinity are three remarkable 'ice-caves' or subterranean *glacieres* of large dimensions. Pop. (1872) 9097. Lake A. is 9 miles long and 2 broad, and is overshadowed by magnificent hills.

An'nelida, the representative class of the *Anarthropoda* or lower annulose animals, represented by the four orders of true *Worms*. This group corresponds to one division of the Linnean class *Vermes*. The body is elongated, and consists of a series of somites, or segments arranged along a longitudinal axis. No articulated limbs exist as in insects, &c., but the higher annelides are provided with bristles or setae attached to the sides of the body-joints, and by means of which the body is supported during locomotion. The blood is red or greenish in colour. A distinct head may be wanting. A system of vessels (*pseudo-haemal system*) exists, which circulates fluid throughout the body, and is connected with the breathing processes in these forms. The first order, *Suctorior* or *Hirudinea*, is represented by the leeches, &c. The second order, *Oligochaeta* or *Terricola*, includes the earth-worms and river-worms. The third order, or *Tubicola*, includes the *Serpula*, *Terebella*, &c., which make tubes to protect their bodies; and the *Errantia*, forming the fourth order, are represented by lobworms, aphrodites or sea-mice, and other marine forms. The last two orders breathe by gills, and are termed Branchiate annelides.

Annonay (anc. *Annoneum*), a town in the department of Ardèche, France, 37 miles S. of Lyon. It lies picturesquely at

the confluence of the rivers Deaume and Canoe. First mentioned about the close of the first crusade. It soon after became the capital of a marquisate, and was, as early as the 14th c., noted for its parchment manufacture, which, after the invention of printing, was changed to paper. It has still extensive paper-mills, which produce 300,000 reams yearly. Its other manufactures are chiefly silk, cotton twist, kid-skins, and woollens. Much silk is produced in the vicinity. The two famous inventors Montgolfier were born here. Pop. (1872) 15,052.

Annual, applied in botany to those plants which flower and fruit the same year they are raised from seed, and then die. Many very showy annuals are cultivated in our gardens.

Annual Register, a yearly record of public events, first published in 1759, and continued down to the present time. It was projected by Robert Dodsley, the bookseller, and for many years Edmund Burke was one of the chief contributors. Indices to the work have appeared at various times, and the whole forms a valuable historical repository. Similar publications had preceded the A. R., of which the principal were Royer's *Political State of Europe* (1711-39), the *Historical Register* (1716-38), and Edward Cave's *Gentleman's Magazine*, begun in 1731. The *Edinburgh A. R.* (1808-27), a rival work, numbered Sir Walter Scott and Southey among its contributors. In Paris the *Annuaire Historique* (1818-49) was superseded by the present *Annuaire des Deux Mondes*. There is an *American A. R.* published at New York.

Annuals were a series of expensive and luxurious gift-books for Christmas, New Year, and birthdays, which appeared in considerable number during the first half of this century. The *Literary Souvenir*, the *Keepsake*, the *Book of Beauty*, the *Forget-me-not*, were the most successful. The last of them, the *Keepsake*, expired in 1856, but since then the name has been revived in Beeton's *Christmas Annual*, which for twelve years has had great popularity. It is the property of Messrs Ward and Lock, Mr Beeton being now simply editor.

Annuity. A certain sum of money paid to any one yearly, or at the end of a fixed period, is, in the wide sense of the word, an A. Usually, however, when we talk of an A., we mean to denote an income which is not derived from the possession of capital. Thus, if a man invests in his own name £1000 at 5 per cent., we should say this gave him an income of £50 a year. If, however, he give his £1000 to another, on condition that he is to receive £70 or £80 for so many years, or for life, we then speak of the return so derived as an A. Annuities are of many kinds. They may be perpetual, descending to heirs; they may be for life, or for a limited number of years. Then there are *deferred* annuities, that is, of which the payment does not begin until a stated period after the payment of the consideration; there are *survivorship* annuities, such as an A. payable to B on death of C, or an A. payable to B or C on death of the first; or *contingent*, as payable to B provided he survive C.

The variety in the nature of annuities is almost endless; and so, consequently, is the nature of the calculations regarding them. These are often very complex; but there are two main elements in them all—the value of money, and the expectation of life. See **ACTUARY**; **LIFE, EXPECTATION OF**; **LIFE, MEAN DURATION OF**; and **MORTALITY, LAWS OF**. By the 'value of money,' we mean the rate of interest which it produces; money being spoken of, commercially, as *cheap* or *dear*, according as the current rate falls below or rises above the mean rate. But for A. calculations it is not the current but the prospective rate that is to be considered; and experience has shown that the only safe way to estimate this is on the data of the past. This is in Great Britain held to be, on real security, 4 per cent., or a fraction above it. Assuming it at 4 per cent., we shall give an example of the mode of calculating the value of a simple, single, life A., this method being the basis of other and much more compendious methods of skilled actuaries. It is required to know the value of an A. of £1, to be paid to B, aged 20. It being understood that all annuities are payable at the end of one year from the date at which they are granted, it is plain that £1 paid for the year's A. would be too much; that is, the value on 1st January 1874, of £1, payable to B on 1st January 1875, is not £1, but the sum which, with interest at 4 per cent., will, in one year, amount to £1. This sum is £0.9615 (see **INTEREST**), or

£0. 19s. 2½d. Nineteen shillings and twopence three farthings would therefore, as nearly as may be, be the value of the first year's A. were B certain to live; but as he is not, we must refer to tables to ascertain the fraction expressing the probability that B, aged 20, will live for one year. Referring to articles cited above, and assuming the probability to be, as it nearly is (certainty being expressed by unity), '986, we have £0.9615 × '986 = £0.9480 = £0. 18s. 11d. as the value of the first year's A. This process being repeated for every year until by the tables age 20 is extinct, and the whole results being added, we shall have the value required. Having got the value of an A. of £1, the value of an A. of any number of pounds can of course be easily found. He who has provision to make for others, or who, from other causes, desires to be thrifty, will find a little study of an A. table well bestowed. It shows to what immense pecuniary results little savings must in time attain. Thus, in thirty years, £1 annually saved, with interest at 5 per cent., will amount to £66.438—consequently £10 a year for the same period will be £664.38.

Annuity, in English law, is a yearly payment of a certain sum of money for life, or a term of years. If payable out of lands, it is properly called a *rent-charge*; but if both the person and estate are made liable, then it is called an A. Under 10 Geo. IV. c. 24, and other statutes, the Commissioners for the Reduction of the National Debt may grant life annuities payable out of the Consolidated Fund, either on one or two lives, or on the continuance of two joint lives, and other kinds of annuities, immediate or deferred, or for a term of years. Annuities granted under the Acts are proportioned to the duration of human life, as ascertained by tables of observation approved of by the Treasury. The purchase is to be made either by the transfer of not less than £100 stock, or by the advance of money, or by the payment of any sum yearly not less than £100. Annuities will not be granted in any case where the Commissioners decline.

In Scotland, as in England, an A. may be charged on real estate by deed, called a bond of A.

Annulet (Lat. *annulus*, a ring), in architecture, is a small ornamental fillet encircling a column, &c. The name was more particularly applied by the ancient architects to the band that girt the capitals of Doric pillars.

Annuloidæ, the term applied to the sub-kingdom *Echinozoa*, one of the primary divisions of the animal world. This group is represented by star-fishes, sea-urchins, sea-cucumbers, tape-worms, and other entozoa, and by wheel-animalcules or rotifera. It corresponds in part to the *Radiata* division of Cuvier, the members of which division are now distributed among the sub-kingdoms *Coelenteratæ*, A., and *Annulosa*. The A. possess a radial symmetry, a perfect digestive system; a nervous system exists in all, and a heart and vascular system in most; whilst in all a peculiar system of vessels ramifies through their bodies—the latter being termed the *aquiferous*, *water-vascular*, or sometimes the *ambulacral* system.

Annulosa. See **ARTICULATA**.

Anulus Ovalis, a circular ridge seen on the right side of the septum between the auricles of the heart. It surrounds a depression called *fossa ovalis*; but in foetal life this is pervious, so as to permit the passage of blood from the right to the left auricle. See **FETAL CIRCULATION**.

Annunciation, Orders of the. In honour of the A. of the Virgin Mary, one secular order of knights and two religious orders of nuns have been formed. 1. *The Order of Knights of the A.*, instituted in 1360 by Amadeus VI. of Savoy, and in 1720 declared the supreme order in the kingdom. The knights must have previously received the badges of St Maurice and St Lazarus, and be of distinguished rank. The king is grand-master, under whom are a chancellor, secretary, almoner, and treasurer. The decoration is a gold medal, with a representation of the A., the collar composed of alternate love-knots and roses. On the roses are engraved the letters F.E.R.T., the interpretation of which, according to some, is *Fortitudo ejus Rhodum tenuit*, in reference to the brave defence of that island by the Duke of Savoy; according to others, *Frappes, entra, rompes tous*. Since 1680 the knights have worn on their breasts a star or sun with streaming rays, in the midst of which there is a representation of the A. 2. *Of the Order of Nuns of the A.*

one belongs to France and the other to Italy. The *French* order was founded at Bourges in 1501, by Joanna of Valois, after her separation from Louis XII., for noble maidens of unblemished fame, and was placed by the Pope, in 1517, under the ecclesiastical direction of the Franciscans. It was destroyed at the Revolution, but still possesses houses at Boulogne and Ville-neuve. The *Italian* order was founded at Genoa in 1694, by Maria Vittoria Fornari, in conjunction with a rich friend, Vincenza Lomellini. In its palmiest days it counted fifty houses, mostly in Italy, but some in France and Germany also. It still exists, and has its chief house at Rome. Its surname of the 'heavenly' arose from the sky-blue dress which the nuns wear, and which makes them popularly spoken of in Rome as the *Turchine*, i.e., the 'Violet Flowers.'

An'us Deliberan'di was, in Scotland, the year allowed by law to an heir to make up his mind whether or not he would enter and represent his ancestor; *entry* involving responsibility for the debts of his ancestor. Under statutes of the present reign, however, proceedings may be taken against an heir-apparent to attack the heritable estate of his ancestor six months after the ancestor's death. See BENEFICIUM INVENTARIL.

Ano'bium. See BORER and DEATH-WATCH.

An'ode, the name given by Faraday to the *negative* electrode, the *positive* being called in contradistinction *cathode*. The substance given off during Electrolysis (q. v.) at the A. is termed the *anion*, and the other product of the electrolytic action the *cathion*.

An'odon, a genus of Lamellibranchiate mollusca, included in the family *Unionida*, or that of the fresh-water mussels, in which the shell is generally equivalve, the outer ligament of large size, and the foot also of large size and of compressed shape. Of the anodons, or 'pond mussels,' as they are popularly called, examples occur in the rivers and lakes of Siberia, N. America, and Europe. Many species are known, the 'swan mussel' (*Anodonta cygnea*) being a familiar form. Other species comprise the *A. angulata*, *A. ensiformis*, *A. anserina*, *A. magnifica*, &c.

Anodynes, substances which, when applied externally or introduced into the body, relieve pain. When applied externally, they act by diminishing the sensibility of the nerves of the part, which, during pain, is excited to a greater degree than normal. This is the effect produced by liniments of opium or belladonna, or aconite. But as all sensory impressions which give rise to feelings of pain are conveyed to the brain, it is evident that if we diminish the sensibility of that organ by remedies which act specially on it, we may relieve pain. Accordingly we find that all substances which lower the sensibility of the brain are A. See ANÆSTHESIA.

Anointing. See CHRISM, CORONATION, EXTREME UNCTION.

Anomalis'tic Year is the time of revolution of a planet or satellite from either apse to the same again. Owing to the continual though slight variation in the position of the apse, this year, in the case of the earth, is twenty-five minutes longer than the tropical year.

Anom'aly (Gr. *anomalía*, irregularity) of a planet at any instant is the inclination of the line joining the perihelion apse and the focus to the radius vector at that instant. The problem of finding the true A. is one of considerable difficulty, and is known as Kepler's Problem, from the circumstance of its having been first proposed by Kepler.

Anomu'ra, a section of the Decapodous order of Crustaceans, which order is represented by the familiar crabs, lobsters, shrimps, &c. The A. are represented by the 'hermit,' or 'soldier' crabs, and their allies, these forms being distinguished by the soft nature of the abdomen, which is generally unprotected by a shell, and which does not terminate in a tail-fin, such as that possessed by the lobsters. The sponge-crabs (*Dromia*), the tree-crabs (*Birgus*), crab-lobsters (*Porcellana*), &c., are also familiar members of the Anomorous section.

Anona and **Anona'ceæ**, a genus and order of Dicotyledonous, Thalamifloral plants. They are trees or shrubs found chiefly in tropical countries. There are upwards of 30 genera

and 300 species in the order. Their properties are generally aromatic and fragrant; some are bitter and tonic, and others yield edible fruits. *A. reticulata* yields the Custard-Apple (q. v.), *A. squamosa* the Sweetsop (q. v.), and *A. muricata* the soursop of the W. Indies. A well-known Peruvian fruit called Cherimoyer (q. v.) is the produce of *A. cherimolia*. Ethiopian pepper is the fruit of *Xylopia aromatica*, a plant belonging to the order, as does also *X. glabra*, the bitterwood of the W. Indies, and *Duguetia guilarensis*, the lancewood of coachmakers.

Anon'ymous (Gr. nameless), applied to any book or writing to which the author has not affixed his name. To one bearing an assumed name the title applied is *Pseudonymous*. There is a French dictionary of A. and Pseudonymous works by Barbier (Paris, 1822-1825), but a similar work in English is still a desideratum. Political writing is, in Britain, usually A.; but of late it has become common for the writers of periodical criticism to adhibit their names to their articles.

Anoplothe'rium, an extinct genus of Ungulate or Hoofed quadrupeds, connecting the ruminants and swine, the fossil remains of which are found in the Lower Tertiary rocks. The *A. commune*, from the Eocene Tertiary formations, is a familiar form. The body was slender, the tail being elongated. The feet had each two hoofs, and rudimentary hoofs were occasionally developed. The dental formula showed six incisors, two canines, eight premolars, and six molars in each jaw. There was no break or interval between the molar and canine teeth. The A. forms the type of a special family included in the Omnivorous section of the Artiodactyle Ungulata. Other genera included in this family are the *Xiphodon*, also from the Upper Eocene formations; *Dichobune* from the Middle Eocene; and *Chalicotherium* of the Miocene rocks, &c.

Anoplu'ra, an order of lower or Apterous (wingless) insects represented by the various kinds of lice. See LOUSE. Cuvier called them *Parasita*, from their parasitic habits.

Anos'mia, insensibility to odours, or loss of smell. This condition may be congenital or acquired. When congenital, it is due to some defect in the olfactory apparatus which cannot be remedied. When acquired, it is caused by repeated inflammations of the mucous lining of the upper chambers of the nose which contains the terminal apparatus of smell. Severe catarrhs, inflammations, the excessive use of snuff, the application of irritant vapours, such as ammonia, may cause A.; and it has also been observed in some cases of brain disease.

Anot'to, or **Arnotto**, a fine red-colouring substance, obtained from the pulp surrounding the seeds of the tropical tree *Bixa orellana*. It is extensively employed in giving a tinge to cheese, and has become an article of considerable mercantile importance, in the form of cakes and of fluid, in all the dairy districts of the United Kingdom.

Anou'ra, an order of the class *Amphibia*, including the frogs, toads, and their allies, in which the tails, with which the tadpoles or larvæ are provided, disappear on the animals attaining maturity; thus leaving them in an 'anourous' or 'tailless' condition. They are also destitute of gills in adult life, although, like all other amphibia, they possess these structures in the early period of their existence; and they thus breathe exclusively by lungs in their mature state. Two pairs of limbs are invariably present. No scales are developed. Teeth are developed in a few instances only, and are then of small size. Three families are included in this order. The first is that of the frogs (*Ranidae*); the second includes the toads (*Bufonidae*); whilst the third is that of the *Pipidae*, which is represented by the Surinam toads and their allies.

An'quetil-Duper'on, **Abraham Hyacinthe**, an enthusiastic, though far from accurate, Oriental scholar, born at Paris, 7th December 1731. He studied theology for some time, but soon selected the field of Oriental languages, and after acquiring a fair acquaintance with Hebrew, Arabic, and Persian, he set out for India. Settling at Surat, among the Parsees or fire-worshippers, he became intimate with their *destours* or priests, was initiated into the doctrines of Zoroaster, got possession of some of his books, and returned to Europe in 1762 with a valuable collection of one hundred MSS. His *Zend-avesta*, in 3 vols., appeared in 1771. It contained a translation of several of the

sacred books of the Parsees, and attracted much attention from its introducing Europeans to authentic records of an ancient and interesting theology. Among his other works are *Legislation Orientale*, 1778; *L'Inde en Rapport avec L'Europe*, 1790; and *Oupnekhat*, 1804, consisting of extracts from the Vedas. He died at Paris, 17th January 1805.

Anselm, St., one of the earliest and greatest metaphysical theologians of the middle ages, was a native of Italy, and was born at Aosta, in Piedmont, in 1033. After a dissipated youth, he was drawn by the fame of Lanfranc (q. v.) to the monastery of Bec in Normandy, and in 1060 became a monk of the order of St Benedict. Three years later he was chosen prior, and in 1078 abbot of Bec. His tenderness, humility, earnestness, and prudence in dealing with the sins and frailties of the brethren proved the sincerity and the depth of his own repentance. In 1093 he succeeded Lanfranc in the archbishopric of Canterbury, but hardly a year had elapsed when he came into collision with the brutal and truculent William Rufus. The first cause of quarrel was a refusal on the part of the prelate to give the king as much money as he wanted for his expedition to Normandy to seize the dominions of his brother Robert; the second was his opposition to the acknowledgment of the anti-pope Clement III., who had been recognised by almost all the English bishops. After a brief reconciliation, the hostility of Rufus broke out afresh, and A. with difficulty obtained permission to leave the country in 1097. He went to Italy, and was received at Rome with the highest consideration. On the death of Rufus he was recalled to England by Henry I.; but difficulties soon arose regarding the right of investiture, and in 1103 he once more left for the Continent. By the friendly intervention of Adela, Countess of Blois, he was reconciled to Henry at the abbey of Bec, resumed his archiepiscopal seat in 1106, and died some three years after, on the 21st of April 1109. A. is justly regarded as the Augustine of the middle ages. He was superior to all his contemporaries in sagacity of mind and dialectical ability, and equal to the most eminent in virtue and piety. Profoundly conscious of the necessity of a religious philosophy, he strove to vindicate before the bar of reason the great Christian ideas that pervade the Augustinian theology. His most notable works are his *Monologium, sive Exemplum Meditandi de Ratione Fidei*, in which he seeks to systematically unfold the knowledge of God and of divine things on rational principles; his *Proslogium*, otherwise entitled *Fides quaerens Intellectum*, in which he proposes to demonstrate the existence of God by the idea of divine perfection, the first instance in history of the famous *a-priori* argument; his *Cur Deus Homo* and his *Concordia Prædestinationis*, which made an epoch in Christian philosophy, and the influence of which is still powerful in the sphere of Christian thought. Besides these, he wrote numerous other treatises, which it is unnecessary to specify. The principal editions of A.'s works are (1) that by Picard (Paris, 1610); (2) that by the Jesuit Raynault (Lyon, 1630), who divides the writings of A. into four classes—*Didactica, Ascetica, Parænetica*, and *Notha*; (3) that by Gerheron (Paris, 1675), in which the previous editions are carefully revised, and some fresh epistolary material added. A.'s life was written by his friend and secretary Eadmar, a monk of the Benedictine order. See Lingard's *History of England*, Ampère's *Histoire littéraire de la France*, Haureau's *De la Philosophie Scolastique*, Frank's *Anselm von Cantorbery* (Tüb. 1842), Hasse's *Leben* (Leipzig, 1843), and Remusat's *Saint Anselme de Cantorbery* (Paris, 1854; 2d ed. 1868). His character and work as a Churchman and thinker are finely portrayed by J. R. King in his *Short History of the English People* (Lond. 1875).

Anser. See DUCK and GOOSE.

Ansgar (Lat. *Ansharius* or *Anserius*), surnamed the Apostle of the N., was born in Picardy in 801, and educated at the monastery of Corbie, not far from Amiens, whence he passed in 822 to Corvei, in Westphalia. His first missionary visit to the N. was in the train of Harold, the newly-converted King of Denmark; his second was to the court of Björn, King of Sweden, who gave him permission to preach the gospel in his dominions. A. and his companions were crowned with success. In 832, Pope Gregory VII. appointed him legate of the Holy See, and first Archbishop of Upsala. On the destruction of this city by the Norsemen in 845, A. took refuge in Bremen. In the reign of Eric he again visited Denmark, and by his pious energy restored life and purity to the feeble and disordered Church. His subsequent labours in

Sweden were no less successful, and, covered with the glory of his conversions, he returned to Bremen, where he died, February 3, 865. The biography of A. has been written by St Rembert in Mabillon's *History of the Benedictines*, and in Langenbeck's *Scriptores Rerum Danicarum Medii Ævi*. See also Kruse's *Lebensbeschreibung A.'s* (Hann. 1824), and Klippel's *Lebensbeschreibung des Heil. A.* (Brem. 1845).

Anson, George, Lord, Admiral, born of a good family at Shugborough Manor, Staffordshire, in 1697, served as volunteer in the *Ruby* in 1712, and as second lieutenant in Sir George Byng's expedition (1718) to Sicily (which crushed the ambition of the King of Spain in the Mediterranean), and was promoted commander in 1722. A. obtained the command of a fleet commissioned to act against the Spaniards in the Pacific in 1739, and, after an absence of nearly four years, during which time he performed his celebrated *Voyage Round the World*, adding much to geographical knowledge, and capturing a rich Spanish galleon, he returned to receive the highest honours of his profession. In 1747, after having captured six French men-of-war and four richly-laden East Indiamen, he was raised to the peerage. Promoted admiral, and placed at the head of the Admiralty in 1757, he died, 6th June 1762, at Moor Park, Herts.

Anspach, or **Ansbach** (formerly *Onolzbach*), the capital of Middle Franconia, Bavaria, at the confluence of the Holzbach and Upper Rezat, 25 miles S.W. of Nürnberg. It was formerly capital of the *principality* of A., and still contains the deserted palace of the old Markgrafs of Brandenburg. Its chief manufactures are half-silken fabrics, cotton stuffs, tobacco, pottery, playing-cards, whitelead, and cutlery. A. is the birthplace of the poets Cronegk, Uz, and Count Platen, to the latter of whom a monument was here erected in 1859. Pop. (1872) 12,635. A., which owes its origin to a religious establishment of the 8th c., passed in 1288 to the Counts of Oettingen, and in 1331 to the Burggrafs of Nürnberg.

The *principality* of A., originally part of the Rangau, and peopled by a Slavie race, was given in 1474, by Albrecht Achilles, Elector of Brandenburg, to his second son Friedrich, the founder of the Frankish line of the Markgrafs of Brandenburg, who were again divided into the lines of Anspach and Baireuth. The last Markgr. of Anspach-Baireuth sold his state to the King of Prussia in 1791, who was compelled by Napoleon to surrender it to France in 1806. It then went to Bavaria, to which it still belongs.

Ant. Under this designation, popularly used, two distinct kinds of insects are included. The first of these is represented by our ordinary British ants, and those familiar to the inhabitants of temperate climates generally. These are Hymenopterous insects, and are included in that order along with the bees, wasps, and other and allied forms. The second kind of ants are the Termites or white ants of tropical climates, and these latter belong to the Nemoptera—an order of insects represented by the dragon-flies, may-flies, and similar forms. Like the ordinary and common ants, the Termites exhibit a social life, and show many wonderful and interesting traits of instinct and habits; but in structure and zoological position they differ from their more familiar neighbours.

The familiar ants (*Formicidae*) exist in communities, which consist of three kinds of individuals—males, females, and neuters, the last being either sexless individuals, or undeveloped females. The neuters in some species are divided themselves into two classes. The first of these includes the 'workers,' on whom devolve all the duties connected with the formation of the nest, with its repair, and with the care and upbringing of the young. The second class of neuters comprises the 'soldiers,' the sole office of which is to defend the colony, for which function they are provided with large jaws or 'mandibles.' The male and female ants possess wings, the neuters being wingless. The former two groups pair in autumn, after quitting the nest. The females are then impregnated, and lose their wings, and set about the task of founding fresh colonies from the eggs they deposit. The males die after impregnating the females. The females are the larger of the three kinds of individuals, and in

Ant (*Formica rufa*),
Male and Female.

some cases (as in the genera *Myrmica*, *Atta*, &c.) possess stings. Other species possess glands wherein a peculiar acid (formic acid), also found in nettles, is elaborated. This fluid possesses an acid or irritating effect upon man and lower animals, and is employed doubtless as a means of defence by the A. The neuters also possess stings, and these latter individuals are so developed or formed, probably from a difference of food with which they are provided in their young or larval state. The larvae that are to become males or females are thus fed on a food different from that supplied to the neuter larvae.

The remarkable instincts of ants have long formed topics of interest to naturalists. Although modern zoology has seen reason to doubt or dispute much that has been alleged of these insects, yet their reputation has in no way suffered from the curtailment of some of the statements of earlier observers. Thus certain ants (*Atta providens*, *A. barbara*, and *A. structor*) are known actually to store up grain, as stated in Solomon's well-known admonition to the sluggard; whilst other kinds are known to capture the young of different species, and to train up their captives as actual slaves, on whom the performance of the menial work of the hive devolves. *Formica rufescens* is thus a slave-making species; as also is *F. sanguinea*. Most ants also 'milk' the little *Aphids* or plant-lice—so common in our bushes and shrubs in the summer season—for the sake of the sweet liquid which the aphides secrete in a glandular structure situated in the abdomen. And by some naturalists, certain ants are alleged actually to keep the aphides within their nests, after the fashion of 'cows,' for the sake of this sweet secretion.

The nests of ants are constructed in various ways and of various materials. They are most commonly formed under the ground; the site of each being indicated by a little mound or hillock—the 'ant-hillocks' of the peasantry. Internally, the nest is divided into compartments or chambers of various kinds and sizes, connected by galleries, and appropriated to distinct purposes, such as the storing of food, nurseries for the young, &c. The red or horse A. of Britain (*Formica rufa*) makes the largest hillocks seen in this country. Other foreign species make nests of variable materials and in different situations. The 'mason A.' thus excavates the trunks of trees; whilst others utilise the tissues of plants as building materials. The most familiar genera of true ants are those included under the names of *Formica*, *Atta*, *Myrmica*, *Polyergus*, *Ponera*, &c. Very many species are included under these genera.

The White Ants are described in the article Termites (q. v.)

Antacids. This name is given in *matéria medica* to a number of substances which have the property of neutralising excessive acidity in the stomach, or in the blood, or in the urine. They are the alkalis and alkaline earths, and the carbonates and bicarbonates of these bases. Frequently they are given in practice along with the carbonate or sub-nitrate of bismuth, or with a bitter vegetable infusion. The principal A. in use are magnesia, carbonate of magnesia, lime-water, the carbonates and bicarbonates of soda and potash, and the carbonate and citrate of lithia.

Antæ. See PILASTER.

Antaloidas, a Spartan politician and diplomatist. When, some years after the Peloponnesian War, Athens seemed likely to re-establish her power, especially after the destruction of the Lacedæmonian fleet by the Athenian Conon, in the battle near Cnidus, 394 B.C., Sparta changed her foreign policy. From being obstinately Grecian, even to sectionalism, she resolved to sacrifice the control of the sea, and the protectorate of the Greek colonies in Asia Minor, for the sake of a Persian alliance which would secure to her again the hegemony or leadership of Hellas. With this view A. was sent (392 B.C.) on an embassy to Tirabazus, satrap of Sardis, and commander of the Persian forces in Asia Minor, who secretly supplied him with money to equip a navy, till he should have received authority from Artaxerxes to assist him openly. The Persian monarch, however, superseded Tirabazus, and it was not till 388 B.C. that A., now made Spartan admiral in the Asiatic waters, being sent out on a second embassy to Tirabazus, who had been reinstated, succeeded in securing through him the goodwill of the king, who aided the Spartans to force Athens to such a peace as Persia, inspired by Sparta, might dictate. The result was the Peace of A. (387 B.C.) Its three chief conditions were—(1) That the Greek cities

of Asia Minor should submit to the lordship of Persia; (2) that all the other Greek cities, great and small, should be autonomous; (3) that war should be declared against any city which should refuse to accept the conditions. Sparta was charged with the miserable task of seeing the treaty observed. The after-history of A. is obscure; but Plutarch's story that he committed suicide, in consequence of the indignation excited by his dishonourable peace, has not obtained credit. Soon after, Epaminondas destroyed the Spartan hegemony, and in a generation more Alexander the Great shattered in pieces the Persian power.

Antananarivo, the capital of Madagascar, lies in the centre of the island, 7000 feet above the sea, having considerable trade, and a pop. of 80,000. It stands on a hill, which is created by the royal palace and the government buildings. Several churches have been erected here by the London Missionary Society, one of which is a handsome granite structure. The climate is temperate and healthy, but the town is occasionally visited by terrible hail and thunder storms. Great material progress has been made by the people under missionary guidance. The chief seaport is Tamatave, on the E. coast, distant 150 miles. All the roads about A. are wretched, and become mere watercourses in the rainy season.

Antar, or **Antara**, an Arab poet and warrior of the 6th c., whose poems had the honour of being suspended on the gate of the Caaba, and were therefore reckoned among the *Moallakat* ('suspended'). We know nothing of the real A. except that he flourished shortly before Mohammed. His exploits formed the groundwork of the romance named *A.*, committed to writing in the 8th c., and of which a much corrupted version has been preserved. This was rendered into English verse by Terrie Hamilton, secretary to the English embassy at Constantinople, under the title of *Antar, a Baidouen; a Romance* (Lond. 1820). In this work A. is represented as the son of an Arab sheik called Cheddad. Unfortunately his mother was a slave, and in spite of his great talents he is long subjected to severe humiliations by those who scorned him for the baseness of his origin. Finally, however, he triumphs over all petty jealousies, is acknowledged worthy to be a chief, and spreads both the terror of his name and the fame of his verse throughout the whole of Western Asia. The moral of the work is the victory of heroic genius over the obstacles of circumstances. It is written in a lofty style, and gives us a splendid and interesting picture of Bedouin life. Among Orientals, the romance of *A.* is almost as much admired as the *Arabian Nights*, and there is not a storyteller who cannot recite some of its numerous episodes.

Antarctic. See ARCTIC.

Antarctic Ocean (Gr. *anti*, against; *arctos*, the Great Bear, a constellation of the northern heavens; the ocean opposite the Arctic or north pole), the sea round the south pole. The term is often confined in definition to the sea within the antarctic circle, but it is usually employed in a more extensive signification, as comprising all the sea S. of the Atlantic, Indian, and Pacific Oceans. It is in this sense also called the Southern Ocean.

The A. O. has not been so much explored as the Arctic Ocean. The highest S. latitude yet reached is 78° 4'. Names have been assigned to the following islands and tracts of land within its bounds: Kerguelen's Land, New Georgia, New S. Shetland Isles, New Orkney Isles, Sandwich Land, Enderby's Land, Graham's Land, Adelie, Balleny, Sabrina, and Victoria Land, the last possessing two mountains, Mt. Terror, 10,000 feet, and Mt. Erebus, 12,400 feet in height, the latter being the only volcano known in the frigid zones.

Antares, a star of the first magnitude, marked a *Scorpiōnis* in the catalogues, may be seen from Greenwich at midnight in the beginning of July, situated about 12° above the southern horizon.

Ant-Eater, the popular name of a genus of quadrupeds included in the Mammalian order *Edentata*, and forming examples of the family *Myrmecophagide*. These are the hairy or true anteaters, occurring solely in S. America, and distinguished by the toothless condition of the jaws; by the greatly elongated tongue covered with viscid saliva, by means of which the ants and insects on which they feed are captured; by the hairy body; by the elongated tail; by the strong claws with which the feet are provided; by the toes being concealed and united under the

skin up to the claws; and by the palms and soles of the fore and hind feet respectively being turned inwards so as to adapt the

Ant-Eater.

hind-feet five claws. The Tamandua (*M. Tamandua*) is of smaller size, the snout being less elongated than in the former species. *M. didactyla* is another form, which possesses but two toes. *Cyclothurus* is another genus included in this family, of which one species, *C. didactylus*, possesses well-developed clavicles or collar-bones. The scaly A. or pangolin of Africa and Asia is described under PANGOLIN, the porcupine A. of Australia under ECHIDNA, and the Cape A. under ORYCTEROPUS.

Antecedent (Lat. going before), in grammar, the noun preceding the relative, as 'God who made the world,' where God is the A.; in logic, that one of two propositions from which the other is deduced; in mathematics, the first of the two terms of a ratio.

Antediluvian literally denotes whatever existed before the Flood, and is applied to the persons, conditions of society, religious and other beliefs that distinguished the ages before Noah. In geology, however, the A. period has no such limitation, but denotes the period preceding the latest transformation of the earth by the agency of water.

Anteflexion. See ANTEVERSION.

Antelope, a Ruminant animal included in the family *Cervicornia* ('hollow-horned'), to which group also belong the sheep, oxen, and goats. The antelopes are essentially distinct from the deer or Cervide, with which they are frequently confused in a popular sense. Like those of all the *Cavicornia*, the horns of antelopes are persistent, and are not shed annually as in deer, each horn consisting of a 'horn-core' or process of the frontal bone, invested by a horn-sheath. In a single A. alone—the Prong-buck (*Antilocapra Americana*)—is the horn-sheath shed or cast annually. No incisors or canine teeth exist in the upper jaw, the six lower incisors and two lower canines biting against

Antelope.

the hardened gums in the front of the upper jaw. Twelve molars exist in each jaw. The feet present the 'cleft' character of Ruminants generally, and accessory or rudimentary hoofs are also developed. Horns are generally present in both sexes of antelopes. In form, these creatures are deer-like, and usually possess slender legs. A 'beard' or 'dewlap' is seldom developed; and 'inguinal pores,' or glandular structures situated in the groin, together with 'tear-pits' or 'lacrimal sinuses' (sacs existing beneath the eyes), are very generally present in the antelopes. They are usually gregarious, and feed chiefly on grasses. Africa forms the headquarters of the distribution of the antelopes, but they also occur in Europe, Asia, and N. America. In Africa these Ruminants take the place of the true deer or Cervide, which, with the exception of one species, are not represented as natives in that continent. The Chamois (q. v.) (*Rupicapra tragus*) of Europe is a familiar A., and in habits resembles the Rocky Mountain sheep of America (*Haplocerus laniger*), which latter, with the Prong-buck (q. v.) already

mentioned, represents this group in America. The Saiga (q. v.) (*Coitus Saiga*), found in Poland, Russia, and in the European borders of Asia, is a form indigenous to both of these continents, the chamois being the only representative European form. The Chiru (*Pantholops Hodgsoni*) inhabits Thibet and the Himalayas; this species possesses long annulated horns. The Chikara of India (*Tetracerus quadricornis* or *A. Chikara*) is remarkable for the males possessing four horns, two smaller horns being placed below the primary pair. The females of this species want horns. The Nyl-ghau (q. v.) (*Portax picta*) of N. India is of ox-like form, the males possessing horns curved in a lyre-shaped manner.

The common or Indian A., or *Sasin*, is also a familiar Indian species. The Gazelle (q. v.) (*Gazella Dorcas*) or A. of S. Asia and N. Africa are small gracefully-formed antelopes, possessing small black horns. It occurs in large flocks. They are readily domesticated, and are of a gentle disposition. The Spring-bok (q. v.) (*Gazella or A. Eucore*), the Bonte-bok (G. or A. *Pygarga*), the Bles-bok (G. or A. *albifrons*), the Kleene-bok (G. or A. *perpusilla*), Blauw-bok (*A. leucophaeus*), and the Riet-bok (*A. arundinaceus*), are all familiar forms of S. Africa. The S. African Water-bok (*Kobus ellipsiprymnus*) is also a well-known species, and derives its name from its habit of frequenting streams. The Klippiespringers (q. v.) (*Oreotragus*) inhabit mountainous districts of S. Africa. The Koodoo A. (*Strepsiceros Koodoo*) of W. and S. Africa possesses horns twisted in a regular spiral manner, the males alone possessing these structures. The Bush Antelopes (*Cephalophus* or *A. sylvicultrix*) and the Pigmy Antelopes (*C. or A. pygmaea*) are found in S. Africa; the latter species being the smallest of the A. family, and measuring only about 8 or 9 inches in height at the shoulders. The Eland (q. v.) (*Boselaphus orcas*), like the nyl-ghau, resembles the ox in general form. It is the largest of the antelopes, and possesses a 'dewlap.' The Addax (*A. or Oryx nasomaculata*) inhabits N. Africa. The horns are elongated, and slightly twisted in a spiral manner. The Gnu (q. v.) (*Catoblepas Gnu*) resembles the nyl-ghau of India; a second species of this form (*C. gorgon*) also occurring in S. Africa. These forms unite in themselves much of the form of the ox, horse, and A. Very many other species of antelopes are known in addition to those here mentioned. Fuller details of each form are given under their respective headings.

Indian Antelope.

Antennæ, the zoological name for the jointed filamentous processes borne by the head-segments of insects, centipedes, &c., and crustaceans, and which are popularly named 'feelers.' These organs chiefly subserve the sense of touch. Two pairs exist in higher crustaceans, and one pair in insects and myriapods. In Arachnida (spiders, scorpions, &c.), A., as such, are not developed, their place being supplied by the mandibles or large jaws of these forms, some naturalists maintaining that the so-called mandibles of the Arachnida are in reality only modified A.

Antequera (the Roman *Anticaria*), a city in the province of Malaga, Spain, 45 miles W. of Granada. It is picturesquely situated and well built, but lies out of the route of travellers. The inhabitants are chiefly employed in agricultural pursuits, and in the manufacture of baize, silk, flannels, cotton, and paper. A. was taken by the Arabs in 712, and was only recovered by Ferdinand in 1410. The French took it during the Peninsular war, and seized a splendid Moorish armoury belonging to the town. Pop. 30,000.

Antequera (the Roman *Anticaria*), a city in the province of Malaga, Spain, 45 miles W. of Granada. It is picturesquely situated and well built, but lies out of the route of travellers. The inhabitants are chiefly employed in agricultural pursuits, and in the manufacture of baize, silk, flannels, cotton, and paper. A. was taken by the Arabs in 712, and was only recovered by Ferdinand in 1410. The French took it during the Peninsular war, and seized a splendid Moorish armoury belonging to the town. Pop. 30,000.

Anteversión. This is a term used in obstetrical surgery to denote a displacement of the uterus, in which the fundus or upper part of that organ is tilted forward, and the cervix or neck projected backwards. It usually occurs in the unimpregnated condition. Anteflexion is a bending forwards of the body of the uterus on the cervix. In A. the uterus is tilted forwards as a whole; in anteflexion, the organ is bent on itself. Details re-

garding these conditions may be found in Churchhill's *Diseases of Women*. Fennia & Co. Dublin, 1874. P. 384.

Antheia (Gr. *anti*, opposite; *helios*, the sun) are luminous coloured rings observed round the shadow of the spectator's head when the sun is at a low altitude and the shadow cast upon a dense cloud or fog-bank, or even upon a field of corn or grass bathed in dew. When viewed under very favourable circumstances there are four concentric rings, the inner three being usually coloured, while the outer and very much larger one is of a whitish light. Fraunhofer explains them as referable to the same causes which produce double rainbows, viz., the single and double reflections of a refracted ray in a small globule of water.

Anthelmintics are agents which cause the destruction or expulsion of intestinal worms. At least six species of worms infest the human intestinal canal—namely, (1) *Trichcephalus dispar*, or long thread-worm, found in the cæcum and large intestine; (2) *Ascaris lumbricoides*, or large round worm, found in the small intestine; (3) *A. vermicularis*, or small thread-worm, found in the rectum; (4) *Tenia solium*, or common tapeworm, found in small intestines; (5) *T. mediocanellata*, or hook-less tapeworm, found also in small intestines; and (6) *Bothriocephalus latus*, or broad tapeworm, found in the small intestines of the Swiss and Russians. The principal A. are the ordinary purgatives which may remove the parasite; koussou, derived from a plant termed *Bryera Anthelmintica*; santonine, the crystalline principle found in *Artemesia santonicum*; oil of turpentine, obtained from various species of pines; and the oil of male-fern, obtained from the rhizome of *Lastrea Filix-mas*. Santonine is specially adapted for the destruction of the round worms (1, 2, and 3), while oil of turpentine, koussou, and oil of male-fern are serviceable in cases of tapeworm.

An'them (Gr. *antiphone*, a hymn sung in alternate parts), a term applied in England since the Reformation to a species of church music adapted to passages from the Psalms or other parts of Scripture, and resembling the Motet (q. v.) It may be sung by one or two voices, or it may be choral.

An'themis, a genus of Composite plants to which the Chamomile (q. v.) belongs.

An'ther, the case containing the pollen of a plant. See STAMEN.

Antherid'ia, the term applied by botanists to the male organs in Cryptogamous plants. In ferns they are produced in the *Prothallus* (q. v.), and contain bodies analogous to the spermatozooids of animals. See PHYTOZOA. In mosses A. appear on the fully-formed plants. The female organs of cryptogams are called *Archegonia* or *Pistillidia* (q. v.).

Anthol'ogy (Gr. a collection of flowers; Lat. *florilegium*; comp. Fr. *recueil*, a culling or gathering), the name given to a collection of the 'beauties' of literature, chiefly poetical, but sometimes blended with prose. Asiatic and modern European anthologies are often made up largely of extracts from extensive works, but the Greek anthologies were strictly composed of short epigrammatic pieces. We may briefly note the most famous.

1. **Greek Anthologies.** That compiled by Meleager, the Syrian, about B.C. 60, was the first; but it has perished, along with the anthologies of Philip of Thessalonica, who flourished under Trajan, Diogenianus of Heraclea, and Straton of Sardes, both of whom lived in the time of the Antonines; and Agathias. Of the two collections that have been preserved, that of Constantine Cephalas dates from the 10th c., and that of Maximus Planudes from the 14th. The latter, printed at Florence in 1494 by John Lascaris, has gone through many editions, of which the latest, begun by Bosch in 1795, and finished by Lennep in 1822, contains the Latin version of Grotius. In 1606, Salmasius discovered in the Heidelberg Library a MS. of the A. of Cephalas, which he collated carefully with Planudes, making exemplars of the poems not found in the latter. This MS., after being transferred successively to Rome and Paris, was restored to Heidelberg only in 1816. It was edited, with augmentations from various sources, by Brunck at Strasburg in 1776, and re-edited by Jacob at Leipzig (1794-1814). These bright consummate flowers have long been the delight of scholars.

2. **Latin Anthologies.** No Latin A. has come down to us from antiquity, nor is there any tradition of such having ever existed. In modern times, however, collections have been made by scholars out of the remains of the minor poets whose works have been accidentally preserved. The first of these is the one by Scaliger, at Leyden, in 1573; another at Paris, in 1590; a more extensive collection, at Amsterdam, by the younger Burmann (1759-73), of which Meyer published an improved edition in 1835.

3. **Chinese Anthologies.** The most ancient existing A. in the world is Chinese, the *Shi-King* (Book of Songs), a collection, by Confucius, of 311 of the best of the songs that were annually sent to the emperor, as having become popular. It is one of the canonical books of the Chinese. Of this a Latin version was published at Stuttgart in 1830, and a German one at Altona in 1833. Two other collections, the one of poems of the time of the Liang dynasty (502-556 A.D.), the other of poems of the time of the Thang dynasty (618-914 A.D.), are also popular.

4. **Arabic Anthologies.** A collection, in ten books, of songs anterior to Mohammed; the *Divan* of the Hudhailites, and the *Ketab al-aghane* (Book of Songs), with the commentary of Abu'l-Faraj, have all a high reputation; but the best and fullest, and consisting in great part of the later Arabic poetry, is the collection of Taalebi, *Yatimat al-dhar* (the Pearl of the World). Its value has been much enhanced by additions which have been made to it.

5. **Persian Anthologies.** These agree in plan with the Arabic, having biographical notices prefixed to selections, either in the order of time or place, though frequently they are arranged according to the subject, of which the *Medshua al Shuara* (a Collection of Poets) is an instance.

Of the other Asiatic anthologies it will suffice to mention—(1.) The *Tartar*, or East Turkish, and the *Turkish*, or West Turkish, the substance of which is given in Hammer's *History of West Turkish Poetry* (Pesth, 1836). (2.) The *Indian*—i.e., the Mohammedan-Indian—of which the most notable are the *Gulshari Ibrahim*, containing specimens of 300 Hindustani poets, with biographical sketches; the *Guldastai Nishdt* (Garland of Pleasure, Calc. 1836); and the *Guldastai Nâsimind* (Calc. 1845), of which the substance is contained in De Tassy's *Histoire de la Littérature Hindui et Hindustani* (Paris, 1839-47). (3.) The *Sanscrit*. Sarnagadhara's *Paddhati*, close of the 14th c., is the only Sanscrit A. proper; but it is very rich, containing 6000 selections from the most celebrated epic, lyric, and dramatic poets, arranged according to the subject.

The collections of modern European nations—English, German, French, &c.—are chiefly intended for popular didactic purposes, and do not require or merit special notice.

An'thony, St. See ANTONY, ST.

Anthony's Fire, St. an erysipelatous disease of a peculiarly pestilential character, derives its name from the circumstance that, when in 1089 it was making numerous victims over the greater portion of France, crowds of pilgrims repairing to the church of La Motte St Didier, in Dauphine, where the bones of St Anthony are deposited, were through his intercession miraculously cured. His help was soon implored over all France. The 'Order of Canons Regular of St Anthony,' instituted in France in 1090, to succour persons labouring under this malignant disease, continued to exist till the year after the great Revolution.

Anthoxan'thum, a genus of grasses. See VERNAL GRASS.

An'thracite is a variety of coal distinguished by its great lustre, hardness, and weight, and chiefly by the fact that when burned it yields little flame or smoke, hence contains more carbon and less bituminous matter than other kinds of coal. A. is found in some parts of Great Britain, in Devonshire, S. Wales, and Ireland, but the largest deposits occur in Pennsylvania. A. was formerly regarded as almost useless, but is now extensively employed in the iron manufacture, and for other purposes.

An'thrax, a term used in surgery for what is known as a carbuncle. A carbuncle consists of severe inflammation of a circumscribed portion of the skin and subjacent tissue, with infiltration of unhealthy adhesive matter called lymph. The swelling is hard, flat, oval, or circular in shape, dull red, acutely tender, or the seat of a throbbing pain. The skin ulcerates at various points, and matter or pus escapes along with shreds of dead connective tissue; this continues until all the dead tissue has

been removed, when healthy action springs up, and the wounds close and cicatrise. During the acute stages of the disease there is great constitutional disturbance—high fever, extreme debility, and mental depression. Occasionally, in aged people, death may result from exhaustion. The treatment is rest, the frequent application of linseed poultices, and free incision with the knife, so as to allow the dead, sloughing matter to come away quickly. At the same time, the patient should be supported by nutritious food, such as beef-tea, or beef-steak and porter; a liberal allowance of port wine is required to support the strength; and tonics, such as quinine, should be freely given. There is no disease in which low diet is more likely to be injurious.

Anthropology (Gr.), the science of human nature, presents itself under two aspects: 1. *Physical A.*, which treats of man in his external relations, as, for instance, his relations to the rest of the animal kingdom; whether he is a distinct creation, or, as Darwin in his *Origin of Species* and *Descent of Man* implies, a development from a lower and simpler organism. In this view of the subject it touches upon and passes into Ethnology, Ethnography, Archaeology, Anatomy, Physiology, and History, &c. 2. *Psychical A.*, which discusses man's spiritual nature, his mental faculties, emotions, moral and religious feelings and aspirations, and thus is closely connected with Æsthetics, Psychology, Theology, &c.

Anthropomorphism (Gr. *anthrōpos*, a man, and *morphē*, form) is the application to God of attributes predicable properly only of men, and springs from the difficulty human beings experience in conceiving of things spiritual otherwise than by a reference to things material. This, primarily a necessity, may lead to error, and to our attributing to the Deity a form, parts, and passions like our own. In the 4th c. the Audeans, a Syrian sect, assigned to God the ordinary human form; and though this notion never prevailed anywhere, there has been much unprofitable speculation about analogous notions. For while Hobbes and Priestley invest God with a body, subtle indeed, but still material, Hegel and Schleiermacher discard his objective personality for the subjective consciousness of him in the human soul, which is really a negative form of A. Our ascribing to God passions and affections results from our conception of him as a moral Governor; and while in one aspect this is natural, there is always a danger of the figurative obscuring the literal.

Anthropomorphous Apes, the name applied to the highest division at once of the *Catarrhine* monkeys, and of the order *Quadrumana*, including the gibbons (*Hylobates*), the orangs (*Simia*), the chimpanzee and gorilla (*Troglodytes*). These forms are thus denominated from their collectively exhibiting the nearest approach to the 'man-like' or human type of structure. See **APES**, **MONKEYS**, &c.

Anthropophagi. See **CANNIBALS**.

Anthus and Anthidae. See **PIPIT**.

Anthyllis, a genus of Leguminous plants. See **KIDNEY VETCH**.

Antiaris, a genus of Artocarpaceous plants. See **UPAS-TREE**.

Antibes, a fortified seaport in the department of the Alpes-Maritimes, France, stands at the point of a peninsula (La Garoupe), about 12 miles S.W. of Nice. It was founded by the Greeks of Massilia (Marseille) under the name of Antipolis, is still in the patois of the spot called *Antiboule*, ranked as an Italian city under Augustus, and has numerous Roman remains, fragments of a theatre, aqueduct, inscriptions, &c. The parish church occupies the site of a temple to Diana. In the 9th c. it was utterly destroyed by the Saracens, but was rebuilt in the 10th, was fortified by Francis I. and Henry IV., stood a three months' siege during the Austrian War of Succession (1746-47), and in 1815 shut its gates against Napoleon on his return from Elba. It has been the seat of a bishop since the 6th c. A. has some trade in olives, fruits, salt fish, and oil; and is famed for the preparation of anchovies. Pop. (1872) 4502.

Antichlore. When chlorine or hypochlorous acid is employed to bleach linen, paper, &c., it is necessary to remove the traces of chlorine which always adhere to the fibre, and which,

unless got rid of, cause the goods to rot. This may be accomplished by long-continued washing, but more easily by dipping the bleached material into a dilute solution of a substance which will combine with the chlorine to form an innocuous compound: such a substance is called A. Formerly, sulphite of soda was employed, but now the hyposulphite is generally used on account of its greater cheapness and superior efficacy. With either of these bodies the chlorine reacts, in presence of water, to form a mixture of chloride of sodium (common salt) and sulphate of soda, neither of which are harmful to the bleached materials.

Antichrist, meaning a power opposed to the Messiah (Gr. *anti*, against, and *Christos*, Christ), has a history dating from the centuries immediately preceding the birth of Christ. The Jewish notions about A., which in their full development are to be gathered rather from the Apocryphal than the Canonical Old Testament Scriptures, can only be understood in connection with those they held about Satan (q. v.) From the time of the captivity much of the Persian Dualism had been adopted by them, though modified by their own conceptions of the Supreme Being. Like the Persian Ahriman, the Jewish Satan was distinguished by hatred of mankind and hatred of God. He had a distinct kingdom, and waged continual war upon men. Still he dared not encounter God himself, but did not fear to resist his servants upon earth. Now, the Messiah was to be the Prince of God's servants, and was to appear in order to establish the kingdom of God upon earth, which was almost entirely in the power of the devil and his angels, so that the 'Prince of this World' would defend his dominions to the utmost against the Messiah. This was the popular belief about A. prevalent among the Jews at the time of Christ.

Regarding the A. referred to by St Paul, 2 Thess. ii. 1-12, so many different opinions have prevailed, that it would be out of place to give any one of them dogmatically here. The epistles of St John, in which the *name* occurs for the first time, merely spiritualise the popular notions about A., and call all who reject the gospel antichrists. The A. of the Apocalypse (the Beast, Rev. xiii.) was the Roman empire, which, in its opposition to the Church, was then regarded as the embodiment of heathenism and ungodly power in the world, and more particularly the Emperor Nero, who was referred to as the head of the Beast whose deadly wound was healed (xiii. 3). There arose soon after the death of Nero a belief that he was not really dead, but had retired beyond the Euphrates, and would return as A. The fact of the prevalence of this belief is clearly testified by the historians of the time; and that this is the explanation of the figures of the Apocalypse is proved by the solution of the *number* of the Beast (xiii. 18), a riddle which has been unquestionably solved only within the last forty years. *Negon Kaiaop* in Hebrew characters is קס"ו קל"ג, and, according to the Hebrew numerals, 3 (=50) + 7 (=200) + 1 (=6) + 3 (=50) = 306; 3 (=100) + 0 (=60) + 7 (=200) = 360; total = 666.

But at last the Church, instead of being longer exposed to persecution by the civil power, rose to the head of that power, and a proud and degenerate hierarchy was established. Then, strange to say, the language of Paul (2 Thess.) and the figures of the Apocalypse began to be applied to the hierarchy itself by those who, from time to time, were opposed to the pretensions of the Bishop of Rome; and in the 11th c. the idea arose that A. was 'the establishment and growing power of the popedom.' This opinion was held by the Waldenses, the Albigenses, and the followers of Wiclif and Huss, and by the time of the Reformation it had become very prevalent. Since that time it has almost assumed the position of a dogma in the Protestant Church; that is, except with those who regard the fulfilment of the language in question as still future. According to the Roman Catholic Church, A. is the Protestant Church; according to the Greek Church, Mohammed.

Anti-Corn-Law League, an association founded at Manchester, March 20th, 1839, by members of the free-trade party, to obtain the repeal of the corn-laws. As early as 1834 an association had been founded in London for this purpose, but the centre and spring of the movement were in Manchester, where Mr Cobden, by his luminous exposures of the bad influence of restriction on trade and manufactures, rapidly gathered numerous and powerful coadjutors. In 1839 delegates were sent from the manufacturing districts to impress their views on the Legislature; and on February 19th, and again on March

12th, Mr Charles Villiers attempted, but without success, to move the House of Commons to inquire into the action of the corn-laws on the interests of trade. This defeat led to the formation of the League on the 20th of the same month. To secure unity of action, the central office was established in Manchester. It was to engage competent lecturers, obtain the co-operation of the press, and establish and conduct a stamped circular for the purpose of keeping a constant correspondence with the local associations. Large funds were placed at its disposal. Gradually some of its most formidable opponents were converted to its views, among them the prime minister, Sir Robert Peel; and the feeling of the country in its favour being at last clearly pronounced, its success was inevitable. This recognition by the country of the truth of one of the most important and beneficial principles of political economy, was owing in great measure to General Thompson's admirable *Catechism of the Corn-Laws*, in which the principles of free-trade were expounded with irresistible logic. Victory was finally achieved in 1846, when Sir Robert Peel carried a measure in the House of Commons for the repeal of the Protective Duties on Corn.

Anticosti (a corruption of the native Indian name *Natiscoti*), an island included in the Dominion of Canada, lies at the mouth of the St Lawrence, N. lat. $49^{\circ} 24'$, W. long. $63^{\circ} 39'$. It has an area of about 2000 sq. miles, and at its S. W. point is a light-house, the keepers of which are almost the sole inhabitants. There are no available harbours, and the interior is marshy and mountainous. A. is chiefly important for its fisheries, and for seal and bear hunting.

Antidote, a substance which counteracts the physiological effects of a poison. Certain antidotes act by precipitating the poison in an insoluble form, so as to prevent its absorption into the blood. For example, chalk-and-water is given in cases of poisoning by oxalic acid, with the view of forming insoluble oxalate of lime. This is a *chemical A.* A second class of antidotes act by becoming mechanically mixed with the poisonous substance, so as to prevent its absorption. Thus, finely-divided animal charcoal is much relied on as an A. in cases of poisoning by alkaloidal substances, such as strychnia. We have here a *mechanical A.* It is evident that both of the foregoing groups of antidotes must be employed at an early stage of the case, while the poison is in the stomach. Both are inapplicable after the poison has been absorbed into the blood. We have, however, a third class of antidotes which may act by neutralising the physiological action of certain poisons, because they exercise an exactly contrary action on the same parts of the nervous or muscular systems as are affected by the poison. This is termed *physiological antagonism*. For instance, strychnia increases the reflex activity of the spinal cord, so that a slight external irritation of any part of the body will at once excite strong spasms or convulsions; but hydrate of chloral has exactly the contrary effect; consequently the one substance is physiologically antagonistic to the other. Another example of the same kind of action we have in the antagonism between atropia and Calabar bean, and morphia and atropia. It is found, however, that this kind of antidotal action is within narrow limits. In a particular case, so much of the physiological A. may be necessary as to endanger life, not by the poison, but by the A. Still, physiological antagonism is now a well-established fact in science, and in such a case as poisoning by strychnia, the only hope of saving the individual would lie in giving large doses of hydrate of chloral, so as to prevent the occurrence of convulsions. A list of the various antidotes placed opposite the respective poisons will be found under POISON.

Antigone. Several persons of this name figure in Greek antiquity.—1. The daughter of Œdipus, by his mother Jocaste, and sister to Eteocles, Polynices, and Ismene. When the blind Œdipus went forth from Thebes, he was accompanied by A., who tended him till his death at Colonus, after which she returned to Thebes. Meanwhile Polynices, having been banished from Thebes by Eteocles, had collected a force, and marched against the city. The result was the death of the two brothers in single combat, the tyrant Creon forbidding the burial of their bodies. A. nevertheless buried the body of Polynices, and for this disobedience Creon condemned her to a cruel death. Sophocles, in his *Œdipus at Colonus*, and *Antigone*, has beautifully embodied in the character of A. the Greek ideal of filial

devotion and womanly heroism.—2. The wife of Peleus, who hanged herself on receiving a false message that Peleus was betrothed to Sterope, daughter of Acastus.—3. The sister of Priam, who boasted that her hair was more beautiful than that of Hera, and whose hair was therefore changed into snakes; but the gods in pity changed her into a stork.—4. The second wife of Ptolemy Lagus, the founder of the Ptolemaic dynasty, and the mother of Berenice, wife of Ptolemy Soter.

Antigonus, surnamed (according to Lucian) the 'One-Eyed,' the son of Philip of Elymiotis, was born about B.C. 382, and was a general of Alexander the Great. He received the Greater Phrygia, Lycia, and Pamphylia, in the division of the provinces after Alexander's death (B.C. 323). By the authority and help at first of Antipater of Macedonia he made a successful war on Eumenes, ruler of Paphlagonia and Cappadocia, whom he ultimately deposed and put to death (B.C. 316). Seleucus of Syria was also obliged to seek refuge in Egypt. But his ambitious schemes excited alarm in the other generals of Alexander. A coalition was formed against him, consisting of Seleucus, Ptolemy, Cassander, and Lysimachus (B.C. 315), and after a fierce and bloody struggle carried on for years all over Syria, Asia Minor, Greece, and the Levant, A. was defeated and slain at Ipsus in Phrygia (B.C. 301). His son, Demetrius Poliorcetes, was deprived of his Asiatic dominions; but in the civil confusions and discords that marked the time he managed to obtain the kingdom of Macedonia (B.C. 294), which, however, he lost before his death.

Antigonus Gona'tas, son of Demetrius Poliorcetes, King of Macedonia, and grandson of the preceding, is supposed by some to have received his surname from Gonnos or Gonni in Thessaly, presumably his birthplace, and by others from a Macedonian word signifying an iron plate covering the knee. His father died B.C. 283, but six years elapsed before he could obtain his father's dominions. Though twice expelled from his dominions, he finished his reign of forty-four years in comparative peace, dying B.C. 239, aged eighty.

Antigua, a W. India island, the most important of the Leeward Antilles, and the residence of the British governor-in-chief, lies in W. long. between $61^{\circ} 44'$ and $61^{\circ} 58'$, and in N. lat. between $17^{\circ} 2'$ and $17^{\circ} 13'$. Its area is 117,120 acres, of which 100,000 are cultivated. Pop. (1871) 34,344, showing a decrease, since 1861, of 2000. Being surrounded by islets, rocks, and shoals, access to A. is difficult; but the chief town, St John, stands at the head of a large and safe, but shallow, bay. English Harbour is capable of containing the largest vessel. A. was discovered by Columbus in 1493, settled by the English in 1632, and formed into a colony in 1666. Of late years Chinese coolies (there were 100 in 1871) have begun to compete with the freed blacks in the labour market. Its products are sugar, molasses, and rum. The total tonnage of vessels which entered and cleared A. in 1872 was 53,971, of which 49,588 were British. The total value of imports (1872) was £200,757; exports, £128,237, of which the sugar was £119,091.

Antilles, a term generally used to include all the W. Indies except the Bahamas, and so designating a semicircular chain of islands stretching from the Channel of Yucatan to the Gulf of Maracaybo. They lie in N. lat. between $23^{\circ} 8'$ and $10^{\circ} 30'$, and in W. long. between $84^{\circ} 58'$ and $59^{\circ} 20'$.

The *Greater A.*, Cuba, Jamaica, Hayti, and Porto Rico, lie on the N. and E., and have an area of about 70,000 sq. miles. The *Lesser A.*, to the W. and S., consist of a number of small islands, with a joint area of 6500 sq. miles. These are the Virgin Islands, Barbuda, Antigua, St Kitts, Montserrat, Guadeloupe, Dominica, Martinique, St Lucia, St Vincent, Barbadoes, Grenada, Tobago, Trinidad, Margarita, Curaçao, &c. The *Lesser A.* are divided into two sections, the Windward and Leeward Islands—terms, however, very variously used. In British phraseology, the Windward Islands are those of the *Lesser A.* S. of 15° N. lat.; the Leeward Islands those N. of that parallel.

The A. were discovered by Columbus, and soon became of great importance in the trade between Europe and the New World. The origin of the name, which was first applied to these islands by Peter Martyr d'Anghiera in 1493, is uncertain. Some say that it was an application of the vague geographical tradition of the middle ages that far to the westward of the Azores there was an island called Antilla or Antilia; others again suppose that the name is from the Latin *ante*, and denotes the islands that lie in front of the mainland of America.

Antimony is a crystalline metal of white colour, with a slight shade of blue. One of its compounds (the sulphide) was probably known by the ancients, but the metal itself was first prepared by Basil Valentine in the 15th c.

The principal ore of A. is the sulphide, called *stibnite* by mineralogists. This occurs in various parts of the world—in Germany, Hungary, France, America, and Great Britain, and in extensive beds in the island of Borneo.

The metal is obtained from stibnite as follows: The ore is first separated from earthy impurities by fusion; it is then mixed with a little charcoal to prevent caking, and roasted in the bed of a reverberatory furnace. By this treatment most of the sulphur is burned off as sulphurous acid, whilst the oxide of the metal remains. This oxide is moistened with solution of common washing soda (to convert any sulphide of A. into oxide), mixed with charcoal, and heated in crucibles. The carbon of the charcoal combines with the oxygen of the oxide of A. to form carbonic oxide gas, whilst metallic A. remains. A. is sometimes extracted from stibnite by simply fusing it with iron.

Metallic A. is characterised by its extreme brittleness; when struck with a hammer, it splits into fragments, and may be readily reduced to powder. It may be obtained in crystals by fusing it in a crucible, allowing it to cool till a crust forms on the surface, piercing a hole through this crust, and pouring away the metal still remaining fluid: on breaking the crucible, beautiful crystals of the metal are found. A. melts at 450° C., and if heated in closed vessels, may be volatilised. Heated in the air, it burns with a white flame, and is converted into antimonious oxide (or acid). It is not attacked by hydrochloric acid, even though this be concentrated and heated to boiling. Nitric acid oxidises without dissolving it. A mixture of the two acids (*aqua regia*) dissolves it readily. A. takes fire when thrown into chlorine gas, chloride of A. resulting. A. is chiefly valuable on account of its alloys: when fused with most metals, it increases their hardness in a marked manner. Type-metal is an alloy of lead and A., containing from 17 to 20 per cent. of the latter. Britannia metal contains about 25 per cent. The chemical characters of A. resemble those of phosphorus and nitrogen; hence many chemists regard it as a non-metallic element. The atomic weight of A. is 122, and its chemical symbol Sb (from *stibium*, Lat., A.). It forms many valuable and important compounds, used both in medicine and the arts. Of these may be mentioned antimonious chloride, $SbCl_3$, called butter of A.; the oxides, antimonious acid, Sb_2O_3 , and antimonic acid, Sb_2O_5 , the former being one of the ingredients of James' powder; the sulphide or stibnite, Sb_2S_3 , the principal ore of the metal, and largely used in firework-making; tartar emetic, or tartrate of oxide of A. and potash, $C_4H_4O_6K(SbO)$; and the oxychloride of A., $SbOCl$, or powder of algaroth.

Antinomianism (Gr. *anti*, against, and *nomos*, law), the doctrine that faith releases Christians from obligation to observe the moral law. It seems to have manifested itself even in the infancy of the Church: apparent references to it occur in the apostolic epistles: the Gnostics were infected with it; and it has been charged, though probably with much exaggeration, against some of the heretics of the middle ages. The term, however, was first applied by Luther to the opinions of Johann Agricola (q. v.), who in 1537 publicly maintained at Wittenberg that justification by the gospel rendered the law unnecessary. Luther, with the aid of the Elector of Brandenburg, compelled Agricola to retract in 1540. Some English sectaries of the 17th c. held antinomian opinions so extreme that in 1648 Parliament passed severe enactments against them. A. has sometimes been held from erroneous conceptions of Christian liberty; but wherever there is any enthusiasm in its adherents, it has generally passed into practical licentiousness. See ANABAPTISTS.

Antinöus, a youth of Bithynium, beloved for his beauty by Hadrian, whose page he was, and whom he accompanied in all his journeys. He was either drowned in the Nile, or threw himself into the river from disgust at his mode of life, 122 A.D. Medals were struck and temples erected in his honour, and Hadrian rebuilt Besa, in the Thebais, naming it Antinöpolis, after his favourite, whom he also ordered to be enrolled among the gods.

Antioch, the capital of the Greco-Syriac kings, was the most famous of the sixteen Asiatic cities founded by Seleucus Nicator, and named after his father. It was situated 20 miles from the sea, in the angle formed by the coasts of Syria and Asia Minor,

and in the opening where the Orontes passes between Taurus and Lebanon. Its harbour, Seleucia, was open to the trade of the W., and through the Syrian desert it was readily accessible by caravans from the S. and E. The original city was built in the plain between the river and the hill, but three other sites were successively built upon and walled in, and the city was hence called a Tetrapolis. The Seleucids adorned the city with the Palace, the Senate-House, and the Temple of Jupiter; and under the empire the Cæsarium, and numerous baths, aqueducts, and porticos, were constructed. The beautiful climate attracted wealthy Roman visitors to this splendid city, the frivolity and vice of whose inhabitants, however, rendered it the most debased even of the Greek cities of the E. The founding of Constantinople deprived A. of its pre-eminence, but it rose to great distinction as a Christian city, ten councils having been held in it between 252 and 380. The peace of the city, however, was frequently broken by internal factions; and the citizens were greatly addicted to ridicule, and to the invention of nicknames. Some think that we have an instance of this in Acts xi. 26: 'And the disciples were called *Christians* first in Antioch,' in which there may lurk a play on the word *Christos* by the suggestion of *Chrestos*, in the sense of 'simpleton.' Whether or not, the propensity to scurrilous banter caused their ruin; for the Persians, who invaded Syria under Chosroes, A.D. 538, took ample vengeance on the Antiochenes for their biting jests by utterly destroying their city. A. was taken by the Saracens in the 7th c., recovered by the Greeks in the 10th, and again taken by the Seljuks, A.D. 1084. The Crusaders under Godfrey besieged and took it, A.D. 1098, and established a Christian principality of A., which lasted till 1268, when it was conquered by the Sultan of Egypt. From the Egyptian Mamelukes it passed into the hands of the Turks in 1516. Since then it has rapidly declined, and the modern Antakieh is a poor town, with a population (1872) estimated at 17,600.—There was another A. in Pisidia (Asia Minor), which is memorable as the spot where circumstances first forced on Paul the conviction that his mission was mainly to the Gentiles (Acts xiii. 46).

Antiochus. Thirteen kings of this name reigned over Syria.—**A. I.** was the son of Seleucus Nicator and Apama, a Persian princess. On his father's murder, B.C. 280, A. succeeded him. **F. I.** A victory over the Gallic horde that broke into Asia Minor, he was surnamed Soter; but in a second battle with them he was killed, B.C. 261.—**A. II.** carried on a long war with Ptolemy Philadelphus, King of Egypt, whose daughter he subsequently married.—**A. III.**, surnamed the Great, made war on Ptolemy Philopator, but was defeated at Raphia, near Gaza, B.C. 217, on which peace was concluded. For seven years (B.C. 212–205) he persevered in an expedition against Parthia and Bactria, which he was unable to subdue; but he established friendly relations with them and with India. On the accession of Ptolemy Epiphanes, he renewed the Egyptian war, and defeated Scopas, near Paneas, B.C. 198. The conquered provinces, however, were given as a dowry with his daughter on her marriage with Ptolemy. A. now commenced his struggle with the Romans. He sustained terrible defeats at Thermopylae, B.C. 191, and at the foot of Mount Sipylus, near Magnesia, B.C. 190. To obtain money to pay the heavy tribute imposed by the Romans, he plundered a temple at Elymais, for which he was killed by the people B.C. 187.—**A. IV.**, surnamed by himself *Epiphanes* (the 'Illustrious'), and by his subjects *Epimanes* (the 'Madman'), inflicted cruelties on the Jews, which led to the heroic rising of the Maccabees, B.C. 168.—In the reign of **A. XIII** Syria was reduced to a Roman province, B.C. 65.—Four kings of this name reigned over Commagene, a small country between the Euphrates and Mount Taurus. **A. I.** was unsuccessfully attacked by M. Antony, B.C. 38. **A. IV.** received his kingdom from Caligula, A.D. 38, and, after a chequered career, was deprived of it by Vespasian, A.D. 72, when Commagene was reduced to a province.—**A. of Ascalon**, an eclectic philosopher of some note, under whom Cicero, who frequently speaks of him in the highest terms, studied when at Athens.

Antipödobaptist, lit. one who is opposed to the baptism of children. It is the correct designation of that sect of Christians commonly called Baptists (q. v.).

Antipöaros, the ancient Ollaros, one of the Cyclades, famed for its stalactitic cavern, 80 feet high, and fully 300 both in

length and breadth. It has been described by several modern travellers, as Tournefort, Leake, Fiedler, &c. A. is 7 miles long, 3 broad, and has 400 inhabitants, who support themselves chiefly by fishing, though corn and wine are produced in small quantities. The only village is Kastron. The existence of the grotto was first announced to the modern world in 1673 by M. de Nohetel, French ambassador at the Porte; but in 1806, Colonel Leake discovered in A. a Hellenic inscription containing the names of ancient visitors to the cavern, thus proving that it was not unknown to antiquity, though no mention is made of it in any extant Greek or Roman writer. The stalactitic incrustations are of dazzling beauty.

Antipater, a name borne in ancient times by many who were eminent in war, politics, literature, and science. The best known and most distinguished was A., a favourite general of Philip of Macedon. Along with Parmenion he attempted, but without effect, to dissuade Alexander from his Asiatic expedition till he had settled the succession to the throne by marriage. Appointed regent of Macedonia during the absence of Alexander, he suppressed the rebellion in Thrace, and concluded successfully the war with Sparta. But Olympias, Alexander's mother, disliked A., and in order to avoid the perils of dissension, Alexander ordered A. to come into Asia with fresh troops, while Craterus, who was leading the discharged veterans home, should assume the regency. On the death of Alexander, however, he was reinstated in his office. Being soon after engaged in war with a confederacy of the Grecian states, he defeated their forces at Cranon, abolished democracy at Athens, and caused the chiefs of the popular party, including Demosthenes, to be put to death. Then followed a war with Perdiccas, on whose murder (B.C. 321) A. became supreme regent. But he died soon after; and though he had a son, Cassander, he left the regency to Polyperchon.—Another A., who has a place in history, was the father of Herod the Great. An Idumean noble, brought up at the court of Alexander Jannæus, he played a prudent part during the conquest of Palestine by Pompey, and was rewarded after the establishment of Roman rule with a variety of honours. Finally, in B.C. 47, A. was made procurator of Judæa by Julius Cæsar, but was poisoned four years later at the instigation of a man whose life he had twice saved.

Antipathy may be defined as the injurious effect, or violent disgust, produced on a person otherwise healthy by an object which does not generally so affect persons of similar organisation. Effects possibly due to a diseased state of the organism must be excluded. The power of habit also must be discounted. Thus Foderé says the fishers of Martigues, who lived on fish, had an A. to meat-broth. This might have been expected: it is often found difficult to resume the eating of pork after discontinuance, but the wholesome variety of modern diet makes this effect rare. Effects sometimes assigned to A. have been traced to actual poisons; as in diseased or putrefied meat, and the cheese and sausage poisons. Again, mental association, especially if operating during childhood, may produce powerful A.; e.g., to the diet used during a painful illness, or to the food which by surfeit caused a violent sickness, the mere sight tending to reproduce the feeling. Pure emotion may produce a real A., as in the physical loathing of a murderer. Certain antipathies, originally common to all men, may be got rid of; e.g., the horror of contact with cold-blooded animals (intensified in some cases by hereditary association of danger); the loathing sickness of the dissecting-room is also removed by practice. Similarly, habit modifies the effect of the narcotic poisons. It is, however, undeniable that pork, shellfish, esculent mushrooms, red fish, and eggs have frequently acted like poisons, causing sickness and fainting. A. belonging to the alimentary canal should, unless frequently repeated, be viewed with suspicion, as the state of the organs is never precisely known. There are antipathies belonging to the special senses: the sight of a toad and the smelling of musk have caused fainting and convulsions. Drawing the finger across the pile of cloth or velvet often has the same effect on the teeth as the noise of scissor-grinding.

Antiphlogistics, a term used in *materia medica* to denote a group of substances which diminish febrile action, and more especially produce a fall of temperature. The normal temperature of the human body is 98.4° F. In fevers, and in surgical affections accompanied by inflammation, there is a rise of temperature—in some cases reaching 106° F.—a sign of grave import,

and always associated with much distress. If such remedies as acetate of sulphate of quinine, spirit of nitric ether, or acetate of ammonia, be frequently given in small doses, the temperature may be lowered, and the skin, instead of being dry and hot, becomes moist and cool. Such remedies, therefore, are largely used in medical practice, although the *rationale* of their action is not understood.

Antiphon, Attic orator, son of Sophilus the Sophist, born at Rhamnus in Attica, B.C. 480. Living when the meretricious fame of Gorgias was at its height, A. resolved to avoid mere tricks of rhetoric, and to produce conviction by solid arguments. He opened a school, in which he laid down sound laws for the regulation of public oratory, and in which Thucydides was a pupil. He did not himself practise oratory, but wrote speeches for others, in which he introduced his own political views, and thus did much for the overthrow of democracy at Athens (B.C. 411), and the introduction of the oligarchy of the Four Hundred. In answer to a charge of treason, for having attempted to negotiate peace with Sparta, he made a splendid but unavailing defence, and was condemned to death, nor were his remains allowed burial in Attic soil. Fifteen of sixty orations composed by him are extant; three written for others, and twelve as specimens for his pupils. The former are clear, true, natural, and vigorously expressed, qualities not found, at least to anything like an equal degree, in the latter. The genuineness of the extant orations is generally admitted.

Antiphony, a method of performing music (chiefly in religious observances) in use among the Hebrews and other Eastern nations, in which two sets of voices sang alternately. It is intimately connected with the parallelisms characteristic of the poetry of the same people. It was adopted by the early Christians; and in this country the traces of it still exist in the 'Deani' and 'Cantoris' sides of the choir in the English Church.

Antipodes (from the Gr. *anti*, against, and *pous, podos*, a foot) is a term applied to the inhabitants of places diametrically opposite, or, generally, to the places themselves. In the 8th c. those who held the existence of such inhabited countries were excommunicated, the doctrine being considered contradictory to the teaching of the Bible. From the definition, it follows that the A. must be on the same great meridional circle, and the one as much S. as the other is N. of the equator. A. Island, to the S.E. of New Zealand, pretty accurately fulfils these relations with respect to London, for which reason it received its name. Various other minor relations also subsist between such places. Thus, the noon of any place must be the midnight of its A.; the summer and autumn of the one corresponds with the winter and spring of the other. Also, the time of day of any place is either twelve hours before or after that of its A., according as you regard the former as W. or E. of the latter.

Antipope, a term applied to a pope not canonically chosen. The first of whom history makes mention is Laurentius, who flourished at the close of the 4th c. The lofty theory of a 'Holy Roman Empire' inspired the successors of Charlemagne with the belief that it was their duty to remove unworthy bishops from the See of St Peter. Thus Otho the Great, Emperor of Germany, in 962 deposed John XII. for licentiousness, and put Leo VIII. in his place. Others, again, interfered for purely political reasons. Thus, in the 11th c., Conrad II. reinstated Benedict IX., who had been expelled by the Romans for his shameless depravity, his substitute, Pope Sylvester III., ruling only three months. Benedict next sold the pontificate to Gregory VI.; but the three popes, all alike unworthy, were deposed by a council held at Sutri, presided over by a German sovereign, and Clement II. was chosen in their stead, 1046. The history of the popedom bristles with similar unseemly scenes. On the death of Honorius III., France, imitating the example of Germany, assisted Innocent II. against the partisans of Anaclet; and even Sicily, ignoring the choice of the emperors, sometimes set up a pope of its own selection. The election of Urban VI., after the death of Gregory XI. in 1378, produced a schism, known in history as 'the great schism of the West,' which lasted fifty years; the French cardinals setting up an A., Clement VII., between whom and Urban VI. the spiritual allegiance of Europe was divided—France, Austria, Spain, Savoy, Genoa, and Scotland siding with the seceders. The last A. was Clement VIII. The dogma of papal infallibility, supposed to

be discredited by these proceedings, is, strictly speaking, not involved by them, because points of doctrine are not at stake; but there can be no doubt that the ambitious intrigues of rival pontiffs have brought the dogma into disrepute.

Antiquaries, Society of. Under this title there are societies in many of the cities of Europe and of America, whose object is to cultivate the study of antiquities, and to preserve the relics of past ages. The earliest S. of A. known to have existed in England was instituted in 1572. It petitioned Elizabeth for a charter of incorporation: the MS. of the petition is in the Cottonian Collection. This society was dissolved by James I. In 1707 another S. of A. was instituted in London. It was reconstructed in 1717. Its minutes begin 1st January 1718. In 1750 it was incorporated by royal charter. It consists of a president, who is *ex officio* a trustee of the British Museum, a council of twenty-one, and several hundred fellows. It has published many valuable works. The S. of A. of Scotland was founded in 1780. Its valuable museum is kept at the expense of government, and now belongs to the nation. See **ARCHÆOLOGY**.

Antique, a term applied to Greek and Roman works of art, to distinguish them from the mediæval and the modern. Greek sculpture passed through several phases, which have their counterparts in the Greek literature and life. The earliest statues are somewhat barbaric, formal, and wanting in flexibility; then follow Titan-like forms, having their analogues in the grand creations of Æschylus; next, like the characters of the Sophoclean drama, come the noblest ideals of humanity, as the sculptures of Phidias and his contemporaries; and then the works of Praxiteles, no longer purely ideal, but, like the characters of Euripides, more in the realm of actual life. With the rise of comedy, everyday forms were introduced. The Roman antiques are not ideal, but real, representing actual life, and thus in keeping with the character of the conquerors and administrators of the world.

Antiquities. See **ARCHÆOLOGY**.

Antirrhinum, a genus of plants belonging to the natural order *Scrophulariaceæ*. See **SNAPDRAGON**.

Antiscorbutics are remedies which act beneficially in the treatment of scurvy, or scorbutus. This disease is believed to be caused by the blood containing an inadequate amount of potash salts, and the virtue of A. is owing to the quantity of potash salts they contain. The chief A. are lemon or lime-juice, oranges, salads, water-cresses, potatoes, greens, onions, radishes, carrots, pickles, common sorrel, dandelion, &c. Acid tartrate of potash, malate or citrate of potash, also belong to the same class. See **SCURVY**.

Antiseptics are employed to prevent or arrest putrefaction. Modern research has shown that all putrefactive changes are caused by the development of minute organisms called *Bacteria*, whose germs have been deposited in the substances liable to putrescence, either from the air or by contact with other substances containing them. In order to prevent putrefaction, it is necessary to destroy these germs, or the mature bacteria, or, if they are not present already, to prevent their coming in contact with the substance to be preserved. Putrefaction may be arrested by simply heating the substances in which it has commenced to the temperature of boiling water, or by cooling them to the freezing-point of the same liquid. Unless, however, the air be excluded after this treatment, or the substances maintained at one or other of the above temperatures, putrefaction will again commence, because new germs will be deposited from the air, and soon develop into bacteria. Meat is preserved by boiling it in tin vessels, and, when all air has been displaced by steam, hermetically sealing them. Fish is often transported packed in ice, and may be preserved for any length of time if maintained at its temperature, and people accidentally buried in glaciers have been found after the lapse of many years exhibiting no sign of decomposition. Heat, cold, and exclusion of air may be called physical A., whereas substances which act as direct poisons on the bacteria may be termed chemical A., and it is in the latter sense that the word antiseptic is usually employed. A quantity of one of these bodies added to any substance liable to putrefaction preserves it, or if putrefaction has already commenced, causes it to be arrested. The more important A. are, spirit of wine more or less diluted, carbolic

acid, solution of corrosive sublimate, white arsenic (arsenious acid), alum, chloride of zinc (Burnett's fluid), permanganate of potash (Condy's fluid), salt brine, saltpetre, and many other metallic salts.

Antispasmodics are medicines which have the property of arresting or of diminishing spasmodic affections of the muscles. The word also includes remedies which allay irritability of mind. Spasm of muscles may occur in hysteria, in painful colic, in whooping-cough, in the breathlessness of asthma, in *angina pectoris*, and in neuralgia. In such cases, spirit of ether, tincture of castor, spirit of chloroform, aromatic spirit of ammonia, oil of peppermint, carbonate of ammonia, asafoetida, tincture or infusion of valerian, bromide of potassium, may allay the severe symptoms. These are the chief A.

Antisthenes, founder of the sect of the Cynics, son of an Athenian, was born in the latter part of the 5th c. B.C., survived the battle of Leuctra (B.C. 371), and died at Athens at the age of seventy. He was a disciple first of Gorgias, and then of Socrates, whose death he witnessed. He taught in the Cynosarges at Athens, whence, probably, the name of his sect, though some affect to derive it from *kunikos*, 'dog-gish,' in allusion either to the snarling ethics, or the filthy habits of his more extravagant followers. He wrote much, chiefly in the form of dialogue. The fragments of his writings that remain were collected by Winckelmann, and published in 1842. His philosophical system, almost purely ethical, represents pleasure as an evil, and pain as a blessing. The highest good, according to A., consists in virtue, which again consists in action. His disciple Diogenes, more famous as a cynic even than A. himself, remained with him till his death.

Antithesis (Gr. *anti*, against; *tithēmi*, to place), a figure of rhetoric which consists in the explicit statement of the contrast implied in the meaning of any term or description. It derives its force from a principle of the human mind—viz., that we are vividly affected only by change of impression, whether as regards knowledge or feeling.

Antitrinitarian, the name given to one who rejects the doctrine of the Trinity for philosophical reasons. If the objection is based on theology, the objector is called a Unitarian.

Antitype (Gr. *anti*, answering to, and *typos*, figure), the correlative of some other type; thus, the paschal lamb is the type or figure of which Christ is the A.

Antium, an ancient city of Latium, 38 miles S.S.E. of Rome, now Porto d'Anzo. It passed into the hands of the Volscians shortly after the expulsion of the kings from Rome, and was a troublesome enemy of Rome till subdued (338 B.C.). The wealthy Romans resorted to A., where they built splendid villas, among the ruins of which were discovered the Apollo Belvedere, and the Borghese or Fighting Gladiator. Caligula and Nero were born here, and there still exist the remains of two moles constructed by Nero, which made A. one of the finest of Italian ports. It was serviceable as late as 537 A.D.

Antlia (Lat. *antlia*, a pump), the name applied to the elongated tube or proboscis forming a chief organ in the mouth of Lepidopterous insects (butterflies and moths), and by means of which they suck up the flower-juices on which they subsist. This organ is formed by the modification of the *maxilla* or lesser pair of jaws, seen in typical form in the biting or masticatory mouths of other insects.

Ant-Lion, the name given to the young or larval stage of a Neuropterous insect (*Myrmaleo formicarium*) which in its perfect stage somewhat resembles the dragon-flies, belonging to the same order of the insect class. It inhabits S. Europe chiefly. The larval form is about half an inch in length, possesses six legs, and powerful mandibles or jaws. It excavates a pit in the sand, in which it lies in wait for unwary insects which may tumble into the trap; and it is said to assist their capture by throwing up jets of sand at such as appear in danger of escaping, and thus jerks them backwards into its trap. It sucks the juices of the prey, and then throws out the bodies from its lair. The pit is often of considerable size, averaging 25 or 30 inches in diameter, and from 15 to 20 in depth.

Antommar'chi, Francesco, a celebrated physician, born in Corsica towards the end of the 18th c. He was a professor

of anatomy at the University of Florence, but is chiefly known as the friend and attendant of Napoleon during the exile in St Helena. As a token of attachment, the emperor bequeathed a legacy of 100,000 francs to his faithful countryman, who in 1823 published *Les Derniers Moments de Napoléon* (new ed. 1852), an unpretentious work full of natural pathos. Some considerable time after his return to Paris he produced a cast of Napoleon's head, professing to have taken it after the death of the emperor. Public opinion seems, however, to have thrown considerable doubt on the genuineness of the work. At last, worried by the bitter attacks of the press, A. emigrated to America, and died at San Antonio, Cuba, 3d April 1838. He published a continuation of a large work on anatomy by his old master, Mascagni of Florence (Pisa, 1823-26).

Antonelli, Giacomo, Cardinal, and secretary to Pope Pius IX., was born, 2d April 1806, at Sonnino, on the Neapolitan frontier. The son of a herdsman, though of an ancient family, he was educated at the Grand Seminary of Rome, where he attracted the attention of the late Gregory XVI., who named him *prelato*, and raised him to several distinguished offices. In 1846 he was made Cardinal-Deacon of St Agatha alla Suburra, and gradually acquired an influence over Pius IX. almost amounting to domination. A. was a member of the committee which gave to Italy the liberal constitution of 1848, the chief articles of which were soon after violated. In September 1850 he was made Secretary of State, and later President of the Council of Ministers, Prefect of the Sacred Apostolic Palaces, &c. Virtually Papal Prime Minister, he conducted diplomatic intercourse, and controlled all transactions of an official nature. At various times the Church benefited by his energy, decision, and shrewdness. During the agitation following on the Œcumenical Council of 1870 he came prominently forward in defence of papal interests. A. died November 6, 1876.

Antonelli (of Messina), a celebrated painter, born in Sicily early in the 15th c. He introduced into Italy the art of oil-painting, which he had been taught by Johann van Eyck of Flanders. The probable date of his death is 1493. Several of his pictures are in the collections of London, Berlin, Vienna, and Palermo.

Antoninus, Itinerary of. See **ITINERARY**.

Antoninus, Marcus Aurelius, 'the philosopher,' son of Annus Verus and Domitia Calvilla, born at Rome, April 20, 121 A.D., was, after his father's death, adopted by his grandfather. In 138 both A. and Lucius C. Commodus were adopted by Antoninus Pius, and Faustina, daughter of Pius, was chosen as the wife of A., though seven years elapsed before the marriage took place. In 140, A. was appointed consul; and on the death of Pius in 161, he succeeded to the throne, voluntarily sharing the government with Lucius, at the same time betrothing to him his daughter Lucilla. A long-threatened war with Parthia breaking out in the year of their accession, the command of the Roman forces was intrusted to Lucius, who, however, proceeded no further than Antioch, where he gave himself up to drunkenness and the most degrading pleasures. Avidius Cassius, intrusted with the command, forced the Parthians to sue for peace, and Lucius returning to Rome in 166, was honoured with an undeserved triumph. A formidable confederacy of the northern tribes now menaced Italy, while the general gloom was deepened by famine and pestilence within Rome itself. Both emperors set out to the war, after rites of unusual solemnity, and a profusion of expiatory sacrifices. In 168 the barbarians were forced to sue for peace, and in 169 Lucius died, when the sole command of the war, which was now renewed, devolved on A. Though embarrassed by difficulties, he prosecuted the war with such vigour that he nearly exterminated the Marcomanni. His victory over the Quadi in 174 was accompanied by circumstances believed to be supernatural, and which gave origin to eager discussions among Christian historians upon the miracle of the Thundering Legion. Dio Cassius states that the cloudless sky suddenly darkening, much rain fell, of which the Romans, dying of thirst in the summer heat, were availing themselves, when they were suddenly attacked by the barbarians. Their position was critical, but they were rescued from it by the descent on their assailants of a fierce storm of fire and hail. That some singular circumstance intervened is attested not only

by the ancient historians, but by the sculptures of the Antonine column, and by an extant letter of Aurelius himself. The latest attempt to vindicate the miraculous character of the incident is that by Mr Newman in his essay prefixed to part of Fleury's *Ecclesiastical History* (Oxf. 1842). While the northern tribes, as a consequence of this overthrow, hastened to submit, or solicit protection, a new danger threatened from the East, the result of the intrigues of Faustina. A false report of the death of A. induced Cassius, the hero of the Parthian campaign, with whom Faustina was in treasonable communication, to rebel and seize Asia Minor. A. was preparing to set out for the East when he heard of the assassination of Cassius. In an address to his soldiers he lamented that he had no longer an opportunity of pardoning the traitor; and when the bloody head of Cassius was brought to him, he shrunk from it with horror, and refused to see the murderers. His first act on arriving in the East was to burn the papers of Cassius unread, that he might calm the fears of those nobles who were implicated in the rebellion. His wife Faustina, who had accompanied him, died at a village in the defiles of Mount Taurus, and A., though conscious of her profligacy and treason, with inexplicable weakness was prodigal of honours to her memory. Returning to Italy by way of Athens, he celebrated his triumph, December 23, 176. Fresh outbreaks on the Danube called him once more to Germany, where success again attended his arms. But his constitution was shattered by incessant toil and anxiety, and he died, March 17, 180, either at Vindobona (Vienna) or at Sirmium.

At the early age of twelve, A. was an avowed Stoic. His instructors in the doctrines of the Porch were Diognotus, Apollonius, and Junius Rusticus. That a nature so gentle should have been drawn to a philosophy so austere is to be explained by the practical character of stoicism, and its uncompromising antagonism to sensual indulgence, then the canker-worm of the Roman empire. But his studies were not confined to philosophy: he was learned in morals and jurisprudence, in metaphysics and mathematics, in music, poetry, and the fine arts. A nobler life can hardly be found in the records of humanity. It was believed that he had been sent by the gods to bless mankind, and that his death, which was accepted as a public calamity, was only a return to the heaven whence he had come. His persecution of Christianity, than which no historical fact is more clearly established, is not only not inconsistent with the inherent nobility and purity of his character, but was a natural outcome of it. The sincerity of his own belief made him intolerant of a system which gave no quarter to the old faith, and which from ignorance he believed to be not only a foul superstition, but whose followers he probably imagined to form a dangerous political association. The only work of A. that has come down to us is a commonplace-book or diary in Greek usually called the *Meditations*, of which the *editio princeps* appeared in 1558. The latest recension is that of Komes (Paris, 1816). Numerous translations exist in most European languages. There is even one into Persian by Hammer (Vien. 1831).

Antoninus, Wall of (*Antonini Vallum*), a military defence constructed by Lollius Urbicus, imperial legate in Britain in the reign of Antoninus Pius, to protect the southern districts from the fierce inroads of the Caledonians. It was executed about the year 140 A.D., extended from Carriden or Kinniel on the Forth, to Old Kirkpatrick or Dunglass Castle on the Clyde, a distance of 27 miles, and consisted of a ditch 20 feet deep and 40 wide, facing the N., with a mound or rampart on the S. side, and behind that again a military road. Forts, with watch-towers between, were erected at intervals along the line. Portions of the Roman structure, which at a later period was popularly known as Graham's Dike, are still traceable.

Antoninus Pius, Titus Aurelius Fulvius, a Roman emperor, born A.D. 86, of a family from Transalpine Gaul. He was appointed consul in 120, was adopted by Hadrian in 138, and the same year ascended the throne. The twenty-two years of his reign, otherwise nearly a historic blank, constituted a continuous period of tranquil prosperity. Internal tumult and foreign aggression were promptly crushed, but there was no war of conquest. An insurrection in the N. of Britain was repressed, and a wall—the Wall of Antonine—built between the Forth and the Clyde, as a defence against the inroads of the Caledonians. A. was a patron of literature, a wise lawgiver, and a thoughtful sanitary reformer. The title *Pius* was bestowed

on him probably for his vindication of the memory of Hadrian against a resolution of the senate. He died 7th March 161.

Ant'nius, Marcus, the triumvir, better known to English readers as **Mark Antony**, was born 83 B.C., of an old patrician family, and related by his mother to Julius Caesar. After a dissolute youth, he fled from his creditors to Greece, B.C. 58, and thence to Syria, where he commanded the cavalry under the Proconsul A. Gabinius. After serving with Caesar in Gaul, he repaired to Rome (B.C. 50) in the interest of the latter, and was chosen a tribune of the people. When the war broke out between Caesar and Pompey, A. commanded Caesar's left wing at Pharsalia, and during the latter's absence in Africa, was intrusted with the government of Italy, when he made himself notorious by his debaucheries. In 44 B.C. he was chosen consul; and when Caesar was assassinated, A. excited such a storm of popular indignation against the conspirators, that they were forced to escape from Rome. After a quarrel with Octavianus, he repaired to a consultation with him and Lepidus, at which the three (hence the name 'triumvirs,' strictly *Triumviri Reipublica Constituenda*) agreed to share the empire between themselves, as a first step to which they put to death all whose power and patriotism were dangerous to their pretensions, and among them the orator Cicero. After a campaign in Macedonia in conjunction with Octavianus, in which they defeated the forces of Brutus and Cassius, A. repaired to Asia to settle his dispute with Cleopatra, by whose beauty he was at once captivated, and he gave himself up to a life of luxurious idleness. A second division of the empire was arranged at Brundisium, the East falling to A., who married Octavia, sister of Octavianus; but he soon after resumed his voluptuous courses with Cleopatra, which roused the ire of the Romans, and widened the breach between him and his brother-in-law. Octavianus declared war against Cleopatra, whose forces, with those of A., were totally defeated at Actium (q. v.), 31 B.C. The infatuation of A. brought him once more to Egypt, where he renewed his career of debauchery; but his pleasures were interrupted by the arrival of Octavianus at Alexandria. Destituting himself, he gained a trifling advantage in a charge with his cavalry; but his star had paled before that of his rival, and hope abandoned him. A false report had reached him as to the death of Cleopatra, when, falling on his sword, he died, 30 B.C., at the age of fifty-three.

Ant'nius, or Ant'ny of Padua, or of **Portugal, St.**, was born at Lisbon, August 15, 1195; studied at Coimbra, and entered the order of St Francis, who was still living. Possessed by a desire for martyrdom, he embarked for Africa, but contrary winds drove him on the coast of Italy, where he gave himself up to theology and preaching at Montpellier, Toulouse, and Padua, where he died 13th June 1231, and where a church bearing his name contains his monument. His sermons (*Sermones Dominicales, Adventus, Quadragesimales*, &c.) are written in the style of his age, when it was customary to sacrifice the literal sense of Scripture to mystical subtleties. The most complete edition is that by Azzoguidi (Bologna, 1757).

Anton', U'rio. See **ANNA CARLOVNA**.

Ant'ny, St., sometimes called **The Great**, and sometimes **Antony of Thebes**, born about 251 A.D., at Koma, in Upper Egypt, was the father of monachism. His parents gave him a very religious, but not a very intellectual, education. All through life he could speak only the Coptic language, and was ignorant of all the literature and philosophy of Greece. About the age of twenty, in obedience to what he believed to be a divine injunction, he sold his possessions, the price of which he gave to the poor, and retired to the wilderness to lead an ascetic life. Not satisfied with even this severe discipline, at the age of thirty-five he separated himself further from the haunts of men, and passed twenty years in the most profound seclusion in an ancient ruin. In 305 he founded the monastery of Faioum, near Memphis, in answer to the prayers of a multitude of anchorites who wished to live under his guidance, but visited Alexandria in 311, during the persecution of the Christians under Maximian, hoping for martyrdom, but in vain. He now sought a deeper solitude near the Red Sea, but having been discovered by his disciples, he returned with them. Again leaving them, he sought the valley of the Nile, but in 335 repaired to Alexandria during the Arian controversy. Feeling the approach of death, he returned to the wilderness, and there died, 356 A.D.,

at the age of 105. Of all the saints in the Romish Calendar, A. is the most popular. His festival is on 17th January. See the *Acta Sanctorum* of the Bollandists, and the *Life of St A.* by Athanasius, translated into Latin by Evagrius.

Antraignes', Emmanuel-Louis-Henri de Launay, Comte d', a talented but unscrupulous statesman, born about 1755, at Ville-Neuve-de-Berg, Vivarais, in the French department of Ardèche. The Abbé Maury was his teacher, and his first literary essay (1788) contained a bold attack on the prevailing governments of Europe, and helped to hasten the French Revolution. When elected deputy for his native town, 1789, he suddenly became a strong Conservative, opposed the union of the three estates, and upheld the royal veto as essential to right government. He quitted France, 1790, and was engaged in diplomacy for several years at Vienna, St Petersburg, and Dresden. While in Russia, he joined the Greek Church, and was a pensioner of the Czar. Many letters and pamphlets were thrown off meanwhile on current subjects, most of which show him as a Bourbon partisan. On the 22d July 1812, A. and his wife were murdered, near London, by an Italian servant named Lorenzo, who had revealed his correspondence to the agents of the French emperor in London, and who dreaded the discovery of his perfidy. A.'s pamphlets are numerous, and were once interesting.

An'trim, a county in the N.E. of Ireland, bounded on the N. and E. by the sea, on the W. by the county of Londonderry and Lough Neagh, and on the S. by the county of Down. Area, 1164 sq. miles. The E. coast is hilly, with ranges stretching into the interior, which slopes towards the S.W. The surface is chiefly composed of basaltic trap, the basalt sometimes assuming strange and picturesque forms, as in the case of the well-known Giant's Causeway on the N. coast. Rathlin or Rachra Island (where Bruce lay hid one winter) and the Skerries ('rocks') lie off the same coast. The principal rivers are the Bann, the Lagan, Bush, and Main. Peat-bogs are large and numerous. Coal, salt, and iron are found. Oats are the chief crop: 66,254,851 acres under crop in 1872, 86,322 were under oats. There are manufactures of linen, cotton, woollen goods, &c., and considerable fisheries are carried on. The chief town is A., Belfast, Carrickfergus, and Lisburn. A. returns six members to Parliament—two for the county, and four for boroughs. The population in 1871 was 404,015, more than half of whom were Presbyterians, the descendants of Scotch and English colonists.

An'trum, a term used in anatomy to denote a space or cavity. The most important is the A. of Highmore in the superior maxillary bone, which communicates with the nose. This space is sometimes the seat of an abscess or of a tumour.

Ant'-Thrushes, or **Ant'-Oatchers**, a group of Insectorial or Perching birds, included in the Deutrostral section of the order, and forming the types of a sub-family (*Formicariinae*), which in turn is included in the *Turdida* or Thrush family. The bill is strong, somewhat straight, but generally hooked at the tip. The tarsi are long, and covered with large scales. The wings are short, and the flight is in consequence of limited nature. The genus *Pitta*, the members of which are found in S.E. Asia and the E. Archipelago, represent these forms—*P. Bengulensis* and *P. Nepalensis* being familiar forms. *Brachypteryx* is another genus of these birds, *B. montana* being found in Java. The S. American species are also numerous, the *Erallaria rex* being the best known of these forms.

Ant'werp (Fr. *Anvers*), the chief commercial city in Belgium, capital of a province of the same name, is situated on the river Scheldt. It is also the Belgian military headquarters, and one of the most strongly fortified towns of Europe, being defended by a recently-built wall, a new and an old citadel, numerous ditches, and a line of detached forts. There is an intricate system of basins, docks, wharfs, and quays; but the harbour, though capable of accommodating some 4000 vessels, is deficient in size, and much of the trade has of late years been transferred to other ports. In 1873 the remarkably small number of only thirty-three vessels belonged to A. For some time (1875) a scheme has been on foot to establish a new commercial town on the left bank of the Scheldt, where unlimited additions might be made to the harbour, and to connect it with A. by a bridge.

The principal building in A. is the Cathedral, erected in the 14th c., a splendid Gothic structure, with a tower 380 feet high, and containing several of Rubens' finest pictures. There are also a Museum, an Academy of Sciences, an Academy of Painting and Sculpture, a Naval Arsenal, Zoological Gardens, a Medical School, and the oldest Exchange in Europe. The chief exports are woollen yarn, flax, sugar, paper, hides, and petroleum. Imports—cotton, silk, oil, and iron. There are important manufactures of thread, silk, sugar, tobacco, and printer's ink; besides which there is extensive shipbuilding. Pop. (1870) 126,663, mostly Flemish. A. is mentioned as early as the 8th c.; flourished during the middle ages; but attained its greatest prosperity in the 16th c., when it had more than 200,000 inhabitants. The rise of the Dutch Republic and the enterprise of the Amsterdamers subsequently deprived it of its superiority. It has sustained numerous sieges, the last in 1832, when France and England forced Holland to surrender it to Belgium.

Anubis, an Egyptian deity, the sixth of the twelve deities who formed the second order, and whose duties lay among the elements of nature, was the son of Osiris and Nephthys, a sister of Isis, and was styled by the Greeks Hermanubus. He appears on monuments with the head of a jackal or dog, and long, pointed ears. Like Hermes, he was the 'shade-conductor,' and in Hades assisted Horus to weigh judiciously the lives of the departed. The Romans invested A. with the insignia of Hermes, in addition to his own. The proper sacrifice to A. was a white-and-yellow cock.

Anupshuhur, a town in the division of Meerut, N.W. Provinces, India, on the Ganges, 73 miles E. of Delhi. It is built chiefly of mud and coarse bricks, but has an increasing trade in cotton, cocoa-nuts, pulse, tobacco, and saltpetre. Pop. (1871) 10,644.

Anus, or **Vent**, the terminal orifice of the alimentary canal of animal forms, in which the intestine opens. Occasionally, as in some of the Brachiopodous mollusca, a perfect digestive system may exist without any anal opening being discernible, the intestine ending cæcally, or like a pocket. In the *Tunicata* or Sea-Squirts (q. v.), the intestine ends in a special sac or *atrium*. In birds, reptiles, and amphibia, in some fishes, and in certain lower mammalia, the intestine terminates in a chamber or *cloaca*, common to the efferent ducts of the urinary, generative, and digestive systems. The anal opening is that by which the effete or excrementitious products of digestion are expelled from the body. In higher forms it is provided with special (*sphincter*) muscles for its closure, and is also in many forms provided with glandular appendages. See ANAL GLANDS.

Anus, Diseases of. The A. is the lower termination of the alimentary canal. It is a dilatible opening, lined internally by mucous membrane, and externally by the skin. The skin, which is thrown into folds during the closure of the orifice, is covered by sensitive papillæ, and contains small sebaceous or oily glands. The diseases to which it is liable are numerous. They are as follows:—

1. **Ulcer and fissure of the A.** These are both distressing affections, giving rise to great pain during defæcation. The treatment is the application of nitrate of silver to the fissure, and the use of a suppository containing morphia or belladonna. In severe cases it becomes necessary to cut the affected mucous membrane, and part of the fibres of the sphincter muscle, so as to set the part at rest.

2. **Spasmodic contraction of the sphincter ani**, often associated with fissure or ulcer of the A. Local sedatives are required.

3. **Abscess in the neighbourhood of the A.** is frequent. It is important to prevent the pus burrowing into the bowel, and therefore the practice is to open freely from the surface at an early stage.

4. **Fistula in ano.** When an abscess forms by the side of the A., it occasionally discharges its contents into the bowel, contracts, and leaves a sinus, which is termed a *fistula in ano*. There are usually two openings into the fistula, one by the side of the A., and the other opening into the gut. The treatment consists in laying the fistula open by cutting from it into the bowel. The wound is then healed by granulations from the bottom, and the fistula is thus got rid of.

5. **Hæmorrhoids, or Piles.** These are small swellings of the

blood-vessels of the A. and lower part of the rectum, which may or may not give rise to bleeding when the bowels are moved. They are of two kinds, internal, or within the A., and external, or round the orifice. The former always bleed, the latter frequently do so. A sedentary life, intemperance in food and drink, the habitual use of drastic purgatives, hard exercise on horseback, and the existence of other diseases in the pelvis, are the chief predisposing and exciting causes of the disease. In addition to the constant irritation caused by their presence, the system soon suffers from the repeated bleedings, and the individual becomes anæmic. The treatment is constitutional and local: *constitutional*—a mild, nutritious diet, the use of purgatives, such as electuary of senna, castor oil, or sulphur, twice or thrice a week, so as gently to open the bowels, and general tonic treatment: *local*—sponging with cold water night and morning, the use of an astringent injection (ten drops of tincture of the perchloride of iron to an ounce of water), or the use of an astringent ointment, such as compound ointment of galls. These measures are merely palliative. To effect a cure, surgical interference is required. This consists essentially in applying a ligature round the hæmorrhoid, and then cutting it off. Sometimes, for external piles, the application of a ligature is not necessary.

6. **Prolapsus ani** is a protrusion of the mucous membrane through the anal orifice. It frequently occurs in feeble children. The palliative treatment is to return the bowel as gently as possible, and afterwards to retain it in its place by wearing a belt with a pad and elastic support. Sometimes, though rarely, a surgical operation is necessary.

Anville, Jean Baptiste Bourguignon d', perhaps the greatest of French geographers, was born at Paris in 1697. He was particularly versed in ancient and classical geography, and he devoted his whole life to this his favourite science. His first production was a map of ancient Greece, published when he was only fifteen. His map of Italy, for which he was especially famed, was published in 1743. Altogether, he published 104 maps on ancient, and 106 on modern, geography. A. died in 1782. His valuable collection was bought by Louis XVI. for the Royal Library in 1779. But his geographical treatises are no less admirable for their time, full of erudition, and of curious, exact, and searching criticism. The works of A., announced by M. de Manne in 1806, were to be in 6 vols., with maps drawn up from the designs of A. himself; but the death of M. de Manne in 1832 arrested the publication at the second volume.

Anwari, a celebrated Persian poet of the 12th c., born in the province of Khorassan, and educated at the Mansur College at Tus. The story of his sudden rise to fame is highly romantic. A grand procession of the Seljukide sultan, Sanjar, at Tus, so dazzled the young poet that he passed the night in writing a poem descriptive of the pageant. Next morning the poem was presented to the sultan, who was so pleased with the production that he placed its author among his courtiers. A. had now ample time to cultivate his art, and he wrote many beautiful love-songs (*ghazels*), and several striking but lavishly ornate panegyrics, besides elegies and satires or *kasidas*. He also addicted himself to the study of astrology. He died at Balkh in 1200 or 1201, whither he had been forced to withdraw owing to the failure of one of his astrological predictions.

Anlaganj, a town in the British district of Bareilly, N.W. Provinces, India, 150 miles W. of Delhi. It has a large bazaar and an increasing trade. Pop. (1871) 9947.

A'orist (or Gr. indefinite), a tense of the Greek verb which expresses an action undefined as to time. The use of this tense gives great animation to narrative.

Aorta, the chief or main artery originating from the left ventricle of the heart in mammals and birds, and which, through its branches, distributes the pure or arterial blood throughout the body. In man, the A. arises from the upper and back part of the left ventricle. It then ascends forwards to the right, and then curves backwards to the left, thus forming an arch known as the *arch of the A.* It turns over the left *bronchus* (or left main division of the windpipe), and passes in an oblique manner from the breast-bone towards the spine. It then descends vertically in front of the spine on the left side, and at the level of the fourth lumbar vertebra divides into the two common *iliac arteries*, which, together with their branches, supply the lower parts of the

body with blood. In birds the A. turns over the right instead of over the left bronchus, as in man. The arch of the A. gives off the left common carotid artery, the left subclavian artery, the innominate artery (which shortly divides into the right subclavian and right common carotid arteries), and the two coronary arteries which supply the heart itself with blood. The entrance to the A. is guarded by three membranous flaps or valves, preventing regurgitation of the blood into the left ventricle, and termed the *semilunar valves of the A.* In the fetus before birth, the pulmonary artery and A. communicate by means of the *ductus arteriosus*; this communication becoming obliterated soon after birth. The A. in the chest gives off the *bronchial arteries* supplying the lungs; the *oesophageal arteries* supplying the gullet, and the *intercostals* distributed to the walls of the chest. The abdominal A. gives off the two *phrenic arteries*, or those of the *diaphragm* or 'midriff'; the *celiac axis* supplying the spleen, liver, and stomach; the *superior mesenteric* and *inferior mesenteric arteries* for the intestines; the *renals* and *supra renals* for the kidneys; the *spermatic* for the reproductive and urinary organs; and the *lumbar arteries* for the walls of the abdomen in the region of the loins. The *caudal artery* is a small branch which is abortive in man, but is continued into the tail, in the lower animals.

Aosta (corruption of Augusta), the chief town of a district of the same name in the province of Turin, N. Italy, situated on the left bank of the Dora-baltea, near the base of Mount St Bernard. It is neat and well built, and possesses a handsome town-hall and a fine cathedral. A. was the ancient capital of the Salassi, a brave mountain race, who fiercely opposed Appius Claudius (143 B.C.) when entering Gaul. The Romans under Augustus rebuilt the town, naming it Augusta Prætoria, and it still abounds with many splendid architectural remains. A. is the birthplace of Anselm, Archbishop of Canterbury; and St Bernard de Menthon, founder of the well-known hospice that bears his name, was for some time archdeacon here. It has considerable trade in leather, cheese, and wine; and in the vicinity are the extensive mines and noted baths of St Didier. Pop. (1870) 5958.

Aoudad Sheep (*Ammotragus tragelaphus*), a species of sheep, occupying an intermediate position between sheep and goats, found in the mountainous parts of N. Africa, from Barbary to Abyssinia. It does not possess the lachrymal sinuses of the sheep, but like the latter forms, it is provided with a gland placed between the hoofs. The body-colour is reddish-brown, and the front of the body is covered with a quantity of thick hair, which gives to the fore parts a singular and massive appearance. It exists in small herds, and is of fierce disposition. The horns are of large size, and curved outwardly.

Apafi, Michael I., Prince of Transylvania, was born in 1632, of noble family. He fought with Prince George II. against the Poles in 1656, but was captured by the Tatars under Mohammed Girai. Shortly after his release he was created Prince of Transylvania (1661) by the influence of Ali Pasha, the Turkish generalissimo under Sultan Mahmoud IV. Supported by the Ottoman power, A. enjoyed a tranquil reign, and acquired fresh possessions. He threw off his allegiance to the Porte after its defeat at the siege of Vienna (1683), and was taken under imperial protection. Grief at the death of his wife, Anna Bornemitz (1688), is said to have brought on sufferings from which he died in 1690, just as the Turks were on the point of entering Transylvania to punish him for his perfidy. His son, Michael II., at once ascended the throne. The Turkish forces were for a time successful, but all the places taken were finally regained by the help of the imperial troops. The young prince of Transylvania, discouraged, probably, by his short and stormy reign, was induced to part with his dominions to Austria for a pension of 12,000 or 15,000 florins. He died childless at Vienna, February 1, 1713.

Ap'nage. This word occurs occasionally in Scotch law-books, as signifying the assignment of crown lands and feudal rights to princes of the royal family. It has probably been borrowed from the French law, in which it is a technical term.

Ap'athin, a town in the province of Bacs-Bodrog, Hungary, south of the E. bank of the Danube, 15 miles S.W. of Zombor, and

130 S. of Pesth. It has some trade in hemp, silk, wood, and madder, and much silk is produced in the neighbourhood. Pop. (1869) 9053, mostly German.

Ap'atite is the name of a mineral containing phosphate of lime, $\text{Ca}_3\text{P}_2\text{O}_8$ or $3\text{CaO}, \text{P}_2\text{O}_5$, together with chloride and fluoride of calcium. It is found in Great Britain, in the tin veins of St Michael's Mount, Cornwall, and in Devonshire; also in France, Germany, Norway, and America, and in large quantities in Spain. It is principally employed in the manufacture of superphosphate of lime, $\text{CaO}, 2\text{H}_2\text{O}, \text{P}_2\text{O}_5$, now used in large quantities as an artificial manure. For this purpose A. is ground to powder and treated with sulphuric acid. This acid precipitates two-thirds of the lime present as phosphate, in the form of sulphate of lime (gypsum), whilst soluble superphosphate remains.

Ape, the name applied to the higher *Quadrumanæ* or monkeys, which are included in the sections *Cynocephali* (baboons and mandrills) and *Anthropomorphi* (gorillas, chimpanzees, gibbons, and orangs). The tail in these forms is rudimentary or wanting. See MONKEYS, QUADRUMANA, &c.

Mandrill Baboon.

Ap'eldoorn, a small village, centre of a manufacturing district in the province of Gelderland, Netherlands, 17 miles N. of Arnhem, and connected by means of a canal with a branch of the Yssel. The district has forty-two paper-factories, several copper-foundries, and many corn-mills, and carries on, besides, an active transit trade. Near A. is the *Zoo*, a royal hunting lodge. Pop. of the commune (1870), 12,661; but of the village itself, only 1853.

A'p'elles, the most famous painter of antiquity, flourished between 352 and 308 B.C. His father's name was Pythias, and though accounts vary as to his birthplace, the best accredited is that which makes him a native of Colophon, in Asia Minor. He studied first at Ephesus, then at Amphipolis, and last at Sicyon, becoming thus acquainted with the excellences of the different schools. A. was the close friend of Alexander the Great, having lived for some time at the court of his father Philip. He thereafter visited Rhodes, Cos, Alexandria, and Ephesus. His *Venus Anadyomene* was the pride of ancient art. It represented the goddess rising from the sea, the drops falling round her like a transparent silver veil. Though he surpassed all his contemporaries in *grace*, he did not hesitate to attempt the heroic, and his representation of Alexander wielding the thunderbolt greatly pleased Alexander himself. A. was an indefatigable student of his art; hence the origin of the famous proverb, *Nulla dies sine linea* ('No day without its line'). He was just to the merits of his contemporaries, and freely acknowledged the departments in which they excelled himself. He was amenable to criticism, and altered a shoe at the suggestion of a cobbler; but when the same critic ascended to the leg, A. told him to stick to his last; hence the proverb, *Ne sutor supra crepidam*. In honour of this exquisite genius, the art of painting was called *Ars Ap'ellica*.

Ap'ennines (Lat. *Mons Apenninus* or *Apeninus*, probably connected with the Cymric Celtic *Pen*, a 'head' or 'hill'; comp. *Pen-nine* Range, *Pin-dus*, *Pen-nigant*, &c. The Gaelic Celtic is *Ben*, as *Ben Lomond*, *Ben Ledi*, &c.), a range of mountains stretching the entire length of Italy, between 37° and 44° 33' N. lat., and 7° 40' and 18° 20' E. long. It is a branch of the great Alpine system, with which it is connected at the Col de Tenda, in the province of Coni. Under the name of the Ligurian A. it partly encircles the Gulf of Genoa; it then continues E. beyond Florence, forming the watershed between the latter and the valley of the Po; thence, taking a southerly direction, it becomes the watershed of the peninsula, and terminates in the island of Sicily. The chain is divided by modern

geographers into (1) *North A.*, from the Maritime Alps at the Col de Tenda to the Pass of Borgo San Sepolcro, near the border of Tuscany; (2) *Central A.*, from Arezzo to the river Pescara; (3) *South A.*, from the valley of the Pescara to Cape Spartivento; and (4) *Insular A.*, or Sicilian range. Towards the Adriatic coast the A. are precipitous, but on the W. side they slope gradually, reaching the rich Italian plains through a series of lower ranges known generally as the *Sub-Apennines*. In N. Italy the Ligurian A. are so close upon the Gulf of Genoa that they only send a few streams down to the coast; but on the N. side rise many large rivers which contribute to the Po, after flowing through the plains of Piedmont and Emilia. The main chain of the A. forms to the W. the basins of the Arno, Tiber, Garigliano, and Volturno; while on the E. side numerous mountain torrents rush down the steep ravines which open out on the Adriatic, but there are no basins of any breadth till we reach the province of Apulia. The average height of the entire A. is about 4000 feet; but in the highlands of Abruzzo it reaches 7000 feet, while in the N. it sinks to 3500. The Gran Sasso d'Italia ('Grand Rock of Italy'), in the province of Teramo, is the highest peak in the whole range, rising to a height of about 10,000 feet. Two of the great European volcanoes, Vesuvius and Etna (q. v.), belong to the chain, which, for the most part, is continuous; but which in the S. is crossed by many rugged gorges and fertile valleys. The geological formation varies greatly. While the Secondary Limestones of the Jura occur most frequently, there are the Tertiary beds of the Sub-A., transition clay-slate in abundance, and the recent lavas and scorise of Vesuvius and Etna. The Roman and Neapolitan A. are universally celebrated for their extensive quarries of the finest marble. None of the heights rise to the level of the snow-line, but the lofty peaks of the Abruzzi and Lunigiana are covered with snow from October till May. In general the entire range presents a naked, dreary appearance, in great part due to the comparative scarcity of water; but at the Riviera of Genoa, the Gulf of Naples, and wherever water is plentiful, the lower slopes of the mountains are clad in almost tropical vegetation. Chestnuts, oaks, and corn-fields are often found at an elevation of 300 feet, while in the valleys beneath flourish myrtles, oranges, Indian figs, and gigantic agaves.

Apenra'de, the capital of a district of the same name in the Prussian province of Slesvig-Holstein, lies in an inlet of the Little Belt. It has a good harbour, considerable shipping, and extensive fisheries. The Wends destroyed A. in 1148, and it suffered severely in 1848 on the insurrection of the duchies. There are beautiful environs, and near A. stands the ancient castle of Brundlund, built (1411), on the site of a still more ancient structure, by Queen Margaret of Denmark. Pop. (1871) 5932.

Apet'alous, a term applied to flowers in which the petals or corolla are absent, and also extended to flowers having neither calyx nor corolla, although Achlamydeous (lit. 'coverless') is the proper term to apply in the latter case.

Aphanip'tera, an order of Holometabolic ('complete metamorphosis') insects, in which the wings are of rudimentary nature, and exist in the form of scales or plates on the hinder thoracic segments. The mouth is suctorial in its nature. To this group the fleas (*Pulicidae*) belong, and of this family the common flea (*Pulex irritans*) is a familiar species. The Chigoe (q. v.) (*Pulex penetrans*) of S. America and the W. Indian Islands burrows beneath the skin of the feet, and causes troublesome and painful sores. These insects live parasitically upon various animals.

Apha'sia is loss of speech dependent on disease of the brain. It is not simply loss of voice, which may be caused by disease of the larynx; nor loss of the power of articulation, which may be the result of disease of the mouth or lips; but it is loss of the power of expressing ideas by means of words. A. is sometimes transitory, but in many instances of brain disease it becomes permanent. It may be complete or partial; that is, there is an entire loss of words as connected with ideas, or only the loss of a few. Frequently A. is associated with hemiplegia, that is, paralysis of one side of the body. *Post-mortem* examination has shown that in the great majority of cases of A. morbid changes are found in the third left frontal convolution of the brain. Dr Bastian, of University College, London, has grouped all cases of

A. into three classes, as follows: (1.) Those who can *think*, but cannot *speak or write*; that is to say, the power of co-ordinating the idea with the muscular actions necessary for speaking or writing is abolished—*A. proper*. This is the most common class. (2.) Those who can *think and write*, but cannot *speak*—*Aphemia*. In these cases the mind is unaffected, and there is usually no paralysis. (3.) Those who can *think and speak*, but cannot *write*—*Agraphia*. Such a person, when asked to write a sentence, scrawls an unmeaning mass of letters, while he may be quite conscious of the defect. Such cases confuse the names of common objects, calling a spoon a fork, and so on. A. is a symptom of cerebral disorder, and probably no treatment is likely to be beneficial. See INSANITY.

Aphe'lion (Gr. *apo*, from; *helios*, the sun) is the most distant point of a planet's or comet's orbit from the sun; the nearest point being called the perihelion. Formerly the Anomaly (q. v.) was measured from the A.; but since the knowledge of comets has been so greatly extended, and as their aphelia are quite out of sight, the anomaly is now taken from the perihelion.

Aph'is, the scientific name of the plant-lice belonging to the Hemipterus order of insects, and included in the section *Homoptera* of that order. They are small insects, both sexes being ordinarily wingless, or occasionally provided with four membranous wings. The beak or rostrum springs from the under part of the head or breast. The tarsi consist of two joints, and are provided with two claws. The body is pear-shaped, and at its hinder portion possesses a glandular structure, which secretes a sweet juice of which ants are extremely fond. See ANT. The aphides live upon plants, congregating in immense numbers, and sucking the plant-juices, thus frequently causing a blight, and the death of the trees or shrubs. The rose-trees, hop-plants, turnip, cabbage, bean, and many other plants are infested, each by a distinct species. The *A. rosa*, of the rose-tree; the bean *A. (A. faba)*; the *A. humuli* of the hop; *A. brassicae* of the cabbage and turnip; *A. lanigera*, or woolly A. of America—the American 'blight' of apple-trees—are all familiar species of these insects. The hop crop, indeed, dates its yearly uncertainty, failure, or success from the more or less destructive effects of these pests. The potato *A. (A. vastator)* is another familiar form. Green is a common colour among plant-lice, the A. of the bean being coloured black. The aphides exemplify in a remarkable manner the reproductive phenomena, known under the name of Parthenogenesis (q. v.) Winged males and females are thus produced in the autumn. These copulate, and produce eggs which lie dormant all winter, but develop into female forms only, in the ensuing spring. These wingless females, or 'fruitful virgins' as they are called, produce living young without the influence of the male, their offspring being invariably wingless, and as invariably female in sex. This second generation of 'fruitful virgins' similarly produce young viviparously, without access to the males, the young being as before wingless, and females. As many as ten or eleven generations of a similar kind will thus be produced; until, when the succeeding autumn comes round, males and females appear in the last brood of the 'fruitful virgins,' and these males and females produce eggs from which, in the succeeding spring, fertile virgins will again be produced. *Parthenogenesis* thus means the development or production of new individuals from females which have had no copulation with males.

Apho'nia. This term means loss of voice, either complete or partial. Voice is produced by vibrations of two thin folds of membrane in the larynx termed the vocal cords. The larynx is a structure composed of cartilages more or less movable on each other by the action of muscles which are supplied with nerves. Any disease affecting this mechanism causes more or less loss of voice. When the nervous supply is interfered with, A. is termed functional; when the vocal cords are thickened by inflammation, or by tumours or warty growths, the disease is said to be organic. The diagnosis of the disease is made by means of the Laryngoscope (q. v.), by the aid of which the cords can be examined. The treatment depends on the cause. If due to catarrh or cold, as in common hoarseness, a mustard plaster to the throat may be beneficial; if due to tumours or growths on the cords, these must be removed; if caused by chronic inflammation and ulceration, the application, by means of a brush, of a strong solution of nitrate of silver (40 grains to the ounce) is beneficial. In

advanced cases of phthisis, patients lose their voice from tubercular ulceration of the larynx. Such cases are hopeless. A variety of A., known as *dysphonia clericorum*, or clergyman's sore throat, is common amongst public speakers of all classes. It is sometimes nervous, but usually is caused by congestion, inflammation, or relaxation of the mucous membrane of the larynx, produced by excessive use of the organ. Rest, change of air, and the local application of nitrate of silver, is the best treatment in these cases.

Aph'orism (Gr. *aphorismos*, a definition), a short, pithy saying, comprehending an important truth; as, 'Delays breed remorse.'

Aphrodis'iacs are medicines which excite or increase the sexual powers. Many substances said to have this effect have no specific action on the sexual organs, but merely excite the imagination. Such substances are musk, castoreum, ambergris, the allyl oils, obtained from Cruciferous plants, such as the onion, leek, horse-radish, &c., and opium and Indian hemp. Cantharides and turpentine occasionally excite the genital organs; but the only true sexual stimulants are those which promote the healthy nutrition of the tissues, such as iron, quinine, phosphorus, nux vomica, and strychnine. See ANAPHRODISIACS.

Aphrodi'te, the Greek name of the Goddess of Love, whom the Romans called Venus, under which heading the origin and development of the myth will be traced. The name A., also in poetry *Aphrogeneia*, is Greek, and means 'foam-born,' because the goddess was said to have sprung from the bright foam of the sea. Her festivals, named *Aphrodista*, included impure mysteries, the main actors in which were prostitutes.

Aphrodi'te, a genus of worms belonging to the order *Errantia* of the Annelidan class (see ANNELIDA), which genus includes those forms popularly known as 'sea-mice.' These worms possess somewhat oval bodies, the jointed back being covered with a double row of overlapping scales or plates, termed *elytra* or *squamæ*. Beneath these plates the gills are contained, and water for the purpose of breathing is admitted and expelled by the elevation or depression of these plates. The upper part of the digestive system can be protruded like a proboscis. The head is small, and pointed with eyes and tentacles. The bristles or setæ fringing the body are of large size, and exhibit the most gorgeous iridescent hues and metallic lustre, rendering the sea-mice objects of exceeding beauty. *Aphrodita hispida* is a familiar species.

Aph'thes is the name given in medicine to the disease called *thrush*. It consists of small, round, white specks or elevations scattered over the tongue and mucous membrane of the mouth. The disease occurs specially in infants, but occasionally it may be seen in old persons, when it is usually associated with a grave disorder of the alimentary apparatus terminating in death. In some forms of A. minute filaments and spores of microscopic fungi are found—the *Leptothrix buccalis* and *Oidium albicans*. The treatment consists of cleanliness, and the application to the lining of the mouth of borax mixed with honey or glycerine.

Apia'ceæ, another name for the natural order *Umbellifera* (q. v.)

Ap'ary. See BEE.

Apic'ius, Marcus-Gabius, a Roman epicure who flourished under Tiberius. His inventive faculty in the culinary art was exhaustless. Having squandered upwards of £800,000 in ministering to his ruling passion, and fearing that, having only £80,000 left, he should have to be content with common fare, he hanged himself. Two other persons of this name are mentioned in history, one of whom lived in the time of Pompey, and the other in the time of Trajan. The Roman cookery-book *De Arte Coquinaria, seu de Obsoniis et Condimentis*, though bearing the name of A., was not written by any of the three, but by a certain Coelius, who judiciously prefixed to his composition the name of the greatest gourmand of antiquity. It was edited by Liater (Lond. 1705), Almelooven (Amst. 1709), and Bernhold (Ansb. 1787-91).

Ap'ion, a Greek grammarian who flourished in the first half of the 1st c. A.D., was born at Oasis, in Libya, and studied at Alexandria under Apollonius, who inspired him with a love for Homer. He subsequently taught rhetoric at Rome,

and from his loquacity and boastfulness was called by Tiberius 'the cymbal of the world.' His works are now almost completely lost. He wrote a work on the text of Homer which attained considerable reputation and authority, and works on Egypt, and against the Jews. This last work brought him under the notice of Josephus, who attributes his death to a disease the result of debauchery. From his book on Egypt, Aulus Gellius has drawn his world-famous story of *Androctus and the Lion*.

A'pis (Egypt. *Hapi*, a name doubtless connected with Hapi, the Egyptian name for the Nile), the bull of Memphis, an Egyptian god, the symbol and visible incarnation of Osiris (q. v.). Two sanctuaries and a large court were set apart for him in the temple of Ptah, where he gave oracles, and received the homage of his attendants. The new-born bull, that was really A., was discovered by certain marks: according to some, four; according to others (Ælian, for example), as many as twenty-nine. All, however, agree as to the following signs: The animal must be black, have a white triangular spot on its forehead, a white crescent-shaped spot on its right side, and a knot resembling a beetle under its tongue. The days of his discovery and birth were festivals; the day of his death filled Egypt with woe. He was not permitted to live longer than twenty-five years. When he reached this age, he was secretly put to death, and buried in a sacred well. If he died earlier, he was solemnly buried in the Temple of Serapis. His worship was certainly at first connected with the sacred river, for the *Apis Natalis*, or annual festival of the discovery of the god-calf, coincided with the rising of the waters of the Nile. Later on A. was merely the animal sacred to Osiris, who himself was called, according to Strabo, 'the bull of the under-world.' Still later he became 'one and the same with Osiris himself;' and last of all, when it was sought to etherialise the nature-worship of the land, the myth of A. was twisted to symbolise the astronomical and physical systems of the Egyptians.

A'pis. See BEE.

A'pium, a genus of Umbelliferous plants. See CELERY.

Ap'la-cent'al Mam'ma'lia, a name applied to the two lower orders of mammals (*Monotremata*, represented by the ornithomyces and echidna; and *Marsupialia*, represented by the kangaroos, opossums, &c.) on account of the young of these forms being unconnected with the mother before birth, by means of a *Placenta* (q. v.) or 'after-birth.' All mammalia, other than those included in the two above orders, possess such a vascular connection with the mother, and are hence termed *placental* mammals.

Ap'la-na'tic Lens (Gr. *a*, without; *plane*, deviation) is a lens so constructed as to be quite free from spherical aberration. See ABERRATION.

Aply'sia, a genus of Gasteropodous mollusca, popularly known as the 'sea-hares,' and forming the type of the family *Aplysiadae*. This family belongs to the *Opisthobranchiate* Gasteropoda, or those in which the gills exist towards the rear of the body. In the *Aplysiadae* the animals are slug-like; the shell being rudimentary, and concealed beneath the mantle. The tentacles are very large, and are turned backwards like ears, whence the suggestion of the popular name of sea-hares. These forms feed upon seaweeds, and are common around the coasts of Britain. They emit a fluid, coloured purple or violet, from the mantle, when they are irritated. This fluid was formerly thought, but erroneously so, to be poisonous in its nature; the ancients using these forms in their spells. *A. depilans*, *A. inca*, &c., are familiar species.

Ap'noea is the name given to the sensation of want of breath. Its cause is probably due to the presence of an excess of carbonic acid in the blood, which acts on the nervous centres governing respiration. Great difficulty in breathing in disease is called dyspnoea, and if a patient can breathe only when the body is erect, the condition is termed orthopnoea.

Apoc'alypse. [See REVELATION OF ST JOHN.]

Apoc'alyp'tic Number. See ANTICHRIST.

Apoc'arpous, a term applied in botany to fruits consisting of a single carpel, as in the pea; or several carpels disunited, as in the columbine.

A Poco a Poco (Ital.), 'little by little,' a musical term.

Apocryphal Scriptures, or the Apocrypha. 1. *The name.* The Gr. *apocrypha* means properly 'hidden, secret,' then, 'spurious.' The use of the word came first into vogue among the heretical sects of the early Christian Church, who applied it to various books which they asserted were the productions of certain holy personages, whose names they bore, and had been obtained by means of a secret tradition. The name was retained by ecclesiastical writers, partly with the sense given to it by the heretics themselves of *secret* and *mysterious*, but also with a scornful sense of *spurious* (i.e., not written by their alleged authors) and heretical. The modern meaning, 'uncanonical,' dates properly, as will appear, from the age of the Reformation.

2. *Their history.* The Hebrew Canon, which was strictly preserved by the Jews in Palestine, was identical with that of our authorised version. But among the Greek-speaking Jews at Alexandria and elsewhere, the limits of the Canon had not been exactly fixed. In the Greek translation of the LXX. several books of the Hebrew Canon received additions, several later books not in the Hebrew Canon were translated, and others were written in Greek. In the Christian Church, from ignorance of Hebrew, the LXX. came to be almost universally used, or, in the Western Church, a Latin version made from it; and thus the practice arose of using, as sacred and canonical, books which had no place in the Hebrew Canon. Still, attempts were made to form more definite views about the Canon (q. v.). The Greek Church, at the Council of Laodicea (360 A.D.), decided to exclude the A. altogether. In the West, one section of the Church wished the A. included in the Canon, and at the Council of Carthage (397 A.D.) a decree was passed making some of them at least canonical (Wisdom of Solomon, The Wisdom of Jesus, Tobit, Judith, and the two Maccabees); while another section, headed by Jerome, held them to be inferior to the other books, but deserving to be read in churches for the edification of the people. The question thus remained undecided for the whole Church till the Reformation. The Roman Catholic Church, by a decree of the Council of Trent, classed the A. along with the canonical books as all deserving of equal authority, with the exception of the Prayer of Manasses and the two books of Maccabees. The Protestant Churches unanimously adopted the pure Hebrew Canon; only, Luther published the A. along with his Bible as books 'which are not of like worth with Holy Scripture, yet are good and useful to be read;' an example which was followed by the Church of England. The Calvinistic Churches have treated the matter more strictly, and by them the A. S. have been altogether ignored.

The name A. is also given, but less accurately, to a class of writings which arose out of the canonical literature of the New Testament, and which concern themselves mainly, though not exclusively, with the history and doctrine of the new religion. They are divisible into three heads: (1) The A. Gospels; (2) the A. Acts of the Apostles; (3) the A. Revelations or Apocalypses. None of these have ever obtained canonical recognition, and it is impossible to speak positively regarding their age or their authors. Most of them exist only in mediæval MSS.; but it is pretty clear from internal evidence that they were composed at a very early date. Of the twenty-two A. Gospels, the most important are *The Protevangelium of James*, *The Gospel of Thomas*, *The Gospel of Mary*, *The History of Joseph the Carpenter*, and *The Acts of Pilate*. Some of these may reach back to the 2d c.; at any rate, from the 4th c. down, allusions and references to particular incidents recorded in them are numerous. Some critics think the A. Acts of the Apostles are, in their first form, of earlier origin than the A. Gospels. Origen and Tertullian seems to have been familiar with books of this description, and mention some of them by name, which may, or may not, however, have been identical with what we now possess. Of the thirteen documents thus classified, the chief are *The Acts of Peter and Paul*, *The Acts of Barnabas*, *The Acts of Philip*, *The Acts of Andrew*, *The Acts of Thomas*, *The Martyrdom of Bartholomew*, and *The Acts of John*. Regarding the A. Revelations, it is still more difficult to pronounce an opinion. The MSS. are characterised by extreme variety of readings, and the text is occasionally very corrupt. The most important and interesting are *The Apocalypse of Moses* and *The Apocalypse of Esdras*, the first of which belongs rather to Old Testament literature; *The Apocalypse of Paul*, *The Apocalypse of John*, and *The Assumption of Mary*.

If the A. writings of the New Testament are not to be received as veracious records of literal facts, they are yet deeply interesting and instructive. We see in these crude performances the natural growth of a vast religious romance, encircling, as with a magic halo, the lives and characters of men whose real exploits had changed the face of the world, and stirred the admiration and the awe of a converted empire. See Tischendorf's *Prolegomena* to the A. literature of the New Testament (Leipzig, 1873), and Clark's *Anti-Nicene Christian Library*, vol. xvi. (Edin. 1870.)

Apocynaceæ, a natural order of Dicotyledonous corollifloral plants, embracing about 100 genera and 600 species, the most of which are natives of tropical countries. Some of the plants in the order yield edible fruits, others are used medicinally, while many of them are very poisonous. One of the most deadly is *Tanghinia venenata*, the seeds of which supply the famous Tanghin Poison (q. v.). The oleander (*Nerium oleander*), common in the S. of Europe, is also poisonous in all its parts. Death has resulted from eating its flowers. *Tabernaemontana utilis* is the Hya-hya or Cow-Tree (q. v.) of Demerara, the juice of which is used as milk. *Urceola elastica*, *Vahea gummiifera*, and others, yield Caoutchouc (q. v.). *Wrightia tinctoria* yields a dye like indigo. Two species of Periwinkle (q. v.) (*Vinca major* and *minor*), found in Britain, are astringent and acrid. *Allamanda cathartica*, and others, are emetic and cathartic. *Apocynum cannabinum*, called Canadian hemp, yields a strong fibre.

Ap'oda, 'footless,' a term applied in zoology to various groups of animals to indicate the absence of the fore or hind limbs, or their homologies. Thus certain cirripedes (barnacles, &c.) among the Crustacea are termed A., from the absence of the cirri, which represent the limbs of other crustaceans. Certain fishes (e.g., sand-eels, eels), in which the ventral fins are absent, are termed A. The blind worms or *Ceciliada* (Amphibia), in which feet are undeveloped, were formerly termed A.

Ap'ogee (Gr. *apo*, from, and *ge*, the earth) denotes generally the furthest distance of any heavenly body from the earth; but is now restricted in its application to the distances of the sun and moon. The shortest distance of these bodies from the earth is called the *perigee*.

Apold'a, a town in the grand duchy of Saxe-Weimar, Germany, on the Werlitz, 8 miles N.E. of Weimar. It is the industrial centre of the grand duchy, has extensive stocking manufactures (there are over 1100 looms), and is a station on the Thuringian Railway. Pop. (1872) 10,507. The castle of A., together with a certain amount of landed property, was presented in 1633 to the University of Jena, in whose possession it still remains.

Apollina'ris, the Younger, son of A. the Elder, a presbyter of Laodicea, was, according to Jerome and Rufinus, Bishop of Laodicea in the latter part of the 4th c. From him the heresy styled Apollinarianism takes its name. He denied that Christ had a rational human soul, affirming that its place was supplied by the divine *Logos* or Word. As this seemed a denial of the true human nature of Christ, it was repeatedly condemned—by the Council of Alexandria in 362, by councils at Rome in 375 and in 378, and by the Œcumenical Council of Constantinople, 381—but the heresy extended widely over Syria. After the death of A., between 382 and 392 A.D., his followers formed two sects, the Vitalians and the Polemeans; the latter of whom, regarding the divine and human natures of Christ as blended into one substance, were styled *synousiastoi*. They were also accused of *sarcotritia* (flesh-worship), and of *anthropotritia* (man-worship), because they deemed the two natures so intimately blended that the spiritualised body was a legitimate object of adoration. Apollinarianism was entirely prohibited by imperial command in 428 A.D. Of the numerous writings of A. there only remain a paraphrase of the Psalms, in Greek hexameters, first published at Paris in 1552, and fragments of a commentary on St Luke, printed by Angelo Mai in his *Classici Auctores* (Rome, 1827).

Apoll'o, one of the great divinities of the Greeks, was, according to Homer and Hesiod, the son of Zeus ('the Sky') and Leto ('Shadow' or 'Darkness'), though no birthplace is noted, unless an epithet of Homer, the meaning of which is disputed, may be taken as implying that he was 'born in Lycia.'

Of the various beliefs of later times in reference to this point, the most popular and generally received was that, with his sister *Artemis*, he was born in the island of *Delos*. Both *Lycia* and *Delos*, it may be noted, signify the 'land of light.' *Leto*, it was said, driven from land to land by the jealousy of *Hera*, at last found shelter in *Delos*, where she brought forth *A.* and *Artemis* under a palm at the foot of *Mount Cynthus*. The youth *A.*, fed with nectar and ambrosia by *Themis*, called at once for a lyre and bow, declaring that henceforth he would reveal to men the will of *Zeus*. Powers apparently differing in kind are ascribed to *A.*, but they are really separate manifestations of one and the same power. For example, *A.* punishes the wicked, as the god that bears the bow and arrows (hence, according to some, his name *A.*, 'the destroyer,' though the solar mythists explain it as meaning that the sun's rays, when powerful, can destroy the life of animals and plants); consequently he is also the helping god. Then he is the god of prophecy, song, and music, deriving his prophetic powers from *Zeus*, and communicating the prophetic gift to gods and men, while he cheers the feast of the gods with his phorminx. Again, he is the protector of flocks and herds; and finally, he founds cities and establishes constitutions. On the view that *A.* and *Helios*, or the sun-god, are identical—and the later Greek poets made no distinction between them—these different attributes are seen to be duly connected. Where the worship of *A.* originated has been much discussed. Some are of opinion that it was introduced from Egypt. *Otfried Müller*, on the other hand, thought that *A.* as 'the averter of evil' was a Doric divinity, having the oldest seats of his worship at *Tempe* and *Delphi*, and that his worship was not introduced into *Attica* till the Ionian immigration. But all such conjectures are considered idle by the new school of comparative mythologists, headed in England by *Max Müller* and *Cox*, who trace back with surprising ingenuity most of the circumstantial details in the lives of the Greek deities to the misapprehension of the figurative language used by the older Aryans in reference to solar phenomena. For a special application of this new principle to the myth of *A.*, see *Cox's Manual of Mythology*, pp. 48-55. The most famous oracles of *A.* in Hellenic lands were *Delphi*, where the Pythian games were held in his honour, *Delos* in the *Ægean*, and *Claros* and *Patara* in *Asia Minor*. The Romans introduced his worship as early as 430 B.C., but as they had no counterpart to this brilliant and variously-gifted divinity in their own mythic system, they were forced to adopt his Greek name also.

Apoll'o Belvedere, a famous statue found at ancient Antium in 1503, and placed by Pope Julius II. in the *Belvedere* of the Vatican, whence its name. The figure is nude, over life-size, and has long been regarded as the most beautiful type of manhood in existence. The artist is unknown, but the reign of *Nero* is fixed as the probable date of the work.

Apollodo'rus, an Athenian painter, flourished about 408 B.C., improved colouring, and invented *chiaroscuro*, hence the epithet of *Shiagraphos* (the 'shader') applied to him.—**A. of Damascus**, architect, put to death 129 A.D., by *Hadrian*, for indiscreet criticism of a design sent him by the emperor.—**A.**, a Greek poet, mythographer, and grammarian, flourished about 140 B.C. The *Bibliotheca* alone of his numerous works is extant. It gives a terse account of the Greek myths down to the heroic age. In 1782-83 *Heyne* published an edition of it at *Göttingen*, of which a second and improved edition appeared in 1803.

Apollo'nios.—1. **A. Dyscolos** ('ill-tempered'), of *Alexandria*, the first who systematised grammar, and so called by *Priscian* the prince of grammarians, belonged to the 2d c., and to the reigns of *Hadrian* and *Antoninus Pius*. Most of his works are lost. The first edition of those that have come down to us was published at *Venice* in 1495, the latest and best is that of *Bekker* (Berl. 1817). His son, *Ælius Herodian*, was as famous a grammarian as *A.* himself.—2. **A.**, son of *Archebulus*, author of a Homeric lexicon, still extant (of which a good edition was published by *Bekker*, Berl. 1833), born at *Alexandria*, and lived in the time of *Augustus*.—3. **A. Molon**, taught rhetoric at *Rhodes*, lectured at *Rome*, and was the teacher of *Cicero*.—4. **A. of Perga** (240 B.C.), a mathematician, known to antiquity as the 'Great Geometer,' was the author of numerous works, all of which are now lost, except a treatise on *Conic Sections*, part of which is in Greek, and part in

an Arabic translation. The best edition of the *Conic Sections* is that by *Halley* (Oxf. 1710).—5. **A. of Rhodes**, born about B.C. 235, instructed in his youth by *Callimachus*, though afterwards they cherished deep and mutual antipathy. The epic of *A.*, styled the *Argonautica*, a work of labour rather than of genius, though not without many beautiful passages, which gracefully imitate the simplicity and naturalness of *Homer*, had many admirers among the Romans. The best edition is that of *Wellauer* (Leipz. 1828, 2 vols. 8vo), with various readings and short notes.

Apollo'nios, of *Ty'ana*, in *Cappadocia*, born four years B.C., a Pythagorean philosopher, half mystic, half impostor, who pretended to supernatural powers, and was commonly regarded as a magician. He travelled in *Asia Minor*, disputing upon divine rites, and twenty years later he consulted the Magi at *Babylon* on his road to *India*. In *India* he met with *Jarchas*, the chief Brahmin, from whom he received such instruction in things divine as induced him to claim miraculous powers and a knowledge of futurity. After much travel, in the course of which he mixed himself up with political movements, he was tried for participating in an insurrection against *Domitian*, but acquitted. His last years were spent at *Ephesus* as a teacher of the doctrines of *Pythagoras*, and here he died at the age of nearly 100. *A.* claims notice principally from the attempts made by *Hiérocles*, in the 3d c., to set up his miracles as rivals to those of *Christ*—attempts renewed in England by *Blount* and *Lord Herbert*, and in France by *Voltaire*. The writings of *A.* were numerous, and a list of them has been preserved; but the only authentic one that has come down to us is the *Apology*, preserved by *Philostratus*, who wrote his life about two centuries after *A.* was dead.

Apollo'nios, of *Tyre*, the title of a Greek metrical romance, of which the original has been lost, though numerous mediæval versions and adaptations exist in most of the European languages. One of the very earliest was a version into the English of the 11th c. The adventures of *A.* himself, of his wife, and of his daughter, and of their happy reunion after apparently hopeless separation, are minutely described. There are no fewer than three Latin versions, one of which is printed in the *Gesta Romanorum*. This subject is treated by *Gower* in his *Confessio Amantis*, and by *Shakespeare* in his *Pericles, Prince of Tyre*. Three English stories, based on a French version of *A. of Tyre*, were published in 1510, 1576, and 1607. The Spanish version, which dates from the 13th c., was republished at *Paris* as late as 1842. The Germans possess the story in various forms, the oldest reaching back to the 13th or 14th c.

Ap'ologue, a fable or story, intended to convey some useful moral, differs from a parable, which must have an air of probability, in employing brutes and inanimate objects as the interlocutors. *Æsop's* fables are excellent examples of the *A.* See the *A.* of *Jotham*, *Judges ix.* 7-15. The *A.* has long been a favourite vehicle of instruction for the young, and is a favourite form of composition with Easterns.

Apology, now used as synonymous with excuse, was originally the title of a book defending certain opinions or doctrines, as *Tertullian's A. for the Christians*. Apologetic works were numerous in the early stages of Christianity; indeed, until Christianity became the religion of the empire in the 4th c. Certain eras have been marked by a greater eruption of the apologetic spirit than others, e.g., that of the revival of learning (15th c.), when Christianity and Platonism seemed to be in antagonism, and apologies were written defending revelation; and the period following the Reformation in England, when, freethinking having become fashionable, numerous apologies were published to prove the divine origin of Christianity. A distinct branch of systematic theology is now named *Apologetics*. Among the ancient apologists were *Justin Martyr*, *Origen*, *Augustine*, &c. Among the modern, the Protestant—*Grotius*, *Butler*, *Paley*, *Watson*, &c.; and the Roman Catholic—*Pascal*, *Berger*, *Chateaubriand*, &c. The more recent apologists are *Neander*, *Tholuck*, &c., in reply to *Strauss* and others.

Aponeuro'sis is a term used in anatomy to designate the strong layers of fibrous or connective tissue which invest the muscles, and send septæ or partitions between them. *A.* are composed of white fibrous tissue mixed with a variable quantity of yellow elastic tissue. They serve as surfaces for the origin and

insertion of muscular fibres, and by special septæ they connect groups of muscles with the bones. They are found only in the limbs.

Aponogeton, a genus of aquatic plants belonging to the order *Juncaginaceæ*, *A. distachyon*, common at the Cape of Good Hope, and called there water Uintjies, is a very handsome, fragrant species. It is a favourite plant in garden-ponds in Britain.

Aponogeton distachyon.

When first introduced, it was grown in hot-houses for many years, until the discovery was accidentally made that it could endure the open-air temperature of this country. The spikes of fragrant flowers, and the flat oblong leaves, float on the surface of the water. Its flowering-tops are said to be used as a pickle, and as a substitute for asparagus at the Cape, and that its root (corm), which is about the size of a hen's egg, is roasted and eaten.

Apophthegm (Gr. *apophthegma*, an utterance), a sententious maxim, conveying an important truth. Proverbs are often in the form of the A. Among others, Plutarch in ancient, and Bacon in modern times, have made interesting collections of apophthegms.

Apophysis is a prominent elevation jutting out from the surface of a bone. If such an elevation is slender, it is called a spine; if blunt, a tubercle; if broader at the base, a tuberosity. It is to be distinguished from an epiphysis, which is a prominence having a separate centre of ossification.

Apoplexy is a name in medicine employed to designate an affection in which an individual suddenly falls down as if from a blow, and in which there is for a time a complete loss of consciousness, of sensation, and of voluntary motion, along with more or less of interference with the functions of circulation and respiration. There are three pathological conditions, to any of which this affection may be due: (1) To hæmorrhage into the substance of the brain, the result of rupture of a blood-vessel; (2) to plugging up of one of the larger arteries of the brain by a clot of blood, either formed at the spot (*thrombosis*), or carried to the spot from some other quarter (*embolism*); and (3) to congestion of a portion of the brain, or effusion of serous fluid causing pressure. Hæmorrhage into the substance of the brain is the result of disease of the cerebral vessels. The clot may vary in size from that of a pin-head to a hen's egg.

Certain persons are predisposed to apoplectic seizures. These are—(1) Those whose ancestors have died of A.; (2) those who live highly, follow sedentary habits, and have a peculiar configuration of body, namely, protuberant belly, large head, short, thick neck, and florid complexion; (3) those who suffer from disease of the heart, of the kidneys, or of the blood-vessels; (4) those who are intemperate.

An apoplectic attack may last from two or three hours to as many days. The respiration is slow, difficult, and snoring; there is frothy mucus about the mouth; the body is sometimes covered with a cold, clammy sweat; the face is pale; eyes dull and glassy; pupils widely dilated; teeth clenched; power of swallowing gone or impaired; bowels usually costive; urine passed involuntarily; absolute unconsciousness. These effects vary according to the severity of the attack. In many cases the coma may pass off leaving the patient well, or with impaired mind, or partial loss of power on one side of the body. In other cases consciousness never returns, and death ends the scene.

The severity of the attack depends on the part of the brain affected. If bleeding take place in the substance of the *Pons Varolii* or *Medulla oblongata* (see BRAIN), speedy death (within a few hours) is the result; but if it happens in the grey or white matter of the cerebral hemispheres, there may be partial recovery of consciousness, and of the power of voluntary motion. This

may continue for several months, or, in rare cases, years; but, sooner or later, another attack occurs, which makes matters worse, while a third almost invariably terminates life.

The treatment may be divided into (1) what is to be done to prevent an attack in those predisposed to it; and (2) what is to be done when an attack has occurred. The preventive treatment is a quiet life in every sense of the term, freedom from excitement or worry, mild diet, abstinence from alcoholic drinks of all kinds, sleep in a well-ventilated room on a mattress with a high pillow, application of cold water to the head daily, and regulation of the bowels so that they never become constipated. Should an attack unfortunately occur, place the patient on his back in bed, with a high head, apply cloths dipped in cold water to the head, remove all tight parts of the dress, more especially about the head or neck, and if the power of swallowing be not lost, give two or three drops of croton oil. Bleeding, as a rule, does no good, and should never be done except by a medical man. If the patient recover from the fit, great care must be taken to prevent the recurrence of another. Everything, either mental or physical, of an exciting nature must be avoided, and the diet must be nutritious and light. No wine should be taken. With care, a second or third attack may be ward off for a considerable time; without care, it will very speedily supervene in a worse form.

Apostate, a term originally applied to one who abandoned his faith from any motive whatever, even from conviction—for instance, the Emperor Julian. In the early Church apostates to heathenism were styled *sacrificati* if they notified their change of faith by offering sacrifices to the gods, and *thurificati* if they offered incense to them. It was a question seriously and even passionately discussed what should be done with those called *lapsi* ('fallen away') when the storm of persecution had blown over, and they sought readmission to the Christian Church. Some thought that since they had in a moment of supreme trial denied their Lord, they could never 'be renewed again unto repentance,' and so ought not to be readmitted. In the Roman Catholic Church the A. was excommunicated, his property confiscated, and even the extreme penalty of death was sometimes inflicted.

Apostle (Gr. *apostolos*, one sent), a messenger generally, but in the New Testament applied specially to the twelve disciples chosen by Christ, 'whom also he named apostles; Simon Peter, Andrew, James and John, Philip and Bartholomew, Matthew and Thomas, James the son of Alphaeus, Simon Zelotes, Judas the brother of James, and Judas Iscariot' (Luke vi. 13-16). To these were subsequently added Matthias, chosen by lot in place of Judas Iscariot (Acts i. 26), and Saul of Tarsus, afterwards termed Paul, miraculously chosen (Acts ix. 15). It was essential to the office of an A. that he should have seen the Lord. This is laid down in Acts i. 21, 22, and confirmed by Paul (1 Cor. ix. 1), 'Am I not an A.? have I not seen Jesus Christ our Lord?' The mission of the apostles was to preach the gospel; the sphere of their labour, at first restricted to the Jews, was afterwards extended to all nations. Episcopal Churches contend that the office of A. is perpetuated in bishops, while non-Episcopal Churches hold that the apostles having a strictly unique work to do, for which they were accredited by the possession of miraculous powers, had, and could have, no successors.

Apostles' Creed. See CREED.

Apostolic, or **Apostolical**, pertaining to the apostles, a term very variously applied. *A. Church*, and *A. See*, are titles assumed by the Roman Catholic Church on account of its having been founded by St Peter, whose successor the Bishop of Rome claims to be. *A. succession* denotes both an unbroken transmission of holy orders from the apostles through a succession of bishops, and a ministry whose ordination gifts them with A. powers and privileges. The questions have excited much controversy between the Roman and Protestant Churches; and in Protestant Churches between Episcopalians and Presbyterians. The *A. chair* is the chair of the Pope as the successor of Peter; the *A. Council* is that held at Jerusalem (Acts xv.), date not certainly fixed, to determine disputes raised at Antioch; the *A. Vicar* is the cardinal representing the Pope in extraordinary missions; and *A. tradition* is that which is asserted to have been handed down from the apostles. A papal brief is styled *A.*, and so are the months January, March, May, July, September, and

November, because in these the vacant German benefices were appropriated by the Pope, in virtue of the Vienna Concordat of 1448. The council charged with the superintendence of the pontifical revenues is also called the *A. Chamber*.

Apostolic Canons and Constitutions, the titles of works both ascribed to Clemens Romanus. Few scholars, if any, however, now believe that they belong to a period so early as that to which Clemens Romanus is assigned, or that they are in any sense apostolical. Krabbe, in his *Essay* on this subject (New York, 1848), endeavours to show that of the eight books of the *Constitutions*, the first seven, containing rules for the Christian life, date from the close of the 3d c., and that the eighth, a guide to the priests in performing the sacred offices, belongs to the end of the 4th or the beginning of the 5th c. The *Canones* was a later production. The first fifty, dating from the middle of the 5th c., were accepted by the Latin Church, while the Greek Church adhered to the thirty-five canons promulgated at the commencement of the 6th c. This produced contention between the Churches. Bunsen, in his *Christianity and Mankind* (Lond. 1854), arrives at similar conclusions. The *Constitutions* have been edited by Netzen (1853), and Lagarde, in Bunsen's *Analecta Ante-Nicana*, vol. ii. (1854). The English translation of Whiston has been reprinted with alterations in Clark's *Ante-Nicene Library*, vol. xviii. (1870).

Apostolic Catholic Church, the name chosen by a religious denomination popularly known as Irvingites (q. v.)

Apostolic Fathers, those Christian writers who had personal intercourse with the apostles. Of only three can this be affirmed with anything like probability—Clemens Romanus, Polycarp, and Papias. Barnabas, Hermas, and Ignatius are sometimes ranked as A. F.; but there is no satisfactory proof that Barnabas, the friend of Paul, wrote the epistle bearing his name; that the Hermas of Rom. xvi. 14 wrote the *Pastor*; or that Ignatius wrote the letters attributed to him. Archbishop Wake and Mr Chevallier have published translations of the A. F., but more accurate and valuable translations have been made by Drs Donaldson, Roberts, and Crombie in vol. i. of the *Ante-Nicene Library* (Clark, Edin. 1867).

Apos'trophe (Gr. a turning away), a figure of rhetoric in which the speaker turns away from his general musing or meditation to address specifically the dead or absent, and even inanimate objects—e.g., (1) 'Departed spirits of the mighty dead;' (2) 'Ye stars, which are the poetry of Heaven.' A. has been a favourite figure with the more impassioned poets and orators of all ages. In grammar, the comma marking the omission of a letter, as in *o'er* for *over*, is called an A.

Apothecary. This name was formerly given in England to the general medical practitioner. It was not till the reign of Henry VIII. that the various branches of the medical profession came to be clearly divided. The physicians were incorporated in 1518; surgeons in 1540. On 9th April 1606, apothecaries were incorporated by James I., along with the Company of Grocers. They had meanwhile, however, notwithstanding these charters, continued to act as physicians and surgeons. According to legal decision, they were then entitled to charge their patients either for the medicines supplied or for attendance, but not for both. The legal recognition of the A. having a right to practise of course exempted him from legal responsibility for the results, unless his treatment showed flagrant ignorance or carelessness. These privileges belonged in England solely to the licentiates of the Apothecaries' Society of London, and in Ireland to the licentiates of the Apothecaries' Hall of Ireland, though many practised without the licence. The Medical Act of 1858 has further improved the position of the apothecaries. They are entitled to be registered as licentiates in medicine, registration giving the right to practise medicine throughout the British empire, to charge for their visits and professional advice, and for medicine and medical appliances supplied by them. The Pharmacy Act of 1868 has further widened the distinction between the A. and the ordinary Chemists and Druggists (q. v.). It still, however, allows the A. to keep a shop for the sale of medicine, and to make up his own prescription. It has been held in England, by the inferior courts, that no other medical practitioner than an A. can recover the price of medicine supplied to a patient; but as there has not hitherto been any appeal to the Supreme Court on the question, it cannot be held as so settled.

Licences are granted by the Apothecaries' Society of London, and by the Apothecaries' Hall of Ireland, on much the same conditions as are required by the other authorities granting medical qualifications. The London Society and the Irish Hall each appoint a member of the General Council of Medical Education and Registration. The privileges of both were expressly preserved by the Medical Act of 1858; but the Irish apothecaries do not seem to have established their rights as medical practitioners to quite the same extent that they have done in England. A provision of an Act under George III. gives a monopoly to licentiates of the Irish Hall in the compounding and selling of medicines; but the provision seems to be neutralised by those of other Acts relating to chemists and druggists. The English Hall has done what no other licensing medical corporation in the United Kingdom has done—it has granted a licence to a woman to practise medicine; henceforth, however, this will be impossible, owing to a change in the by-laws.

An Act of George III. provides for the efficient supervision of apothecaries' shops, and imposes penalties for keeping any in an unwholesome condition.

In Scotland an A. is not a medical practitioner. He merely sells medicines, corresponding to what in England is called chemist and druggist.

Apothecia, the term applied in botany to the shield-like fructification of *Lichens* (q. v.)

Apothéosis, a Greek word signifying precisely the same as the Lat. *aificatio*, deification, or enrolling a mortal among the gods, was applied most commonly to the elevation of a deceased Roman emperor to divine honours—an act, however repugnant to modern ideas, quite in harmony with the ancient Roman *cultus*. The ceremony (*consecratio*) consisted in the burning of the body, and at the same time letting loose an eagle to convey the soul to heaven. Of the medals struck on these occasions, sixty separate examples have been preserved.

Appalachians, sometimes called the Alleghanies, the general name given to the mountain system which runs nearly parallel to the Atlantic seaboard from the State of Maine to the borders of Alabama, a distance of about 1200 miles. It does not consist of a single unbroken chain, but is made up of various parallel ridges, which are known by different names. Beginning at the N., we have the White Hills of New Hampshire, of which Moosehillock and Washington are respectively 4636 and 6634 feet high; the Green Mountains in Vermont, reaching in Killington Peak an elevation of 3924 feet; the Highlands on the E. of the Hudson, and on the W. the Catskill Mountains, of which Round Top, the highest peak, is 3804 feet above the sea; the Kittatinies, stretching from New Jersey to Virginia; the Blue Mountains, a parallel range to the E. of the last, and extending as far S. as N. Carolina; and lastly, more to the westward, the range of the Alleghanies proper, in Pennsylvania, Virginia, and the N. of Georgia and Alabama, and the Cumberland Mountains on the E. of Kentucky and Tennessee.

There is no single range in this system which could be mentioned as the true watershed, for the rivers which have their source among the mountains usually flow for a considerable distance along the valleys which lie between the different ranges, and then cut their passage through the hills so as to join the Mississippi or St Lawrence on the W., or the Atlantic on the E. The distance of the Atlantic from the most eastern of the A. varies considerably. At the Hudson the ocean almost washes the base of the hills, while from N. Carolina to Florida the breadth of the slope is 200 miles. On the W. there is a gentle but broken descent to the Mississippi, the breadth of the country from the river to the most western of the ranges being about 300 miles.

With regard to geological formation, a considerable portion of the northern tracts is occupied by Primary strata—such as gneiss, mica-slate, clay-slate, and granular limestone, frequently associated with granites and traps. In the mountains proper, however, sandstones, slates, and transition limestones are much more abundant. Coal, sandstone, and slate are found in Pennsylvania, the coal being of the kind known as anthracite or blind coal. Beds of bituminous coal are obtainable high up in the Alleghanies of Ohio. The Secondary formations of Europe, between the coal measures and the chalk, are of rare occurrence. The country between the mountains and the Atlantic is covered

for the most part with Tertiary deposits, in the alluvial accumulations above which are found remains of the mastodon and megatherium. The formation of the A. dates from a period posterior to the Carboniferous epoch, and anterior to the Jurassic era, for the strata, including the coal measures, are the newest upturned beds associated with the Appalachian range; while on the eastern base of the mountains there is a series of red sandstone beds, belonging to the Jurassic period, which are unconformable with the upturned strata, and which, consequently, must have been deposited after the upheaval of the range. Of unstratified rocks there occur granites, syenites, and serpentines, together with columnar basalts and other traps.

Large beds of different kinds of iron ore are found in various formations throughout the range; and in Pennsylvania and Ohio there are important iron-works. Lead, gold, copper, and nickel also occur, the two last in not inconsiderable quantity among the Paleozoic formations.

Appalachicola, a river of the United States, rising near the Appalachian range in the N. of Georgia, and flowing S. into the Gulf of Florida, after a course of about 400 miles. During the larger part of this course it bears the name of Chattahoochee, and forms the boundary between Georgia and Alabama; but after the confluence of the Chattahoochee and the Flint on the borders of Florida, the united waters take the name of A. The river is navigable for steamers up to the point of confluence, a distance of 70 miles. At its mouth lies the town of A., with a pop. (1870) of 1129, and a large export trade in cotton.

Apparent Magnitude of a body is an angle subtended at the eye by the diameter of the body. *Motion* is the motion which a body seems to us to have, from the position of our own organ. The *A. position* of a star differs from the true position owing to the effect of various physical phenomena, such as atmospheric refraction, aberration, nutation, &c., and for which, a corresponding correction must be made.

Apparitions. History and popular experience show that there has existed from remote ages a belief in the existence, especially among less civilised nations, of a host of the spirits of departed ones frequently present themselves to the earthly vision of living relatives or friends. There are many records of such, but it is doubtful if there have ever been more than one individual to whom the apparition was visible at one time. Many cases are easily referred to an over-excited brain, a strong imagination, or some bodily malady. Every one is more or less capable of receiving the appearance of some object previously seen, or even of forming a combination of physical objects which was probably never before observed by any one. Artists poets and musicians, have this faculty in a marked degree; and the only difference between this and the appearance of A. seems to be that the one is voluntary and the other involuntary. The case of Nicolai, a Berlin bookseller, is well known; and he himself referred the appearance of these spectral images, which were visible to him for several months, to the condition of his bodily health during that period. Sir Walter Scott, in his work on *Demonology and Witchcraft*, gives, among other instances, that of a gentleman who died from the great mental agony which he suffered on account of the continual presence of a human skeleton, which appearance his reason told him was nothing but the product of his imagination. The appearance of the murdered Caesar to Brutus before the battle of Philippi was perhaps the consequence of Brutus's recollections of his former friend's kindnesses, and the evident failure of the scheme for securing the liberty of Rome. Another curious and well-authenticated anecdote is in connection with Sir Charles Lee's daughter, who is said to have died at the exact hour which she previously told had been predicted by her mother's spirit the preceding night. Possibly she was so convinced that the prediction would come true, that her feelings became more intensely excited as the time drew near, and just as she heard twelve strike, the excitement proved too much for her brain, and she expired. The fact that great excitement may produce death has been fully authenticated in many instances.

Until psychology has been more fully studied, however; until the action of the brain, the extent of the sphere of its action, as to whether minds may act and react upon each other, though separated by a considerable distance, the phenomena of dreaming, and kindred subjects, are more fully investigated and under-

stood, we cannot hope for a satisfactory theory or solution of what are called A.

Appeal, in law, signifies the removal of a suit from one court to a higher, that the latter may affirm, reverse, or alter the judgment of the former. In England, A. is competent from the inferior courts of record to the Queen's Bench; and the writ of error from the Queen's Bench or Common Pleas is returnable into the Exchequer Chamber, thence to the House of Lords, whose judgment is final. In criminal cases, the judgment of lower tribunals may be reversed by writ of error. There are also appeals in equity, in bankruptcy, and from the summary convictions of magistrates. All appeals are subject to regulations as to security for costs, bail, and deposits. In Scotland, judgments of the Sheriff-Substitute may be appealed against to the Sheriff-Principal, from whom an A. may again be made to a Lord Ordinary of the Court of Session, whose judgment is subject to review by the 'Inner House'—consisting of two divisions, with three judges in each—of the Court of Session. Under certain restrictions, A. may again be made to the House of Lords, whose judgment, as in England, is final. Under the Supreme Court of Judicature Act of 1873, which makes many important alterations in the legal administration of England, it was proposed to constitute a new supreme 'Court of A.' of the House of Lords, for the United Kingdom. This part of the bill of 1873 did not become law; but under a bill now (1875) before Parliament, it is still intended to carry out this provision. Under the bill of 1873 the new Supreme Court would have consisted of, *ex officio*, the Lord Chancellor, the Lord Chief-Justice of England, the Master of the Rolls, the Lord Chief-Justice of the Common Pleas, and the Lord Chief-Baron. Her Majesty was empowered to appoint certain other English, Scotch, Irish, and Colonial judges, to the proposed new Court of A. of the House of Lords. The scheme is, however, meeting with strong opposition in Scotland, mainly on the ostensible ground of its being contrary to a clause of the Treaty of Union with England.

Another Supreme Court of A. is the *Judicial Committee* of the Privy Council. Appeals to this court may be made from the Admiralty and Ecclesiastical Court, and from the courts of the British colonies and dominions abroad. See PRIVY COUNCIL, JUDICIAL COMMITTEE OF.

Appenzell, a canton in the N.E. of Switzerland, encircled by that of St Gall, is mainly mountains with numerous small valleys. Its highest point is Mt. Säntis, 8232 feet high, and it is intersected by the river Sitter. There are two divisions—Ausserrhoden, entirely Roman Catholic, and Innerrhoden, exclusively peopled by Protestants, of which the last is by far the more populous, forming, indeed, one of the most densely-peopled districts in Europe. This division has existed since 1597. Both the Catholics and Protestants have separate, but purely democratic constitutions. The chief industries are agriculture, and the manufacture of cotton and embroidery. Area, 152 sq. miles; pop. (1870) 60,635.—A., the capital (pop. 3686), lies on the Sitter, and has some trade in linens.

Ap'perley, Charles James, a notable English hunter and writer on sporting subjects, was born in Denbighshire in 1777, educated at Rugby, and after a lengthened career devoted to the pleasures of the chase, and marked by habitual extravagance and frequent impecuniosity, died in France, 19th May 1843. The best of his clever and chatty performances, *The Chase, the Turf, and the Road*, appeared in the *Quarterly Review* (1827).

Appert, Benjamin Nicolas Marie, a philanthropist of France, born at Paris in 1797. At the age of eighteen the desire seized him to devote himself to a life of practical benevolence. From 1816 to 1830 he was principally engaged in establishing army, orphan, and penitentiary schools. In 1846 he visited Belgium, Germany, and Austria, everywhere inspecting schools, prisons, and hospitals, and has published the result of his investigation in several valuable works, of which may be mentioned his *Voyage en Belgique* (Brun. 1846); *Voyage en Prusse; Hambourg, ses Prisons et Hospices* (1850); *Les Prisons, Hôpitaux, Écoles en Autriche, en Bavière, &c.* (Leipz. 1851.)

Ap'pétite is a sensation referred to the stomach. When the sensation is intense enough to be pleasurable, it is called A.; but

when painful, it is called hunger. It indicates not any local affection of the stomach which can be detected, but rather a general want of the system for nourishment. Nutrient introduced directly into the blood, or into the rectum, in the form of injection, removes A., and even hunger, without the stomach being directly affected. See FOOD, HUNGER, THIRST.

Appia'ni, Andrea, court painter to Napoleon, was born in 1754 at Milan, where are his most famous works, two frescoes, in the church of Sta Maria and the royal palace. He painted the portraits of the family of Buonaparte, and a number of classical and romantic pictures, among which are 'Olympus,' 'Toilet of Juno,' 'Venus and Cupid,' and 'Rinaldo in the gardens of Armida.' Honours were heaped on him prior to 1814; but his fortunes declined with his patron, and he died poor in 1818.

Appia'nus, author of a Roman history in Greek, was born at Alexandria, and lived at Rome during the reigns of Trajan, Hadrian, and Antoninus Pius. Eleven of the twenty-four books of his history are extant. His method of narration is peculiar, and not on the whole happy. Of the various peoples with whom the Romans warred from the beginning of their power till they had acquired universal dominion, he gives the history of each separately till its final conquest. Beginning with the old Italian tribes, he ends with the Illyrians and Arabians. His geographical blunders are very gross, but we have abundant evidence that he was in some cases singularly careful and exact in his weighing of evidence and authority. This holds good especially of the period of Augustus. Yet he is never brilliant or morally impassioned. Schweighauser's edition (3 vols. 8vo, Leipzig, 1785) is highly esteemed, but the most complete is that in the *Bibliothèque Grecque* of Firmin Didot, which contains the new fragments discovered by Angelo Mai. A. also wrote memoirs of his life, which have perished.

Appian Way (Lat. *Via Appia*), the oldest of the Roman roads, leading from the *Porta Capena* at Rome southward to Capua, and named after Appius Claudius Cæcus, who was censor in 313 B.C. It was afterwards extended to Brundisium. Remains of it may still be seen at Terracina. The engineering difficulties, which were great, were successfully overcome, but at an enormous cost. The roadway consisted of a foundation and several carefully-cemented strata, topped with a neatly-jointed pavement.

Appius Clau'dius Crassus, a Roman decemvir (451-449 B.C.) Remaining at Rome while his colleagues, with one exception, were abroad with the army on an expedition against the Sabines, he secretly ordered a beautiful maiden named Virginia, the daughter of Virginius, a plebeian who was with the army, to be seized, on the plea that she had been born the slave of his client M. Claudius, and then pronounced this plea valid in the court over which he himself presided. Virginius, informed of this by Icilius, the betrothed of Virginia, hastened to Rome to claim his daughter, but a second trial merely confirmed the issue of the first. Virginius, seizing a knife, slew his daughter to preserve her honour. Popular indignation was roused, and the army, returning to Rome, deposed the decemviri. A. C., according to Livy, committed suicide in prison, but Dionysius says the common opinion was that he was put to death in prison by order of the tribunes. This incident, graphically narrated by Livy, forms the subject of one of Macaulay's *Lays of Rome*.

Apple. The fruit known in Britain as A. is the produce of cultivated varieties of the common wild crab-tree, *Pyrus malus*. See PYRUS. The A.-tree is the most widely distributed of all fruit-trees, and succeeds best in temperate regions, although it also grows in the Indies, Persia, Arabia, and Australia. In tropical regions and in high latitudes, the fruit, however, is almost worthless. The varieties of A. are exceedingly numerous, and new ones are continually being produced by cultivators. Many marked varieties are known by general names, such as rennets, pippins, codlins, &c. All the different kinds are kept up and propagated, not by seeds, but by grafts and cuttings. The fruit is used for dessert, jelly, tarts, pies, sauces, &c. Its fermented juice forms Cider (q. v.). The cider A. takes the place of the vine in the N.W. of France. A. contains malic acid, which is used for medicinal purposes, and a vinegar and a spirit are made from them in Switzerland. Large quantities of apples are annually imported into Britain from the Continent and

America. The Greeks called the A. *Mela*, and the Romans *Malum*; the Hungarians call it *Alma*, the Bretons *Aval* or *Avall*, the Welsh *Afelen*, the Germans *Apfel*, in Dutch *Appel*, in Danish *Æble*, and in Swedish *Äple*. Botanists term the fruit a *Pome* (q. v.). Biffins or Beauffins are apples which have been dried in ovens. There are different species of crab apples. The Siberian Crab A. is *Pyrus baccata*, the American Crab A. *P. coronaria*, and the Chinese Crab A. *P. spectabilis*. The name A. has also been given to other fruits, i.e., A. of Sodom to the fruit of *Solanum Sodomæum*; Adam's A., *Citrus Limetta*; Custard A., *Anona reticulata*; Devil's A., *Mandragora officinalis*; Egg A., *Solanum esculentum*; Love A., *Lycopersicum esculentum*; Mammee A., *Mammea Americana*; May A., *Podophyllum peltatum*; Pine A., *Ananassa sativa*; Rose A., *Eugenia lambos*; Thorn A., *Datura Stramonium*, &c. Oak A. is the name given to an excrescence formed on oak-trees by insects puncturing the branches.

Apple-Berry, an Australian name for *Billardiera* (q. v.)

Appleby, the county town of Westmoreland, on the river Eden, 30 miles S.E. of Carlisle, is a station on a branch of the Stockton Railway. It has an old castle which was defended during the civil wars by the Countess of Pembroke against the Parliamentary forces. The keep, 80 feet high, is called Cæsar's Tower. A. has linen and woollen manufactories, and some brewing and malting. Pop. (1871) 1989.

Apple of Sodom. See SOLANUM.

Appleton, a town of Wisconsin, United States, on Fox river, near the Grand Chute rapids, with considerable trade in wheat, Indian corn, tobacco, and timber. Pop. (1870) 4518.

Appoggiatu'ra, a note in music printed always in small type, receiving the accent of, and taking half the duration from, the next following note. It is commonly a discord, and its notation probably arose from a wish to evade the strict laws of the old harmonists as to the preparation of discords. It was written as an ornament, with a tacit understanding that it was to be played in full. The purely ornamental note, printed in the same way, but played *without* accent, is called an *acciacatura*.

App at'ment, in English law, means the exercise of a power reserved under a deed of conveyance; such as a power to charge the property conveyed with a pecuniary burden. In Scotch law, the equivalent terms are 'reserved power,' and 'faculty to burden.' Courts of equity in England often give relief when the power of A. is defective in legal execution, if adequate, or what is called 'meritorious' consideration has been given for the reservation.

Appor'tionment, a legal term in the law of England and Scotland arising under the Appointment Act of 4 and 5 Will. IV. c. 22. The questions with which the Act deals were previously a common cause of litigation, arising mostly between the heir-at-law of one deceased and his executor; the heir being entitled to the real, the executor to the personal, estate; the difficulty being with regard to the portion of rents, interests, salaries, &c., which thus fall to each as determined by the date of death. The Act was for some time not held to apply to Scotland, but in 1844 the Court of Session decided that it did so, and this decision was affirmed by the House of Lords. The Act, being expressed exclusively in the phraseology of English law, has given much trouble to the Scotch courts. Its operation has been greatly extended by the Act 33 and 34 Vict. c. 35. The general principle of the accounting is that when any one dies, his income is counted up to the day of his death, and is payable at the same time as the next payment would have been had the recipient not died.

Apposi'tion (Lat. *appositio*, a placing near) denotes in grammar the placing of a noun, pronoun, adjective, or phrase beside another noun, to explain or limit it, as 'John the Baptist;' 'we thought her foolish;' 'you were silent when accused—a clear confession of guilt.'

Appraise'ment is the valuation made by the appraiser; but in English law it signifies the judicial valuation made under a 'distress' for rent. The corresponding term in Scotch law is *appriciation*, under a *Prinding* (q. v.), an important process in the law of Scotland.

Appraiser is a person employed to value property. By 3 Vict. c. 15, duties on sales by auction were repealed, and a licence-duty of £10 a year imposed on the A. A few of the more important provisions of the Act are, unless an auctioneer disclose the name of his constituent, an action will lie against him in the event of breach of contract. Goods sold remain at the risk of the seller, so long as anything remains to be done by him to ascertain the price; afterwards, if allowed to remain on the premises of the auctioneer, it is at the risk of the buyer. If an estate advertised for sale by auction is sold by private contract, those who come to the expected sale may recover the expense of attendance from the seller, or from the A. if he will not name his principal; hence the common precaution in an advertisement 'unless previously sold by private contract.' A bidder may retract his offer previous to the fall of the hammer, unless there is an article of sale to the contrary. 'Luffing' may, in a court of equity, be held to vitiate a sale by auction.

Apprehend' is, in law, to arrest a criminal or debtor in order to commit him to prison. The warrant of a judge is usually required for the legal justification of apprehension; but certain officers may, under certain circumstances, A. summarily, without warrant. But the right must be exercised with great caution, any infringement of legal liberty forming a valid ground of action against the offender. A private person may find himself in considerable difficulty under the statutes regarding the law of apprehension; for not only is he entitled to arrest a felon if he observes the committal of the felony, but he is bound by law to do so, under penalty of fine and imprisonment, if he negligently allow him to escape. But again, a private person may not A. another merely because he suspects him of felony, however strong may be the suspicion. A peace-officer may A. any one against whom he can show reasonable ground of suspicion. The warrant of any judge in the United Kingdom for the apprehension of a criminal is effective throughout the United Kingdom, on the endorsement of a judge of the territory in which the warrant is to be enforced. Conventions have now been entered into between the British government and most foreign States for the extradition of criminals, except for political offences; and on the extradition of a criminal, it is always understood that he shall not be tried for a political offence. The wilful obstruction of a legal warrant to A. is a very grave offence, and if accompanied by certain aggravating circumstances, such as the use of firearms, is punishable with penal servitude for life. If the legal officer, or any one assisting him to discharge his duty, be killed in the endeavour, the crime is murder. See **DEFENDING FORCEFULLY**, **DEFORCEMENT**.

Apprentice. An A. is one who engages by indenture to serve a master for a certain number of years, in order to be instructed in some profession, art, or manufacture, which the master becomes bound to teach him; or at least to afford him fair opportunity of learning. In Scotland, a pupil (see **AGE**) may enter into an indenture, yet he or she must have the concurrence of parent or tutor, who is alone responsible for the engagements of the A. At common law an A. cannot enlist or enter the Royal Navy; and by the Mutiny Act severe penalties are attached to his enlisting, besides which he is bound to serve as a soldier on the expiry of his apprenticeship; and if he does not deliver himself to a military officer authorised to receive recruits, he incurs the penalties of a deserter. In 1837 the House of Lords, on appeal, reversed a decision of the Court of Session in Scotland finding that an A. to a Dundee barber was bound to attend at his master's shop on Sunday mornings for the purpose of shaving customers. The decision of the Scotch court proceeded on the terms of the indenture, which provided that the A. should 'not absent himself from his master's business, holiday or weekday, late hours or early, without leave first asked and obtained.' The reversal again was on the ground of the stipulation being contrary to certain old Scotch statutes, especially one of 1559, which provides that 'na handy lauboring or winking be used on Sunday.' It is probable, however, that considerations of public expediency may have influenced the House of Lords in giving effect to the provisions of an ancient statute, which might otherwise have been set aside as obsolete. See **DESERTION**.

Appriming, an old Scotch law term now obsolete. See **ADJUDICATION**.

Approaches, in military language, are the trenches or protected roads by which the besiegers may advance with comparative safety, from one parallel of earthworks to the next, upon a besieged town or fortress.

Approbate and Reprobate. This is a technical expression in the law of Scotland, signifying that one takes advantage of one part of a deed, but rejects the rest. This the law does not permit. The analogous doctrine of the law of England is called *Election* (q. v.). The doctrine recommends itself to common sense; yet there are exceptions to its operation which probably do so also. The law will not allow any one to take benefit under the provision of a will, and at the same time to refuse to give effect to another of its provisions in favour of some one else; but to secure a benefit under a will, the law will not oblige the beneficiary to fulfil a frivolous condition, or a condition which in no way affects any private or public interest. Thus, a legacy devised under condition that the legatee change his name, will legally fall to the legatee without his being obliged to fulfil the condition; the law regarding the name by which a man chooses to call himself as a purely private affair. Apparent exceptions also occur. Thus, it has been decided by the Court of Session in Scotland, and affirmed by the House of Lords, that an heir-at-law may, in virtue of a deathbed deed, reduce a previous deed, otherwise good; at the same time, that he may set aside the deathbed deed, in so far as he is injured by it.

Appropriation Clauses. The effect of the Roman Catholic Emancipation Act (1829) was disappointing to those politicians who had hoped that one main effect of it would be the social and political pacification of Ireland. Of the causes of failure, the chief tangible one lay in the antipathy of the Roman Catholics to pay tithes to the Protestant clergy. So strong was this feeling, that any Protestant clergyman in the Catholic districts resorting to law to exact his rights, did so at the imminent risk of assassination. The remedies devised by the Liberal party in England were termed the A. C. They provided for the commutation of tithes into a rent-charge upon the land, for the reduction of the number of sinecures in the Irish Protestant Church, and for the appropriation of the surplus revenues to the advancement of the education of the people.

In 1833 the Liberal Cabinet succeeded in substantially carrying the second of these provisions. The Act by which this was effected is known as the Irish Church Temporalities Act. It still, however, left the Church of Ireland with an income wholly out of proportion to its adherents. The efforts of the Liberal party—somewhat, however, divided on the question—were renewed in 1834, but unsuccessfully. On 2d April 1835, however, the House of Commons, by a majority of thirty-three, passed a resolution affirming the principles of the third clause. The Conservatives resigned in consequence, and the Liberals returned to office, pledged to the appropriation principle. They twice succeeded in passing a bill affirming this principle through the House of Commons, but on both occasions the A. C. were rejected by the House of Lords. For some years the question maintained a precarious vitality at the hustings and in Parliament, but England and Scotland were plainly tired of it. The Government of 1838 carried a measure for Ireland, by which the tithes were commuted into a rent-charge of three-fourths of their value. They were now collected with comparative ease. The disendowment of the Irish Church in 1868 of course ended the controversy.

Approver, or Prover, in English law, is one who is necessary (see **ACCESSARY OR ACCESSORY**) to a crime, and bears evidence against his accomplice. There is an implied promise to the witness, or *Queen's evidence* as he is called, on condition of his making a full and true confession; but if he equivocate, he forfeits this claim, and his confession may be used against himself. The law of Scotland is very nearly the same as that of England respecting the A. or *Socius criminis*, as he is called in the criminal courts of Scotland. In Scotland, however, the *Queen's evidence* has better legal protection than in England. By the mere act of calling an accomplice as a witness, the public prosecutor gives up all right to proceed against him on account of the crime in question. Thus the objection to his testimony on the ground of its being his interest to criminate his associate is, or is supposed to be, obviated. But a private prosecutor cannot tie the hands of the public authorities by examining a *Socius criminis*. Sir Archibald Alison, in his *Practice of the Criminal*

Law of Scotland, mentions the case of a soldier, confined as a military delinquent, who was allowed to become A. against another charged with the same offence as himself. Counsel for the soldier objected to his client being made a witness, as he was amenable to trial by court-martial, and his testimony might be used against himself. The civil court, however, declared that they had power to protect him, and would do so if he were endangered by his evidence.

Approximation is a mathematical term applied to calculations which are not rigorously accurate, but are sufficiently near the truth for all practical purposes. As instances of A. may be mentioned logarithmic, trigonometric, and astronomical tables, and the solution of equations beyond the fourth degree.

Appui, a French word meaning generally a stay or support. In military language a *point d'A.* is any part of a field of battle which can be used to assist the operations of an army, to facilitate assault or obstruct attack. Thus a wood, a morass, a river, or a slope may become a *point d'A.*

Appuleius, or **Apuleius**, son of a wealthy magistrate of Madaura in Africa, was a famous satirist of the 2d c. After studying at Carthage and Athens, he entered on an extensive course of travel, during which he visited Italy and Asia. His first literary effort was his *Apologia*, still extant, spoken before the proconsul of Africa, in which he vindicated himself from the charge of using magic, preferred against him by the relatives of a lady whom he had married, and whose hopes of sharing in her wealth had been thus destroyed. It contains various biographical circumstances, and in particular an elaborate account of the circumstances that led to his marriage with Pudentilla at Oëa (mod. Trifoli). His after-life was spent at Carthage, where he devoted himself to literature and oratory. He was a priest of Æsculapius, the patron god of the city; he had the charge of exhibiting gladiatorial shows and wild-beast hunts in the province; and statues were erected in his honour by the Senate of Carthage and of other states. According to Lactantius, the early pagan controversialists used to rank A. with Apollonius of Tyana as a miracle-worker equal to Christ. His reputation has been preserved by the *Golden Ass*, a work the motive of which is difficult to determine, but it can hardly be (as some have supposed) a satire on the quackeries of the pagan priesthood, for the hero (Lucius), after having gone through numerous ludicrous and painful adventures as a jackass, is at last restored to human shape by the interposition of the goddess Isis, to whose service he is solemnly consecrated for life. The *Golden Ass* abounds in wit and humour, and gives evidence of a wide erudition; but it is artificial, affected, and viciously archaic in diction, besides being unutterably gross in passages. Several other works of A. remain, though many are lost. G. F. Hildebrand published a complete edition at Leipzig in 1842. There are three separate English versions of the *Golden Ass*, one by T. Taylor (1822), another by Sir G. Head (1851), and a third in Bohn's Classical Library (1853).

Apraxin, **Feodor Matveyevich**, a famous Russian admiral, born of noble family in 1671. He entered the navy in 1683, and in 1700 was made chief admiral. By greatly extending the marine forces he advanced the ambitious projects of Peter the Great, who favoured him with a warm friendship. He defeated Lübek, the Swedish general (1708), in Ingermannland, and captured the Finnish town of Viborg in 1710. In 1713 he took Helsingfors and Borgo, defeated the Swedish fleet, and brought about the peace of Nystadt, by which Finland and Esthonia were finally ceded to Russia. He was present at the siege of Derbend (1722) during the Persian war; and died at Moscow, 10th November 1728.—His brother, **Peter Matveyevich A.**, rose to be lieutenant-general in the Russian army, and signalled himself by the suppression of a rebellion on the Lower Volga in 1703. He died at St Petersburg in 1720.—**Stepan Fedorovich A., Count**, a Russian field-marshal, grandson of Feodor, fought first against the Turks under Münich, and afterwards in the Seven Years' War against Prussia, in which he overran Courland (1757), entered Prussia, captured Memel, shattered the Prussian army under Lewwald, and was threatening Königsberg, when the news reached him that the Russian Empress Elizabeth was dying. Knowing the Prussian sympathies of her successor, he stopped in his career of victory. Unfortunately for him, Elizabeth recovered. A. was now re-

called, and imprisoned at Narva, where he died 31st August 1758. See *Biographien der Russ. Feldmarschälle* (Petersb. 1840-41).

Apricot, the name given to fruit of the different varieties of *Prunus Armeniaca*, a tree, indigenous to Armenia, belonging to a sub-order of *Rosacea*. The name A., which was written *a-precoke* by early authors on horticulture, is supposed to be a corruption of *Fraxinea*, the name given to it by the Romans. The tree is believed to have been introduced into Britain from Italy during 1524 by Woolf, gardener to Henry VIII. There are now numerous varieties in cultivation. The following are among the finest, viz., the royal, the Turkey, the large early, the Moorpark, and the Breda. Some of the kinds have sweet kernels, while in others they are bitter. The former are eaten as almonds, and from the latter, which contain prussic acid, is distilled the French *eau de noyau*. The fruit is either eaten fresh, made into a preserve, or split up, the stone removed, and then dried. In Eastern countries it is used in cases of fever. A black pigment is obtained by charring the stones. *Prunus Brignatiaca* is the Briançon A., and *P. Sibirica* the Siberian A.

April (from Lat. *aperire*, to open), the name given in the Roman calendar to the month of the opening of the buds. The 1st of A. is called in England All-Fools' Day, from the custom of sending on that day simple persons on bootless errands. The person so imposed on is called in England an A. fool; in Scotland, a gowk, i.e., simpleton (also applied to the cuckoo); and in France, *un poisson d'Avril* (an A. fish). The origin of this custom is not certainly known. It may be a relic of paganism, or it may have been suggested by the sending of Christ backward and forward from Annas to Caiaphas, and from Pilate to Herod, as represented in one of the Easter miracle-plays. The Hindus practise the same sort of tricks on the 31st of March.

A-priori is the name given to that process of reasoning which rests on what are held to be necessary or universal ideas, while reasoning *à-posteriori* is based on experience. Otherwise these two methods are styled the deductive and the inductive methods, Aristotle representing the former, and Bacon the latter. The advocates of each system assert that it virtually includes the other; the A. school holding that experience merely tests necessary truths; while the *à-posteriori* school maintains that these so-called 'necessary' notions are not simply verified by experience, but are derived from it.

Apsæ (Lat. *apsis*, an arch), the end of the choir or chancel of a church. It is sometimes semicircular, at other times it is polygonal, or even triangular. The word is applied also to the series of small lateral chapels which are usually arranged behind the altar in this recess. Crypts and vaults are generally placed under the A., to secure their being near the altar; and this gave rise to the structural necessity, which by-and-by became the traditional usage, of having the level of the A. above that of the floor of the church. When the ends of the transepts are finished with vaults, as they sometimes are, they are said to have apsidal ends. The origin of the A. in Christian churches was the vaulted extremity of the ancient basilicas. It is common as an architectural feature of the churches of Germany and France. In Italy it is seen chiefly in baptisteries; in England in chapter-houses. Specimens of it in Scotland are to be seen in the parish churches of Leuchars in Fife, and of Kirkliston and Dalmeny in Linlithgowshire.

Ap-sides, are the greatest and least distances of a heavenly body from its centre of attraction. In hyperbolic and parabolic orbits there is evidently but one apse. The line of A. (the line joining those points) is, as a necessary consequence of the law of gravitation, subject to a continual rotatory motion, which is well marked in the case of the moon.

Apsæ.

Apaloy, a river of New South Wales, Australia, enters the Pacific 40 miles N.E. of Port Macquarie. A. is also the name of a strait, 48 miles long, and from $1\frac{1}{2}$ to 4 broad, between Bathurst and Melville Islands, to the N. of Australia.

Aptera ('wingless'), a name applied collectively to denote the three lower orders of insects—*Anophura* (lice); *Thysanura* (spring-tails); *Mallophaga* (bird-lice)—in which wings are undeveloped. The eyes are, further, of simple structure, or may be absent. The young undergo no metamorphosis, and these orders are hence also termed *Ametabola*.

Apteryx, a genus of Cursorial or Running birds, found in New Zealand, and including three species, the best known being the *A. Australis* of Gould.

Apteryx Australis.

It averages a goose in size. The webs of the feathers are of loose, unconnected structure, and no accessory plumes exist in the feathers. The beak is long, slender, and possesses the nostrils opening at its tip. The legs are short. Three front toes and a hinder toe exist, the latter being spur-like. The tail is rudimentary, as also are the wings, which are hidden by the feathers. Each wing terminates in a sharp claw.

This bird is of nocturnal habits, and feeds chiefly on insects.

Aptornis, the name of an extinct bird genus, the fossil remains of which occur in the Recent formations of New Zealand. These birds, like the apteryx, were wingless.

Apulia, anciently a maritime province in the S.E. of Italy, between the Apennines and the Adriatic, bounded on the N. by the Frentani, and on the S. by Calabria and Lucania. Its limits, as defined by Strabo, show that it included the area now forming the modern provinces of Capitanata (q. v.) and Terra di Bari (q. v.) The ancient inhabitants of A. were the Apuli, probably an offshoot of the Oscan race, and the Daunians, so called, according to Greek legend, from Daunus, the son of Lycan, who settled on this coast; but whatever original difference may have existed between the two, at the dawn of Roman history they are completely blended into one people. Horace was a native of this region, and here, during the second Punic or Hannibalic war, the Romans suffered the tremendous disaster of Cannæ. The modern form of the name A. is Puglia.

Apure, a river of S. America, rising in the Eastern Andes of the United States of Colombia, and flowing westward through Venezuela till it joins the Orinoco (q. v.), after a course of 982 miles, 867 of which are navigable.

Apurimac, a river in Peru, rises to the N.W. of the tableland of Titiaca, and flows N. to join the Tangaragua and form the Amazon. It waters the richest part of Peru, and after 500 miles of its course takes the names of Tambo and Ucayali. From the great rapidity of its stream, the A. is useless for navigation, and its banks are almost inaccessible.

Aqua Fortis was the name given by the alchemists to dilute nitric acid on account of the corrosive action it exercises on many substances, and is still employed in the same sense. See **NITRIC ACID**.

Aqua Regia is a mixture of nitric and hydrochloric acids, usually in the proportion of 1 to 3, and is principally employed to dissolve the metals gold and platinum. The name A. R. was given to the above mixture by the alchemists, because it was the only substance then known which would attack gold—the king of metals.

Aquarium, an arrangement for keeping marine and freshwater creatures in captivity under conditions as nearly as possible the same as those in which they naturally exist. An A. is either one or a series of tanks or vessels containing fresh or sea water, according to the kind of creatures they are intended to receive. Aquaria are very useful for observation of the habits and life-history of creatures otherwise difficult to watch, and, on the small

scale, they form both a pleasing and instructive domestic ornament. The water in an A. must be kept in a condition fit to maintain the life of its inhabitants, not by frequent renewals, but by a sufficient access of atmospheric air, and by adjusting the balance of animal and vegetable life within it. The vegetation in a tank should be sufficient to absorb and decompose the carbonic acid evolved by the animals, and in fact an A. should be a perfect illustration of the reciprocal relations of animal and vegetable life. It should not be necessary to add anything to an A. in a healthy condition other than the food necessary for the creatures and sufficient water to replace that lost by evaporation. An A. tank should have a large superficial exposure, and the depth should be graduated by a sloping back of stonework. In the case of a domestic fresh-water tank it is sometimes possible to have a small jet continually playing in the centre, and where this is not practicable the water—both fresh and salt—must be frequently agitated to expose fresh surfaces to atmospheric influences. Where sea-water is not obtainable it may be artificially prepared by adding the necessary salts. It is seldom possible to keep seaweed alive in tanks, but under the influence of light sufficient minute vegetation develops from the spores disseminated through water, and in fresh-water as well as marine aquaria such vegetation is now preferred. Aquaria vary in size from small glass globes in which one or two gold-fish may be kept up to large buildings containing numerous tanks, many of them of several thousand gallons capacity. The first public A. was opened in the Zoological Society's Gardens, London, in 1853. Many Continental towns now contain aquaria on an extensive scale, and a large one was opened at the Crystal Palace, London, in 1871, besides another at Brighton a year later. In several other British towns public aquaria are either in contemplation or actual progress. The construction of aquaria proper may be said to date from 1841, when one was made by Mr N. B. Ward, the inventor of the Wardian case for plants. Since that time they have enjoyed great popular reputation, but success in managing the tanks of amateurs is frequently the result of much patient endeavour and many disastrous failures. Some creatures are easily kept alive in the confinement of aquaria, while others immediately succumb in spite of every care and attention.

Aquarius ('the Water-carrier'), one of the constellations of the zodiac, which the sun traverses during a part of January and February.

Aquatic Animals. Various species and groups of animal forms are adapted for life in the water. The fishes, crustaceans and many similar groups exemplify forms which are suited for a permanent aquatic life. Others, such as frogs, crocodiles, &c., are only partly aquatic in habits, and are said to be 'amphibious.' The swimming and wading birds also exemplify such forms; whilst the beavers, water-rats, otters, seals, &c., form examples of terrestrial types adapted for aquatic existence in a greater or less degree. The respiration or breathing of purely A. A. (e.g., fishes and crustaceans) is always carried on by *branchiæ* or gills—organs adapted for utilising the air, mechanically combined with or suspended in the water, for the purification or aeration of the blood. The air is not chemically combined, but merely mixed with the water; and if the water be deprived of this air, these A. A. perish for want of the vitalising atmosphere, just as land animals would do if the atmospheric air were abstracted. The land or terrestrial forms breathe by lungs, by the general surface of the body, or by air-tubes or pulmonary-sacs, as in insects or spiders. In these cases, the air is inhaled directly from the atmosphere. The plumage or fur of A. A. is usually protected by special secretions, as seen, for example, in the oily fluid furnished by the tail-gland of birds, &c. The whales—true mammals, breathing by lungs—seals, and other allied forms, require to ascend periodically to the surface of the water to inhale the atmospheric air. Some water insects and spiders (e.g., the water-spider *Argyroneta*) carry down bubbles of air with them for the purpose of breathing, and thus fill their abodes constructed at the bottom of pools.

Aquatic Plants. This appellation is sometimes used very vaguely, and made to embrace all plants found growing in salt and fresh water and in marshes. Botanists, however, apply it only to plants found in running or stagnant fresh water, such as the arrowhead (*Sagittaria*), water-lily (*Nymphaea*), pond-weed (*Potamogeton*), awlwort (*Subularia*), water-soldier (*Stratiotes*),

Jack-weed (*Lemna*), water-buttercup (*Ranunculus Aquatilis*), African pond-weed (*Aponogeton*, q. v.), *Vallisneria* (q. v.), *Anacharis* (q. v.), &c. Some A. P. root in the mud, and appear above the surface of the water, others remain submerged, while a few float freely on the surface without rooting below. A. P. possess a large number of Air-Cells (q. v.) in their structure.

Aquatint, a form of engraving by which imitations of China ink or sepia drawings are produced. It is accomplished by strewing powdered mastic over the surface of the copper-plate, which prevents the aquafortis from biting the points to which the particles adhere, and a mottled granular surface is the result.

Aqua Tofana. See TOFANA.

Aqua Vitæ, two Latin words signifying 'water of life', a phrase applied to alcoholic stimulants, inasmuch as they were considered capable of prolonging life, and as a cure for many diseases. Alcohol undoubtedly is a most valuable remedial agent in the hands of the skilled practitioner, and hence it was specially called A. V.

Aqueduct, an artificial watercourse. The fountains of Greece were so numerous and full-flowing that the Greeks stood in no need of aqueducts, though they were not unacquainted with them, but those of the Romans constituted some of their noblest structures, and two of them still contribute to supply Rome with water. Of the fourteen aqueducts of ancient Rome, only nine existed in the time of Frontinus, keeper of the aqueducts under Nerva and Trajan, and of these he wrote an account, which is still extant.

Aqueduct

1. *Aqua Appia*, begun by the censor Appius Claudius about 313 B.C. It was chiefly underground. All traces of it have disappeared.

2. *Anio Vetus*, commenced B.C. 273 by M. Curius Dentatus; chiefly subterranean; length 43 miles, traces of it at Tivoli and near the Porta Maggiore.

3. *Aqua Marcia*, built by Q. Marcius Rex, B.C. 144, about 60 miles long, its water was cold and wholesome, some arches are still to be seen in the Campagna.

4. *Aqua Tepula* (127 B.C.), afterwards connected with

5. *Aqua Julia*, built by Agrippa, B.C. 33, remains of it still exist.

6. *Aqua Virgo*, built by Agrippa to supply his baths; still in use, having been restored by the popes Nicholas V and Pius IV. in 1568, now called *Aqua Vergine*, and furnishes the best water in Rome.

7. *Aqua Alsietina*, built by Augustus to supply his *Naumachia*, on which his mimic sea-fights were represented. It has been restored, and supplies the fountains in front of St Peter's.

8. *Aqua Claudia*, commenced by Caligula A.D. 36, and finished by Claudius A.D. 50. A series of splendid arches, still stretching across the Campagna, formed part of the *Aqua Claudia*.

9. *Anio Novus*, the highest of all the aqueducts, with a length of 62 miles. The two last were united near the city, their channels running on the same arches. Their united streams doubled the former supply. The gate named *Porta Maggiore* is an interesting relic connected with these. By means of it they were carried over the *via Labicana* and the *via Praenestina*.

The aqueducts subsequently formed were inferior in extent and splendour to the older ones. The Romans generally built their aqueducts of brick. The conduit, which was paved, and had sides of brick or stone, covered over with an arch or a flat coping of stone, ran over semicircular arches, spanning from square piers.

Even the provincial towns of Italy in the Roman times had their water supply by means of aqueducts, as is witnessed by the A. of Trajan at Civita Vecchia, which had a course of 23 miles; and as late as 604 one of the Lombard 'dukes,' Theodolapius, built that of Spoleto. The modern aqueducts of Leghorn and Pisa are magnificent structures, the latter having a thousand arches. Wherever Rome formed settlements, this mode of procuring a supply of water was introduced; and in Spain, Portugal, and France extensive remains of such structures still exist. Those of the A. formed at Nismes, probably by Agrippa, now known as the Pont du Gard, are the most striking and the best preserved. Three rows of arches, rising the one above the other, support a small conduit, covered with slabs, the interior of which still retains its coat of cement. The height is 188 feet, and the length of the highest row of arches 873 feet. We have seen that Frontinus was 'keeper' or 'guardian' of the aqueducts under Nerva and Trajan. There was always such an officer, with the proper subordinates, to inspect, repair, and improve those useful structures. Special and separate functionaries were intrusted with the care of the channel, of the reservoir, of the cement, &c. That the Romans did not conduct water as we do in pipes, was not because they were ignorant of the law that water always finds its own level. This fact was well known to them. A magnificent recent construction of this kind is the Clifton A., 38 miles long, which supplies New York with the waters of the river Clifton. It was commenced in 1837, and finished in 1842. It crosses the river Haarlem by fifteen arches, the highest elevation of the masonry from the foundation being 150 feet. It can discharge 60,000,000 gallons of water in a day.

Aqueduct, a term used in anatomy to denote a narrow channel or conduit. There are the A. of Fallopius, the A. of the cochlea, and the A. of the vestibule in the petrous portion of the temporal bone, and the A. of Sylvius, communicating between the third and fourth ventricles of the brain.

Aqueous Humour, the watery or semi-fluid substance which fills and distends the *corneal chamber* of the eye or space between the posterior part of the *cornea* (the transparent front part of the fibrous capsule of the eye) and the front portion of the *crystalline lens*. The A. H. consists chiefly of water; $\frac{1}{10}$ of its weight being composed of chloride of sodium (salt) and extractive matters (Bazellius). It is probably formed by the epithelial cells of the posterior part of the cornea. See EYE.

Aqueous Rocks, otherwise called sedimentary or stratified rocks, are, as these names indicate, rocks which have been deposited in layers or strata through the agency of water, either in its liquid state, as in seas and rivers, or in its solid state, as in glaciers and icebergs. Such formations are continually going on, especially at the mouths of our great rivers and estuaries, the waters of which bring down from the interior large quantities of minutely divided sand and mud in suspension, which are gradually precipitated as the force of the current diminishes. A. R. are divided into a number of distinct strata, which serve as landmarks to the great periods of animal life upon the earth's surface. For further information the reader is referred to the three great primary divisions of A. R.—Kainozoic, Mesozoic, and Palæozoic.

Aquifolia'ceæ, a small natural order of evergreen trees and shrubs found in various parts of the world. Astringent, tonic, and emetic properties characterize the order. The common Holly (q. v.) (*Ilex Aquifolium*) is indigenous to Britain, and forms excellent hedges and fences. At Tynninghame, in Scotland, there are great hedges composed of it, which are about 150 years old. Its wood is white and hard, and is valued by the cabinetmaker; its bark furnishes birdlime; and its berries are emetic and purgative. *Ilex Paraguayensis* furnishes the *Yerba maté* or Paraguay tea of S. America. A decoction of the leaves of *Ilex vomitoria* is used by the Creek Indians as a mild emetic, under the name 'black drink.'

Aquila. See EAGLE.

Aquila, a fortified town of Italy, capital of a province of the same name on the Aterno, a branch of the Pescara, and in the neighbourhood of the highest peaks of the Apennines, is the seat of a bishop, and has a trade in paper, linen, wax, and saffron. It was built by the Emperor Frederick II., but was destroyed by an earthquake in 1703, when 2000 people perished. During

the Neapolitan rule the town was noted for its liberal sentiments. Pop. 12,000.

Aquila, Ponticus, the author of a Greek translation of the Old Testament, was born at Sinope, and flourished in the 2d c. A.D. Epiphanius states that he was a nephew of the Emperor Hadrian, but this is improbable. He was originally a pagan, then, according to some, a Christian, and finally a Jew. His version is remarkable for its literalness, and on that account was placed above the Septuagint both by the Jews (who called it *the Hebrew verity*) and the Ebionites (q. v.). Every Hebrew word is rendered by a corresponding Greek one. This feature renders it valuable for textual criticism, but much less so for interpretation.

Aquilaria cecis, a small order of Dicotyledonous trees, natives of the tropical regions of Asia. The fragrant wood of *Aquilaria ovata* and *A. Agallochum*, is called eagle-wood or Aloes-Wood (q. v.). It is regarded as the aloes or lign aloes of Scripture.

Aquilegia, a genus of plants in the order *Ranunculaceae*. See COLUMBINE.

Aquileja, or **Aglar**, the most westerly town of the Austrian Coastlands on the Adriatic Sea, 22 miles W.N.W. of Trieste. It was founded by Roman colonists in 181 B.C., soon became a rich centre of trade, and on account of its strong fortifications was called the second Rome (*Roma Secunda*). The great high-road of Italy to the East, the Via Emilia, was continued to A., and the roads to Rætia, Pannonia, Noricum, and Dalmatia had their starting-point here. In 452 it was destroyed by Attila, and has never since risen to importance. Its line of bishops is carried back to the age of Nero, and can be traced with certainty to the 3d c. About the 6th c. they took the title of patriarchs, and claimed rank next to the Pope. In 1750 the patriarchate was divided into the two archbishoprics of Udine and Görz. As has a cathedral built in 1041, but is now a decayed place, without trade. Pop. 1750.

Aquinas, **St Thomas** (It. Tommaso d'Aquino), a famous schoolman of the middle ages, was born in 1225 at Rocca Secca, a small town near Aquino, in Naples. The family to which he belonged was one of the most illustrious in Southern Italy. His father, the Count of Aquino, was a nephew of the Emperor Frederick Barbarossa; his mother was descended from Tancred of Hauteville, the Norman conqueror of Sicily; his elder brothers, Reginaldo and Landolfo, held high offices in the Imperial army, while most of his sisters contracted distinguished alliances. A., however, was insensible to the associations of mere worldly greatness. From his youth he displayed an exclusive passion for philosophical and religious study. At the age of fifteen he entered as a novice the Dominican order. To escape the reproaches of his relatives he fled from Naples to Rome, and then proceeded on his way to Paris, but was arrested by his brothers at Sienna, and confined in the paternal castle of Rocca Secca for a space of two years. According to the Bollandists (q. v.), who have invested this captivity with a halo of miraculous circumstances, when everything else failed, it was attempted to win A. back to the world by introducing a Lais into his chamber, but such was the violence of his virtue that she was forced to beat a precipitate retreat. It is said that the Dominicans obtained from the Pope and the emperor an order for his release, and for leave to follow the way of life he preferred. Be that as it may, in 1243 he took the Dominican vows, and went first to the schools of Paris, and afterwards to Cologne, where he had for his master Albertus Magnus (q. v.). At this period of his life he was very silent and meditative: his fellow-students called him *Bos magnus*, *bos mutus*, 'the great dumb ox'; but when he publicly sustained an argument with a singularly strict and luminous logic, Albertus, turning to the pupils, said, 'The bellowings of this ox will yet resound throughout the universe.' During 1245-48 he resided in Paris with his master, and on the return of Albertus to Cologne, A. accompanied him in the capacity of *magister scholarum*. It was about this time that he composed his first works, *De Principiis Naturæ* and *De Ente et Essentia*. In 1252 he again went to Paris, obtained a chair of theology, preached in the churches, and commenced the writing of his *Opuscula*. Meanwhile a lively quarrel broke out between the University of Paris and the mendicant orders, which was ultimately fought out before Pope Alexander IV.; Albertus

Magnus, Bonaventura, and A. were the victorious champions of the latter. Their arguments can still be read in one of A.'s *Opuscula* entitled *Contra Impugnantes Dei Cultum et Religionem*. In 1257 he obtained from the same university, against whose leaders his polemic was delivered, the degree of doctor, and his reputation as a philosopher and divine now spread over the whole of Latin Christendom. His school in Paris was crowded with disciples; princes sought his advice, and Louis IX. made him a member of his Privy Council. Pope Urban IV., anxious to bring about a reconciliation between the Greek and Roman Churches, called him to Italy in 1261, and A. accompanied his Holiness on all his journeys, teaching and lecturing in many cities of the peninsula. To this period belongs his *Contra Errores Græcorum*. Clement IV., who became Pope in 1265, entertained the same high respect for A. as his predecessor, and offered him the archbishopric of Naples, which he declined. A.'s real ambition was to govern the thoughts of men, not to rule the Church. It was from this desire that he undertook the great work of his life, the *Summa Theologie*. 'Disgusted,' as he tells us himself, 'with the extravagances, obscurity, and disorder of the scholastic theology up to his own time, he conceived the idea of a luminous and methodical compend of the entire system of Christianity, from the sublime doctrine of the existence of God down to the humblest precept of evangelical morality.' The execution of this *chef-d'œuvre*, the supreme monument of the 13th c., occupied the last nine years of his life, without, however, hindering him from discharging his public duties as a lecturer on divinity in Bologna, Paris, and Naples. Summoned from the last of these cities by Pope Gregory X. to take part in a council at Lyon, he was seized with illness on his journey, and expired at Fossa-Nuova, in the diocese of Terracina, 2d March 1274, at the early age of forty-nine. His canonisation was declared by Pope John XXII. in 1323, and the title of *Doctor Ecclesiæ* was conferred on him by Pius V. in 1567. His world-famous surname *Doctor Angelicus* was given to him because of the precision and completeness with which in the first part of his *Summa* he defines the nature and attributes of angels. If any one wishes to thoroughly comprehend the peculiar character of metaphysical thought in the middle ages, he should study A., in whose writings it is seen in its greatest consistency. Depth and strength of understanding, vigour of logical statement, fulness of knowledge,—these are the great qualities of the *Summa*. Nor is there absent from it, though more fully seen in some of his other works, such as the *Summa Catholica Fidei contra Gentiles*, a flame of devotional poesy, and that strange mysticism into which all spiritual thought seems ever destined to pass. The literature to which A. has given birth would itself make a library, and is a testimony to the immense influence of the man. His own writings, which are far too numerous to specify, have been printed separately and collectively many times. Among the complete editions may be mentioned those of Rome (18 vols. fol. 1570-71); Venice (18 vols. fol. 1593-94); Antwerp (19 vols. fol. 1614); Paris (23 vols. fol. 1636-41); Venice (20 vols. fol. 1745-60). A new edition, to be completed in 24 vols., was begun at Rome in 1858. See Haureau, *De la Philosophie Scholastique* (2 vols., Paris, 1850).

Aquita'nia, the name given by Cæsar to that part of Gaul which lay between the Garonne and the Pyrenees, and which was originally peopled by an Iberian race akin to the Basques of Spain, whose name is still preserved in the words 'Vascons' or 'Gascons' and 'Biscay.' See BASQUES. Augustus added the country between the Garonne and the Loire, which was inhabited by fourteen tribes. In the year 412 it was conquered by the Arian Visigoths, from whom it was wrested in 508 by the 'Catholic' Clovis, but under the later Merovingian kings it became an independent duchy. After various fortunes, it was united to France in 1137 by the marriage of the heiress Eleanor to Louis VII. Fifteen years later, by the marriage of the divorced Eleanor with Henry II., it became English, but it was finally united to France in 1451.

Ara, a genus of Scansorial or Climbing birds, popularly known as Macaws (q. v.). The name *Macrocerus* is more frequently applied to indicate this genus; and the name A. is derived from the Indian name for these birds, which inhabit tropical America and the W. Indies.

Arabesque (Fr.), a term meaning in the Arabian style, but

generally applied to a fanciful style of ornament, much used in mural decoration among the ancients, and subsequently in

Arabesque.

general use for various purposes, and the purest types of which are afforded by the Venetian monuments of the Lombardi and other *cinquecento* sculptors. It consists of floriated scrolls and figures perfectly executed. *Grotesquerie*, however, has formed—though not in all cases—a quality of A. from the earliest times, and foliage with griffins appears in the friezes of Greek temples, and in the mural decorations of Pompeii. Saracenic A. is seen in wonderful variety and beauty in the Alhambra; but the most splendid examples of this species of ornamental design are the works of Raphael and Giulio Romano. See Wornum's *Analysis of Ornament* (1861).

Arabgir' (anc. *Anabracc*), a town in the vilayet of Sivas, Asiatic Turkey, on the caravan route between Aleppo and Trebizond, distant from the latter S.S.W. 150 miles. It lies on an elevated plateau, is surrounded by mulberry-trees, and employs an immense number of hand-loomers in the weaving of cloths from English cotton yarn. Near A. are the lead and copper mines of Kaben-Maden. Pop. about 30,000, chiefly Turks and Armenians.

Arabia, the great peninsula of south-western Asia, connected with Africa by the Isthmus of Suez, and with the Asiatic continent by the Syrian Desert, is bounded W. by the Indian Ocean, S. by the Red Sea, and E. by the Persian Gulf. Lat. 12° 30' to 31° N.; long. 32° 20' to 60° E. Area estimated at 1,230,000 sq. miles; pop. at 4,000,000. The general type of A., according to Palgrave, the most recent explorer of A., who has crossed the peninsula from the frontier of Palestine to Muscat on the Sea of Oman, is that of a central tableland, surrounded by a desert ring, sandy to the S., W., and E., and stony to the N. This outlying circle is in its turn girt by a line of mountains, low and sterile for the most part, but attaining in Yemen (q. v.) and Oman (q. v.) a height of from 6000 to 8000 feet in many of the peaks, and also considerable breadth and fertility, while beyond these a narrow rim of coast is bordered by the sea. The surface of the midmost tableland or Nejed (q. v.) equals somewhat less than one-half of the entire peninsula, and its special demarcations are much affected, nay, often absolutely fixed, by the windings and in-runings of the 'Nefood,' or sand-passes—offshoots from the D'hana, or Great Sandy Desert, in the S. of the peninsula, and which covers about one-third of its entire extent. If to these central highlands we add whatever spots of fertility belong to the outer circles, it will be found that A. contains about two-thirds of cultivatable or at least of available land, with a remaining third of irreclaimable desert, chiefly to the S. The whole of the W. maritime region of A., extending S. from the Syrian frontier to the neighbourhood of Aden, stretching inland in some quarters to the depth of 200 miles, and embracing the provinces of Hedjas, 'Aseer, and Yemen, belongs to the Ottoman empire; the north-eastern region around the lofty Djebel Shomer is under the dominion of the Sultan of Shomer; Nejed, the central highlands, extending N.E. from Mecca to the N.W. shores of the Persian Gulf, and having an average breadth of about 350 miles, forms the empire of the

Sultan of Wahhabi; while the maritime region of the S.E., from the peninsula of Katar to Dofar on the Indian Ocean, is under the supremacy of the Sultan of Oman or Muscat. Hadramaut (q. v.), the strip of coast region extending along the Indian Ocean from Aden to Dofar, is occupied by independent tribes. The principal towns are Mecca and Medina in the province of Hedjas; Sana and Mocha, in Yemen; Aden, on the S. coast, near the entrance to the Red Sea, and belonging to England; Muscat, in the S.E., on the Gulf of Oman; and Ri'ad, the capital of the Wahhabis, in the central highlands.

Climate, Soil, &c.—In the low lands and upon the strips of desert the heat is intense, and the blast of the Semum, or 'poisonous wind,' is described by Palgrave as fatal when encountered on the open plains. In the central highlands the climate is delightful, and here corn, vegetables, and most of the sub-tropical products are grown with success. In A. the best coffee and dates are produced and exported, besides gums, myrrh, and various spices, senna and other drugs, and pearls from the Persian Gulf. Cotton, indigo, and tobacco are also cultivated, and might be largely grown for export. The principal domestic animals of A. are the camel, the celebrated breed of horses, oxen, sheep, and goats. Among wild animals are the lion, panther, jackal, and hyena.

History.—The earliest inhabitants of A. are believed to have been Cushites, who were forced to migrate from A. to Abyssinia on the arrival in their country of certain Semitic tribes descended from Kahtan, the grandson of Shem, and Ishmael. The *Ilmyarides*, a dynasty descended from Kahtan, are said to have flourished in Yemen for 2000 years. The Romans, who invaded A. in the beginning of the 2d c., and again under Augustus, failed to reduce this dynasty to dependence. But what the Roman legions could not accomplish was brought about by subsequent internal disturbances, and for several centuries the history of the country is only a record of inter-tribal wars. With the rise of Mohammed A. also arose; and the tribes, having adopted the creed of the Prophet, united for the sacred purpose of extending it; and under the Califs (q. v.)—the successors of Mohammed—A. attained great power, and spread her conquest far and wide. In 749 the Abbasides (q. v.) assumed the rule of the Faithful, and the reigns of Mansur, Harun-al-Raschid, and M. al-Mu'tasim, the most splendid of the Bagdad Califs for luxury and refinement, form the golden age of the Mohammedan dynasty. In the 9th c. the merchants of A. were in all the markets of the world, trading from Spain to India and China. The removal, however, of the capital of the Califs far beyond her frontier was the first cause of the decline of A., and after the capture of Bagdad (1258) and the fall of the Abbasides, the country relapsed into insignificance. In recent centuries the territory of A. has been ravaged by various assailants, and during the 16th c. the Turks had acquired Yemen, the Persians Oman, and the Portuguese Muscat. The *Wahhabis* (q. v.) arose in A. towards the close of the 18th c., and established themselves supreme in Nejed. Their enjoyment of power, however, was not without a check. Ibrahim Pasha (1818) swept down upon them, and set up Egyptian domination in their province. But the misrule of the Egyptian princes led to their own overthrow, and Turke, a surviving son of the last Wahhab monarch, was installed in the throne of his fathers. Feizul, the son of Turke, has extended the Wahhabite religion and sway, and seems to have inaugurated a more promising era among its inhabitants, as a wider area of soil is now under cultivation in Nejed and its dependencies. See Palgrave's *Central and Eastern Arabia* (Macmillan, 1865); Burton's *El-Medina and Meccah* (Longmans, 1855); and Wrede's *Reisen in Hadramaut* (1870).

Arabian Language and Literature. The Arabic is the most widely-spread branch of that family of languages commonly called the Semitic, though a more appropriate designation would be the Syro-Arabian. Together with the Ethiopic it forms the southern branch of the family, and is divided into a northern and southern dialect, the former of which has become predominant through the influence of the Koran. Arabic is not only a language highly-developed, but from the peninsular position of Arabia it has preserved nearly perfect purity of form and idiom. Being necessarily coextensive with the spread of Islamism, it was spoken and written in almost all Western Asia, in Eastern and Northern Africa, in Spain, and in some of the Mediterranean islands. It was the ecclesiastical language of Persia, Turkey, and the other Mohammedan countries, in each of which it has

left traces of its former ascendancy; and it is still as indispensable a part of a learned education to a Moslem priest as Latin is to a Christian ecclesiastic. It has a close affinity with Hebrew, and contains nearly nine-tenths of the Hebrew roots; hence it has now begun to be studied by those who wish to accomplish themselves as Biblical scholars. The grammar and lexicography have been so elaborately explained by native scholars, that the student of Arabic can proceed with as much confidence as the student of Greek. Abul-Aswad-al-Duli, who flourished under Ali, the fourth calif, was the earliest grammarian; Mohammed-ben-Yakub-al-Firuzabadi (died 1414) compiled *Al-Kamus*, the best lexicon of the language; and technical terms in art and science have been explained by Jordahani. Arabic, which is singularly rich in synonyms, is spoken with the greatest purity in Yemen. The old Kufic form of writing, which had special symbols for only sixteen of the twenty-eight consonants, was displaced in the 10th c. by a current handwriting, the *Nas'hi*, still in use, in which points distinguish the consonants that are similar in form. Arabic texts are either pointed or unpointed, the points representing the vocalisation. There are collections of Arabian MSS. in the Escorial, and at Rome, Paris, Berlin, Vienna, Gotha, Leyden, London, and Oxford. Among the more recent contributions to Arabic grammar and lexicography are *Grammatik der Neu-Arabischen Sprache*, by Wahrmund (4 vols. 1861-66); and an *English Lexicon of Modern Arabic*, by Newman (2 vols. 1871).

The earliest Arabian literature is poetic, as was to be expected from the temperament, the mode of life, and the surroundings of the nomadic tribes. Love and war are the themes, and poetic contests, like those at the Grecian games, were held at the great fair of Mecca and elsewhere. The successful poems, rewritten in characters of gold, were hung up in the Kaaba at Mecca, and thence termed the *Motsahhabat*, 'the Golden,' or *Moullakat*, 'the Suspended.' The *Chrestomathie Arabe* of De Sacy (2d ed. Paris, 1822) contains translations from Nabegha, Asha, and Shansara, the most distinguished of the bards before Mohammed. Kaab-ben-Zohair also deserves mention. He lived to celebrate the work of the Prophet in verse, which Freytag published with a Latin translation (Bonn, 1822). The peculiar nature of the life and poesy of an Arab minstrel of this period are beautifully delineated in the *Divan* of Amrulkais (translated into German by Rückert, Stuttg. 1843). The richest collection of the older Arabian poesy is to be found in the *Anthologies* of Hamasa, the *Divan* of the Hudhailites (published by Kosegarten, Greifswald, 1854), and the *Kutab al-aghani* (Kosegarten, Greifswald, 1840). See Weil, *Die Poetische Literatur der Araber vor Mohammed* (Stuttg. 1837).

The revision and publication of the Koran by Calif Othman, in the middle of the 7th c., marks an important era in Arabian culture; and fully a century later, after a whirlwind of conquest, the Arabs settled themselves down to literature, science, and the arts, under the fostering sway first of Al-Mansur (754-75), and afterwards of the world-renowned Harun-al-Raschid (786-808). Men of learning were attracted from all quarters, and splendidly rewarded; translations of the best Greek, Syriac, and Persian authors were made and disseminated; schools were founded in the more important cities; libraries were collected; and pupils repaired from many parts of Europe to Cordova, in Spain, where also the Arabs had founded a famous school. Such rapid progress in culture is without a parallel; indeed, Arabian literature spans the chasm between the extinction of classical learning and the revival of letters in the 15th c., and what is justly known as the 'dark ages' in the rest of Europe, was a period of intellectual light and splendour in Arabian Spain. All departments of learning were cultivated. Medicine, physics, and mathematics received special attention, and astronomy, geography, and history were favourite studies. The earliest Mohammedan historian is Hesham-Mohammed-al-Kelbi (died 819), who wrote a life of the Prophet (ed. by Wüstenfeld, Gött. 1857). In the same century flourished Wakedi (died 822), Ibn-Kotaiba, Abu-Obaida, Al-Baladkori, and Afraki. But with the 10th c. history became a sort of passion with Arabian authors. Masudi wrote an historical encyclopædia entitled *Meadows of Gold* (Fr. transl., vol. I. Paris, 1861); Tabari (died 922) wrote *Annals* (Kosegarten, Greifswald, 1831), and Hamza of Ispahan, and Eutychius of Alexandria first attempted universal history; Abulfaraj and Abulfeda followed; Abul-Kasem of Cordova (died 1139) narrated the history of the Arabic dominion in Spain, Navairi the

history of Sicily under the Arabs, and Ibn-Abizer the annals of the Moorish kings. The style of the Arabian historians is simple and unadorned.

The Koran is the basis of Arabian theology and jurisprudence; but the study of the Aristotelian philosophy resulted in speculations which gave rise to numerous sects, four only of which are regarded as orthodox. The sayings of Mohammed have been collected into what is known as the *Sunna*, a valuable body of tradition, which helps to the elucidation of the Koran, the principal occupation of students in theological jurisprudence. The attention of the French has of late been directed to Mohammedan law, a course rendered indispensable by their conquest of Algeria. In philosophy, the Arabians confined themselves mainly to the exposition of Aristotle; and Western Europe owed its acquaintance with the Peripatetic philosophy to translations into Latin from the Arabic. Among their most eminent and best known philosophical writers are Avicenna (11th c.), Abubekr Ibn-Tofail, who seems to have anticipated the evolution theory in his *Hai-elm-Yokdan* (Pococke, Oxf. 1671); and Averrhoes (12th c.), famed as much for his medical system as for his commentaries on Aristotle. See Ritter's *Ueber unsere Kenntnisse der Arab. Philosophie* (Gött. 1844), Dieterici's *Naturanschauung und Natur Philosophie der Araber im 10. Jahrh.* (Berl. 1861). That medicine owes so much to the Arabs results primarily from their intimate acquaintance with the uses and properties of simples, due to the exuberant vegetation of South-Western Arabia. Alchemy (q. v.), first cultivated in Egypt, was taken up by the Arabians, and by them introduced into Spain; and hence arose chemical pharmacy, a purely Arabic creation. In all departments of medical science they were brilliant discoverers, except in anatomy, dissection being forbidden by the Koran. The Arabic notation, and the substitution of the sine for the chord in trigonometry, were valuable contributions to mathematical science; astronomy and geometry were sedulously cultivated; Euclid was translated into Arabic, and several important astronomical discoveries were made. The Christian and Jewish elements are necessarily meagre, as neither Judaism nor Christianity obtained any permanent influence among the Arabs as a nation. Hence no entire version of the Bible exists in Arabic, though independent versions of separate books are far from scarce. These versions, however, were not made directly from the Hebrew, but from the Septuagint, or from Latin versions.

But by far the brightest outcome of their literature was their poetry, which gradually assumed a highly artistic form. Fiction, expressed both in verse and prose, was wonderfully popular; and *The Arabian Nights' Entertainments* (q. v.) still ranks as perhaps the most graceful and interesting collection of fabulous and romantic lore in existence. Hardly less popular is the poem on the exploits of Antar (q. v.). The drama alone, of all species of poetic composition, was neglected; but their imaginative literature still colours that of Europe. We have only space for the names of some of their more brilliant bards; as Motenebbi, Abul-Ala, Omar Ben-Faredh (*Divan*, Paris, 1855), Abu Nuwas, Tograi Ibn-Doreid, Busiri, Hamadani, and Hariri. This wonderful luxuriance has been succeeded by a barrenness as wonderful, due to the depressing sway of the Turks, though the press of Cairo, Beyrout, and Algiers occasionally issues works of no great importance, written evidently with an eye to European criticism. Hammer has written a history of Arabian literature in 7 vols. (Vien. 1850-56); it is exhaustive so far as it goes, but it only comes down to 1258. A very complete survey of the subject is given by Zenker in his *Bibliotheca Orientalis* (2 vols. Leipz. 1846-61).

Arabian Nights' Entertainments, the title usually given to English reproductions of *Les Mille et une Nuits*, *Contes Arabes traduits en Français* (The Thousand and One Nights—Arabian Tales, translated into French), by Antoine Galland, a famous Orientalist, and which were first published in Paris in 12 vols. 1704-14. Galland described the collection as that of an unknown Arabian author; but at first he himself was believed to be the writer. All doubt on this question has long been dispelled: a number of MS. copies of the text in Arabic have been found at Cairo and published. Among these is the *Alif Laila*, or *Book of the Thousand Nights and One Night*, commonly known as the *A. N. E.*, now for the first time published complete in the original Arabic, from an Egyptian MS. brought to India by the late Major Turner Macan (editor

of the *Shah Namah*), edited by W. H. Macnaughten, Esq., 4 vols. Calcutta and London, 1839. The *Thousand and One Nights* had its origin in a collection of Persian tales called the *Thousand Fanciful Tales*, which are known to have been in existence in the middle of the 10th c. But though the *A. N. E.* contains much matter similar to what occurs in its archetype, yet it has this claim to be an original work, that it was written most probably in Egypt during the 16th c. by an Arab, and that its tales are exclusively illustrative of Arab character, whether the scene in which they are cast be Persia, India, or China. 'In my endeavours,' says Mr Edward William Lane (q. v.), the most scholarly and most successful translator of the *A. N. E.*, 'to ascertain the period and the country in which this work was composed, I have not merely considered its internal evidences of the time and place. The earliest period at which any portion of it has been incontestably proved to have existed is the year 955 of the Flight (A.D. 1548).' The exquisite fancy, humour, and pathos of these tales, and the evident fidelity of its pictures of Arab town life and manners, have won for it an extraordinary popularity in England and on the Continent, and evoked the indirect flattery of scores of imitations. Perhaps the latest and most perfect edition of the *A. N. E.* is the new edition of E. W. Lane's translation, edited by E. Stanley Poole (Murray, Lond. 1859). In this work, which is *de luxe* in illustrations, &c., the interesting question of the origin and literary history of this singular collection of tales is fully and satisfactorily discussed. Among the other translators of the *A. N. E.* may be mentioned Dr Scott (1811); Henry Torrens, who translated the *Alif Laula* (Calc. 1838); and the Rev. Ed. Forster (Lond. 1847).

Arabian Numerals, the name given to the characters 0, 1, 2, 3, 4, 5, 6, 7, 8, 9. They were in reality borrowed by the Arabs from the Hindus, and were first introduced into Europe about 980 A.D., but were not in general use until the invention of printing.

Arabian Sea (anc. *Mare Erythraum*), an immense bay of the Indian Ocean, stretching from India to Arabia, and extending from Beloochistan on the N., to about the latitude of Cape Comorin and Cape Guardafui in the S. It includes the Persian Gulf and the Red Sea proper, the latter of which was connected with the Mediterranean Sea in 1869 by the Suez Canal (q. v.). From the earliest times till the doubling of the Cape of Good Hope in 1497, the A. S., together with its great inlet, the Red Sea, was the chief route by which trade between Europe and the East was carried on.

Arabine is the chief constituent of *gum-arabic*, in which it occurs combined with lime and potash. By adding alcohol to an aqueous solution of gum arabic acidulated with hydrochloric acid, pure A. is precipitated in white flocks. Its composition is the same as that of starch, both of which contain quantities of carbon, hydrogen, and oxygen, corresponding with the formula $C_6H_{10}O_5$. When boiled with dilute sulphuric acid, A., like starch, takes up water, and becomes converted into grape sugar.

Aracaju, the capital of the Brazilian province of Sergipe, on the river Cotiguiaba about 5 miles from its mouth, and 150 miles N. of Bahia. It is the only port of the province opened to foreign commerce, and has considerable trade, chiefly in cotton and sugar, the latter of which is of superior quality. In 1872 the value of sugar exported was £369,938, and of cotton, £306,532. A bar at the mouth of the river, however, is a great hindrance to shipping, and has caused the transmission of two-thirds of the trade of Sergipe to the port of Bahia. Pop. over 20,000.

Aracan, or **Arakan**, the most northerly province of British Burmah. Area, 18,530 sq. miles; pop. (1872) 484,363. It is separated from Pegu and native Burmah by the Yomah Mountains, from 3000 to 5000 feet high, and its seaboard extends from the estuary of the Naaf to Cape Negrais, along the E. side of the Bay of Bengal. Akyab (q. v.) is the chief town. The principal export is rice. A. (properly Kakhang-pyce-gyce) was once an independent kingdom, but was conquered by the Burmese in 1783. Its old capital, now known as Mro houn, lies in a basin 50 miles inland, and is now a place with 4000 inhabitants. Some

parts of its former fortifications are still to be seen, and the numerous ruined pagodas and palaces buried in the jungle attest its ancient grandeur. The famous idol which stands near the capital of Burmah was taken from A., and is still tended by the descendants of Aracanese captives. The province was annexed by the British in 1826, and is now divided into four districts—A. Hill Tracts, Akyab, Kyauk-hpyoo (formerly Ramree), and Sandoway.

Aracari, or **Aricari**, a sub-genus of the Toucans, included under the name *Pteroglossus*. These birds are coloured green, with red or yellow breasts. They inhabit S. America, and possess much smaller bills than the toucans.

Araceæ, an order of Monocotyledonous plants. See ARUM.

Arachis, a genus of Leguminous plants with papilionaceous flowers. *A. hypogæa* has the remarkable habit of pushing its fruit or pods into earth, where they are matured; hence they receive the name of *ground nuts* in this country. The plant is an annual, and was originally a native of the W. Indies and Africa, but is now cultivated in most warm regions, and even succeeds well in France. The pods contain two seeds about the size of a pea, which are eaten as food, either raw, boiled, or roasted. When pressed, a large quantity of oil is obtained from them, one bushel yielding about one gallon. The oil is equal in quality to olive oil, and is often used as a substitute for it. It has been used in the manufacture of soap, &c. The plant is recommended as forage for cattle.

Arach'nida, a class of *Arthropoda* or Higher Annulose animals represented by spiders, mites, scorpions, &c. The A. are distinguished by the head and chest being united to form a single segment—the *cephalothorax*; by the presence of eight legs; by the absence of wings and antennæ, and by the breathing organs consisting of pulmonary-sacs, or of tracheæ, or of both combined. The eyes are simple. The class is divided into the section *Tracharia*, represented by mites, ticks (*Acarina*), sea-spiders (*Podosomata*), and harvest-spiders (*Phalangida*), &c. These breathe by air-tubes or tracheæ, and the eyes are not more than four in number. The second section, or *Pulmonarians*, represented by spiders and scorpions, breathe by pulmonary-sacs alone, or combined with tracheæ, and the eyes number six or more.

Arach'noid Membrane. The brain and spinal cord are protected by three membranes. These are (1) the *dura-mater*, a fibrous structure which lines the skull and canal of the vertebral column; (2) the *pia-mater*, a very thin fibro-vascular membrane spread over the surface of the brain and cord; and (3) the *arachnoid*, a serous sac placed between the *dura-mater* and *pia-mater*, covering the inner surface of the *dura-mater* on the one side, and the outer surface of the *pia-mater* on the other. The *arachnoid* is thus a shut sac containing a small quantity of serous fluid. Between the A. M. and the parts where the *pia-mater* dips into the fissures of the brain is a space called the sub-*arachnoid* space, which also contains a serous fluid called the cerebro-spinal fluid.

Arad, the capital of a province of the same name, Upper Hungary, on the Marosh, a branch of the Theiss. It was destroyed by the Turks in the 17th c.; but when rebuilt it was strongly fortified, and afterwards played an important part in the revolution of 1849. Kossuth issued from A. his proclamation declaring the hopelessness of the Hungarian cause. A. is the seat of a non-united Greek bishop, and has a gymnasium and a Walachian seminary. Next to Pesth and Debreczn it has the largest cattle-market in Hungary. There is also a large trade in corn and tobacco. Pop. (1869) 32,725. On the opposite bank of the river lies New A., a fortified suburb with 4670 inhabitants. The province is rich in wine and wood, and contains marble quarries and mines of copper and iron. Area, 1700 sq. miles; pop. 254,000.

Ar'afat, **Mount** (*Jebel-ar-'rafne*, Mountain of Mercy), a small hill 15 miles S.E. of Mecca, on which, according to Mohammedan belief, Adam again met Eve, after a separation of 200 years, following the banishment from Paradise. See ADAM. It is the scene of a great yearly ceremony at which the Mohammedan pilgrims require to be present before they can assume the name of Hadji. Burckhardt states that in 1814 the gathering consisted of upwards of 70,000 people.

Arage, Dominique François, a famous French physicist, was born at Estagel, near Perpignan, in the department of the Eastern Pyrenees, February 26, 1786. At the age of seventeen he entered the Polytechnic School at Paris; and in 1805 became secretary to the Paris Observatory, in which capacity, along with Biot and the two Spanish commissioners Chaix and Rodriguez, he extended from Barcelona to Formentera the measurement of the arc of the meridian which had been begun by Delambre and Méchain. A succession of romantic and perilous incidents now befell him. Suspected of being a spy, he was for a time a prisoner in the citadel of Belver, near Palma, twice carried to Algiers, and once sent to the Spanish hulks at Palamos. Finally, in 1809, he reached Marseille. A few months after his return to Paris he was almost unanimously elected to fill up the vacancy in the Academy of Sciences occasioned by the death of Lalande, and about the same time was appointed a mathematical professor at the Polytechnic School, where he had Laplace and Monge for his colleagues. From this date till 1848 he was engaged almost wholly in scientific pursuits. In 1811 he directed his attention to the polarisation of light, and laid the foundation of that branch of physical optics known as chromatic polarisation. In 1816 he started, along with Gay-Lussac, the *Annales de Chimie et de Physique*; and, in the same year, demonstrated the truth of the undulatory theory of light over the emission theory. In 1820 he followed up with great success Oersted's discovery of the action of an electric current upon a magnet; and for his labours in this field he received, in 1825, the Copley Medal of the Royal Society of London. As regards politics, A. was a keen republican. He had a seat in the provisional government of 1848, and was made Minister of War, and later was a member of the War Committee in the National Assembly. He showed his consistency in refusing to take the oath of allegiance to Napoleon III. after the *coup d'état* of 1852; but the emperor made special exception for him in recognition of the valuable services, scientific and political, which he rendered his country. A. died at Paris, October 3, 1853. A fine edition of his *Œuvres*, in 17 vols. (Paris, 1855-60), has been published by Barral.—His son, **Emmanuel A.**, born at Paris, 6th August 1812, is a distinguished member of the French bar, and a notable

politician of the party of the Left.—**Étienne A.**, brother of the astronomer, and a well-known playwright and journalist, was born at Estagel, near Perpignan, 7th February 1803. He has held several State offices, and was mayor of Paris during the Franco-Prussian war.—**Jacques Étienne Victor A.**, another of the brothers A., was born at Estagel, 10th March 1790. He was artist to the Government expedition of 1817-20, under Freycinet, described in his *Promenade autour du Monde* (1822). He wrote many plays, but while still young was suddenly afflicted with blindness. His *Voyage d'un Aveugle en Californie* is the record of a hapless expedition to the gold-fields of California, headed by A., who died 1st January 1855.—**Jean A.**, the fourth brother, a distinguished general in the Mexican service, born in 1788, sailed for the New World in 1815, and died in 1836. Santa Anna owed to him a great part of his first successes.

Aragón, a former province in the N.E. of Spain, embracing the three modern provinces of Saragossa, Huesca, and Teruel. It is bounded N. by the Pyrenees; E. by Catalonia and Valencia; S. by Valencia and New Castile; W. by Old and New Castile and Navarre. Its greatest length from N. to S. is about 200 miles; its greatest breadth is 130 miles; and its area 14,720 sq. miles.

The central part of A., through which the Ebro flows, receiving the waters of many rivers, is level. The N. and S. portions are mountainous. The Pyrenees send down long spurs into the district. Except on the banks of the Ebro the plain country is not fertile, being badly supplied with water. There is, however, splendid vegetation in the Pyrenean valleys, where wheat, rye, maize, barley, &c., are plentifully produced. Excellent timber grows on the mountains, and rich pasturage abounds. In the plains the climate is sultry, but on the hills it is temperate. Among the minerals are copper, lead, iron, salt, saltpetre, amber, and coal. The bear, wolf, and lynx inhabit gorges of the Pyrenees, and merino sheep are reared in great quantities. The manufactures are unimportant. The people of A. are brave and active, but proud, cold, and stubborn. They are true friends, but fierce enemies; and hence their country has often been the scene of the most embittered and bloody strife. The population

in 1871 was 928,718. Chief towns, Saragossa, Teruel, Huesca, and Calatayud.

Conquered by the Romans at an early period, A. afterwards came into the possession of the Visigoths, and in the 8th c. of the Arabs, from whom it was subsequently wrested by the Christians. It was then governed by its own monarchs until its union with Castile in 1469, on the marriage of Ferdinand and Isabella.

Arago'na, a town of Sicily, 8 miles N.N.E. of Girgenti. Pop. 7947. The ancient castle of the princes of A., a vast structure in the Renaissance style, is rapidly becoming a ruin. The mud-volcano of Maccaluba is near A.

Aragonite, or **Arragonite**, a mineral named from Aragon in Spain, composed chiefly of carbonate of lime, with a small percentage of carbonate of strontia and sometimes magnesia. It frequently occurs in compound crystals, chiefly white, but sometimes tinted with yellow, green, or violet, and when it has a silky lustre it is known as satin spar. In this last form it is used for small ornamental articles in the same way as alabaster.

Araguay, also **Rio Grande**, a large river of Brazil, rises in 18° 10' S. lat., among the southern sierras, and is about 1000 miles long. It flows N., surrounding in its course an island (Santa Anna) over 200 miles long, and joins the Tocantins at San Joao das duas Barras. The valleys of this river are so richly beautiful that the region is known as the 'Garden of Brazil.'

Aral Sea of (lit. 'Island Sea'), the 'Blue Sea' of the Russians, a great lake to the S. of the Russian government of Orenburg, about 150 miles W. of the Caspian Sea, between 43° 42' and 46° 44' N. lat., and 58° 18' and 61° 46' E. long. Area, 26,650 sq. miles; lying 243 feet above the Caspian. Its waters are brackish. The Sir (anc. *Jaxartes*) and Amu (anc. *Oxus*) are its only feeders, and it has no outlet. In the opinion of Rawlinson and others it was dry land during the Greco-Roman period, and again during the 13th and 14th centuries after Christ, the Jaxartes and Oxus then entering the Caspian. The restoration of the Oxus to its old bed is being attempted (1875) by the Russian government. There is a Russian squadron stationed at Kazala (q. v.), which, however, was of too great draught for river service during the Khivan expedition of 1873.

Aralia and **Aralia-cææ**, a genus and order of Dicotyledonous trees, shrubs, and herbaceous plants found both in tropical and cold regions. The common ivy (*Hedera Helix*) and the moschatel (*Adoxa Moschatellina*) are the only representatives of the order in Britain. The plants have generally aromatic and stimulant properties. *Panax Schinseng* furnishes a stimulating drug, much used by the Chinese under the name of ginseng, and *P. quinquefolium* possesses similar properties. *P. fruticosum* and *P. cochleatus* are used as aromatic medicines in the East. The pith of *Fatsia* (Arabia) *papyrifera* forms the famous rice paper of China. *A. nudicaulis* of N. America has a fragrant and aromatic root, which is used as a substitute for Sarsaparilla (q. v.), and is also said to be used as a remedy against syphilis, and as an application to fresh wounds. Some American species of A. yield an aromatic gum resin. *A. spinosa* is called angelica-tree and toothache-tree in N. America.

Aram, Eugene, the hero of poem, drama, and romance, was the son of a gardener, and was born at Ramsgill, Yorkshire, 1704. He pursued learning with avidity, though his poverty retarded his progress in this direction. He married early, became a schoolmaster, and settled at Knaresborough, where he contracted a friendly alliance with one Daniel Clark, a shoemaker. The sudden disappearance of the latter, while in the temporary possession of a quantity of valuable property, threw suspicion upon A., and the schoolmaster's garden having been searched, a quantity of the missing property was found. A. was consequently tried, but acquitted for want of evidence. Leaving Knaresborough he travelled through a considerable part of England, eventually becoming usher of Lynn Academy, Norfolk. While thus engaged, his secret was betrayed by a confederate: the skeleton of the murdered man was exhumed and identified, and A., tried at York, 3d August 1759, for murder, was found guilty, and condemned to be executed within three days. He had conducted his own defence with consummate ability—his great speech being remarkable for its learning and close reason-

ing. Before his execution he confessed his guilt, wrote a defence of suicide, and endeavoured to practically illustrate his theory; but failing to gratify his desire in this direction, was executed according to sentence. His studies were mainly philological, and he had acquired a knowledge of Chaldee, Arabic, Welsh, and Irish. At the time of his apprehension he was engaged upon a *Comparative Lexicon of the English, Latin, Greek, Hebrew, and Celtic Languages*. In Lord Lytton's romance of *Eugene Aram* (later editions), a very interesting and learned essay by A. on an antiquarian subject will be found. More exquisitely genuine than this romance, however, is the poem of Hood on the same subject.

Aram'sa (Heb. *Aram*, the plateau or highland), the country N.E. of Palestine, bounded N. by Taurus, E. by the Tigris, S. by Arabia, W. by Arabia and Phœnicia, and corresponding to the Mesopotamia of the Greeks. The language of the country, called *Aramaic*, was divided into two dialects, that of the W. being the Syriac, and that of the E. the Chaldee, specimens of which are to be found in Daniel and Ezra. After the Babylonish captivity, the Syriac, or Western Aramaic, gradually superseded the Hebrew in Palestine, and was the vernacular of the Jews in the time of Christ. Everywhere, however, in Syria and Mesopotamia, the Aramaic has now been displaced by the Arabic and Persian, and though it was probably the most ancient of the Syro-Arabian tongues, it only lingers in isolated spots among the mountains of Kurdistan.

Aran'da, Pedro Pablo Abaraca y Bolea, Count of, a Spanish statesman, was born 18th December 1718. He was for seven years ambassador of Charles III. at the court of Augustus III. of Poland. A formidable revolt having broken out at Madrid in 1765, A. was made President of the Council of Castile. He restored order in the capital, established the supremacy of the law throughout the kingdom, and energetically introduced a series of liberal reforms in the army, navy, commerce, and agriculture of the country. Having procured the expulsion of the Jesuits, he was, in 1773, through clerical intrigues, got rid of for a time by being sent as ambassador to France. Returning to his old position, he once more lost it through intrigue; and having expressed unpalatable sentiments respecting the war with France that followed the Revolution, he was banished to Aragon, and died there in 1799.

Arañes and Araneidæ. See SPIDER.

Aranjuez (Lat. *Ara-Jovis*), a town of Spain, 28 miles S.E. of Madrid, famed for its palace and gardens. The gardens were laid out by Philip II., but the palace, completed by Charles IV., is a reconstruction in the French style, by Philip V., of an older edifice that had been partly destroyed by fire. The residence of the royal family here during the spring formerly brought a great influx of visitors into A., the population of less than 4000 being sometimes increased to 10,000. In the gardens are magnificent elm-trees that were brought from England by Philip II. Here an alliance was concluded between France and Spain against England, 12th April 1772, and here Charles IV. abdicated, 18th March 1808.

Arány, János, a Hungarian poet, inferior in reputation only to Petöfi, was born of poor parents at Nagy-Szalonta, March 1, 1817. He studied hard for four years at Debreczin College with the view of entering the Church; but in 1836, wearied of the dull inactive life, threw in his lot with some strolling players. He soon, however, returned to Szalonta, where he settled as a notary. In 1847 he published *Toldi* (the Hungarian Samson), a trilogy which instantly nerved the national sentiment of all classes. A. rose to fame and favour after the Austro-Hungarian war. He has written many poems, some of which are translated into German, the best known being *Katalin* ('Catherine'), a narrative in thirteen cantos. The first part of a second great trilogy, *Buda Haldia*, was crowned by the Hungarian Academy in 1864. In 1874 appeared a humorous epos, recounting his early adventures as an itinerant actor.

Ararat (properly *Airarat*, 'the plains of the Aryans'), the name originally given to the high plain or plateau on the middle Aras or Araxes, which was the earliest home of the old Armenian and Medo-Persian Aryans, and formed, even in the time of the writer of Genesis, a country distinct from Armenia proper; for the phrase in the narrative of the Deluge, 'the mountains of A.,'

obviously means a region and not a particular summit. Still it was quite natural that the name should be transferred to the highest peak in the region, as the spot where in all probability the ark rested. It is known to the natives as *Massis Lantz* ('mountain of the ark'), to the Turks as *Agri-Dagh* ('steep mountain'), and to the Persians as *Kaki-Nus* ('Noah's mountain'). It is about 12 miles southward from Erivan, and rises in a double peak to the height of 17,212 feet. Politically Mount A. is a prominent landmark, as since 1827 it has indicated the locality in which the Russian, Turkish, and Persian territories converge. The village of Arguri, encircled by gardens and orchards, and tenanted by 1000 inhabitants, formerly stood at its base; but was destroyed by a frightful earthquake, 20th June 1840. Naturalists and other travellers have shown considerable activity in the neighbouring regions in recent years. Mount A. was ascended by Major R. Stewart in 1856, by Dr. Radde, director of Tiflis Museum, in 1870, and by Professor Bryce in 1877.

Aras (anc. *Araxes*; Turk. and Arab. *Ras*, from the Sansk. root *Ar*, swift), the largest affluent of the Kur (q. v.), rises in Turkish Armenia to the S. of the city of Erzerum, and flows E., forming in the middle part of its course the boundary between Russian Transcaucasia and the Persian province of Azerbaijan, and after a course of about 500 miles, joins the Kur, which flows into the Caspian Sea.

Ara'tus, of Sicyon, a Greek statesman and general, born B.C. 271. His father having been slain in a political conflict, A. was, at the age of seven, withdrawn to Argos, whence he returned in his twentieth year. Like most of the cities of the Peloponnesus, Sicyon was then under a tyrant. Protected and encouraged by Antigonos Gonatas, A. succeeded in expelling the usurper, whose name was Nicocles, made the city a republic, and joined it with the Achaian League, his aim being to form a united Greece out of the several states. A. saw the double danger to his country—from Rome and Macedonia—and sought to surmount it by an alliance with Ptolemy of Egypt, but his efforts were unsuccessful. Seventeen times generalissimo of the Achaian League, he was finally, in B.C. 213, poisoned at the instance of Philip II. of Macedon, his disinterested efforts for the liberties of Greece having been frustrated by the petty jealousies of the states. A. wrote a history of the Achaians, which Polybius praises.

Ara'tus, of Soli, Cilicia, wrote about 270 B.C. his *Phainomena*, a Greek astronomical poem, which Cicero translated into Latin. To these was joined his *Diosemia* or *Prognostica*. The quotation made by Paul (Acts xvii. 28), 'We also are his offspring,' is from A., whose fellow-countryman the apostle was. The *editio princeps* of A. was published by the elder Aldo Manuzio (Ven. 1499); the most complete edition is that of Buhle (2 vols. Leipz. 1793-1801), but there are later ones by Buttmann (Berl. 1826), Bekker (Berl. 1829), and Köchly (Paris, 1851).

Araucania, an independent state, within the boundaries of Chili, between 36° 44' and 39° 50' S. lat., and 70° and 74° 30' W. long. It rises from the Pacific to the Andes in three great terraces, and its productions resemble those of Chili. Area about 25,000 sq. miles; pop. estimated (1868) at 300,000. From 1537 to 1773 A. waged an almost constant war of independence with the Spaniards, and is the only country of the New World whose aboriginal race has successfully resisted European invasions. Of late years (1870) it was at war with Chili, stirred up by a French adventurer named De Tonneins, who had assumed the title of King Orelío Antoine I., and is striving to form in A. a constitutional monarchy. Los Angeles is the capital, with 3960 inhabitants. See Smith, *The Araucanians* (New York, 1855); *Ordie Antoine Ier Roi d'Araucanie et de Patagonie, par lui-même* (Paris, 1863); and Aimard, *L'Araucan* (Paris, 1864).

Araucaria, a genus of Coniferous, Evergreen trees found in the southern hemisphere. *A. imbricata*, called Chili pine or 'puzzle monkey,' is the only species which will bear the climate of Britain, but occasionally during severe winters it is much injured. It is found growing in large forests on the mountains of Southern Chili, where it attains the height of 150 feet. Its wood is yellowish-white, hard and durable; its cones are large and round, and its seeds are eaten either raw or roasted. *A. Bidwillii* or the Bunya Bunya is a handsome tree found in Queens-

land; its cones and seeds are larger than those of the preceding species, and the latter are eaten by the aborigines. *A. brasiliensis* is the Brazil pine, where it forms forests, and its seeds are used as an article of food. The Norfolk Island pine, *A. (Lutana) excelsa*, is grown in conservatories in Britain. *A. (Bulnesia) Cunninghamii* is the Moreton Bay pine.

Araucarioxylon, a genus of fossil trees found in the Carboniferous sandstone. In the neighbourhood of Edinburgh specimens have been met with in the Granton, Craigleith, and Redhall quarries. One obtained from Craigleith is exhibited in the Edinburgh Botanic Gardens, which measures 30 feet 8 inches in length, and 6 feet across at the lower end of the trunk. Full details regarding this and other specimens of *A.* have been given by Sir Robert Christison, Bart., in *Transactions of the Royal Society of Edinburgh*, vol. xxvii. In structure and appearance *A.* resembles *Araucaria* (q. v.) of the present day.

Arau'jo d'Azevedo, Anto'nio, a celebrated Portuguese statesman, known in political life as the Count da Barca, was born near Ponte de Lima, May 14, 1754, and was successively ambassador at the courts of Holland and Russia, Secretary of State (1803) and Prime Minister of Portugal (1806). The wide industrial knowledge which he had acquired by his observations in England and France was now put in use for the benefit of his country, and he made great efforts to establish different kinds of manufactures in Portugal. Following the royal family to Brazil on the temporary triumph of the French invaders (1807), he immediately set about improving the agriculture and manufactures of that rich country; and founded, in 1816, a school of fine arts at Rio Janeiro. *A.* died at Rio Janeiro, 21st June 1817.

Arau're, a town of Venezuela, S. America, about 160 miles S.W. of Caracas, near a spur of the Andes, that runs up to the Venezuelan coast. Pop. 10,000. The neighbourhood is well watered and fertile; coffee and cotton are grown, but cattle-breeding is still the most important industry.

Aravull'i (Aravil), a mountain-range of N.W. India, running for 300 miles N.E. through the states of Rajputana. The average elevation is from 1000 to 3000 feet; highest peak, Mount Abu, is 5000 feet. The slopes are bare of vegetation, and give birth to few rivers. Of these, the Luni drains into the Runn of Cutch, the Chumbal into the Ganges.

Arbalest, Arou'balest, or Cross-Bow, a famous weapon in mediæval wars, gave place in the 14th c. to the long-bow, which was found to be much more convenient in battle. The *A.* consisted of a bow fastened cross-wise upon a stock. When the bow was bent, the string was caught up by a kind of spring in such a way that upon pulling a trigger the string was loosed and shot a short and stout arrow, commonly called a *quarrel*, forward with considerable velocity. The window or opening through which the arbalesters or cross-bowmen discharged their bolts was called an *arbalestina*.

Arbela, now Erbil, a small Assyrian town, 40 miles E. by S. of Mossul, near which at Gaugamela, Alexander finally defeated Darius, B.C. 331, and subverted the Persian empire.

Arbitra'tion is the adjudication by one or more persons, at the request of parties who are at variance, to end the matter in dispute; the object being generally to prevent the loss of time and the expense incident to procedure in a law court. Usually these ends are to some extent gained, but an *A.* is nevertheless a lawsuit, the judge in which has to be paid by the litigants; nor does the procedure prevent the possibility of ultimate appeal to a court of law. The act or deed of reference is called the *submission*; the judge appointed by it is called the *arbitrator* or *arbitrator*. When reference is made to more than one arbitrator, with provision that, should they disagree, another shall decide, that other is called an *umpire*.

'Arbitrations are of two kinds: first, where there is a cause pending in court; and secondly, where there is no cause pending. The submission in the former case is either by rule of court, or judges' order before the trial, or by the order of *nisi prius* at the trial. In the second case, the submission is by the agreement of the parties, which is either in writing or by parole; or by the positive direction of an Act of Parliament, as in the case of the Inclosure Acts. Submission to *A.* by rule of court is not revocable by either party without leave of the court. The court may order the

attendance of witnesses and the production of documents. Disobedience to the order is contempt of court. The submission becomes void by the death of an arbitrator, or of one of the parties to the deed, unless there is a stipulation to the contrary. Every one legally free, and held capable of judging, may be an arbitrator or umpire. Arbitrators have a jurisdiction over the costs of the submission. An award must be in writing, legally executed. It may, however, be made by *parole*, if it is so expressly provided in the submission. The right of counsel to bind his client to an *A.* has generally been upheld by English and Scotch courts, especially by the latter. But in the Court of Common Pleas, in the case of *Swinfen v. Swinfen*, a compromise by her counsel was successfully resisted by the plaintiff.

It is the duty of an arbitrator to base his conclusion upon the same rules of law and equity which would have guided the decision of the court for which he acts as substitute. An award may be set aside on appeal to court, on the ground of corruption and fraud on the part of the arbitrator. A frequent ground of litigation in court following a submission is that in his award the arbitrator has gone beyond the power conferred on him under the submission. Again, an award may be set aside owing to a wrong view of law on the part of the arbitrator; or where his procedure has been plainly unjust; as, where he has not fully heard the parties, or when he has taken a proof in the absence of one of them. Thus, as we have said, it by no means follows that an *A.* is a short cut to the end of a litigation. The burden of proof, however, always lies on the party wishing to set aside the award, or any part of it. And, on the other hand, if there is no manifestly wrong application of law, the court will not consider the matters of dispute merely on their own merits. The *A. Act*, 1872 (35 and 36 Vict. c. 46), makes further provisions for *A.* between masters and workmen, and applies the Masters and Servants Act (30 and 31 Vict. c. 141).

An arbitrator who accepts the office is not entitled to renounce it. He is bound to perform faithfully the duty which he has undertaken, and he may be compelled by law to do so, and to execute his award.

Arbo'ga, an old city in the province of Westmannland, Sweden, lies on a stream of the same name, near where it enters Lake Mälär. It is only now of historic interest, having been at one time a residence of the royal family of Vasa, and the scene of many Church assemblies and diets. The *A. Articles* (1561) gave Eric XIV. a check on the power of his nobles; and in 1625, Gustavus Adolphus issued at *A.* an edict relating to the coin of the realm. Pop. (1872), 3393.

Arborescent, a term applied to plants having a tree-like character, however dwarf they may be.

Arboricultural Society. The Scottish *A. S.* is the only society of the kind in Britain. It was instituted in 1854, and has now a membership of about 800, consisting of proprietors, nurserymen, factors, land-stewards, and foresters. The Queen is patron. The object of the society is the promotion of arboriculture in all its branches, by periodical meetings for the reading and discussion of papers, the offering of prizes for essays and reports on the practical operations of forestry, and the publication of these papers. The society has published 7 vols. of transactions.

Arboriculture. The cultivation of forest-trees and shrubs is one of the most interesting and important of the rural arts. Scientific men have recently shown that trees exercise a great and benign influence on the health and death-rate of a country, so that their conservation and cultivation has now become a subject of national importance, not only as regards Great Britain, but also her colonies and Indian empire. Within the last hundred years the landscape of Britain has undergone a complete change from the extensive planting of trees, and many of the bleak and barren hills and tracts of waste ground are now occupied by thriving plantations, thus improving the health of the people, as well as making the adjoining lands more fertile and valuable, and thereby materially increasing the food-production of the country. To cultivate timber-trees successfully, many things have to be carefully attended to, such as soil and situation, draining and fencing, selection of plants, mode of planting, and judicious thinning and pruning.

In forming plantations, the object always held in view is the

production of revenue, shelter, or ornament. One or other of these ends can invariably be obtained, and not unfrequently a harmonious combination of all three. There are two classes of timber-trees—viz., the *hard-wooded* and the *soft-wooded*. The former are illustrated by the oak, elm, ash, beech, birch, hornbeam, Scotch fir, &c. and the latter by the poplar, willow, lime, horse-chestnut, &c. Some trees will grow well in exposed situations, such as the Scotch fir and oak; while others, which are not natives of Britain, require a good soil and shelter, such as the lime and horse-chestnut. The cluster pine (*Pinus Pinaster var. maritima*), the plane or sycamore, the elder, and the buckthorn are adapted for planting in situations exposed to the sea-breeze.

Sometimes plantations are formed of only one kind of tree, but more frequently a mixture of different sorts are employed, some being destined for the permanent crop, while others act as *nurses*, and are gradually removed as the plantation increases in growth. Spruce and larch make the best and most profitable *nurses*.

The rearing of timber-trees on land unfitted for agricultural crops is very remunerative, the return being on an average £1 per acre for every year the trees have occupied the ground. Hedgerow-trees are planted either for ornament or shelter. See articles **TRANSPLANTING** and **COPPICE**.

For full directions as to the practical operations of A. we refer the reader to Brown's *Forester*, and *The Transactions of the Scottish Arboricultural Society*.

Arbor Vitæ, in anatomy, a name given to the arborescent or leaflet appearance shown in a section through the cerebellum. It is produced by the lobes of that organ being composed of leaflets; each leaflet consisting most internally of a layer of white matter composed of nerve-tubes, outside of this a layer of granular nerve-cells, and still more externally a fenily molecular layer. See **CEREBELLUM**.

Arbor Vitæ, the name given to certain species of Evergreen, Coniferous, shrubby trees, belonging to the genus *Thuja*. The origin of the designation is uncertain. The common A. V. of gardens is *T. occidentalis*, a native of N. America, and grows to the height of 40 feet. The plant possesses an aromatic odour, and the young twigs have been used in cases of rheumatism, on account of their causing sweating. *T. (Biota) orientalis*, the Chinese A. V., is also cultivated in Britain. It has a somewhat pungent, aromatic odour, and its wood resists the action of moisture for a long time. The derivation of the generic name *Thuja*, is from *thyon*, sacrifice.

Arbroath, or **Aberbroth'wick**, a seaport in Forfarshire, at the mouth of the Brothock, 13 miles S.E. of Forfar. In 1178 King William the Lion here founded an abbey, in which (1214) he was buried, and where the Scottish nobles met (1320) to oppose the aggressive claims of Edward II. The abbey, next to Holyrood, the richest in Scotland, was destroyed (1560) by the Reformers; its ruins are still picturesque. A. is now a busy town, with much flax and jute spinning, and large leather and sail-cloth manufactures. The vessels of the port (1873) numbered 65; tonnage, 9362. The exports are grain, potatoes, fish, and paving-stones. A. is a royal burgh, and unites with the burghs of Montrose, Brechin, Forfar, and Bervie to send one member to Parliament. Pop. (1871) 19,973. About 12 miles S.E. the well-known Bell-Rock Lighthouse rises from the sea.

Arbuthnot, John, physician, littérateur, and wit, the friend and companion of Pope and Swift, and the most learned of the knot of brilliant satirists of the reign of Queen Anne, was a cadet of the old Scottish family of the same name. He was born at Arbuthnot, near Montrose, about 1675, studied medicine and graduated at Aberdeen. His father, a clergyman of the Scottish Episcopal Church, being deprived of his charge at the Revolution, young A. removed to London, where for a time he maintained himself by teaching mathematics. He owed his introduction to the court to accident, and the first royal favours he received were in acknowledgment of professional services. Appointed court physician in 1709, he had serious reason to regret the death of the queen in 1714. Referring to the effect of this event upon himself, he says, in a letter to Pope, 'This blow has so roused Scriblerus that he has recovered his senses,' &c., a passage which establishes his copartnership in the authorship of the *Memoirs of Martinus Scriblerus*, the first book of which, forming a powerful satire upon the abuses of human learning,

was exclusively A.'s production. His letters are remarkable for their wit, and also for their somewhat melancholy and savage irony, which may in his case, as in that of Swift, have been spontaneous and natural, but was probably developed, to some extent at least, by companionship with the author of *Gulliver*. His literary reputation, however, most securely rests on his satirical *History of John Bull* (1712), a political *jeu d'esprit* ridiculing the quarrels of nations, the inspiration of which has fired every pamphleteer down to the author of *The Fight in Dame Europe's School*. A. is also the author of a number of essays on scientific subjects. He died, February 27, 1735, at Hampstead.

Arbutus, a genus of trees and shrubs belonging to the natural order *Ericaceæ* (q. v.), or the Heath family. They are chiefly found in the S. of Europe and N. America. A. *Unedo*, the strawberry-tree, grows abundantly on the rocks at Killarney, in Ireland, and is also found in Asia and N. America. In Corsica a wine is made from its fruit, and both a sugar and a spirit are obtained from it in Spain. In Greece its bark and leaves, which

Arbutus Unedo.

are astringent, are used for tanning some kinds of leather. All the species possess more or less narcotic qualities.

Arc (Lat. *arcus*, a bow) is any portion of a curved line. The *chord* of an A. is the straight line joining its extremities, and is always less than the A. The A. of a circle is proportional to the angle which it subtends at the centre.

Arc, Joan of. See **JEANNE D'ARC**.

Ar'ca, or **Ark-Shell**, a genus of Lamellibranchiate mollusca, forming the type of the family *Arcae*, in which the shell is equi-valve, the hinge long and toothed, the muscular impressions symmetrical, the foot large and deeply grooved, and the mantle lo' not united. The valves of the shell are 'boat-like' in form, hence the popular name. Three or four species are British, the most familiar being the *A. tetragona*. The *A. noce* is a Mediterranean species.

Arcade, in architecture, a series of arched openings attached to a building. The use of arcades was developed from the introduction of the circular arch into Roman architecture. In its modern use the term has come to be wrongly applied to any covered way, whether arched or not, and by an A. a glass-roofed roadway lined with a series of booths or small shops is now generally understood.

Arca'dia, the central portion of Peloponnesus, took its name, according to mythic legend, from Arcas, son of Callisto, though the name is better explained as denoting the 'land of bears,' from its dense oak and pine forests having been the resort of numbers of these animals. It was encircled and traversed by mountains, and was thus cut off, to a great extent, from its neighbours. The western part, rugged, and clothed with dense forests, was bleak and sterile; but the eastern part possessed some fertile valleys, and in these were situated its chief cities. The highest peak was Cyllene (7778 feet); the chief river, Alpheius (q. v.). The Arcadians were long rude and barbarous, and their livelier and more polished neighbours used their name as a synonym for a simpleton. They were fond of music and dancing. Their mode of life was pastoral, and Pan was their favourite divinity. 'Arcadian song' is another expression for pastoral poetry, and the poets represented A. as the abode of song, felicity, innocence, and peace.

Arca'dius, first Emperor of the East (395-408 A.D.), born in Spain in 377 A.D., was the elder son of Theodosius the Great, at whose death the division of the empire into East and West took place. A., effeminated by luxury and sloth, suffered the empire to be ruled in turn by Rufinus, Eutropius, Gainas, and his wife Eudoxia, known principally by her inveterate persecution of Chrysostom, whose exile she procured in 404, for his persistent opposition to the doctrines of Arius. A. died in 408 A.D., leaving the empire to his son, Theodosius II., who was a minor. The

greatest event of his reign was the movement of the West Goths under Alaric on Italy, to which they were instigated by Eutropius.

Ar'ce, a town of S. Italy, province of Caserta, 60 miles E. S. E. of Rome. It derives its name (Lat. *arx*, citadel) from occupying the summit of a hill, still crowned by a fortress, *Rocca d'Arce*. Pop. of commune, 5467.

Arce'sila'us, founder of the Middle Academy, born at Pitane, in Æolia, B.C. 316, studied first under Theophrastus the Peripatetic, and then under Crantor, at whose death he became head of the Academy, and gave it a new critical direction, which marks it off historically from the school of Plato. His position was that there is no certainty in the knowledge arrived at through the senses, and that dogmatism is not permitted to a philosopher. The ancients complained with justice that there was no system in his teaching, and no conviction in his opinions, which were an eclectic and discordant medley of Platonism and Pyrrhonism. Witty and poetic, he loved the licence of literature more than the restraints of metaphysical dogmatism, and went to the *Iliad* (according to his own phrase) 'as to a mistress.' Diogenes Laertius has preserved some of his *bon-mots* and epigrams in his Life of A., who loved controversy, though not a fanatic, and who combated with keenness and vigour the stern conclusions of the Stoics. His death (B.C. 241), in his seventy-sixth year, is said to have been caused by excess in wine.

Arch, an architectural erection sustained by the mutual gravitating pressure of the individual parts. It seems to have been

Pointed Arch.

Tudor Arch.

known and used by the ancient Egyptians; and as representations of arched gates are frequent in Assyrian bas-reliefs, it is certain that this nation was also acquainted with the principle. The A. never appears in the architecture of the ancient Greeks; and it was only in later ages that the Romans introduced it, having probably borrowed it from the Egyptians. Gradually, however, the A., as a principle in architecture, gained ground, passing during the dark and middle ages from the simple semicircle to the segment and ellipse, from these to the more complicated horseshoe, pointed, trefoil, cinquefoil, and polyfoil arches, until at last it arrived at the graceful decorative *ogee* and *Tudor* arches. The peculiarity of shape of most of these is indicated by the name. The sides of an A. are called the *haunches* or *flanks*, the top part the *crown*, the wedge-shaped stones or bricks of which it is formed the *voussoirs*, the highest being the *keystone*, and the lowest the *springer*; the under sides of the *voussoirs* are the *intrados*, the upper the *extrados*.

Arch, Triumphal, among the Romans an insulated structure, erected across some main street of the city, to commemorate

Horseshoe Arch.

(1) the triumph of a victorious general; (2) a victory for which no triumph had been granted; and (3) sometimes events other than victories. It took its origin from the *Porta Triumphalis*, the gate through which the triumphing general led his army into the city. Stertinius (B.C. 196) first erected a T. A. at Rome; six years later another was erected by Scipio Africanus; and under the emperors they became numerous and splendid. Twenty-five in all are recorded

as having been erected at Rome, of which the Arch of Titus, with bas-reliefs of the spoils of the temple at Jerusalem carried in procession, is specially interesting and magnificent.

Archæology, the study of the evidences of the manners and customs of ancient times. The wide field of investigation denoted by the term causes it to be somewhat vague. In its popular and narrower meaning, A. concerns itself with the monumental, written, and traditional evidences of the ancient condition of a country. In its wider meaning, it is used as a collective term for several distinct branches of knowledge, bearing on the origin, laws, religion, language, science, arts, and literature of ancient peoples. The evidences of these are sought for in philology, ethnology, mythology, &c. For long archæologists were occupied almost solely with the antiquities of ancient Greece and Rome. The discovery of the famous Rosetta stone in recent times, by giving a key to the hieroglyphics, has enabled A. profitably to give its attention to the history and records of the civilisation of the ancient Egyptians. The discoveries of Layard and George Smith at Nineveh are among the most interesting and instructive of our day; and perhaps not less so are those of Mr Wood at Ephesus. Mediæval A. began to be cultivated about the middle of the 16th c. The following are probably the most celebrated archæological collections of Europe: The Royal Museum of Naples, which contains the objects gathered from the ruins of Herculaneum and Pompeii; the Museums of the Louvre at Hôtel de Cluny in Paris; the British Museum in London, established in 1753; and the Museum at Copenhagen of the Royal Society of Antiquaries of the North.

Archæopteryx, a remarkable extinct or fossil bird-genus, the remains of which—forming a single specimen only—were discovered in the lithographic slates of Solenhofen in Bavaria; rocks belonging to the Upper Oolite system. It presents characters closely approaching those of reptiles. The tail is elongated and reptilian. It was longer than the body, and each segment or vertebra supported a pair of quill-feathers. No ploughshare bone or pygostyle, present in all existing as well as fossil birds, terminated the tail in this form. It had two free claws developed in the wing, which claws are possessed by no other living or fossil bird. The metacarpal bones were not ossified together, as in all other birds. It equaled a rook or crow in size, was probably a vegetable feeder, and perched on trees. The *A. macrura* is the only species. It is made the type of a special order (*Saurura*) of birds by Huxley.

Archangel (Gr. *arch-on*, a chief, a captain, and *angelos*, an angel). According to the later, more fully-developed Jewish notions regarding angelic beings (see ANGELS), there were different degrees and classes among them. Such a celestial hierarchy is referred to by Paul, Rom. viii. 38, Eph. i. 21, and Col. i. 16. The same apostle mentions an A., 1 Thes. iv. 16. Michael, called an A. by Jude (9), is also mentioned in Daniel (x. 13, &c.), and in the Apocalypse (xii. 7). In the apocryphal Book of Tobit (xii. 15) Raphael calls himself 'one of the seven holy angels, which . . . go in and out before the glory of the Holy One.' According to another Jewish tradition, four principal angels stood round the throne of God: Michael, Gabriel (Dan. viii. 16, &c.; Luke i. 19, &c.), Raphael, and Uriel (2 Esdras iv. 1).

Archangel (properly **Archangelsk**), the capital of a department of the same name in Russia, lies on the Dwina, about 40 miles above where it enters the White Sea. The Norsemen made trading expeditions to this region as early as the 10th c., and Englishmen began to resort hither after the middle of the 16th c. to carry on an overland trade with Persia and India; but the town proper was first founded in 1584, and was named after a monastery dedicated to the archangel Michael. It was for 120 years the only port of Russia, and though its trade fell off greatly after the founding of St Petersburg, it has of late years risen again, and A. is once more the chief entrepôt for Siberia; but the harbour is only clear of ice from July to September. The houses are mostly built of wood, and the trade is chiefly in train oil, furs, timber, wax, iron, and caviare. A. is the see of a bishop. Pop. 19,936.

Archangel, New. See SITKA.

Archbish'op (Gr. prefix, *archi*, chief, and *bishop*), a bishop

who has rule over several other bishops, as well as his own diocese. The office and title arose in connection with the provincial councils which began to be held in the Church in the 2d c. Of the delegates (see BISHOP) who met, it was necessary that some one should preside and exercise a certain authority. This pre-eminence was generally conceded to the bishop of the city in which the council met, generally the metropolis of a civil province. Hence arose the office and title of Metropolitan (bishop), which by the addition of certain other prerogatives were developed into those of A. The Council of Antioch (341) gave the metropolitans jurisdiction over several dioceses, which were called their *province*, and a pre-eminence in rank over other bishops. The title of A. was first used by Athanasius in the 4th c.; in the West it was not adopted till the 8th c. After the hierarchy of the Church was fully established, besides what were absorbed by the Pope, the privileges of archbishops were chiefly these: Jurisdiction over the bishops of their province in ecclesiastical matters, and an appellate jurisdiction over the bishops' courts; the right of convening the provincial council and presiding in it, of enforcing the rules of the Church, and of correcting abuses.

In England there are two Protestant archbishops—the A. of Canterbury, who has the title of Primate of all England, and ranks next to the royal family and its immediate relatives; and the A. of York, who has the title of Primate of England, and ranks next to the Lord Chancellor—and one Roman Catholic A. of Westminster. In Ireland there are two Protestant and four Roman Catholic archbishoprics; and in Scotland there were, in the 16th c., two Roman Catholic archbishoprics (St Andrews and Glasgow), now there is but one.

Archidiacon (Gr. prefix, *archi*, chief, and *deacon*) was originally the chief of the deacons in a metropolitan church. But in the 5th c. archdeacons became the assistants and representatives of the bishops. Until the 9th c. they were only delegates of the bishops, but after that they became independent officials. After the 13th c. their power again declined, and the office is now almost wholly abolished in the Roman Catholic Church. It still exists, however, in the Church of England, in which the archdeacons act as the deputies of the bishops, especially in the duty of parochial visitation.

Archduke, a title superior to that of duke, and first assumed by the Dukes of Austria in 1156, to mark their equality in rank with the electoral princes of the empire, but their right to it was only confirmed in 1453 by Frederick III. A. is now only an Austrian, not a Germanic, title, and is taken by all the sons of the emperor. The daughters are archduchesses.

Archegosaurus (Goldfuss), a genus of fossil or extinct *Amphibians* (frog-like animals), the remains of which occur in the Carboniferous rocks. These animals belong to the order *Labyrinthodontia* (q. v.), the extinct order of the class *Amphibia*; and by Professor Owen, A. has been made the type of a distinct group, to which he has given the name *Ganocephala*. By some paleontologists the A. is accounted the immature form of some amphibian. The head was defended by bony or *ganoid* plates. The occipital condyles were not apparently ossified. The skull is flattened and triangular in shape. The teeth are conical in form, and possess a labyrinthine structure. The fore and hind limbs were small, and adapted for swimming. A perfect spine was undeveloped, a *notochord* supplying its place. The ribs were short and straight. The feet were provided each with four toes of slender make. The A. remains were first discovered in the clay-slates of the Bavarian coal measures, and were also found in the coal-field of Saarbruck, near Treves. These animals were at first deemed to be fishes; but Gergen, Meyer, and others subsequently remarked and maintained their amphibian characters. Three or four species are known.

Archelaus, the name of several persons of note in antiquity.—1. A., a mythic Heraclid, son of Temenus, was banished by his brothers, and fled to Macedon. Alexander the Great was supposed to have been descended from him.—2. A., illegitimate son of Perdiccas II. of Macedon, gained the throne by perpetrating three murders, and ruled from B.C. 413 to 399. He patronised literature and art, and Euripides and Zeuxis were guests at his court. He is said to have been murdered by a favourite named Craterus, either from ambition or contempt.—

3. A., the greatest of the generals of Mithridates, was a native of Cappadocia. He was sent by his master into Greece with a great fleet and army, overran and conquered nearly the whole country, and was on the eve of reorganising a league against the Romans, when Sulla met him at Cheronæa, and so completely defeated him, that of an army of 120,000 men only 10,000 could be rallied after the battle. A fresh army of 80,000, after two days' fighting, sustained an equally signal defeat at Orchomenos. Becoming suspected by Mithridates, he deserted to the Romans B.C. 81, and then vanishes from history.—4. His son, of the same name, married Berenice, Queen of Egypt. After reigning six months, he was slain in a battle against Gabinius, B.C. 55.—5. A., son of Herod the Great, succeeded under his father's will, but being accused of tyranny by the Jews in the tenth year of his reign, he was deposed by Augustus, and banished to Vienna, in Gaul, where he died.

Arch'enholtz, Johann Wilhelm, Baron von, a German *littérateur*, born at Dantzic, September 3, 1745; served in the Seven Years' War, but did not secure the good opinion of Frederick the Great, and was dismissed after the peace in 1763. For sixteen years he wandered about Europe as a sort of *chevalier d'industrie*, and on his return to Germany settled at Hamburg, where he lived mainly by his pen. He wrote an animated and picturesque *History of the Seven Years' War* (2 vols. Berl. 1793, 9th ed. 1867), and several other historical and biographical works, of which, perhaps, the most valuable and interesting is a history of the buccaneers who infested the W. Indies in the first part of last century. A. died at Oyendorf, in Holstein, 28th February 1812.

Arch'er or Shooting Fish (*Toxotes*), a genus of fishes belonging to the family *Squamipennes* ('scaly-finned'), of the group *Acanthopterygii*. Their popular name is derived from their habit of shooting drops of water at insects which light on aquatic plants, in order to cause the insects to drop into the water, and so become their prey. The soft and spiny part of the dorsal fin is covered with scales like the rest of the body. Numerous teeth, closely set in the mouth, exist. These fishes inhabit tropical seas. The *Toxotes jaculator* of the Ganges and Indian Ocean is a familiar species. This form can project drops of water to a height of 3 or 4 feet.

Arch'ery. Bow and arrow are among the earliest weapons. Thus the Assyrian archers formed both light and heavy troops, using both curved and angular bows, each heavy-armed archer being protected by two shield-bearers. After the second Punic War, the Romans employed *sagittarii*, who marched with the *velites* or light troops. In Christian Europe the bow has been generally used. A capitulary of Charlemagne directs every feudal soldier to have a bow, two strings, and twelve arrows. By 1139, long-bows and cross-bows had become so deadly, that the second Lateran Council prohibited their use. England became noted under Edward II. for long-bow shooting, which often prevailed, as at Cressy and Homildon Hill, against superior numbers. The long-bow, which shot faster, and was more easily carried than the Norman cross-bow or arbalest, was therefore encouraged. Towns were directed to provide butts, and practice was made compulsory, an idea borrowed by James I. of Scotland (Act 1424, c. 18). The importation of bow-staves was enforced on the importers of certain merchandise, the price of bows was regulated, and bowmakers planted in places where required. The self-bow was probably 6 feet long, straight when unstrung, and of ash or yew wood in one piece. (The backed-bow, consisting of two pieces of bent wood fixed in a handle, was not in military use in England, but is still used by Eastern nations.) Lighter arrows were used against an enemy at a distance. At closer quarters the archer was protected by an iron stake thrust in the ground before him. At sieges, combustibles were sometimes fastened to arrow-heads, and signals were given by 'whistling' arrows. Four hundred yards was the *maximum* flight. A general stringent law was passed by Henry VIII., directing every male between seven and sixty years of age to practise A. at 220 yards. From the slow action of the primitive musket, the long-bow was used long after the introduction of firearms. By treaty in 1572, Queen Elizabeth engaged to send Charles IX. 6000 men with long-bows and cross-bows. There is no mention of bows in the Commission of Charles I., issued in 1631, to examine the arms used by the militia. Essex tried to raise a

troop of archers in the Civil War, but by this time military A. may be said to have ceased. The Artillery Company of London kept up the practice of A.; but not till towards the end of last century did it revive as a national pastime. Toxophilite societies came into existence, and in 1844 the Grand National A. Society was started. This holds meetings at which both sexes compete. A self-bow, 5 feet 10½ inches in length, and from 48 to 55 lbs. in pull, is generally used. The backed-bow, with a reflex pull, is said to jar. The arrows are 27 inches long, and either 'self' or 'footed' (i.e., with a piece of hard wood let in at the feather end). 'Cheated' and 'bobtailed' arrows, in which the 'stele' of the arrow diminishes in circumference from the feathers to the 'pile,' and from pile to feathers respectively, are said not to fly straight. The 'bracer' is buckled round the left arm, to protect it from the recoil of the string. The 'ascham' is a sort of movable cupboard for holding A. implements. 'Bracing' and 'notching' are technical terms for stringing the bow and fitting the arrow to the string. The targets are usually made of straw, covered with canvas, and are 4 feet in diameter. The range for flight-shooting is seldom more than 100 yards. The Royal Company of Archers and Queen's Body-Guard for Scotland (created by Act of Privy Council in 1677) still shoot for their silver-arrow prizes at 180 yards. The history of this company has been written by Mr Balfour Paul (Edinb. 1875). Three hundred yards is now thought to be the maximum flight. 'Clout-shooting,' or shooting with heavy arrows over a long range at a wand, is almost abandoned. 'Roving,' or shooting at accidental marks, is sometimes practised.

Archibiosis is a term proposed by Dr Charlton Bastian to designate the production of living forms from a non-living organisable fluid. It is synonymous with the words heterogenesis and spontaneous generation. Many naturalists deny the possibility of any such mode of origin, and hold that living forms must come from pre-existing living forms. See REPRODUCTION.

Archill, or **Orchill**, the name given to a colouring substance obtained from various species of dull-grey coloured lichens, but especially from *Rocella tinctoria*; which grows in large quantities on rocks in the Levant, and on the Cape de Verd Islands. The colour is not originally in the plants, but is developed during putrefaction. A. is soluble in water and alcohol, and is employed chiefly in dyeing silken fabrics a rich lilac colour, which, however, is easily acted on by the sun's rays. *R. fuciformis*, abundant on the coasts of Africa, yields much of the A. or Orchilla weed of commerce. Angola A. is regarded as the best quality. The Spanish name Orciglia is that from which the names A. and O., as well as the generic name *Rocella*, are derived. Cudbear (q. v.) and Litmus (q. v.) are analogous to A.

Archilochus, of Paros, flourished about 714-676 B.C., one of the earliest Greek lyric and elegiac poets, was the son of Telesicles, and of a slave named Enipo. He conducted a colony from Paros to Thasos, and while here lost his shield in a contest with the Thracians. Repairing to Sparta, he was soon banished, probably from the licentiousness of his verses; and returning to Paros, he fell in a battle against the Naxians. The fame of A. is founded on his satiric iambic poetry, in which, by the consent of the ancients, he held undisputed pre-eminence. Like Homer, Pindar, and Sophocles, he was ranked as chief in his own department. His satire was merciless and scathing, and his words unmeasured in their licence. Lycambes, who had promised him his daughter Neobule in marriage, but afterwards refused her, was, together with his family, satirised with such malicious skill, and with so much force and point, that his daughters are said to have hanged themselves. His imitator Horace calls 'rage' (*rabies*) the special feature of his muse. This he expressed by means of the iambus, which gives a light tripping movement. He was also the inventor of the *epode*, in which a shorter verse is subjoined to one or more longer ones. The extant fragments of A. are contained in Bergk's *Poeta Lyrici Græcorum* (Leipzig. 1843 and 1854).

Archimandrite (Gr. *archi*, and *mandra*, a fold, a monastery), in the Greek Church, the title of the superior of several monasteries, and corresponding to that of Abbot Superior in the Roman Catholic Church.

Archimedes, the most famous of ancient mathematicians,

was born at Syracuse about the year 287 B.C. His remarkable penetration of mind is shown in connection with the crown which Hiero, King of Syracuse, had commissioned his goldsmith to make of pure gold, but which was suspected of being composed of an alloy of gold and silver. The king, wishing to detect the fraud without injuring the crown, applied to A., to whom the solution suggested itself on his entering the bath one morning, when he observed that he displaced so much water as to cause it to overflow. This is said to have been the occasion on which he uttered his world-famous *Eureka! Eureka!* ('I have found it! I have found it!') Possibly some such incident led A. to the enunciation of that hydrostatic law known as the Principle of A. (q. v.). Of the numerous inventions ascribed to him may be mentioned the Archimedian Screw (q. v.). The old Greek historian Polybius, and, following him, Livy and Plutarch, write with feelings of astonishment of his mechanical contrivances to baffle the Romans at the siege of Syracuse; but the story of his burning their ships by means of mirrors is first found in Galen, who wrote in the 2d c. A.D. As regards his discoveries in pure mathematics, we may mention his quadrature of the parabola, his treatises on spheres and cylinders, spheroids and conoids, and his investigations on spirals.

A picturesque legend represents A. as slain by a Roman soldier, when Syracuse was captured (212 B.C.), while profoundly engaged with a mathematical problem in the public square. His tomb, on which was engraved a sphere with the circumscribing cylinder, was discovered by Cicero while quaestor of Sicily. A collection of his extant works was edited by Torelli at Oxford in 1792; a French translation, by F. Peyrard, was published at Paris in 1808; and a German one, by Nizze, at Stralsund in 1824.

Archimedes, Principle of, a most important hydrostatic law, discovered by Archimedes the Syracusan, which may be enunciated thus: When a body is immersed in a specifically lighter fluid, the weight lost by the body is equal to the weight of the quantity of fluid displaced. See HYDROSTATICS.

Archimedian Screw is a machine for raising water, said to have been invented by Archimedes during his stay in Egypt, in order to irrigate some portions of land which were above the direct influence of the Nile.

In its simplest form it consists of a tube bent spirally round a solid cylindrical axis, which is inclined to the horizontal at an angle varying usually from 35° to 45°. Suppose now that a small solid body is placed in the lowest bend of the tube, and the screw turned round in a direction opposite to that of the hands of a watch, it is evident that as each point of the screw will successively pass beneath the body at the lower side of the cylinder, the body will ultimately be found at the upper end. Similarly, if the lower end be immersed in water, the continual turning of the screw will raise the water until it flows out at the top. Machines differing only in detail from this are used extensively in Holland.

Archimedian Screw.

Archipelago, a term applied to such tracts of sea as are thickly interspersed with islands, or to the clusters of islands themselves. It was originally applied to, and still especially denotes, that part of the Mediterranean between Asia Minor and Greece. The islands in this A. are divided into the *Cyclades*—Tenos, Andros, Naxos, Melos, &c., belonging to Greece, under which they are noticed; and the *Sporades*—Cos, Scio, Rhodes, Lemnos, Samos, Metelin, &c., belonging to Turkey (q. v.). Other archipelagoes, still more notable geographically, though not historically, are those of the E. and W. Indies, the Aleutian A. in the N. Pacific, and the Patagonian A. at the opposite extremity of the New World.

Architecture, a Latin formation from the Greek prefix *archi*, chief, and *tekton*, a workman, denotes literally the master art or science, but practically signifies the application of artistic

principles to the art of building. In a loose manner, A. and the technical art engineering are frequently confounded, as, for example, when naval A. is spoken of. But the engineer simply takes cognisance of the problems of how best to secure strength, stability, and suitability of a structure without regard to its relation to the æsthetic sense, while the architect has to deal not only with the fitness of a structure for the purposes to which it may be devoted, but with the harmony of its proportions and the beauty of its details. A. therefore ranks as one of the fine arts, and it has fully been described as the 'art of ornamental and ornamented construction.' It is not sufficient for an architect to understand the nature and properties of the materials in which architectural conceptions are embodied, and the technical details by which these are most fitly and durably put together. With these his function as a building engineer ends, but as an architect he must understand the principles of design, and the various qualities which go to form a dignified, impressive, and artistic structure.

A. took its rise from the necessity felt by the human race for some shelter from the vicissitudes of weather. Among the primitive inhabitants of the earth, and still among savage races, there is no scope for architectural display, for all such skill denotes a considerable advance in the arts of civilised life. During the early ages of the world, when implements of stone only were used by the human family, the erections of our ancestors must necessarily have been rude and simple. Nevertheless, such megalithic structures as Stonehenge, and Avebury or Abury, must have possessed a certain grandeur and massiveness from the arrangement and vast proportions of their design, and the evidence of immense labour which they afford. Similarly, the ancient Cyclopean structures, in which huge masses of stone are piled up into rough mason-work, give a vivid sense of power and stability which are among the essential features of true A. Such structures, however, in their rudeness and simplicity, are a faithful reflex of the condition of the people who erected them, as indeed all A. is a measure of the civilisation of the races by whom it has been elaborated.

The development of A. among different races, and in various regions of the world, has been guided by the materials at the disposal of the people, the climate of their lands, their social condition and habits, their intellectual and scientific advancement, and, above all, by their religious beliefs. Thus connected with each distinct growth of civilisation there is a special and characteristic style of A.; and so we have Egyptian, Persian, Indian, Greek, Roman, Byzantine, and Gothic styles, all as distinct as the races with which they originated. Architectural style and remains, therefore, become a valuable adjunct to the study of history, and parallels in the A. of different countries or periods indicate either an amount of similarity in the condition and habits of the races, or a borrowing of the civilisation of the one by the other. The highest efforts of architectural skill have in all ages been put forth in connection with the loftiest conceptions of our race; and as it was in the temples for their deities, or in memorials for apotheosised mortals, that the ancients attained their architectural triumphs, so it is in cathedrals, churches, and places of worship that the purest examples of modern architectural power are exhibited.

Much ingenious speculation has been indulged in to account for the first causes which led to the development of A. along any special line, such as the Grecian or Gothic. The A. of Greece, for example, is affirmed to have its basis in a wooden hut. 'The first ties and posts which were fixed in the earth for supporting a cover against the elements, were the origin of the isolated columns which afterwards became the support of porticos in temples. Diminishing in diameter as it rose in height, the tree indicated the diminution of the column. No type, however, of base or pedestal, is found in trees; hence the ancient Doric is without base.' The other constituent elements of Grecian A. are accounted for by similar analogies. In like manner the mass and solidity of Egyptian buildings are derived from the rock-cut caves in which its early inhabitants dwelt, and the topes of the Buddhist races of India are supposed to be the natural sequence of the 'barrows' or tumuli of primitive man. But although such causes as these may have given the first impulse to the styles characteristic of the various races, their development must have been modified by all the complex influences which affect the progress and direction of the civilisation of any people. The leading characteristics of the various styles will be

noticed under their respective headings. See BYZANTINE, GOTHIC, GREEK, RENAISSANCE, ROMAN, &c.

Architrave (Gr. prefix, *archi*, chief; Lat. *trabs*, a beam), that part of the entablature which rests immediately on the columns. The name is also given to the outer moulding of the arches of doors and windows.

Archives. See RECORDS.

Archivolt (Gr. *archi*, chief, and Lat. *volvere*, to roll), the band of mouldings running round the voussours of an arch, and terminating on the impostes or capitals.

Archon, the chief magistrate at Athens, of whom the first was Medon, son of Codrus, the last king of Athens. The office was at first for life, and dynastic, *i.e.*, confined to one family; but in 752 B.C. it was limited to ten years; in 714 B.C. it was thrown open to the nobles; and to all citizens in 477 B.C. In 683 B.C. the office became annual, and the number of archons was increased to nine, the first of whom was called A. *Eponymos*, the year being registered in his name; the second, *Basileus*, managed religious affairs; the third, *Polemarchos*, was generalissimo; and the other six were styled *Thesmothetæ*, or legislators, though, strictly speaking, they did not make laws, but only declared and expounded them.

Archytas, of Tarentum, a distinguished philosopher, mathematician, soldier, and statesman, who flourished probably about 400 B.C., and was drowned on the Adriatic coast. So great was his integrity, that he was seven times the general of his city, though the office was usually held only for a year. He was victorious in all his campaigns, and his administration of civil affairs was of the greatest benefit to the community. In his philosophy he was a Pythagorean, and Plato and Aristotle are thought to have been both indebted to him. He invented the method of analytical geometry, solved the problem of the doubling of the cube, and applied mathematics to mechanics. Numerous fragments attributed to A. are given by Stobæus (see Orelli's ed. 1821), but their genuineness has not been satisfactorily established.

Arcidosæo, a town in the province of Grosseto, Central Italy, on an affluent of the Umbrone. Pop. of commune, 5859.

Arcis-sur-Aube, a town in the department of Aube, France, famous as the scene of a victory of the Austro-Russian allies over Napoleon, March 21, 1814. It is now an entrepôt for the iron of the Vosges, and has several cotton-factories. Pop. (1872) 2784.

Arcola, a village in the province of Verona, N. Italy, on the Adige, 15 miles E.S.E. of the town of Verona. It is remarkable for a battle in which Napoleon, after three days' hard fighting, defeated the Austrians under General Alvinczy, November 17, 1796.

Arçon, Jean Claude Eléonore d', a French engineer, was born at Pontarlier, 1733, and studied at the school of Mézières. He is chiefly noted for the invention of floating batteries, by means of which he hoped to capture Gibraltar from the British in 1782. The project, however, failed, and A. fell considerably in the opinion of his volatile countrymen, though Elliot, the defender of Gibraltar, did justice to the boldness and ingenuity of his design. In 1793 he distinguished himself during the war of sieges with Holland, and forced Breda to open its gates to him. A. died July 1, 1800. His chief work is *Considérations militaires et politiques sur les Fortifications* (1795).

Arcos de la Frontera, a town of Andalusia, Spain, overhangs the Guadalete, 32 miles N.E. of Cadiz. It has a romantic situation, with a splendid view W. towards the Ronda Mountains. It was called *Arcos*, a 'bow,' from its crescent shape, and *de la Frontera*, because it stood near the Moorish frontier. In the plains below A. a rare breed of horses was reared, and the A. barbs and their skillful riders are often mentioned in the national ballads. The chief industries are tanning, and rope and thread spinning. Pop. 11,270.

Arcoot, the capital of a district of the same name, stands on the river Palar, 68 miles W. of Madras. It contains the ruins of

the Nawaab's palace, military cantonments, and some mosques. Clive first won distinction as a soldier by the capture and subsequent defence of A. in 1751. Pop. 53,500.

Arcoot, a district on the E. coast of the province of Madras, British India. It is divided into North A., with an area of 7526 sq. miles; and South A., with an area of 4765 sq. miles. Near the coast the country is low and productive, but inland it is hilly and full of jungle. As most of the rivers become empty in the dry seasons, thousands of tanks, some of which are of enormous size, are required for irrigation and domestic use. Pop. (1871) of North A., 2,007,667; of South A., 1,762,525.

Arctic and Antarctic Circles are imaginary lines drawn round the earth at a distance of $23\frac{1}{2}^{\circ}$ from the N. and S. poles respectively, and serving to mark those regions at which, at one period of the year, there is no night, and at another period no day. The word A. is from the Greek, and literally signifies 'near the Bear,' i.e., the great constellation in the northern sky; hence northern, its secondary meaning.

Arctic Ocean, the sea which surrounds the N. pole, and extends as far S. as the Arctic Circle. It is partly hemmed in by the northern shores of Europe, Asia, and America, leaving open the connection with the Atlantic on the N.W. of Europe, and with the Pacific through Behring's Straits. Despite the heroic daring and active enterprise of about three centuries, little is yet known of this great ocean. Beyond the 83d parallel there lies a circle nearly 2100 miles in diameter, being about equal to the area of Europe, which remains totally unexplored. The numerous polar expeditions of late years have resulted in conflicting accounts regarding the A. O.; but it would seem that at the most northerly point reached the fields of unbroken ice give way to a sea more or less covered with drifting floes. Parry, who reached lat. $82^{\circ} 45'$ in 1827, mentions heavy falls of rain as indicating the comparative mildness of temperature. It is now also beyond a doubt that there exists an almost constant current from the A. O. southwards; and it would seem to be established that Greenland is an island, or possibly a group of islands, which the glacier ice has covered and united. The German expedition of 1869-70 reached the 77th parallel, explored part of the E. coast of Greenland, and made many valuable scientific discoveries, notably that of the abundance of the musk-ox at the most northern point to which they penetrated. See NORTH-EAST PASSAGE, NORTH-WEST PASSAGE, and POLAR VOYAGES.

Arctium, a genus of Composite plant. See BURDOCK.

Arctomys. See MARMOT.

Arctostaphylos, a genus of plants of the order *Ericaceæ*. There are only two species which properly belong to the genus, and both are natives of Britain. The red bearberry (*A. uva-ursi*) is a small trailing evergreen shrub found in the northern parts of Europe, Siberia, and N. America. It ascends to 3000 feet in the Scottish mountains. The plant is astringent, and is occasionally used for tanning, as well as a valuable astringent in cases of excessive secretion in the human body. The black bearberry (*A. alpina*) has black berries about the size of the common sloe, which have a peculiar taste. The plant, which is the badge of the Clan Ross, has a trailing habit similar to the other species, and is found on some of the Scottish mountains.

Arcturus, or α Bootes, a star of the first magnitude, in the same direction, and about twice as far from the Pole-star, as the end tail-star of the Great Bear.

Arctus Senilis. This term is given to a blue or grey ring seen around the margin of the cornea of the eye in people of advanced or premature age. It is due to fatty degeneration of the substance of the cornea, and is usually regarded as significant of the presence of the same kind of degeneration in the coats of the blood-vessels and in the heart. At the same time, cases of fatty heart occur in which there is no A. S., and, on the other hand, A. S. may exist without fatty changes in the substance of the heart.

Ard, or **Aird**, a Celtic root, meaning 'high,' 'great,' which enters into the composition of many names of places in Scotland, Ireland, France, and other Celtic countries; e.g., Ardnamurchan, the Aird of Lewis, Ardrossan, Ardmure, Arran, Ardagh, Ardglass, Ardennes, the Ardes (or 'heights') in Auvergne, &c.

Ardes. See HERON.

Ardèche, a southern department of France, about 50 miles inland, formerly part of Languedoc. It is a wild hilly region, and abounds in extinct volcanic peaks, basaltic columns, vast caverns, and deep ravines. The Rhone bounds A. on the E., and along its banks the rich terraces produce good wine, olives, figs, and almonds. The Cevennes traverse the W., and in the N. terminate in the volcanic Mont-Mézène, 5972 feet high. The river A. is a branch of the Rhone, and has many affluents. The chief towns are Privas, Aubenas, and Bourg. The manufactures are silk, paper, leather, and iron. Area, 2133 sq. miles; pop. (1872) 380,277.

Ardee (*Ath-Fhirdia*, pronounced *Ahirdee*, 'Ferdia's Ford'; in old English writers, *Atherdee*), a town of Louth County, Ireland, on the Dee, 12 miles from its mouth, with some trade in agricultural products. It has two ancient castles. Pop. (1871) 2572. The name is derived, according to Irish tradition, from a Firbolgic chief called Ferdia, who fell in battle here.

Ardennes (Celt. the 'Great Forest'), a department of France on the Belgian frontier, formerly part of the province of Champagne. The surface is generally hilly and sterile; the prevailing rock is limestone, and in the S.E. the muschelkalk is rich in iron ore; only at Mézières, in the S.W., is the vine grown. The N. of A. is watered by the Meuse, and the S. by the Aisne; both rivers have affluents, and the *Canal des A.* unites them. The chief towns are Mézières, Rethel, Rocroy, and Sedan. The manufactures are glass, woollens, marble, iron-ware, and pottery. Area, 2021 sq. miles; pop. (1872) 320,217. A. is part of the rugged slate plateau of the same name, which includes also parts of Belgium and Rhenish Prussia ('the forest of Ardennes'), a region of vast heaths, impenetrable marshes, and dense oak and beech forests. The bed of the Meuse here presents a sterile, savage appearance, overhung sometimes by cliffs 600 feet high.

Ardnamurchan Point (Gael. *Ard-na-mor-chinn*, the height of the great headland), a promontory of trap-rock in the N.W. of Argyshire, and the most westerly point of the British mainland. A lighthouse, visible 20 miles off, was built here in 1849.

Ardoch (Gael. 'high field'), a village in Perthshire, Scotland, 8 miles S.S.W. of Crieff, interesting for its Roman camp, the best preserved in Britain. The camp formed a rectangle, 500 feet by 430. Five ditches and six walls defended the N. and E. sides, while a morass lay on the S.E., and the precipitous banks of Knaig Water, 50 feet high, protected the W. side. The prætorium, a square with a side of 60 feet, occupied a position near the centre, and the sites of three of the gates can still be traced. A human skeleton was found in a stone coffin under a cairn a mile to the W. of the village, but this was probably a Caledonian and not a Roman work. The stones have been gradually carried off to construct buildings and fences.

Ardoye, a town in W. Flanders, Belgium, 17 miles S. of Bruges. Chief industry the bleaching of linen. Pop., including commune, 6478.

Ardrossan (Gael. 'high foreland'), a seaport and watering-place of Ayrshire, 32 miles S.W. of Glasgow by rail. Founded in 1806 by the 12th Earl of Eglinton, it has a town-hall, 5 churches, 2 banks, a large hotel and baths, 2 newspapers, and a harbour with a wet-dock of nearly 9 acres and a graving-dock. In 1879 there entered with cargoes 932 vessels of 193,555 tons, and cleared 3255 of 361,247. Coal and pig-iron are the chief exports; industries are shipbuilding (21 sailing vessels of 1261 tons during 1875-79), ironfounding, and the timber trade; and steamers ply to Ayr, Glasgow, Arran, and Belfast. Pop. (1871) 3845.

Are, the unit of French land measure, is equivalent to 100 sq. metres (see METRE), and therefore contains about 1076 English sq. feet. The décare contains 10 ares, and the hectare 100 ares—nearly 2½ English acres.

Area is a mathematical term signifying *quantity of surface*; or it may be defined as the number of square units contained by a given surface. The calculation of such is one of the most practical outcomes of geometry. The analytical expression for the area of any plane surface is the integral of the product of the ordinate and the increment of the abscissa, or $\int y dx$.

Areca, a genus of palm-trees. *A. Catechu* has a lofty stem, and is cultivated in parts of India for its seeds, which are contained in fruits of a fibrous texture about the size of a fowl's egg. The seeds are known as A-nuts and betel-nuts, and are much used in Eastern countries. They are cut into small pieces, chewed along with hot-lime and the leaves of the betel-pepper as a stimulant. See BETEL.

Areca Catechu (Betel-nut Palm).

Charcoal is made of the nuts, and used as a tooth-powder in Britain. A kind of Catechu (q. v.) is obtained by boiling the nuts. The cabbage palm of the W. Indies (*A. oleracea*) has a tall stem terminated by a large leafy bud, which is used as a vegetable; hence its name. A small species, *A. sapida*, occurs in New Zealand.

Arecibo, a town on the N. coast of Puerto Rico, in Spanish W. Indies, with a good trade. Pop. 11,187.

Areiop'agus ('Hill of Mars'), a celebrated council of ancient Greece, so called from the hill of that name on which the council met. The hill lies to the W. of the Acropolis at Athens. The origin of the council is lost in antiquity. As early as the first Messenian War (B.C. 740) we find notice of its fame. Even then it is spoken of as old. Solon made important changes in it, modifying considerably its purely oligarchical constitution. It was now composed of the archons (see ARCHON) of the year. Besides exercising supreme authority in affairs of state, the rule of the council seems to have been eminently what we call 'paternal.' They enforced observance of hygienic law by prohibiting the overcrowding of rooms at social gatherings, and they even sent officers on such occasions into private houses to see that their rules were observed. Drunkenness, extravagance, and impiety were noted, offenders punished, and the deserving rewarded.

Pericles, however, dealt the A. a blow from which it never recovered. What was the precise nature of the decree which he succeeded in carrying (B.C. 458) we do not know. It is probable that the A. was deprived of its high political authority, but it long retained considerable moral influence over the community. Even this gradually dwindled away, until in the general moral corruption of Athens which followed its subjection to Macedonia an Areiopagite became a name of scorn. Still, as late as the time of St Paul we hear of it as having some religious authority, and we find it in existence so late as A.D. 380. The date of its extinction is not known.

Are'na, that part of an amphitheatre in which the combats of gladiators and wild beasts took place. It was usually strewn with sand, hence its name. The A. was surrounded by a wall of sufficient height to protect the spectators, and—a feature worthy of imitation in our own places of public assembly—there were four main entrances. On the Continent, any open building of the nature of a theatre is called an A.

Arena'ceous Rocks include all rocks composed largely or wholly of grains of quartz or flint. The recent deposits are interspersed with loose sand; but in the older deposits the sand is generally held together by various cements, silicious, calcareous, ferruginous, &c.

Arena'ria (Sandwort), a genus of plants belonging to the order *Caryophyllaceæ*. The species are numerous, and are widely distributed. They are mostly small herbs found in sandy places, and are of no economical value.

Are'ndal, a thriving seaport on the bay of Christiania, in the S.E. of Norway, with considerable shipbuilding-works, distilleries, breweries, and tobacco-factories. It is picturesquely situated, the houses being partly built on rocky islets and on piles overhanging the water, on account of which the Norwegians call it 'Little Venice.' Many of the streets are merely bridges

connecting isolated clumps of houses. A. was for some time the residence of Louis Philippe after the French Revolution. Pop. 4456.

Aren'ga, a genus of palms. See GOMUTO.

Arenic'ola, a genus of Errant worms or Annelides, represented by the *A. piscatorum*, the familiar lob or lug worm of fishermen, so much used for bait; hence the specific name, *piscatorum* ('of fishermen'), of the worm. This worm possesses a massive, obtuse, rounded head, and a body of smaller calibre. In size they generally resemble large earth-worms. The branchiae, or gills, exist in the form of thirteen pairs of tufts placed along the sides of the body. No eyes or jaws exist. The lob-worm is the artificer of the little coils of sand so numerous on the sea-beach after the tide has receded. These sand-coils are passed through the body as the animal burrows downwards in the sand.

Are'olar Tissue is a variety of connective tissue found in the animal body, by means of which various organs and parts of organs are connected together. A. T. consists of very soft fibres of various degrees of coarseness. These are often so close together as to form laminae, which frequently cross and recross in all directions, leaving open spaces, or areolae, between them. A. T. is found underneath the skin, forming a bed in which lie numerous fat-cells, also covering the muscles, blood-vessels, and nerves, and also connecting the lobes and lobules of glands. It is the most widely-distributed tissue of the body, and it may be traced uninterruptedly from one part to another. For further details regarding it see CONNECTIVE TISSUE.

Areom'eter (Gr. *araios*, thin; *metron*, a measure) is an instrument for measuring the densities of liquids. Its principle may be stated simply thus: Any solid body sinks further in a light liquid than in a heavy one. The A. usually consists of a small glass bulb loaded at the bottom with mercury or small shot, so as to keep it upright, and provided with a graduated scale at the top, so as to mark the depth to which it sinks in the liquid. As the densities of the liquids change with the temperature, a thermometer is frequently placed alongside the graduated scale, and is sometimes so ingeniously adjusted as to give at once the required correction. The delicacy of such instruments depends to a great extent upon the thinness of the tube with respect to the bulb, so that it may be disregarded in the calculation.

Of all areometers, Gay-Lussac's is decidedly the most accurate, but is seldom used in practical measurements. In Nicholson's A. the specific gravities are obtained from the weight which is required to be added to the bulb, so as to sink it to a fixed mark upon the neck. This form evidently requires no graduated scale.

Areometers.

Arequí'pa, the third largest city in Peru, capital of a province of the same name, lies in the rich valley of Quilca, at the W. base of the Andes, 35 miles from the Pacific. It was founded in 1536 by order of Pizarro, and has now a considerable export trade, chiefly in wool and Peruvian bark. Its port, Islay, which has one of the best harbours in the republic, was partly destroyed by an earthquake in August 1868. A. is connected with its port by a railway. Pop. about 45,000.—The province of A. extends along the Pacific, and is generally sterile. Area, 26,700 sq. miles; pop. 180,000. About 14 miles E. of the city is the famous volcano of A., 19,704 feet above the sea.

Are'tæus, a famous Greek physician, born in Cappadocia, of whose life nothing is known further than that he practised probably at the close of the 1st and beginning of the 2d c. A.D. He generally followed Hippocrates in his practice, but was not the slave of any system; and his descriptions of the symptoms, and his prescriptions for the treatment of disease, have been often endorsed by subsequent experience. His work on the causes, symptoms, and treatment of acute and chronic diseases, in eight books, written in very pure Ionic Greek, in imitation of Hippocrates, is not quite complete, some chapters being wanting, and minor *lacunæ* numerous. The first edition of the Greek text was published by Goupyl (Paris, 1554). A much finer one appeared at Oxford (Wigan, 1723); but the latest and best is that of

Ermerius (Græn. 1847). It has been translated into French, Italian, and German, and parts of it into English by J. Moffat (Lond. 1785), and by T. F. Reynolds (Lond. 1837).

Arethusa. See ALPHEIUS.

Are'tino, Pietro, an Italian wit and poet, born at Arezzo, in Tuscany, in 1492, was the natural son of a gentleman, Luigi Bacci, and of a female of obscure origin named Tita. From the Latin *Arctinus* ('belonging to Aretium,' or Arretium, mod. Arezzo) comes the Italianised form Aretino. Throughout life A. was accomplished, licentious, and vagrant. Banished from Arezzo, he commenced a wandering life, and eventually found himself at Rome, fascinating people by his wit, daring, and general talent. He first won, then lost, the patronage of the Pope, through writing licentious verses, the notorious *Sonetti Lussuriosi*, sixteen in number, intended to accompany as many obscene engravings. He shone for a time at the court of Giovanni de' Medici, and of Francis I., at Milan (1524); passed to Venice, which he was wont to call an earthly paradise, and where he and his sisters led a life of scandalous pleasure. Yet this unsurpassable libertine occasionally affected the saint, and wrote works of piety which drew tears from devotees, and induced him to cherish hopes even of a cardinal's hat; but though Pope Julius III. flattered A., he did not venture to commit so flagrant an outrage on religion. A. died at Venice, 1556. His works comprise five comedies, abounding in humour; a tragedy; the *Sonetti Lussuriosi*, a French version of which is oddly named *Académie des Dames*; *Rime, Stanze*, and *Capitoli*, mostly panegyric, or licentious, or satirical; an unfinished epic, *Due Cante di Marfisa*, and a considerable number of other pieces, some religious, but the greater part indecent. See Mazzuchelli *Vita di Pietro Aretino* (last ed. Milan, 1841).

Aretino, Spinello Spinelli, an early Italian painter—Vasari prefers him to Giotto—born at Arezzo in 1323, studied under Casentino, and lived sometimes at Florence and sometimes at Arezzo, where he died in 1415. Among his works are—(1) in Arezzo, an Annunciation, a Madonna presenting the infant Jesus with a rose, the Twelve Apostles, and other frescoes; (2) in Florence, frescoes in San Miniato from the life of St Benedict; (3) in Pisa, in the *Campo Santo*, some incidents in the lives of St Potitus and St Eplesius.

Arezzo (anc. *Arretium*), capital of the Italian province of the same name (1276 sq. miles; pop. 219,559), in the valley of, and 4 miles distant from, the Arno, and 38 miles by rail E.S.E. of Florence. Its chief buildings are its churches, and its cathedral contains a magnificent marble altar by Pisano. It is one of the oldest towns in Tuscany—the ancient *Arretium* having been one of the twelve chief cities of Etruria—and was famous for its pottery—bright red ware, with objects in relief—and its works in bronze. No important industries are now carried on. Pop. (1872) 38,907. A. is the birthplace of Mæcenas, the Emperor Augustus, Petrarca, Pietro Aretino, Spinello Aretino, Vasari, and many other illustrious men.

Argali Sheep (*Ovis Annon*). This, the 'wild sheep' of naturalists, inhabiting Kamchatka, Siberia, the Himalayas, Barbary, Corsica, and Greece, is by some naturalists considered the original progenitor of our domestic breeds. It is agile and active, and inhabits mountainous districts. Its flesh is savoury. The food consists of grass and leaves of young trees. The milk is used as food. The horns are about 4 feet long, and 14 inches in circumference at their base.

Argand, Aimé, physician and chemist, celebrated as the inventor of the A. lamp, was born at Geneva about the year 1755. At London, in 1782, he made his first lamp, which differed from other lamps at that period in having a circular wick and a glass chimney, by which means a greater supply of air was obtained, and a more perfect draught generated, thus effecting a more complete combustion. As the priority of the invention was disputed by a Parisian of the name of Langé, the patent was taken out in the name of both; but the controversy in which he had been involved so preyed on his mind that he became subject to deep melancholy, and died in great misery in his native town, October 24, 1803.

Argania, a genus of plants of the order *Sapotacea*. The argan-tree of Morocco, *A. sideroxylo*, yields an egg-shaped

fruit, used for feeding cattle. From the seeds an oil is extracted of great value. Its wood sinks in water, and is very hard.

Argaum', a village of Berar, Central India, 40 miles S.W. of Ellichpore, where Major Wellesley (afterwards Duke of Wellington) gained a signal victory over the Mahrattas, November 28, 1803.

Argel, or **Arghel**, the Syrian name for *Solenostemma A.*, a plant of Arabia and Northern Africa, belonging to the order *Asclepiadaceæ*, the leaves of which are used for the adulteration of Egyptian senna.

Argelander, Friedrich Wilhelm August, an eminent German astronomer, born at Memel, March 22, 1799. In 1823 he was appointed astronomer at the observatory of Åbo in Finland. The result of his observations on the fixed stars, both here and subsequently at Helsingfors, was the publication of a catalogue of 560 of these stars having proper motions. After removing to Bonn in 1837, he published *Uranometria Nova* (1843), and *Astronomical Observations* (1846, *et seq.*). A. was subsequently engaged in observing the changes of light in variable stars. He died February 17, 1875, at Bonn. His latest observations were of Coggia's bright comet of 1874.

Argem'one, a genus of plants belonging to the order *Papaveracea*. *A. Mexicana*, the Mexican poppy, has become widely distributed over the warmer regions of the globe. Its seeds, like others of the Poppy family, have narcotic and purgative qualities. An oil is obtained from them. The juice of the plant, which is yellow, has been successfully used in diseases of the eye.

Argemone grandiflora.

Argens, Jean Baptiste de Boyer, Marquis d', has a place in history as a friend and associate of Frederick the Great. He was born at Aix, in Provence, June 24, 1704, entered the army at fifteen, but was from the first (according to Carlyle) an 'extremely dissolute creature.' After being disinherited by his father, he took to literature, and published *Lettres Juives*, *Lettres Chinoises*, *Lettres Cabalistiques*, and *La Philosophie de Bon Sens*, 'frothy books' of an 'anti-Jesuit turn,' but, like himself, full of good-humour and a 'certain light, sputtery wit.' They attracted the notice of Frederick, who invited the author to Prussia, appointed him chamberlain, and a director of the Art Academy at Berlin. He was more loyal to Frederick than any of the foreigners who summered in his favour, and but for his amorous peccadilloes, might be considered a very honest gentleman. After 'many temporary marriages with actresses,' he wedded one 'in permanence, Mamsell Cochois, a patient, kind being,' and settled down into domestic regularity. A. died on a visit to his native Provence, 26th December 1771. Frederick's letters to his widow show how truly he loved his light-hearted friend of thirty years' standing. A collection of his works, in 24 vols., appeared in 1768. See Carlyle's *History of Frederick the Great* (*passim*).

Argen'sola, Lupercio and **Bartolomeo**, poets of Spain, born respectively in 1565 and 1566, studied at Huesca, and afterwards removed to Madrid, where they were taken under the patronage of Maria of Austria, who appointed the elder her private secretary, and Bartolomeo her chaplain. Lupercio was subsequently appointed Historiographer of Aragon to Philip III., and afterwards Secretary of State to the Viceroy of Naples, where he died 1613. Bartolomeo succeeded his brother as Historiographer of Aragon, and, having earned a fame, chiefly by his *Conquista de las Islas Molucas* (1609) that ranks him among the Spanish classics, died 1631. Besides their poems, *Rimas* (Saragossa, 1634), examples of cultivation rather than of originality, the combined work of the brothers may be seen in the continuation of Zurita's *Annals of Aragon* (1630).

Argenson, Marc Pierre, Comte d', a French statesman, born 1696. The family to which he belonged has held property in Touraine for many generations. Nor was he its first distinguished member. History takes note of **René de Voyer, Comte d'A.**, a diplomatist and statesman in the days of Richelieu and Mazarin; of **Maro René d'A.**, President of Finance in the time of Law, and a resolute but unsuccessful opponent of that wild speculator; and of his two sons, **René Louis, Marquis d'A.**, a vigorous and bold politician and author, and **Marc Pierre**, the subject of our notice, who became lieutenant of police in 1720, and Secretary of State to the Minister of War in 1742. On the death of Fleury, the year after, the whole burden of the department fell on him, just when France was completely exhausted by repeated disaster. He soon changed the face of affairs, and the victory of Fontenoy and the league of Maestricht led to the glorious but unprofitable treaty of Aix-la-Chapelle in 1748. He now repaired the fortresses, inspired the army with fresh spirit, and established the *École Militaire* in 1751. As a generous and intelligent patron of literature, the *Encyclopédie* was dedicated to him by Diderot and D'Alembert, and he supplied Voltaire, whose schoolfellow he had been, with materials for his *Sicéle de Louis XIV.* Intrigues set on foot by Madame Pompadour caused him to be exiled; but after her death he returned to Paris, and died there, August 22, 1764. His grandson, **Maro René de Voyer d'A.** (born 1771, died 1842), was notable in his later years for his devotion to republican ideas.

Argent (Fr. *argent*, Lat. *argentum*, silver), the term always used in heraldry for silver. In engraving shields, it is left white.

Argenta, a town in the province of Ferrara, Central Italy, on the Reno. Pop. of commune, 15,926.

Argenteus Oodex. See ULFILAS.

Argentine Republic (Sp. *Confederacion Argentina*), formerly called the Confederation of the Rio de la Plata, a country of S. America, in lat. 22° 30' to 41° S., and long. 54° to 70° 30' W. It is bounded N. by Bolivia; E. by Paraguay, Brazil, Uruguay, and the Atlantic; S. by Patagonia; and W. by the Andes of Chili. In length it is about 1740 miles, in breadth 1000 miles. The following table shows its divisions, area, and population, according to the census of 1869:—

Provinces.	Departments.	Area in Sq. Miles.	Population.
1. Buenos Ayres . . .	51	83,615	495,107
2. Santa Fé . . .	4	25,087	89,117
3. Entre Rios . . .	10	29,955	134,271
4. Corrientes . . .	17	45,454	129,023
5. Cordova . . .	14	58,997	215,508
6. San-Luis . . .	8	24,151	53,294
7. Santiago . . .	8	38,799	132,898
8. Mendoza . . .	8	30,699	65,413
9. San-Juan . . .	4	18,772	60,319
10. Rioja . . .	7	31,103	48,746
11. Catamarca . . .	8	35,780	79,962
12. Tucuman . . .	9	53,386	108,953
13. Salta . . .	16	63,461	88,933
14. Jujuy . . .	9	33,527	40,379
Total . . .	173	542,786	1,741,923

Besides the above provinces there are some unorganised territories, such as *El Gran Chaco*, whose area and population are uncertain. Great numbers of immigrants, chiefly Italians, have been increasing the population of late years. In 1871 there were 45,390 immigrants.

With the exception of the N.W. corner, which contains some of the loftiest outlying portions of the Andes, and the province of Entre Rios, where there are some elevated ranges, the country is very level, consisting chiefly of immense grassy plains. In the N. is the desert of *El Gran Chaco*.

The republic is well watered by numerous rivers, among the principal of which are the Parana, with its great tributaries from the N.W., the Pilcomayo, the Vermejo, and the Salado; the Colorado, and the Negro, all debouching into the Atlantic. Lakes, both fresh and (in the W.) salt, are abundant. The climate and productions vary from tropical in the N., to temperate in the S. Agriculture is little prosecuted, but millions

of cattle and large droves of horses and mules are reared on the rich pasturage of the Pampas (q. v.). Among wild animals mention may be made of the tapir, hippopotamus, armadillo, llama, and vicuna. Mining has not been vigorously engaged in. There are silver mines at San-Juan, and sulphur, alum, iron, have been found; but the name given to the estuary of the Parana, viz., *Rio de la Plata* ('river of silver'), though it is perpetuated in the new name of the Confederation (*Argentine Republic*), merely represents the unfulfilled expectation of the early explorers.

The estuary of the La Plata was discovered by Don Juan Diaz da Solis in 1515, and Buenos Ayres was founded twenty years afterwards by an expedition sent out by the Emperor Charles V. Cities were gradually founded by the Spaniards all over the country, which, however, remained under the Peruvian viceroyalty till 1775, when the Plate provinces were formed into a separate government, the viceroyalty of Buenos Ayres. In 1808 the colonists deposed the Spanish viceroy, and, after a struggle, succeeded in asserting their independence of Spain. Between 1810 and 1835 the A. R. thus formed had upwards of thirty changes of government. From 1835 to 1851, General Rosas ruled with dictatorial sway. In 1853 the present constitution, which provides for an elective president, a senate, and a house of deputies, was established. A., along with Brazil, carried on a war with Paraguay from 1865 to 1870. Buenos Ayres (q. v.), as the seat of the principal city, and the outlet of all the trade of the republic, has always exercised a preponderating influence in the formation and execution of the intrigues, conspiracies, and insurrections which constitute the political history of the confederation.

Arges, a genus of fishes belonging to the family *Siluride*. These forms are of small size, and were described by Humboldt and other travellers as being ejected from the craters of S. American volcanoes, in showers of muddy water. The most familiar species is the *A. cyclofum*. Their origin, or the conditions under which they exist, form unsolved problems of the naturalist; but as water in the form of steam is now known to be the cause of volcanic eruptions, these fishes are doubtless contained in this water, which gains access to the volcanic depths.

Argile Plastique, a series of beds at the base of the Tertiary formations occurring in France, and consisting of sandy deposits, interspersed with beds of clay, and corresponding to the lower Eocene c. the English geologists. They rest on a conglomerate of angular chalk-flints.

Argilla'ceous Rocks are composed, either entirely or in part, of clay or silicate of alumina, and include the plastic clays, such as *kaolin* and *common clay*; the laminated clays, such as *shale*; and the hard metamorphic clays, such as *clay-slate*. These last form extensive deposits in the *Asio* strata, but are also found in the Palæozoic formations, having been produced by the action of heat on the shales of these strata.

Argol, or **Argal**, is the name given to the impure bitartrate of potash, $\text{KHC}_4\text{H}_4\text{O}_6$, which is deposited from wine after it has been kept for some time in cask. The bitartrate of potash is not formed during the keeping of the wine, but exists in the grape-juice in a state of solution before fermentation; owing, however, to its insolubility in dilute alcohol, it becomes deposited after this is produced. A. is the chief and only important source of tartaric acid, the preparation of which from this substance will be found in article TARTARIC ACID. Pure bitartrate of potash, or *cream of tartar*, as it is called, is readily prepared from A. by dissolving it in boiling water, decolorising the solution with animal charcoal, and allowing to crystallise.

Of the two kinds of A. found in commerce, *white A.* is deposited from white wine, and is of a pale pink colour; whilst *red A.* is obtained from red wine, and is dark red.

Argolis, the peninsula lying between the gulfs of Nauplia and Ægina, in the N.E. of the Morea, was anciently a state of the Peloponnesus, and now forms, along with Corinth, a nome of modern Greece. The plain of Argos, 12 miles long and 5 broad, once famous for its noble breed of horses, is now largely occupied by marshes. The only river flowing through A. during the whole year is the Kephalaria (Erasinus); the Baniza (Inachus), which falls into the Argolic Gulf, is often dry in summer; and the others are mere mountain torrents. Mountains, the highest summits of which rise to between 5000 and 6000 feet, shut in

the plain on three sides, while on the fourth it is open to the sea. The plain produces corn, cotton, vines, and rice. Argos was said to be the oldest city in Greece, and was fabled to have been built by Inachus, 1800 B.C. It was the head of a league of Doric cities, and, together with its urban territory, contained, in the height of its prosperity, 100,000 inhabitants. According to the Greek myth, it was the birthplace of Hercules, who performed in the neighbourhood two of his twelve labours—the destruction of the Lernean hydra and the Nemean lion. Agamemnon was ruler of Argos. The inhabitants were famed for their piety to the gods, and were skilled in statuary and in music, but did not excel in literature. The modern Argos contains 10,000 inhabitants, and the nome 127,820.

Argonaut, a name given to the genus *Argonauta*, one of the Dibranchiate or Two-gilled Cuttle-fishes (q. v.) (*Cephalopoda*), popularly known as the *Paper Nautilus*, or 'Paper Sailor.' It belongs to the *Octopoda*, or group of eight-armed cuttle-fishes.

Argonaut.

Two of the eight arms are greatly expanded, and secrete and protect the shell, which is single-chambered, and possessed by the females only. The male A. is a small shell-less form, averaging an inch in length; and the third left arm of the male is developed to form a *Hectocotylus* (q. v.) for reproductive purposes. This is the animal so celebrated in poetry, and which formerly used to be regarded as sailing on the surface of the sea; using its two expanded arms as sails, and the other arms as oars—a statement purely fictitious and erroneous. The expanded arms are always

clasped around the shell, and the creature can move only after the fashion of other Cuttle-fishes (q. v.).

Argonauts ('sailors of the *Argo*'), the name of certain Greek heroes, who, according to a beautiful legend, set out in their ship *Argo*, under Jason, to fetch the golden fleece a generation before the Trojan war. The author of the *Odyssey* knew the story; Pindar and others give versions of it; but the first consistent and connected narrative is that of Apollodorus, the outlines of which are these: Jason, commissioned by his uncle Pelias of Iolcus to fetch from Colchis the golden fleece, which was guarded by a sleepless dragon, commanded Argus, the son of Phrixus, to build a ship of fifty oars, which he manned with fifty of the choicest heroes in Greece, whose names are given differently in different lists, and sailed from Iolcus. They remained two years at Lemnos, their first landing-place, where Hypsipyle, wife of Thoas, bore Jason two sons. Next they sailed to the Doliones, whose king, Clizycus, Jason accidentally killed, and proceeding to Mysia, they left there Hercules and Polyphemus. In the country of the Bebryces, Pollux killed King Amycus with the boxing-gloves. In Thrace the A. consulted the blind seer Phineus, who gave them his counsel on condition of their delivering him from the Harpies, which was done by Zetes and Calais. With the aid of Juno they steered their vessel through the opening and closing Symplegades, losing only some of its stern ornaments, as had been prefigured to them by the fortune of a dove let loose by the advice of Phineus. After further adventures they reached the mouth of the Phasis, in Colchis. The king, Æetes, promised Jason the golden fleece on the condition that he should yoke to a plough two fire-breathing, brazen-hoofed oxen, and sow the dragon's teeth which Cadmus had left at Thebes. Medea, daughter of the king, by her magic power enabled Jason to accomplish this and other perilous exploits. Seizing the golden fleece, Jason embarked by night with Medea and her brother Absyrtus. Æetes pursuing them, Medea cut up her brother into fragments, which she cast into the sea, and she and her lover escaped while her father was gathering them up. The mast, formed of one of the vocal oaks of Dodona, now warned them to sail to Ausonia, and get purified by Circe for the murder of Absyrtus. Thus they did. As they sailed past the Sirens, they were preserved from their charms by the song of Orpheus, and arrived at Corcyra, the island of Alcinous. Leaving Corcyra, they encountered a storm, from which they were saved by the agency of Apollo. Touching at Crete, they sailed thence to Ægina, and, after a four months' voyage, arrived safely at Iolcus. At the Isthmus of Corinth Jason dedicated the *Argo* to Neptune. The story of the A.

has been differently interpreted; but it probably refers to a voyage of discovery to the coasts of the Euxine by eager spirits among the wealthy Minyans of Iolcus, in quest of new commercial relations.

Argos. See ARGOLIS.

Argostoli, the capital of Cephalonia, the largest of the Ionian Islands, lies on the S.W. coast, and has a good harbour. Pop. about 5500.

Arguella's, Agustin, a liberal Spanish statesman, was born at Ribadesella, in the Asturias, in 1775, and studied law at Oviedo. When the War of Independence broke out in 1808, he began an agitation in Cadiz for a regency and free constitution. In 1812 he was made a member of the Cortes, where for his fiery eloquence he was soon known as the Spanish Cicero, and surnamed *El Divino*. Ferdinand VII., on his return, arrested A. (1814), who, however, by his subtle defence, evaded conviction on five successive trials. The monarch himself finally sentenced him to ten years at the galleys of Ceuta. The revolution of 1820 again set him free, and he became Minister of the Interior for a short period. On the restoration of Ferdinand in 1823 he fled to England, where he resided till 1832. After his return he was repeatedly made President of the Chamber of Deputies, was for some time guardian to the young Queen Isabella, and, next to Espartero, was the most trusted of the Spanish patriots. In discussing the law regarding the sale of Church property (1841), he strongly opposed all concordats with the Pope. A. was a moderate, but staunch and consistent liberal, who loved his country, and distrusted the projects of the republicans. He died at Madrid, March 23, 1844.

Argument, a reason advanced to induce belief, an abstract of the subject-matter of a writing, and, in logic, the premise on which a conclusion rests. Logicians distinguish several kinds of A., of which the best known, though not the best, is the *Argumentum ad hominem*, which is simply an unfair attempt to prove a position by appealing to a man's known prejudices or admissions. Another favourite A. with those who are in a position to effectively use it, such as military tyrants and enraged mobs, is the *Argumentum a baculo* ('from the cudgel'), or 'physical-force A.,' which, though rudely expressed, is difficult to answer.

Argus, according to Apollodorus, the son of Zeus and Niobe, was the third king of Argos, which, Hyginus says, received its name from him. — A., surnamed *Panoptes* (the 'all-seeing') because he had 100 eyes, some of which were always awake, a mythic personage whose origin is variously given. After several heroic exploits in the Peloponnesus, Juno set him to watch Io, but Mercury, after lulling him to sleep with his lute, cut off his head. Juno transferred his eyes to the tail of her favourite, the peacock. — A., the son of Phrixus, and builder of the *Argo*. See ARGONAUTS.

Argus Pheasant (*Argus giganteus*), a prominent member of the genus *Argus*, included in the sub-family *Phasianina* of the Rasorial or Gallinaceous birds. This bird inhabits the Eastern Archipelago. The male measures about 5 or 6 feet from the bill to the tip of the tail, which consists nearly wholly of two elongated central feathers. The body-plumage is of a brown colour. The secondary quills of the wings are very long, and are each marked by ocellated or eye-like spots, from the presence of which the name A. has been derived. These long secondary plumes are said to impede the flight, but to assist the bird in running. The feathers of the female are much less brilliant, and are not so elongated as those of the male.

Argyle's Campbells of, a family of whom Scotland has some reason to be proud. Its origin reaches far back into the middle ages. Eight centuries ago, Gillespie Campbell acquired, by marriage with an heiress, the lands of Lochow, in Argyleshire. From him descended Sir Colin Campbell of Lochow, who obtained the surname of 'More' or 'Great' on account of his deeds in war. He was made a knight by Alexander III. of Scotland. From him descended Sir Duncan Campbell, who assumed the designation of 'A.' He was summoned to Parliament in 1445 by James II., under the title of 'Lord Campbell.' This Lord Campbell married Lady Marjory Stewart, daughter of the Regent Duke of Albany.

He was succeeded by his grandson Colin, created Earl of Argyle in 1457. Archibald, the second earl, was killed at Flodden in 1513. Archibald, the eighth earl (see ARGYLE, A. C., MARQUIS OF), was created a marquis on 15th November 1641.

Argyle, Archibald Campbell, first Marquis of, an eminent character in the history of Scotland. He was born in 1598, and succeeded his father as Earl of Argyle in 1638. An honest and fearless man, on the formation of the National Covenant, he gave his opinion without reserve to the king and government, by whom he was consulted. In 1638 he took the side of the Covenanters, of whom he at once became the leader. Notwithstanding, when Charles I. came to Scotland in 1641, he showed favour to A., creating him a marquis. In the war which followed, the Royalists under the Marquis of Huntly were defeated by A.; but the brilliant victories of Montrose ultimately drove him from the field. During the negotiations between Charles and his parliament, A. endeavoured to mediate, but unsuccessfully. He opposed Cromwell's invasion of Scotland, and to the last remained loyal to the king, Charles II., on whose head he had put the crown at Scone, 1st January 1651. Ultimately he made terms with the Protector. On the Restoration, he was impeached for high treason, on the ground of having made terms with Cromwell. He was tried before the Scotch Parliament in February 1661, and being found guilty, was executed at Edinburgh on the following 27th May. There are few nobler characters in Scotch history than that of A.

His son, Archibald, ninth Earl of A., fought at Dunbar and Worcester on the side of the king, but was no less a lover of constitutional freedom than his father; and when the policy of James VII. excited the rebellion of Monmouth in the S.W. of England, A. sought to stir Scotland also, but was taken prisoner, and executed, June 30, 1685.

Argyle, John Campbell, Duke of, was born Oct. 10, 1678. He served with distinction under the Duke of Marlborough, of whose political party he was originally an adherent. On the fall of the Whigs in 1710, he was nevertheless appointed by their successors to command the British army in Spain. The dexterity with which A. contrived to steer through the political turmoils of his time has laid him open to the charge of laxity of political principle; yet, practically, he rendered real services to his country. The union between England and Scotland was largely owing to his influence and energy; and during the troubled times which followed the death of Anne, his prompt and wise measures were of the utmost service to the State. In recognition of this, he was in 1718 made Duke of Greenwich, in the peerage of England. His defence of Edinburgh before Parliament, after the Porteous mob, in 1737, showed a patriotism which secured him unbounded popularity in Scotland. He died in 1743. Of him Pope has written—

'Argyle, the State's whole thunder born to wield,
And shake alike the senate and the field.'

His good qualities are seen at their best in Scott's *Heart of Midlothian*.

Argyle, George John Douglas Campbell, eighth Duke of, was born April 30, 1823, and succeeded his father in 1847. The great Presbyterian struggle in Scotland, which, slumbering for centuries, ended in the disruption of the Scottish Church in 1843, engaged his earnest attention while yet a minor. On taking his seat in the House of Lords, he quickly showed a capacity for statesmanship; and on the formation of Lord Aberdeen's Ministry in 1853, he was made Lord Privy Seal. In 1855 he was made Postmaster-General, and on the formation of Mr Gladstone's Cabinet in 1868, Secretary of State for India. In 1854 he was elected Lord Rector of Glasgow University, and in 1861 President of the Royal Society of Edinburgh. In 1844 he married Lady Elizabeth Georgiana Gower, eldest daughter of the Duke of Sutherland. By her he has a numerous family, the eldest of whom, the Marquis of Lorne, married in 1871 H.R.H. the Princess Louise. He is the author of one or two able works, of which the most popular is the *Reign of Law* (London, 1867).

Argyle'shire (*Arrer-Gadhil*, pronounced *Arrer-Gale*, land of the Gael, a memorial of the Gaelic or Irish colonisations) is a maritime county in the W. of Scotland, bounded N. by Inverness-shire, W. and S. by the Atlantic, and E. by Perthshire, Dumbarton, Loch Long, and Firth of Clyde. It includes upwards of forty

islands, the chief of which are Mull, Islay, Jura, Tiree, Coll, Rum, Lismore, and Colonsay. Its coast-line is so much indented that it exceeds 660 miles in extent, though the county is not over 115 miles long and 60 broad. Area, 3255 sq. miles; pop. (1871) 75,679, showing a decrease of 13,619 since 1851, chiefly caused by emigration. A. is famed for its romantic scenery, abounding in lofty mountains, rugged glens, wild promontories, and extensive lochs or arms of the sea. The principal peaks are Beinn-an-brann, 3760 feet; Ben Cruachan, 3668; Buachaille Etive, 3341; Ben Jura, 3319; and Ben More, 3174. The chief rivers are the Urchay and the Awe. By far the largest inland loch is Loch Awe (q. v.), one of the finest in Scotland; the sea-bays, Lochs Moidart, Sunart, Linnhe, Eil, Leven, Fyne, and Long. In this wild district the prevailing rocks are mica-slate, trap, quartz, and granite. Excellent roofing-slates are quarried at Easdale and Ballachulish; the mineral *Strontianite* was first discovered at Strontian; and lead and copper mines occur in Coll and Islay. A. rears more sheep than any other Scotch county, and is only behind Aberdeen, Ayr, and Perth in the number of its cattle. In 1872 there were 54,967 acres of permanent pasture, 24,246 of corn, and 12,305 of green crops. The chief towns are Inverary (the county town), Campbellton, and Oban, which unite with Ayr and Irvine in sending one member to Parliament; the county returns one also. There still exists much poverty and ignorance amongst the peasantry of A.; but there is no lack of vigorous character in A. men, who have supplied Glasgow, and other centres of industry, with not a few of their foremost citizens. The only considerable manufacture is whisky, Islay and Carriphelton being famous wherever that liquor is consumed. The chief antiquities are the ruins of Iona and Oronsay. Cantire, in former times, belonged to the powerful Lords of the Isles, and has many very interesting ecclesiastical remains. A large portion of A. is the property of the Campbell family, represented by the Duke of Argyle as its head, and also by the Marquis of Breadalbane.

Aria (Ital. 'air'), in music, is a word generally restricted to the more elaborate and extended airs in an opera, cantata, or other such composition.

Ariadne, daughter of Minos of Crete and Pasiphaë, fell in love with Theseus, who had come from Athens with the tribute for the Minotaur. She gave him a clew given to her by Iphæastus, by which to guide himself out of the labyrinth into which he had penetrated to slay the monster. Theseus having promised to marry her, she fled with him to Naxos, where Diana slew her. Another legend represents Bacchus as finding her in Naxos on his return from India, and marrying her. On her death he placed her nuptial crown among the stars.

Arial'dus, a deacon of Milan in the 11th c., who strongly condemned simony, and the practice common among the priests of the time of keeping concubines. Popes Stephen X., Nicholas II., and Alexander II. lent him their countenance; but emissaries of the Archbishop of Milan, who by his agency had been excommunicated, murdered him in an island in Lake Maggiore, whither he had fled from the violence of his enemies in Milan, and threw his mangled remains into the lake, June 28, 1066. The Bollandists register him among the saints of June.

Aria'na (mod. *Iran*), the name given by Strabo to an extensive region in Asia, corresponding pretty closely to the area occupied by the existing states of Persia, Afghanistan, and Beloochistan. It has originated the modern name 'Aryan,' which, as an ethnological and philological term, has almost entirely superseded 'Indo-European' and 'Indo-Germanic.' See ARYAN.

Aria'no, an episcopal city in the province of Avellino, S. Italy, in a pass of the Apennines, 2800 feet above the sea, and 50 miles N.E. of Naples. Earthenware is manufactured, and wine and butter are exported. A. has a noble cathedral. It has suffered much from earthquakes. Pop. 12,588.

A'rians. See ARIUS.

Arias Monta'nus, Benedict'us, a famous Catholic divine and Orientalist, born in 1527, in the village of Frexenal de la Sierra, in Estremadura, at an early age acquired a competent knowledge of Arabic, Syriac, and Chaldean, and subsequently

mastered several modern languages. After accompanying the Bishop of Segovia to the Council of Trent, he resolved to dedicate his life to literature, and withdrew to the mountains (hence his name 'Montanus') of Andalusia; but at the request of Philip II. he left his hermitage of Arcena, and repaired to Antwerp, to superintend the publication of Christopher Plantin's *Polyglot Bible*, which appeared in 1572. For this he received a pension of 2000 ducats from the king. The Jesuits caused him much annoyance by questioning his orthodoxy. Though he devoted himself mainly to Jewish antiquities and biblical lore, he was the author of several works in the department of general literature. He died at Seville in 1598.

Arica, a seaport in the S. of Peru, with an excellent roadstead, 190 miles S.E. of Arequipa. It forms an outlet also for the products of Bolivia, and exports silver, copper, wool, alpaca, and guano. In 1872, 222 vessels of 259,824 tons entered, and 221 vessels of 257,024 tons cleared, the port. The climate is unhealthy, and A. is frequently visited by earthquakes, the last and most destructive of which occurred in August 1868. It was once a flourishing and populous town, but has lost much of its importance, and is now merely the port of Tacna (q. v.), a large town about 30 miles inland.

Arichat. See CAPE BRETON.

Ariège, a department of France, lies along the N. base of the Pyrenees. It is extremely mountainous, the highest peaks being Montcalm (10,513 feet), Estats (10,611), and Serrère (9592). The manufactures are linen, woollens, and pottery; there are also iron mines and marble quarries. Chief towns, Foix, Pamiers, St Giron. Area, 1847 sq. miles; pop. (1872) 246,298. The river A. is a branch of the Garonne.

Aries, the Ram, the first of the signs of the zodiac, begins at the point where the ecliptic cuts the equator at the vernal equinox. It originally coincided with the constellation A.; but now, owing to the precession of the equinoxes, the sign A. is in the constellation Pisces, and all the other zodiac signs are altered to the same extent. See PRECESSION.

Aril, a peculiar body which surrounds the seeds of some plants. It forms the *mace* in Nutmeg (q. v.), and the orange-coloured covering of the seeds of the spindle-tree.

Ari'on, of Methymna, Lesbos, a famous lute-player, and inventor of the dithyramb, flourished about B.C. 700. According to a story which first appears in Herodotus, he was returning to Corinth from Tarentum with much treasure, when the mariners conspired to kill him and seize his riches. Warned by Apollo, he first, with the consent of the sailors, played on his lute, and then cast himself into the sea, where a dolphin receiving him on its back, carried him to Tænarus, whence he went to Corinth. The sailors told Periander of Corinth that A. was dead; but being confronted with him, they owned their guilt, and were put to death. The only remains of A.'s verse that have come down to us—and even these are doubtful—are a hymn in honour of Neptune, and an inscription preserved by Ælian, which are given in Brunck's *Analecta*.

Arios'to, Lodovico, author of the famous romantic poem *Orlando Furioso*, born at Reggio (Modena), 8th September 1474. His father was a military officer in the employment of Ercole, first Duke of Ferrara, and Cardinal Ippolito d'Este, younger son of this duke, having been favourably impressed by a collection of odes written by A., received the young poet into his household as gentleman, and employed him on various missions and other important affairs. Amid these employments, and the distractions of the court, *Orlando Furioso*, a poem descriptive of the marvellous adventures of paynims and Christian knights of the age of Charlemagne, and upon which the author spent ten years, was composed. It was first published at Ferrara, April 1516, in forty, and afterwards in forty-six, cantos. From the service of Cardinal Ippolito, A. passed into the service of his brother Alfonso, Duke of Ferrara. In 1522 the poet was appointed governor of Garfagnana, a wild district in the Apennines infested with bandits. Here A. resided nearly three years, during which time his wise administration of affairs, to which his reputation as a poet considerably contributed, resulted in the suppression of the more criminal forms of lawlessness. He returned in 1524 to Ferrara;

and, ostensibly in the service of the duke, but free to follow his literary employments, he continued to reside there, wrote comedies, and superintended their public performance. He died June 6, 1533. Italy is justly proud of A., who preceded and inspired the still greater Englishman, Spenser. The *Faery Queen* is a work of higher genius and nobler motive than the brilliant romance of the Italian poet, yet, but for the latter, it might never have been written. The *Orlando Furioso* continues to charm its author's countrymen, and has been repeatedly reprinted in the present century. The best editions are those of Panizzi (Lond. 1834); Gioberti (Flor. 1846, 3d ed. 1854); Lloyd (Trieste, 1857-59). It has also been translated into many European languages. A.'s English translators are Sir John Harrington (Lond. 1607), John Hoole (Lond. 1785), and, the most elegant of all, Wm. Stewart Rose (Lond. 1823-31).

Aripvíst'us, a German chief, entered Gaul on the invitation of the Averni and Sequani, who wished his aid against the Ædui. The Germans crossed the Rhine in vast numbers, and the allied forces subdued the Ædui. A., however, seized a third part of the Sequanian territory as his reward, and then made further demands. The Gallic tribes, in their despair, invoked the aid of Cæsar; and in a great battle (B.C. 58), from which A. escaped by flight, the Romans scattered the German host. The name of A. is conjectured to be Latinised from *Heer*, an army, and *Fürst*, a prince.

Arip'pé, a town of Mexico, state of Sonora, in the extreme N.W. of the country, is situated on the river Sonora, near the Sierra Madre. The neighbourhood is rich in the precious metals, and also produces considerable wine, grain, and cattle. Pop. 8000.

Arist'a and Aristate. See AWN.

Aristæ'us, according to the Greek myth, was a son of Apollo by Cyrene, the granddaughter of Peneius. He was born in that district of Libya named Cyrenaica, after his mother, and was taught the arts of healing and prophecy by Cheiron and the Muses in Boeotia, where he is said by some to have married Autonoe, daughter of Cadmus, by whom he had several sons, notably Actæon (q. v.). After delivering the inhabitants of Ceos from a destructive drought, he sailed away into the Western Mediterranean, ruling for a time over Sardinia. He was next initiated in Thrace into the mysteries of Dionysus; and after residing for a short time near Mount Hæmus, disappeared from the earth. His worship was widely diffused in all Hellenic lands, and he figures in the mythic tale as a beneficent divinity who protected and fostered the peaceful industries of mortals.

Aristar'chus, the greatest grammarian and critic of antiquity, flourished at Alexandria in the 2d c. B.C. He made recensions of many ancient writers, but he specially devoted himself to the construction of a sound text of Homer, and his text has been the basis of all subsequent editions. He died at Cyprus of voluntary starvation, to escape the pain of an incurable disease.

Aristar'chus, of Samos, one of the earliest astronomers of the Alexandrian school, flourished about 280-264 B.C. His only extant work gives an ingenious but unpractical method of comparing the distances of the sun and moon. Archimedes states in his *Arenarius* that A. held the true theory of the diurnal and annual motions of the earth; Vitruvius ascribes to him the invention of the *scaphium*, a kind of concave sundial; and finally, Censorinus says that he was the author of the *Annus Magnus*, or Great Year, which comprised a period of 2484 years. Only one work of A. survives, which was first published at Venice in 1498, and again by Wallis at Oxford in 1688. It has been translated into French by D'Urban (Paris, 1823).

Arist'æas, according to a tradition reported by Herodotus, a magician whose soul could quit and return to its body at will. After visiting the Arimaspeæ and the Hyperboreans, he described what he had seen in an epic of three books entitled *Arimaspeia*. Of the existence of such a poem there can be no doubt, but even the ancients did not believe A. to be its author.

A. is also the name of a Cyprian, represented as an officer at the court of Ptolemy Philadelphus, to whom was long ascribed a remarkable letter (now considered a fabrication), giving an account of the Egyptian embassy to Jerusalem to obtain translators of the Pentateuch into Greek. See SEPTUAGINT.

Aristides, surnamed 'The Just,' was the son of Lysimachus, of one of the leading families of Athens. One of the ten leaders chosen to oppose the Persian invasion, A., setting the example, prevailed on the others to make Miltiades commander-in-chief on the field of Marathon. For some time after the victory A. held the office of chief archon; but by an intrigue of Themistocles, and by popular fickleness, he was subsequently banished from Athens by 'ostracism.' After the victory of Salamis, in which he took a generous part, A. was restored to popular favour—being in command of the Athenian forces at the victory of Plataea in 479. Elected archon a second time in 468, he assured the welfare of Greece and the pre-eminence of Athens by his wisdom and moderation. A. died B.C. 468. He died as he had lived—a poor man, as regards material wealth. He is one of the finest characters of antiquity. His life has been written by Plutarch with his customary grace and dignity, in the delineation of character.

Aristippus, a Greek philosopher, was born at Cyrene, in Africa, about 424 B.C. He went at an early age to Athens, where he became the pupil of Socrates, to whose teaching, however, his own is directly opposed. He is the founder of what is called the Cyrenaic school of philosophy among the Greeks—a philosophy which is essentially a form of Epicureanism, teaching that it is wiser to seek pleasure than pain, better to be happy than sad; that the morality of action consists simply in its results, as affecting the welfare of others. A. spent much of his time at the court of Dionysius of Syracuse, where he was noted as a philosophic man of pleasure. He imbued his daughter Arete with his principles; these she again taught to her son, A. the Younger. By him they are supposed to have been worked into a system known as *Hedonism*, or the philosophy of pleasure. See Wieland's historical romance, *Aristipp und einige seiner Zeitgenossen* ('A. and some of his Contemporaries').

Aristobulus, an Alexandrian Jew, probably a Galilean by birth, was the first (B.C. 160) of a series of Jewish philosophers, poets, and historians who mediated between Judaism and the Gentile world. With the LXX. as a centre, they formed an elaborate literature, transforming Moses into a Greek philosopher, and the philosophers into the patrons and clients of Hebrew wisdom. He was long credited with being the author of the *Exegetical Commentaries on the Books of Moses*, which consisted of forged extracts from some of the oldest Greek authors, intended to show that they had borrowed from the Old Testament.

Aristocracy means, etymologically, a form of government in which power is in the hands, not of the mass, but of a select few, presumably the fittest for the office, the superior aptitude arising either from demonstrated personal ability or from the inherited wealth and consequent culture of successive generations. Among the Greeks and mediæval writers the word is only used as denoting a form of government. But in this sense it has never been popularly used in England, owing to the fact that in England aristocratic government has never existed, unless it was in the days when Cromwell ruled the land. A. in England denotes a special class of the community invested with peculiar privileges, and possessing a social influence more powerful there than in any other country in the world. Strict definition is impossible. No ordinary wealth will admit any one to the aristocratic society of England. On the other hand, a certain wealth is requisite for any one to move comfortably in it. Again, the minutiae of social culture are more rigidly insisted on by the well-born and well-educated in England than in any other country. An Englishman may be wealthy, clever, and accomplished; yet if he calls a horse an 'orse,' or uses his knife in place of his fork, the flaw would be fatal to any aristocratic claim.

Aristogiton. See HARMODIUS AND ARISTOGEITON.

Aristolochia, a genus of Dicotyledonous plants, the type of the order *Aristolochiaceae*. Most of the species are climbers in habit, and have a singularly coloured, inflated calyx. They are found in tropical Africa, S. America, N. America, Europe, and Asia. *A. Clematitis*, or common birthwort, is a doubtful native of Britain, being generally found in the neighbourhood of ruins. Its roots were formerly used medically in parturition, hence its English name. Other species had a similar reputation. *A. serpentaria* is called Virginian snakeweed, from its being used as a serpentine drug in some parts of America as a cure for the bites

of snakes and mad dogs. It is also used as a stimulant in cases of fever. One or more species of A., called Guaco, is used for similar purposes by the natives in Central America. When a drop or two of the drug is placed in the mouth of the snake, it produces stupidity; but if an overdose is given, it results in death. *A. Siphon* is cultivated in gardens under the name of pipe-vine, from the form of the flowers resembling a tobacco-pipe. *A. grandiflora* is a handsome species cultivated in hothouses. Its roots have a powerful nauseous odour, and are said to kill any animal that eats them. The flowers of many species form a sort of fly-trap. *A. Indica* is common to India and Australia.

Aristophanes, the only writer of the old Greek comedy of whom any entire works are extant, and one of the greatest masters of Attic Greek, was born about B.C. 444. He was a native of the Attic borough Cydathene, and in early life was a pupil of Prodicus. He was of a social and convivial temperament, and passed the life of a lover of pleasure; but the profoundest historical and poetical interest is awakened by the wonderful series of comedies in which, with unsparing hand, he lashed the evils, follies, and extravagances of Athenian life. He was the author of fifty-four plays, of which only eleven are extant. Of these the earliest was the *Acharnians* (B.C. 425), in which he inveighs against the Peloponnesian war, and represents the evils of war by a comparison between Dicaeopolis, a native of Acharnae, who made a separate peace for himself and his family, and Lamachus, the representative of the war-party. In the *Knights* (B.C. 424) A. attacked the insolent demagogue Cleon with such scathing satire that the latter brought an action against the poet to deprive him of his civic rights. In B.C. 423 was exhibited the *Clouds*, the best of all his comedies. In it he attacked the school of sophistical philosophy, of which he made Socrates the impersonation, and throughout the play the great philosopher and moralist is represented as teaching Theidippides to cheat his creditors, beat his father, and disregard the gods. This can best be accounted for by the considerations that A. could not appreciate the true character of Socrates, that Socrates was the most prominent of the public teachers, and that his snub nose, bare feet, careless dress, and strange manners were ready materials for caricature. In the *Wasps* (B.C. 422) A. attacked the flagrant litigiousness of the Athenians. The *Peace* (B.C. 421), like the *Acharnians*, exhibited the miseries of war. The *Birds* (B.C. 414), in which the Athenians, under the figure of the birds, are persuaded to build a city in the clouds, which is to cut off all communication between gods and men, is a powerful satire on the Sicilian expedition. In B.C. 411 appeared the *Lysistrata* and the *Thesmophoriazusa*, the latter commencing the attack on Euripides which was continued in the *Frogs* (B.C. 405). The *Ecclesiazusa* (B.C. 392) ridiculed the theories of Plato and the institutions of Sparta; and the *Plutus* (B.C. 388) was an allegorical satire on the rich. A. died probably not later than B.C. 380. The *editio princeps* appeared at Venice in 1498. More recent editions are those by Brunck (Strasb. 1781-83), by Dindorf (Leipz. 1826), Bekker (Lond. 1829), and Dindorf (Paris, 1838). There are English translations by Hookham, Cumberland, &c.; French by Artaud, Poinset de Sivry, &c.; and German by Voss, Droysen, &c.

Aristotelia. See MACQUI.

Aristotle, the weightiest, and, except Plato, the most illustrious of Greek philosophers, was born at Stageira, in Chalcidice, B.C. 384. His father, Nicomachus, who was physician to Amyntas II., King of Macedon, died before his son had reached his seventeenth year, and A. was intrusted to the guardianship of Proxenus. In B.C. 367 A. went to Athens, where he passed the succeeding twenty years of his life. During the first three years, while Plato was absent in Sicily, he engaged chiefly in private study. On Plato's return, A. became pre-eminent among his pupils, and was called by his master the 'Intellect of the School.' The remainder of his residence at Athens was spent in study, uninterrupted, save by his warm controversy with Isocrates, the distinguished teacher of rhetoric. After Plato's death, disappointed, possibly, that he had not been chosen to succeed his great master, he left Athens, B.C. 347, and went to Atarneus, in Mysia, where he lived for three years with his former pupil Hermeias, the ruler of the city, on whose assassination by the Persians, B.C. 343, he fled to Mitylene with his wife Pythias. In B.C. 342 he accepted the invitation of Philip of Macedon to become the

tutor of his son Alexander, then thirteen years of age. This relationship between the great philosopher and the future conqueror continued for four years; and its beneficial effects may be traced in Alexander's love of physical exercise, interest in philosophy and literature, and intimate intercourse with his old master, which lasted till it was painfully interrupted by the murder of Callisthenes. In B.C. 335 A. returned to Athens, and founded the famous Peripatetic school, to which he soon attracted numerous pupils. Here, during twelve years, in the shady walks of the Lyceum, to his select followers in the morning, and to a wider circle in the afternoon, he expounded in regular lectures the principles of philosophy, rhetoric, and politics; and at this time too he composed the greater portion of his works. On Alexander's death, A. was accused by his enemies in Athens of impiety, and fearing the fate of Socrates, he retired to Chalcis, where in the same year he died, B.C. 322. Numerous as are the genuine extant works of A., they form a small portion of what he actually wrote. Many of them seem to be mere outlines of lectures, and they treat of every subject in the whole range of the learning of his time. His writings on *Physics*, from their defective method, are necessarily incomplete and unsatisfactory. The *History of Animals*, a voluminous work, the extent, if not the existence, of which was due to the munificent aid of Alexander, is a vast treasure-house of well-classified facts in natural history, being, according to Cuvier, not so much a zoology as a general anatomy. The *Metaphysics* received its title in an arbitrary manner, because in the order of arrangement of his works it came after the *Physics*. It is an abstruse treatise on the science of 'that which is,' the universal, the first principles and causes of things, called by A. the absolute philosophy, wisdom, theology. The *Poetics* and the *Rhetoric* are well-known treatises on these two forms of the exercise of the creative faculty. The *Economics*, the first book of which alone is genuine, treats of the domestic relations, and uses them to illustrate the relations of the various members of the State. The *Nicomachean Ethics*, named after his son Nicomachus, and by some scholars attributed to him, is the earliest treatise devoted to the special discussion of morals, and much of its penetrating thought has been embodied in later ethical systems. The *Politics*, a work based on a collection of 158 constitutions made by A. himself, is designed to show how the happiness of the State may be secured, and contains a searching investigation into the principles of the various constitutions, the opinion of the philosopher himself tending towards monarchy. This catalogue of A.'s principal works may be fitly closed with the *Organon*, for logic occupies a most prominent place in the Aristotelian philosophy; and it is not too much to say that he was at once the creator and the completer of the science and art of reasoning. It is impossible to avoid contrasting A. and his master Plato, to whom it is pleasant to note that he always shows marked respect, even when opposing his views. 'Plato considered the sensible as transitory, changeable, and therefore untrue: it was but an imitation of that which alone had true existence, the ideal world. With A., experience of the sensible is the starting-point; from the actual he ascends to the ideal. He begins with the impressions made upon the senses from without, and advances step by step through each operation of consciousness, until he arrives at the highest energy of the intellect. A. does not, like Plato, consider the sciences as mutually connected parts of one harmonious whole, but parallel to, and independent of, one another. A.'s method is plain, simple, and uniform. After clear definition of his subject, and adequate criticism of pre-existing doctrines, he traces the object of his treatise, and develops its parts from its simplest principles to its most complicated results.' Though differing widely in style, method, and mental constitution, the great master and pupil divide between them the supremacy of the intellectual world.

The influence of A. as a thinker was less predominant in antiquity than during the middle ages. Although his greatness was felt and acknowledged, and his works frequently copied by scribes, and commented on by the Alexandrine critics and philosophers, it was not till the Arab followers of Mohammed had acquired, by their Persian conquests, a taste for science and literature, that his genius began to exercise its almost superhuman authority. The wisdom which Justinian had banished from the schools of Greece, and which found a home at the court of Khosru Nushirvan, was soon carried by the victorious arms of the Moslem into the most distant regions of the West. What Avicenna did in Bagdad, Averrhoes did in Cordova.

Arabic versions of the Greek originals became the basis of Latin translations for the scholars of Western Christendom; but gradually a knowledge of the originals themselves was obtained, especially after the Crusades, and before long the Universities of Paris and Oxford were filled with crowds of implacable disputants, who regarded A. as an almost infallible master. The exclusive devotion of the schoolmen to his logic, and their misuse of his method, brought about a reaction on the revival of learning, and the name of Bacon is associated with an imaginary antagonism to the 'mighty Stagirite.' But the scope of his philosophy is now better understood, and almost every country of Europe has furnished critics and editors of his works, of whom Bekker (Berl. 1831) is perhaps still the best. Translations also exist in English, French, German, and other languages.

Aristoxenus, of Tarentum, a Peripatetic, and writer on music, flourished about 330 years B.C. Suidas says he produced 453 treatises in all departments of literature, of which we only possess his *Elements of Harmony*, and a few fragments. The best edition of the *Elements* is that of Meibomius (Amst. 1652). It is said that A. expected to have been appointed successor to Aristotle, and was much chagrined when Theophrastus was chosen. His musical system consisted in judging of *intervals* by the ear, in opposition to the Pythagorean system of determining them arithmetically.

Arithmetio (Gr. *arithmos*, number) means the science of numbers, and as such is properly applicable to algebra. It is now, however, restricted to the application (not investigation) of the properties of numbers to practical calculations.

Not till the introduction of the decimal system and the Arabian numerals, when the science was freed from the thralldom of a cumbersome and inconvenient notation, did A. make much progress. Since then, however, it has made great advances. The discovery of compound proportion, and the introduction of decimal fractions in the 16th c., constitute a great epoch in the history of A. The last great step was the invention of logarithms in the 17th c.

Arithmetical Mean is that number which lies midway between two others, and is equal to half their sum.

Arithmetical Progression is a series of numbers which increase or diminish by a common difference. The sum of such a series is found by multiplying the sum of the first and last terms by half the number of terms; and the last term is the algebraic sum of the first term, and $(n - 1)$ times the common increment (where n is the number of terms).

Arithmetical Signs are symbols used for the sake of brevity, to denote the various arithmetical operations to be performed on numbers. Thus, + (plus) is the sign of addition; - (minus) of subtraction; \times of multiplication; \div of division. 7^5 means that 7 is to be raised to the fifth power; $\sqrt[5]{32}$ means that the fifth root of 32 is to be extracted. The same signs are used in algebra.

Arius, from whom the doctrine called Arianism got its name, was a native of Libya, and born about the middle of the 3d c. At the end of the 3d c., the doctrine of the Logos, as a secondary God become man in Jesus Christ, which had first appeared in the works of Justin Martyr, and been developed by Tertullian, Clement, and Origen, was apparently the prevalent doctrine of the Church. The Son was a God, but subordinate to the Father. But now there began a divergence of opinion, some holding to the subordination of the Son; others, to satisfy their feelings of piety, which could not exalt Christ too much, sought more and more to raise him to an equality with God. This last was the current of Christian sentiment at the time, and A. became a heretic for struggling against it. The abuse with which he has been loaded by Church historians has been due to the writers projecting the notions of their own time back to that when the Arian controversy took its rise.

A., who had become pastor of a parish in Alexandria about the beginning of the 4th c., fearing the above tendency would lead either to Sabellianism (which held the three persons of the Godhead to be merely three *modes* of the divine essence) or to Ditheism, set forth in distinct terms the inferiority of the Son to the Father; a point on which all were agreed. It was the doctrine of the Church according to the Council of Antioch, which condemned at the same time Paul of Samosata and Sabellius. But if, said

A., the Son is subordinate to the Father, he is not absolute God; in other words, he is not equal to the Father. Not being equal, he is not of the same substance. If he were, that substance being perfect, he would himself be perfect, and there would be two Gods equal in everything. Besides the uncreated One there can only be created beings, *i.e.*, beings created in time by God out of nothing. The Son, therefore, is not eternal, but merely the first and most excellent of the creatures; there was a time when he was not. In a word, the Son is neither consubstantial nor coexistent with the Father. These two negatives were the leading points in what came to be known as Arianism. The Bishop of Alexandria, whom A. had previously accused of Sabellianism, called a synod in 321, at which A. was deposed and excommunicated. He found sympathy and support, however, among the bishops of the East, who tried in vain to settle the dispute. On the contrary, it grew more bitter, and spread over the whole empire, to the great annoyance of the Emperor Constantine. After trying in vain to impose silence on the two parties, the emperor convened a council at Nicea, in Bithynia, for the purpose of restoring peace. Three parties were represented at this famous council (325)—the Arians, whose doctrine is stated above; the opponents of A., whose views were defended before the council by Athanasius, an archdeacon of Alexandria, who thereafter became the champion of the absolute deity of Christ; and a third party, including the majority of the members, who did not agree with either, thinking that A. stated the truth too roughly, and charging Athanasius with innovation. The opponents of A. got the ear of Constantine, and in the end all but three yielded to the imperial pressure, and decreed the perfect equality of the Son with the Father. A. and two others were deposed and banished. But the opinions of A. were not crushed. Having friends at court, he was recalled from exile (328), and had an interview with the emperor (330), who merely required from him a confession couched in general terms. Satisfied with that, he desired that A. should be reinstated at Alexandria; but Athanasius, who was now bishop there, refused to receive him, and a series of tumults ensued. Eusebius, Bishop of Nicomedia, called a synod at Tyre, and deposed Athanasius, who in his turn was banished by the emperor. A. was about to make a triumphal entry into the Church of Constantinople, when he died suddenly of a bloody flux, which was viewed by his opponents as a divine judgment, by his friends as the result of foul play.

At the death of A., the West only was faithful to the Creed of Nicea; the friends of A. holding, however, intermediate opinions, and hence called Semi-Arians, were strong in the East. After numerous disputes, schisms, &c., the Semi-Arians were reconciled to the Athanasian party, and the majority of the Church was won over to the Nicene doctrine. The conversion of the Goths and other Teutonic nations by Arian missionaries imperilled for more than two centuries the fortunes of the Trinitarian creed, which, however, finally triumphed by the zeal of successive bishops of Rome, and Arianism died out before the close of the 7th c.

Arizona, a territory of the United States, bounded N. by Utah, E. by New Mexico, S. by the Mexican Confederation, and W. by Nevada and California. Area, 113,916 sq. miles; settled pop. (1870) 9658, besides over 32,000 Indians. A. forms part of the great western plateau of North America, has a southward slope, and is crossed from N.E. to S.W. by high ranges, mostly spurs of the Rocky Mountains. Individual peaks attain a height of 12,000 to 14,000 feet. The territory is drained by the Colorado (q. v.) and its tributaries of which the principal are the Little Colorado, the Gila, Bill Williams' Fork, Yampa Creek, and Diamond River. A marvellously striking feature of the A. plateau is the way in which it has been riven in all directions to great depths by these rivers. The channels thus formed are known as cañons, and sometimes show perpendicular walls many thousand feet in height. The most famous is the Grand Cañon of the Colorado, 400 miles in length, and ranging in the altitude of its walls from 1500 to 6000 feet. A. is mineralogically one of the richest regions in the United States. Gold and silver are mined everywhere. It has also quicksilver mines (La Paz); tin, nickel, and cinnabar, copper, iron, bituminous coal, salt, sulphur, &c., are found; and various kinds of precious stones (opals, garnets, sapphires, &c.) are abundant. The soil is naturally fertile, and with proper irrigation would yield large crops. It is also admirably

adapted for grazing. In 1870 the total value of farm produce was \$227,998. Up to June 30, 1872, A. had sent to the United States' Mint for coinage \$1,015,274, but most of its silver ore was sent to Swansea in Wales for reduction, and the bullion afterwards sold in London. A. was organised as a separate territory in 1863. The capital, Tucson, in the Santa Cruz valley, 70 miles N. of the Mexican frontier, has a church, several schools, and a newspaper. Pop. (1870) 3224.

Arkansas, one of the United States of America, bounded N. by Missouri, E. by the Mississippi river, S. by Louisiana and Texas, and W. by Texas and Indian Territory. Lat. 33° to 36° 30' N.; long. 89° 45' to 94° 40' W. Length, 242 miles; breadth, 170 to 229 miles; area, 52,198 sq. miles.

In the E. portion the surface is low and marshy, and the climate unhealthy. In the centre and W. it is hilly and more salubrious. It is well watered by the A., the Washita, the White River, the Red River, the St. Francis, &c. The soil varies greatly; the chief products are cotton, Indian corn, wheat, and oats. Iron, coal, zinc, lead, manganese, gypsum, and salt are among the minerals. Wild animals are still numerous—buffaloes, elks, stags, beavers, otters, bears, and wolves. The manufactures are unimportant. Pop. (1870) 484,471; *i.e.*, with an area equal to England, it has a population less than Manchester. Capital, Little Rock. A. was settled by the French in 1685 (their first settlement being A.-Port, now a village just below the mouth of the river A.), and came into the possession of the United States by purchase in 1803, as part of Louisiana. It was organised as a separate territory in 1819, and was made a state in 1836. In the war of 1861-65 it sided with the Southern States.

Arkansas River, a large river of the United States. It rises in the Rocky Mountains, on the borders of Utah, and joins the Mississippi in lat. 33° 55' N., and long. 91° 10' W., after a course of 2170 miles, receiving in the Indian territories the waters of the Canadian and Poteau from the right, and of the Verdigris and Illinois from the left. During the periodical swell, it is navigable to the Rocky Mountains, and at other times for 600 miles from its mouth. After the Missouri it is the largest affluent of the Mississippi.

Ar. ew, a seaport in the S.E. of Wicklow County, Ireland, at the mouth of the Avoca, with extensive herring and oyster fisheries. The river is spanned by a bridge of nineteen arches. Sandbanks greatly obstruct the harbour. Near A. is Shelton Abbey, the seat of the Earl of Wicklow. Pop. 3500. The name A. is conjectured to be Danish, but its etymology is uncertain.

Ark of the Covenant, a description of which is given in the 25th and 37th chapters of Exodus, was an oblong wooden chest, about 4 feet 4 inches long, by 2 feet 8 inches wide, and 2 feet 8 inches high, and plated with gold outside and inside, which was placed in the innermost apartment of the Jewish tabernacle and temple. The lid was of solid gold, and called the mercy-seat. Upon it, facing each other at the ends, were the figures of two cherubs. Within the A., according to Dent. x. 2, were the two tables of the law. According to the Epistle to the Hebrews (ix. 4), besides the tables, there were in it the golden pot with manna (Exod. xvi. 34), and Aaron's rod (Num. xvii. 10). If so, they had been removed by the time of Solomon, for it is distinctly stated (1 Kings viii. 9), that there was nothing in it when placed in his temple but the two tables.

The real significance of the A. seems to depend on the answer to the question, Was the mercy-seat merely a cover for the A., or was it occupied by any object? Some of the reasons for supposing that it was not unoccupied, as is generally assumed, may be briefly stated: 1. Among the Egyptians, Phœnicians, and other ancient nations, an A. or chest was kept in the innermost sanctuary of their temples, which, as seen on the Egyptian sculptures, bears the most exact resemblance to that described in the Old Testament, except that between the cherubs there is the truncated cone or symbol of the generative principle in nature. 2. That the mercy-seat was to be something more than a mere lid to the A. is evident from the fact that it was not made of wood plated with gold, like the A. itself, but of solid gold. 3. The office of Cherubs (q. v.) was that of guardians; and what would have been the meaning of their stooping over the mercy-seat, with wings spread out like a screen, had there been nothing be-

tween them; and that there was something seems to be the plain meaning of Exod. xxv. 22, 'There I will meet with thee, and I will commune with thee from above the mercy-seat, from between the two cherubim which are upon the A. of the testimony.' 4. Of the four names applied to the A.—A. of Jehovah, A. of the Covenant (of Jehovah), A. of the Testimony, the A.—the first is used in all the oldest narratives, and it is sometimes distinctly spoken of as the abode of Jehovah; see Num. x. 35, 36; 2 Sam. xv. 25 (it=Him), &c. 5. The Eduth, always translated 'Testimony,' does not always refer, as is supposed, to the tables of the law (see Exod. xvi. 34; xxv. 16, 21, &c.), although it is true that in Deuteronomy this Testimony, whatever it was, is transformed into the tables. 6. And what did the prophet Amos mean when he said (v. 26), they had 'borne for forty years in the wilderness' (which could not refer to any temporary outbreak of idolatry) 'the tabernacle of their king, the pedestal of their image, the star of their god, which they had made for themselves?' From which hints, all taken together, there seem some grounds for believing that the Jewish A., as it exactly resembled those used by other nations in every other respect, so also in this, that on the mercy-seat there was at one time, if not always, some representation of Jehovah, which was sometimes put in the A.

Arkona, a promontory in the N.E. of the island of Rügen, in the Baltic, is mentioned as far back as the time of Saxo Grammaticus (q. v.). It was noted for a temple of the Wendish god Swantewit, which stood within a sacred enclosure, and which was captured and destroyed in 1168 by Waldemar, King of Denmark. A lighthouse was erected on its site in 1827, which is visible at a distance of more than 30 miles.

Arkwright, Sir Richard, a celebrated inventor, was born at Preston, December 23, 1732. Being the thirteenth child of very poor parents, he had few opportunities of mental or literary culture. He first followed the trade of a barber, which he gave up in 1760 to become a dealer in hair. About 1767 he made the acquaintance of a watchmaker of the name of Kay, in Warrington, and with his help (for he had no knowledge of mechanics) projected a cotton-spinning machine. Henceforth his whole attention was directed to the subject of inventions for spinning cotton. His first machine—the spinning-frame—was set up at Preston in 1768, but excited such furious indignation on the part of the operatives that he removed to Nottingham, and there erected in the following year a mill worked by horse-power to carry out his invention, which he had patented. A. had no means of his own, but he had fortunately entered into partnership with one who had, Mr Jedediah Strutt, the improver and patentee of Lee's stocking-frame; and several improvements suggested by the latter were adopted by A. In 1771 the partners built a second spinning-mill, worked by water-power, at Cromford, in Derbyshire. Owing to the strenuous opposition of other manufacturers, it was not till five years had elapsed from the establishment of this mill that any profits were realised; but after that time wealth continued to flow in abundantly. In 1783 the partnership was dissolved, A. retaining the works at Cromford, while Strutt continued those at Belper, which had been founded about 1776. In 1786, A., as High-Sheriff of the county of Derby, was knighted on presenting an address to George III. after the attempt on the king's life by Margaret Nicholson. He died at Cromford, under a complication of disorders, on 3d August 1792. His only son, Richard (born 1755, died 1843), carried on the business with the same sagacity and business talents which had characterised his father, and was said to have been the richest commoner in England.

Arles (anc. *Arelate*), a town in the department Bouches du Rhone, France, on the Rhone, 26 miles from its mouth. It is very old, having been the seat of a Roman prefect, and the residence of the Emperor Maximian. The Gothic king Eurich made it his residence; and in 879 it was the capital of the Burgundian kingdom of Arelate. A. contains many Roman remains, among them those of an amphitheatre built to hold about 30,000 persons, of a theatre, of a palace of Constantine the Great, of temples, triumphal arches, &c. In the 3d and 4th centuries several ecclesiastical synods were held here. A. now has considerable manufactures of silk, tobacco, brandy, and hats, and possesses a good haven, a naval school, a college, and public library. Pop. (1872) 15,120.

Arion, the capital of Luxemburg, Belgium, on the Brussels Railway, with a trade in iron and corn, and manufactures of linen and woollen stuffs, leather, tobacco, &c. It suffered greatly in the wars of Louis XIV., and was pillaged by the French in 1793. Pop. about 5760. In the *Itinerary* of Antonine it is mentioned as *Orolaunum vicus*, and from the number of coins, inscriptions, &c., found here, must have been of some importance in the times of the Romans.

Arm. This is the name given to a part of the anterior extremity in man. The anterior extremity may be anatomically divided into (1) the shoulder, (2) the arm, (3) the wrist, and (4) the hand. The arm is subdivided by anatomists into the arm and forearm.

1. **Bones**.—There is one bone in the arm called the humerus, and two in the forearm, the radius and ulna. The humerus articulates with the glenoid fossa of the scapula or shoulder-blade above, forming the shoulder-joint. At the other extremity it forms the elbow-joint with the upper articular surface of the ulna. The radius articulates above with the ulna, and below it supports the semi-lunar and scaphoid bones of the carpus or wrist.

2. **Muscles**.—In front of the humerus there are three muscles, the *coraco brachialis*, the *biceps*, and the *brachialis anticus*. The biceps raises the arm at the shoulder-joint, is a powerful flexor of the elbow, and also assists in supination, that is, turning the forearm so as to direct the palm upwards. The brachialis anticus flexes the elbow; the coraco brachialis draws the arm inwards. On the back of the arm there is a very powerful muscle, called the triceps, which extends the elbow-joint. In the forearm the muscles are divided into great groups: in front there are flexors of the wrist and fingers, and pronators which so rotate the radius as to direct the palm downwards; while behind there are antagonistic groups of extensors and supinators.

3. **Arteries**.—The arm is chiefly supplied by the brachial artery, which is a continuation of a large vessel in the armpit, termed the axillary. During its course down the arm, the brachial gives off several branches, and finally terminates below the bend of the elbow by dividing into the radial and ulnar arteries. The radial is a continuation of the brachial, and extends along the front of the forearm as far as the lower end of the radius, where it passes into the palm. It is the vessel which is usually employed in observations on the pulse. The ulnar extends along the inner side of the forearm into the palm of the hand. Both of these arteries give off numerous branches during their course, which supply the muscles and other structures of the forearm.

4. **Veins**.—The blood is returned from the hand, wrist, forearm, and arm by two sets of veins, the superficial and the deep. The former are the larger, and collect so as to form three, the radial on the radial side of the forearm, the ulnar on the ulnar side, whilst between the two there is a larger one termed the median. This middle vein, at the bend of the elbow, divides into two. On the other side there is the median cephalic, which, uniting with the radial, forms the cephalic vein; on the inner side the median basilic, which, uniting with the ulnar, forms the basilic. The latter (median basilic) is the vein usually opened in blood-letting. The cephalic vein terminates in the axillary vein in the armpit, and the basilic unites with one of the companion veins of the brachial artery, or with the axillary vein. The deeper veins of the arm are companion veins to the various arteries.

5. **Nerves**.—The nerves of the arm are derived from a great plexus in the lower part of the neck, termed the brachial plexus. See BRACHIAL PLEXUS. They are divided into cutaneous and muscular. The former confer sensibility on the parts to

Right Forearm: Superficial Flexor Muscles.

- a, biceps flexor cubiti.
- b, pronator radii teres.
- c, flexor carpi radialis.
- d, palmaris longus.
- e, flexor digitorum sublimis.
- f, flexor carpi ulnaris.
- g, palmaris brevis.

which they are supplied, while the latter supply the muscles and excite their power of contractility. They are—

(a.) *Internal cutaneous*. This nerve supplies the skin of the anterior and posterior surface of the forearm.

(b.) *Small internal cutaneous*. This nerve supplies the skin of the lower half of the arm on its posterior and internal aspects.

(c.) *Musculo-cutaneous*. It supplies the muscles in front of the arm, and the skin on the outer side of the forearm.

(d.) *Ulnar nerve*. This nerve supplies certain muscles on the anterior aspect of the forearm, the elbow and wrist joints, the skin on the lower part of the forearm, and the hand on its palmar and dorsal surfaces.

(e.) *Median nerve*. It supplies pronator and flexor muscles, and gives cutaneous branches to the thumb, index, middle, and one side of the ring fingers—the remainder being supplied by the ulnar.

(f.) *Musculo-spiral*. This nerve supplies the extensor muscles both of the arm and forearm, and to the posterior and outer aspect of the lower part of the upper arm, forearm, and hand.

6. *Lymphatics*.—These originate in the hand, receive numerous branches from all parts of the forearm, pass into small lymphatic glands placed near the bend of the elbow, receive other branches from the arm, and finally terminate principally in a group of glands in the armpit known as the axillary glands. The glands at the bend of the elbow and in the axilla are often swollen and painful during inflammation or suppuration in the hand or fingers.

All of the foregoing structures are bound together by connective tissue and aponeurosis, whilst underneath the skin there is usually a layer of fat.

Arma'da (the Spanish form of the Lat. *armata*, armed) means, among the Spaniards, any armed naval expedition, but is used in English to denote the great fleet launched against England by Philip II. of Spain, called by him the 'Invincible,' but always spoken of by us as the 'Spanish' A. It consisted of 130 vessels, mostly of very large size, bearing 19,295 soldiers, 8000 mariners, 2000 oarsmen, and 2000 volunteers of the most distinguished families of Spain. The English force held in preparation to meet the A. amounted to only 30 vessels, but, before the actual collision of the fleets, was augmented, by volunteers and otherwise, to 181, mostly small vessels, carrying 17,472 men. The Duke de Medina Sidonia and Ricaldo (vice-admiral) commanded the A., while the English fleet was led by Lord Howard of Effingham, supported by Drake, Hawkins, and Frobisher. The Spanish plan of attack was, after sailing through the Channel, and taking up the force of the Duke of Parma (amounting to 30,000 foot and 4000 horse) on the coast of Flanders, to descend with the combined forces upon England. The A. left Lisbon 29th May 1588, was delayed several weeks at Ferrol, to refit after a storm, and only on the last day of July was seen by Lord Howard bearing up the Channel in the form of an immense crescent, seven miles from horn to horn. Unable to deliver general battle, Lord Howard hung upon the rear of the A., and cut off or seriously damaged a number of the ships. Tracking the enemy to Calais Roads, he sent a number of fire-ships, with a favourable breeze, into their midst, thus creating consternation and confusion, of which he promptly took advantage by attacking the Spaniards, and capturing or sinking ten of their largest vessels. The A., already practically defeated, now bore away northwards, to round the N. of Scotland, and so return to Spain. No naval retreat was ever so disastrous. A terrible tempest smote and scattered them when they reached the northern seas. Only 'fifty reached Corunna, bearing 10,000 men, stricken with pestilence and death; of the rest some were sunk, some dashed to pieces against the Irish cliffs. The wreckers of the Orkneys and the Faroes, the clansmen of the Scottish Isles, the kernes of Donegal and Galway, all had their part in the work of murder and robbery. Eight thousand Spaniards perished between the Giant's Causeway and the Blaskets. On a strand near Sligo an English captain numbered 1100 corpses which had been cast up by the sea' (Green's *Short History of the English People*, p. 412). The results of the failure of the A. were that it destroyed the power of Philip on the Spanish-main, and threw open the commerce of the Indies—hitherto jealously guarded—to Britain and to all the world.

Armadillo, a genus of Edentate mammals, forming the type of the family *Dasyproctidae*, and confined in their distribution to S.

America. The jaws possess simple molar teeth, which may number nearly one hundred, as in the great A. In one form incisors are present;

and in some of the armadillos, alone of all Edentates, a second set of teeth is developed. The limbs are short, the toes being provided with strong claws adapted for burrowing.

Well-developed collar-bones exist. The skin is covered in these forms by a coat or armour-casing of bony scutes or plates, disposed in various ways, and so arranged as to permit of flexibility and movement.

The tail is in many cases also invested with bony plates, and the animals, in some instances, possess the power of rolling themselves up into a ball-like form for protection, after the fashion of the hedgehog. Various genera and species exist. The *Dasyprocta puma*; the poyou (*D. sexcinctus*); the tatuay (*D. tatouay*); the *D. gigas*, or great A., are familiar species. *Chlamyphorus truncatus* is a diminutive species, averaging only 6 inches in length. The food consists chiefly of insects. The tongue is smooth, and the saliva glutinous. The flesh is eaten by the natives. *Glyptodon* (q. v.) is an extinct gigantic form allied to the armadillos.

Armadillo.

Armagh, the capital of a county of the same name, on a rising ground near the Callan, 62 miles N. of Dublin. The name A., originally *Ard Macha* (Lat. *Altitudo Machæ*), 'Macha's Height,' preserves the memory of one of those semi-mythical personages to whom the oldest Irish traditions seem to cling for support. 'Macha of the golden hair' is said to have founded the place, and to have been buried here in the 3d c. B.C. After the conversion of the island to Christianity, it became the metropolis of I. and from the year 495 to the 9th c., and its college was then in the highest renown throughout Latin Christendom. Its cathedral, which was lately repaired at a cost of £10,000, is said to be on the site of that founded in the 5th c. by St Patrick. A. is the seat of the Archbishop of A., the Primate and Metropolitan of the disestablished Irish Protestant Episcopal Church, and returns one member to Parliament. The chief industry is linen-weaving. Pop. (1871), including the suburb of Drumadd, 10,138, of whom 5243 are Roman Catholics.

Armagh, a county in Ulster, Ireland, 32 miles long and 20 broad; area, 5124 sq. miles. It is low and marshy in the N., adjoining Lough Neagh; but is hilly in the S., where it borders on Louth, the chief heights being Slieve Gullion, 1893 feet high; the Newry Mountains, 1385; the A.-Breaghy Hills ('Wolf Hills'), 1200; and Mullyash, 1034. The chief rivers which flow through A. are the Upper Bann and the Blackwater, with its branch the Callan. The north and centre of A. are fertile, and very populous; in 1872, 172,554 acres were under crops. The chief towns are A., Lurgan, Portadown, and Newry. The county returns two members to Parliament. Pop. (1871) 171,260, of whom 85,057 were Roman Catholics.

Armagnac, formerly the name of a district in France stretching from the Pyrenees to the Garonne, now included in the Hautes Pyrénées and Gers. The land, producing corn and wine abundantly, is held in small estates by numerous peasant proprietors, distinguished equally by their simple morality and their ignorance. Capital, Lectoure. Pop. 2820. Principal product, *eau d'Armagnac*, a much-esteemed brandy, reckoned not inferior to cognac. In the middle ages A. gave name to a race of counts who drew their descent from Clovis, and who played an important part in French history. Bernard VII., Comte d'A., a bold and powerful soldier, took the side of the Orleanists (thence named *Armagnacs*) against the Burgundians in the civil broils that disgraced France in the early part of the 15th c., and rendered the triumph of the English arms comparatively easy.

Armament is the term used to express the complete equipment of a ship or army with the weapons of war.

Arminsherg, Jos. Ludwig, Count of, an able statesman and diplomatist, was born at Kötzing, in Lower Bavaria, 28th February 1787. He entered public life in 1808, and held a great variety of offices, administrative and diplomatic. Ludwig I. of Bavaria, on his accession to the throne, appointed A. his Minister of Finance and Foreign Affairs; but his liberal opinions drew upon him the hatred of the Camarilla and the Jesuits, and forced him to resign his post in 1831. In 1833 he undertook to form the government of Greece under Ludwig's son, the young King Otho, and for four years laboured with good results for the new kingdom. Intrigue here also proved too much for him, and in 1837 he was dismissed from office. A. died at Deggen-dorf, 3d April 1853.

Armatoles, a name given by the Turks to a Greek militia force organised by Sultan Selim I., and intended to guard Northern Greece against the inroads of the *Klephas*, or patriotic brigands of Thessaly. On the outbreak of the Greek war of independence in 1820, the A. threw off the Turkish yoke, and were distinguished by their bravery in the contest that followed.

Armature (Lat. *armatura*, armour) is a term applied to a piece of soft iron which joins the poles of a magnet, the object being to preserve their magnetic power. This A. is itself a magnet as long as it is in contact with the true magnet; and thus the latter is kept in a state of constant magnetic activity, which prevents any disturbing influence from lessening its power.

Armed Ship officially denotes a private vessel hired and commissioned by the Admiralty for some special purpose, such as protecting part of the coast, or attending a fleet in time of war.

Armenia, in ancient times a powerful, independent kingdom of Western Asia, now partitioned unequally between Russia (Russian A., or government of Erivan), Persia (province of Azerbaijan), and Turkey (vilayet of Erzerum). The region of A. extends between the Black and Caspian Seas, and between the Caucasus on the N. and the plains of the Euphrates on the S. Its boundaries have differed at different periods in its history, and it is now only a geographical name without political significance, although the inhabitants have succeeded in preserving their language, literature, and national characteristics. The region embraces the sources of the Euphrates, Tigris, and Aras. The country consists of plateaux of from 5000 to 7000 feet, dominated by mountains, of which the highest is Ararat (q. v.), and furrowed by deep valleys. On its high plains the finest corn crops are grown in abundance, its rich pastures support good breeds of horses and cattle, while in its valleys the grape and many other fruits are indigenous. Its climate in the upland districts is subject to extremes, being rigorous in winter, and very hot in summer. A., according to one of the most widely-diffused traditions of mankind, is the cradle of the human race. The Armenians, who belong to the Aryan family, were one of the earliest civilised peoples in the world. When first heard of they were governed by independent kings, afterwards they became tributary to Assyrians and Medes, but recovered (6th c. B.C.) independence under Tigranes I., whose dynasty was, however, swept away by Alexander the Great. The country was afterwards ruled by the Seleucids (q. v.) and their governors, in whose time the division into Greater and Lesser A. took place; and subsequently by the Parthians and Romans. Early in the 5th c. the Persians made A. a province of the empire of the Sassanides (q. v.), and in the 7th c. it passed under the dominion of the Arabian califs. In 1472 Greater A. became a Persian province. A. Minor, the part of this region to the W. of the Euphrates, was conquered in 1374 by the Egyptian sultan Shaban, and since that time it has remained subject partly to the Persians and partly to the Turks, though recently, as noted above, part of the country S. of the Caucasus has become a Russian government.

Armenian Church. Christianity seems to have been introduced into Armenia during the first half of the 3d c., for Eusebius records that Dionysius of Alexandria, about 260, 'wrote concerning penance to the brethren of Armenia, over whom Meruzanes was bishop.' But the A. C. was first organised in the be-

ginning of the 4th c. by Gregory the Illuminator (so called from his work in converting the country). Having succeeded in converting the king and his nobles, he was ordained the first Bishop of Armenia by the Bishop of Cappadocia, and then laboured to diffuse the Christian religion throughout the country. In the beginning of the 5th c. a translation of the Old Testament was made by the Patriarch Isaac and Miesrob (see ARMENIAN LITERATURE) from the LXX., which was used in MS. till 1666, when an edition of the New Testament was printed at Amsterdam by one of their bishops.

About 460 A.D. the Monophysite doctrine (q. v.) regarding the person of Christ was disseminated in Armenia, and the A. C. has held it ever since, though differing from the other Monophysites of the East as to many opinions and practices. Except in this point, it does not differ very materially in doctrine from the Roman Catholic Church; the hierarchy differs little from that of the Greek. The Primate of the home Church is the *Catholicos* or Patriarch of Etchmiadzin. Most of the numerous Armenians in foreign countries belong to a sect called the United Armenians, acknowledging the supremacy of the Pope, and holding the Roman Catholic doctrines.

Armenian Literature. The Armenian alphabet was invented (according to tradition, however, received from heaven) by Miesrob, a learned Armenian, at the beginning of the 5th c. Having communicated it to the Patriarch of the Church, they made together a translation of the Old Testament from the Syriac. Two pupils were sent to the Council of Ephesus (431) to request a copy of the LXX.; but Miesrob and the patriarch were unable, from ignorance of Greek, to make any use of it when they got it, till other pupils were sent to Alexandria to study Greek. On the return of these young men, however, the work was soon accomplished. Fragments of translations of several Greek authors made about the same time are still in existence: the Chronicle of Eusebius; the Discourses of Philo; Homilies by St Chrysostom, Severianus, Basil the Great, and Ephraem Syrus. One of the pupils sent by the Patriarch Isaac to learn Greek at Alexandria was Moses Chorenensis, who wrote a history of Armenia. From this time till the 14th c. there were numerous theological, historical, and geographical writers; among others David, who translated the works of Aristotle, Ebnik, and Joannes Ozniensis. But the old Armenian language is no longer spoken; and the new Armenian, or spoken language, which exists in four dialects, is much corrupted with Turkish. See Neuman's *Versuch einer Geschichte der Armen. Literatur* (Leipz. 1836); Patkanian's *Catalogue de la Littérature Arménienne* in the *Mélanges Asiatiques* (St Petersburg. 1860).

Armentières, a town in France, department of Nord, on the Lys, 9 miles N.W. of Lille, clean, well built, and prosperous, with manufactures of linen, lace, hosiery, and beetroot sugar, and a brisk trade in grain, bricks, wine, brandy, and tobacco. Pop. (1872) 17,831.

Armeria, a genus of plants belonging to the order *Plumbaginaceæ*. See THRIFT.

Armfelt, Gustav Moritz, a famous Swede, born in Finland, 1st April 1757. Having rendered important services to Gustavus III. of Sweden in his disputes with his nobles, he was rewarded by that monarch with an important military post. In the war which followed (1788-90) with Russia, he showed genius and energy, which were crowned with good fortune. He defeated the Russians at Summa; and, as the representative of his king, he made peace with them at Verela, 14th August 1790. Gustavus was assassinated in March 1792. He was succeeded by his son, a minor, Gustavus IV., under the regency of the late king's brother, the Duke of Sudermania. Becoming conscious that his court influence was fast waning under the new government, A. got himself made ambassador to Naples in July 1792. Here he entered into treasonable correspondence with certain factions in Sweden, with the view of overthrowing the regency. The plot being discovered, A. fled to Russia. He was tried in Sweden for high treason, found guilty, and deprived of his titles and possessions. These were, however, restored to him by Gustavus IV., when he received the crown in 1799. He was recalled, and appointed to military command in Finland in a war against Norway. Fortune this time went against him, and he was in consequence recalled. In the subsequent revolution

which again placed the Duke of Sudermania in power, A. was treated with consideration; but getting compromised in the poisoning of the Prince of Augustenburg, he was obliged again to retire to Russia. He was there received with great honour, being created a count, and made a member of the senate. He died at Zarskoje-Selo, 19th August 1814. His autobiography can be found in the *Handlingar rörande Sveriges Historia* (Stockh. 1830).

Armida, a beautiful enchantress, who may almost be considered the heroine of Tasso's *Gerusalemme Liberata*, and whose name has passed into literature as an exquisite type of the seductive siren. Rinaldo, the model crusader, for a time forgets his religious vows in her voluptuous bowers, but is at length delivered by the efficacy of a powerful talisman, and finally persuades the lovely emissary of Satan to embrace the Christian faith.

Armies. According to the international law of civilised nations, during war the hostile countries accord to each other, and to the army of each other, what are called belligerent rights. Thus it would be held a violation of these rights to shoot prisoners, or to refuse quarter to an army after it had hoisted the flag indicating surrender. But questions sometimes arise as to what constitutes an army, and gives an armed force a title to these rights. Mere armed bands of peasantry, for example, molesting an army of occupation, are not held entitled to the belligerent rights of an army, and prisoners are accordingly liable to be shot. A certain amount of organisation and discipline, with recognition by the proper authorities of the country, are required to constitute an army.

Armies, Ancient. The immense change in the implements of war which has taken place since ancient times, has caused a corresponding change in the strategy and tactics of modern A., as compared with those of antiquity; nevertheless, there are certain rules for individual training, and for the effective organisation of military force, which have held good in all time, and, having their foundation in human nature, must always continue to do so. Thus, the value of discipline was as great and as well known to ancient as to modern generals. If we look to the ancient Egyptians—whose great conqueror, Sesotris, lived sixteen centuries B.C.—we find that the youth of the country intended for war were from their earliest days so trained as to develop to the full their physical strength and their skill as soldiers, as subordinates and as commanders. The youth of Persia, also, in the great days of that empire, were trained and hardened to military life. Perhaps, above all, the Lacedæmonians were inured to self-denial, frugality, endurance, and all the virtues which are essential to make the successful soldier. To this training were probably mainly owing the victories of Marathon and Plataea. Yet, to their great contest with the mighty empire of Persia these ancient Greeks brought a knowledge of military organisation and tactics such as was probably at that time confined to themselves. The vast hosts of Persia, drawn from all its conquered and tributary nations, were to a great extent little better than an armed mob, which supposed that it could strike its foes with panic by force of its immensity, its elephants, its war-chariots, and other showy appliances. But every Greek was a trained soldier, and 'the pomp and circumstance' vanished into air before the serried ranks of the Lacedæmonian Phalanx (q. v.).

Again, in ancient Rome, every Roman was a trained soldier. Nor does any such doctrine seem to have been mooted in ancient times as that this physical training of its youth was so much loss to the State, by reason of its being so much time abstracted from productive labour. Their doctrine, probably, rather was that a reasonable portion of human life given to the cultivation of its vital force was—considerations of war apart—a wise and economical measure, likely even to be remunerative in agriculture and in commerce. The hardy Roman legion (see LEGION) was formed of young men who, from the age of seventeen, had been subjected to military discipline and drill—taught to camp, and march, and work out of doors. Thus, when he came to face the enemy, the Roman felt himself at home. The Roman legion was, among the military forces of ancient times, especially distinguished for its power of preserving order, and of rallying when obliged to yield. Thus, even in retreating—that important point of strategy—the fighting power of the legion was very formidable.

Armies, Mediæval. The division of the territory of the western portion of the Roman empire among the races by whom it was conquered, gave rise to what is called the Feudal System (q. v.), of which the shadow even yet remains. A standing army at the service of the king, and owing allegiance solely to him, was a thing unknown. Each baron was entitled to keep an armed force of his own. With this he was, no doubt, in terms of his allegiance, obliged to assist his sovereign when called on to do so; but, nevertheless, the substantial power so retained in the hands of the greater nobles was an effectual check on the power of the crown. The chief A. of the 14th and 15th centuries were those of France and England, those of the Moors and the Spaniards, and of the Italian republics. Of strategy and tactics there was comparatively little, and valour and enthusiasm were of more effect on the battle-field than in ancient or more modern times. Knights—'steel-clad warriors'—singled out some 'foeman worthy of their steel,' and the battle would pause to see the end of the duel; sometimes, indeed, its issue was allowed to determine the issue of the battle itself. The invention of gunpowder gradually changed all this, and effected a total revolution in the military art. This change, however, was very gradual, and can hardly be said to have taken place until after the 'middle ages.'

Armies, Modern. Towards the close of the 15th c. we begin to trace some endeavour to embody a system of strategy and tactics for cavalry, as also to train the infantry to the use of firearms. In France, Charles VII. and Charles VIII., after repeated efforts, succeeded, in spite of feudal opposition, in establishing a well-disciplined standing army, trained to the use of firearms. The strategy and tactics of the A. engaged in the great wars of Western Europe from this time began to grow into a science, and to supersede valour as determining the issue of battles and of wars. The science may be said to have culminated under Frederick the Great of Prussia, whose skill in manœuvring troops was beyond that of any general of his age. But the skill of Frederick was that of immense experience, not the intuition of consummate natural military genius; and when this did appear upon the stage in the person of Napoleon Bonaparte, the inadequacy of established routine quickly appeared. Selecting the weak point of his foe, the young general threw an overwhelming force upon it with a celerity until his own time undreamt of. Thus Napoleon gained his early victories in Italy; thus he destroyed the Austrian army in 1805, the Prussians in 1806, in both cases before the advent of the Russians, whom again, in conjunction with the remnant of their allies, he crushed at Austerlitz, Eylau, and Friedland.

The recent improvements in breech-loading rifles and cannon have revolutionised the tactics of armies, and altered the relative importance of the different branches of military service. The great lesson of the late Franco-Prussian war was that the combination of such vast numbers in the field of action, and the movement of these with the required celerity, depended principally on the application of engineering science. Prussia began the war of 1870 with 88 engineer companies, 16 telegraph and 6 railway detachments, beside several other bodies of 'technical troops.' Most European armies are now organised on a system similar to that of Germany.

We now give a few details regarding the present military organisation and A. of the principal powers of the world:—

Germany.—Under the constitution of 1871, every male subject of the German empire, capable of bearing arms, must serve in the army. After completing his twentieth year, he must be in active service for three years; four years must then be passed in the reserves. Five years more must then be passed in the *Landwehr*. During peace, the German army, organised by the law of May 2, 1874, consists of (1874) 401,659 men, with 19,752 officers. In time of war this force is raised to 1,278,619 men, with 31,546 officers. In the last war with France, the Germans had at one time in the field 1,300,000, and more than quarter of a million of horses.

France.—By the law of August 18, 1872, all Frenchmen, with a few exceptions specified, are obliged to serve in the army. They must serve five years in the active army, four years in its reserve, five years in the territorial army, and six years in its reserve. The active army of France had, in 1875, 442,014 men, which, during war, can be raised to over 1,100,000. Including the territorial army, its reserves, and reserves of the active army,

the total military force of France will amount, when the new organisation is completed, to 2,423,164.

Russia.—The Russian army is recruited by annual conscription, to which all males, without distinction of class, capable of service are liable who have attained their twentieth year. The period of service is six years in the active service, and nine in the reserve; but in the case of those called to military service in Asia the period is reduced to a total of ten years, of which seven are in active and three in reserve service. The regular Russian army, during peace, consists of over 23,500 officers, and over 750,000 men. During war, there are over 28,000 officers, and about 1,520,000 men, and 300,000 cavalry.

Austria.—All subjects of the empire are liable to military service, the period being three years of active service and seven in the reserve. There is a further liability for two years in the *Landwehr*. The total of the Austrian army during peace is (1873) 259,173 men; in war, about 772,729.

Italy.—The army is recruited under the Sardinian law of conscription, and the service is three years active and nine reserve. The total peace force is (1874) 203,279 men; during war this is raised to over 823,827; besides which there is a strong provincial militia.

Spain.—The Spanish army is stated (1872) at 80,000 men, with 136,000 of reserve. There is, besides, an army of over 60,000 in Cuba, with a small force in Porto Rico and in the Philippines. The military system is modelled on the French, and though conscript, admits of substitution.

Denmark.—All subjects of the kingdom over twenty-one are liable to military service for eight years in the regular army, and eight years in the reserve. The total of regular and reserve during peace is about (1874) 35,975 men, with over 1031 officers. During war this is raised to over 52,656.

Sweden and Norway.—The regular army has (1873) 35,646 men; the reserve 86,101; the Gothland militia 150,773. Norway has a small army of 12,000, which can be raised to 18,000.

Holland.—The total military force, officers and men, in Europe, is (1874) 62,071, exclusive of a militia. There is, besides, an army of (1872) 27,659 in the E. Indies. The system of recruiting is partly by enlistment and partly by conscription.

Belgium.—The total force, without officers, is (1874) 103,900. Recruiting is by conscription, but substitution is allowed. The service is for eight years.

Switzerland.—The total federal army has (1874) 84,045, with a reserve of 51,102, and a *Landwehr* of 65,562, making a total available military force of 201,578.

Turkey.—An obligatory system was nominally established in 1869, holding all Mohammedans liable to a service of twenty years, four being active, eight reserve, and eight *Landsturm* (*Hiyade*). The regular army now (1873) is said to number in peace 157,667, and 11,540 cavalry, and on a war-footing can be raised to 486,100. By 1878 it is assumed that this will be increased to 700,000. The irregular force—*Bashibazouks*, &c.—numbers about 50,000. Egypt and other dependencies are bound to furnish contingents to the number in all of about 60,000.

United States of America.—Before the civil war, the United States only kept up a force of about 14,000 men; while, by the successive levies during the war, over 2,500,000 men had been called out by the Northern States. In 1874 the standing army amounted to 32,602 men. The militia was at last census (1870) nominally 3,245,000.

See BRITISH ARMY, EAST INDIA ARMY.

Armillary Sphere (Lat. *armilla*, a ring) consists of a number of rings which are so put together as to represent the principal circles of the heavens. It may be regarded, then, as a sphere of which every part has been cut away, except the equator, the ecliptic, the colures, &c. This instrument, however, is never used now for any practical purposes.

Arminius, Jacobus (the Latinised form of James Harmensen), was a Dutchman, born at Oudewater ('Old Water') in 1560. Educated first at Utrecht and Leyden, he then studied at Geneva under Beza, and at Basle under Grynæus, so that he was trained in the strictest Calvinism. Nevertheless, being appointed a minister at Amsterdam (1588), he soon after (1591) abandoned the Calvinistic doctrines about predestination and the divine decrees, being led, by a candid study of the writings of Coornhart, which he had been engaged to refute, to adopt the opinions of

his opponent, that God is graciously disposed to the whole human race, and that no one is absolutely excluded from eternal salvation. When appointed Professor of Theology in the University of Leyden (1604), he felt it to be his duty to controvert the Calvinistic doctrines; by which he drew on him the hostility of the Calvinistic, *i.e.*, nearly all the divines in Holland, and in particular of his colleague Francis Gomarus. A. died (1609), however, just as the long and bitter controversy was beginning to rage.

At first the controversy was confined to the points of Grace and Predestination, and the Arminian doctrine very nearly resembled the Lutheran on these subjects (see PERSEVERANCE OF SAINTS and PREDESTINATION), as appears from the five points of a 'Remonstrance' drawn up by the followers of A. (1610), and presented to a conference of the States at the Hague (1611). The substance of these articles is as follows: 1. That God made from all eternity a conditional decree to bestow salvation on those who, as he foresaw, would persevere in their faith in Christ, and to inflict everlasting punishment on those who should continue in their unbelief. 2. That Christ made an atonement sufficient, and intended for all men, but that the efficacy thereof is restricted to those who believe in him. 3. That true faith cannot proceed from the operation of free-will, since man is incapable of any good, but that regeneration by the Holy Spirit is necessary for his conversion. 4. That, nevertheless, this divine grace of the Holy Spirit may be resisted and rendered ineffectual by the perverse will of the impenitent sinner. 5. That believers are enabled successfully to resist sin; but that whether or not they may fall from a state of grace and finally perish is not clearly stated in Scripture. (This doubt was afterwards changed to the affirmative.) In reply to this Remonstrance the Calvinists prepared a Counter-Remonstrance; hence the one party was called the Remonstrants, and the other the Contra-Remonstrants. After long altercation and violent contests, the States-General ordered the controversy to be submitted to a national synod (held at Dort 1618-19), at which were present representatives from England and Scotland, Hesse, Bremen, the Palatinate, and Switzerland. At this synod the Arminians were found guilty of 'corrupting theology and holding pestilential errors.' In consequence, all were deprived of their sacred and civil offices, and those who would not submit exiled. Under the next stadtholder, however, the exiles were recalled, and enjoyed toleration. A seminary was established at Amsterdam in which their own theology was taught by Episcopius.

After the Synod of Dort, the opinions of A. were at least more clearly expressed, and came very near to a denial 'that a man needs any divine aid in order to his conversion and living a holy life.' Their whole system is directed to the one object of uniting Christians into one brotherhood, notwithstanding differences of opinion in doctrine and worship. According to them every one belongs to the kingdom of Christ who (1) receives the Bible as the rule of his religion; (2) is opposed to polytheism; (3) leads an upright life; and (4) never disturbs those who hold different opinions from himself. The sect is dwindling in nominal adherents, but their opinions are widely prevalent. A.'s writings were collected and published at Leyden 1629, and at Frankfurt 1631 and 1635. See Brandt's *Historia Vita Arminii* (Amst. 1724).

Armistice is a cessation of hostilities between two armies or nations at war, either to allow of a breathing-space when both are exhausted, or to give an opportunity for arranging a treaty of peace. For instance, during the war between the Germans and Danes in 1864, an A. was agreed upon while the London Congress was meeting, when accordingly the Danish and German armies remained most strictly at peace. The desire of an A. for a temporary purpose is indicated by the hoisting of a white flag.

Armorica, in Cæsar's time, denoted the whole country along the coast of Gaul from the Seine to the Loire, but at a later period only Bretagne. The word is a Latinised form of a Celtic name, meaning 'the region near the sea.' The Celtic *mor*, 'the sea,' entering into the composition of many Armerican names, as Morlaix, Morbihan, is also seen in the Gaelic Moray, and is cognate with the Latin *mare* and the German *Meer*.

Armour, the defensive covering used in war and military exercises, down to the period when the introduction of firearms rendered such a kind of protection impracticable. Some kind of A. was probably of almost as early invention as the weapons

of offence against which it was intended to guard. The shield, as the simplest, most obvious, and most useful defensive weapon, was the earliest adopted, and in early times it was made of wood, the hide of animals, and plaited osiers, and to these, plates of metal were added, till the entire shield of metal-work gradually developed. The remains of shields belonging to the bronze period of Central Europe, some of them characteristically ornamented, are yet numerous. The sculptured figures of ancient Assyrians and Persians represent their warriors clad in complete suits of A., and in the time of Homer the defensive weapons of the Greeks consisted of helmet, cuirass or corselet, *knemides* or greaves, and shield. The Roman legionaries were protected with helmet, breastplate, and greaves, with a large rectangular shield or *scutum*; and the cavalry in the time of Trajan wore a bronze cuirass of scales (*squamata*), or a kind of mail-coat (*hamata*). In Europe, from the 10th to the 15th c., mail-coats were worn, composed either of flat rings fastened on to cyth or leather; of oval rings overlapping each other; of lozenge-shaped pieces of metal; or of metallic scales. The art of wire-drawing, first practised about 1306, greatly facilitated the manufacture of chain-mail. Mail-A. gradually gave way to complete suits of plate-A., which system of equipment reached great perfection about the early part of the 16th c. A knight armed *cap-à-pie* during the middle ages wore the helmet or casque; neck collar; cuirass, composed of breast and back plates; shoulder-plates, arm-guards, and palettes to protect the arms; brayette, and loin-guard, to protect the abdomen; cuishes, knee-plates, and greaves for the legs; solerets for the feet, and gauntlets for the hands. A system of protective A. for war-horses was also used in the middle ages. Some suits of A. manufactured in the 16th c. are masterpieces of artistic skill. One, by the German armorer Kollman, for a mounted warrior, now in the Dresden Museum, decorated with subjects representing the labours of Hercules, cost 14,000 crowns. The introduction of gunpowder gave the deathblow to defensive A., and from the end of the 15th c. its use gradually declined, till it altogether disappeared before the end of the 17th. Relics of the system are yet seen in the metallic helmet and cuirass worn by some cavalry regiments.

Armourer, a name applied to the artificers who in ancient and mediæval times were employed in the fabrication of weapons of offence or defence. Many armourers have become famous owing to the perfection of the metal in which they wrought and the beauty of their workmanship; others are renowned for the artistic finish of the shield, mail, and defensive accoutrements fabricated by them. For making suits of defensive armour, the armourers of Italy and Germany were most highly esteemed. The brothers Nigroli and Hieronimo Spacini (*temp.* Charles V.) were among the most famous Italians; Kollman and Seussenhofen being the leading German artificers of the same period. In the manufacture of sword-blades, the armourers of Toledo excelled; but those made by Andrea di Ferrara, an Italian in the 16th c., are most highly prized. The skilled artisans attached to regiments and war-ships to care for and repair weapons are called armourers.

Armour Plates, the thick plates of rolled iron used for the defensive protection of modern war-vessels. The system of armour-plating was first applied to the French vessel *La Gloire* and the British *Warrior*. In the case of the *Warrior*, the A. P. were $4\frac{1}{2}$ inches thick, and they were applied only to a certain portion of the vessel, leaving both extremities unprotected. Several vessels in the English navy were built on this type. In other ships built later, the hull is protected from stem to stern, the thickness of the armour is increased to 5, 6, 7, 8, 9, 11, 12, and even 20 inches, the thickness being in recent vessels varied according to the vulnerability of the point to be protected. The resisting power of these plates is increased in most vessels by thick backings of teak, and an iron skin varying from $\frac{3}{4}$ to 1 $\frac{1}{2}$ inch in thickness. The law of resistance of A. P., established by experiments on plates up to 5 $\frac{1}{2}$ inches, is that the resistance varies as the square of the thickness. Thus a plate 4 inches thick is found to have sixteen times the resisting power of another 1 inch thick. Laminated armour, which is a covering of several plates bolted together, was adopted in the American navy; but such plates are much weaker in proportion to the aggregate thickness of the armour than solid plates. A. P. are also employed for land fortifications, to their thickness in which case there is no neces-

sary limit. The extreme limit of naval armour does not yet appear to be reached, for Mr Barnaby has designed vessels in which he proposes the employment of plates 24 inches in thickness.

Armoury, a storehouse of military weapons, or a museum collection of specimens of arms valuable for artistic beauty or historical connection. The most famous collection of armour in the world is at Dresden; but the Tower of London also contains a very valuable collection.

Arms, the general name given to weapons of offence. Amongst the earliest of these were the bow and arrow, the sling coming perhaps next in point of antiquity. The club, sword, javelin, pike, spear, dart, lance, dagger, axe, mace, and chariot-scythe seem also to have been in use from the earliest times. The cross-bow was introduced at a later date by the Normans, and previous to the invention of gunpowder a rude artillery consisting of catapults, ballistæ, and battering-rams were used in warfare.

Till the introduction of gunpowder in the 13th c., little change had taken place in the implements of war; but that invention set men's genius to work to utilise it, and the larger sort of firearms (artillery) were brought into use early in the 14th c. Cannon were used by Edward III. in his first campaign against the Scots in 1277; and twenty years later we hear of them being used by the French at the battle of Cressy. Portable firearms, the earliest in date of which was the hand-cannon (a simple tube of iron fixed on a straight stock of wood, furnished with a touch-hole, and fired from a rest by a lighted piece of tow), were introduced into this country by Henry VI. in 1471; but it is generally believed that such A. were in use in Germany nearly half a century previously. The principal varieties of portable firearms which have been in use are the hand-cannon, arquebus, haquebut, demi-haque, musquet, matchlock, wheel-lock, currier, carabine, fusil, musketoon, blunderbuss, dragon, hand-mortar, dag, pistol, firelock, rifle, &c., nearly the whole of which are now obsolete. In connection with portable firearms, various contrivances for rendering them serviceable as weapons of offence when unloaded have from time to time been used, amongst the earliest being the 'sweynes feather' (hog's bristle), a long blade, the handle of which, being inserted into the muzzle of the gun, made a very effective weapon. About 1671 the bayonet was introduced, and at first the handle fitted into the muzzle of the piece; but subsequently a ring was added to fit over the outside of the muzzle, thus permitting of the firing of the weapon with the bayonet attached. In recent years the improvement of A. has advanced with almost inconceivable rapidity, and a mere catalogue of modern inventions would occupy a large space. The principal kinds of A., ancient and modern, will be described under their proper headings.

Arms, Assumptive. See HERALDRY.

Arms, Bells of, are tents for keeping the small-arms of each company in a regiment of infantry.

Arms, Heraldic, or **Armorial Bearings**, the badges by which, in early ages, military knights and leaders were distinguished. The badge was engraven, or otherwise represented, on the shield; hence the shield form of A. B. The practice is alluded to by Homer, and it rose into high importance at the period of the Crusades.

Arms, Messenger at. See MESSENGER-AT-ARMS.

Arms, Sergeant at. See SERGEANT-AT-ARMS.

Arms, Stand of, denotes every weapon, offensive or defensive, required for the complete equipment of an infantry or cavalry soldier.

Arm'strong, John, whose *Art of Preserving Health* (1744) was, until the commencement of the present century, esteemed one of the finest didactic poems in the language, but which is now quite, though not deservedly, forgotten, was born at Castleton, Roxburghshire, about 1709, studied medicine at Edinburgh, graduated in 1732, and settled in London as a physician in 1735. He died 7th September 1779. The four stanzas concluding the first part of Thomson's *Castle of Indolence* are A.'s. Besides other poems, he is the author of a number of medical essays.

Armstrong, John, M.D., an eminent physician and medical writer, born May 18, 1784, at Ayres Quay, near Sunderland, died December 12, 1829, at London, where he had practised for eleven years. His principal works are treatises on *Puerperal Fever* and *Typhus* (1816). His lectures on the practice of physic, delivered in London, were published in 1834 by Joseph Rix, one of his pupils.

Armstrong, Sir William George, was the son of an eminent citizen of Newcastle-on-Tyne, and was born there in 1810. He first entered the legal profession, but his unmistakable scientific bias, developed by the tastes of his father, after some years diverted him from the law. While still a practising solicitor, however, he was led to the invention of the hydro-electric machine (1842), for which he was elected, in 1846, a fellow of the Royal Society. In 1845 he invented the hydraulic crane, and in later years extended the application of hydraulic power to hoists of every kind, capstans, spring-bridges, and a host of other purposes. It was for the manufacture of such machinery that he, after having given up the less congenial profession of the law, established along with some friends the Elswick Engine-Works.

A. is especially famous, however, for his invention of a gun of most extraordinary power and precision. His attention was drawn in this direction during the Crimean war in 1854, when many inventors were producing new forms of cannon and projectile. In 1858 the Rifle Cannon Committee recommended the adoption of the A. gun (see BREECH-LOADING ARMS, CANNON, &c.), which was specially distinguished from the old pieces of ordnance in being rifled, and in having an ingenious contrivance for loading at the breech. Soon after, Mr A. presented his patent to the government, without any stipulation. He was made chief-engineer of rifled ordnance for seven years provisionally, and received the honours of C.B. and knighthood. In February 1863 Sir W. A. resigned his appointment, and re-joined the Elswick Manufacturing Company, and in the same year was elected President of the British Association. In 1862 he received from Cambridge the honorary degree of Doctor of Laws.

Army. See ANCIENT, MEDIEVAL, MODERN ARMIES; ARMIES. Besides the main A. which conducts the great operations in the field, various subsidiary armies are employed in a war. The *Covering A.* guards the roads and passes. The *A. of Observation* watches the enemy. The *A. of Reconnaissance* ascertains the strength and position of the enemy at a special position, or generally. The *Flying A.* moves quickly, protects garrisons, and alarms the enemy when required. *Siege and Blockading Armies* may also be required.

Army Administration. The sovereign is the supreme ruler of the British army, from which it follows that the responsible ruler is a member of the Ministry for the time being. He is called the Secretary of State for War. It is his business to prepare the Army Estimates (q. v.), and to lay before Parliament any scheme which may seem to him likely to promote military efficiency and economy of administration. Questions regarding enlistment, recruiting, and promotion, and with regard to the relationship to be maintained between the Regular Forces and the Militia (q. v.) and Volunteers (q. v.), are probably the most frequent which the Secretary for War has to consider. The commander-in-chief, again, is the representative of the sovereign in matters relating to military command and discipline. Promotions and appointments in the army are ordinarily under the patronage of the commander-in-chief. See COMMANDER-IN-CHIEF.

Army Agent. See AGENT, ARMY.

Army Estimates. As the name imports, these are the estimated expenses of the army. They are made up annually in spring by the War Secretary, and submitted by him for approval to the Treasury and to the Chancellor of the Exchequer. After adjustment, they then form part of the Budget (q. v.) which the Chancellor of the Exchequer submits to Parliament. They are of course open to criticism in detail, and to amendment in Committee of the House of Commons. On the supply as granted by the House the Accountant-General of the War Office passes drafts as they are required, addressed to the Paymaster-General

of the Forces, who is authorised by the Treasury to honour them. The total A. E. for the period 1st April 1875 to 31st March 1876 was £13,488,200.

Army List is issued monthly under authority of the War Office. It gives the names of all commissioned officers in the British army, of the general and field officers of the old Indian army, of the holders of staff appointments and military honours, besides further ample military detail. Hart's *A. L.*, printed in smaller type than the above, gives even more information, but does not possess official authority.

Army Schools. There are schools in connection with the army, for giving general tuition to private soldiers and to their children, such as the Royal Military Asylum at Chelsea. There are also schools which specially train youth for military service. All candidates for the Royal Artillery and the Royal Engineers must be trained and pass their examination at the Royal Military Academy (q. v.) at Woolwich. Then there are schools for improving the military efficiency of the officers and men. The principal one of these is now—since the abolition of purchase in the army—the Royal Military College, Sandhurst. See SANDHURST, ROYAL MILITARY COLLEGE.

Arnauld, Antoine, a great French advocate, born at Paris in 1560. He was the son of A. A., counsellor of Catherine de Médicis, and was distinguished for his earnest opposition to the Jesuits, by whom he was accused, though without reasonable cause, of being a Protestant. His defence of the University of Paris in 1594 against this formidable order is the chief foundation of his reputation; but he wrote a variety of political works which were notable in their day. A. died 29th December 1619. Of his family of twenty, six daughters embraced a 'religious' life, and were the founders and mainstay of Port-Royal. The two most conspicuous were Jacqueline Marie Angélique A. (born 1591, died 1661), and Jeanne Catherine Agnès A. (died 1671).

Arnauld, Antoine, known as 'the great A.', youngest son of the above, was born at Paris, 6th February 1612. Intended by his father for the bar, he early showed a strong bias towards the Church, with a love of scholastic theology. For the Church he accordingly studied, entering the Sorbonne as a pupil of Lescot, confessor of Cardinal Richelieu. His study of the writings of St Augustine fixed his theology for ever. In 1641 he was ordained a priest, and in 1643 he published a work entitled *De la Fréquente Communion*. On its account he was admitted 'of the Society' of the Sorbonne. The work, however, gave great offence to the Jesuits, with whom A. henceforward carried on an implacable controversy, which may be considered to have begun with his *Théologie Morale des Jésuites*, and to have closed only with his death. In 1640, on the appearance of the *Augustinus*, a posthumous work of Jansenius (q. v.), which gave rise to the great Jansenist controversy, A. defended the learned work in opposition to the Jesuits, and to Pope Urban VIII., by whom it had been condemned by Papal bull. His apologetic pamphlets, which appeared in quick succession, were *Premières et Secondes Observations*; *Considérations*; *Difficultés*; and *Apologie de Jansenius*. But piety had its charms for him as well as religious strife, and his *Mœurs de l'Église Catholique*; *Correction*; *Grâce*; *La Vérité de la Religion*; *De la Foi, de l'Espérance, et de la Charité*, are evidences of a noble and devout soul. Even secular literature claimed a high share in his regards. During a lull in the theological storm, he wrote his *Grammaire Générale Raisonnée, Éléments de Géométrie*, and *L'Art de Penser*. In 1649 the Jansenist controversy broke out with renewed fury, with the customary flood of polemical literature, the practical result being that in 1655 56 A. found it prudent to leave Port-Royal, being at the same time expelled from the Sorbonne and from the Faculty of Theology. But his pen was more vigorously employed than ever. Besides furnishing his friend Pascal (q. v.) with the materials for his *Provincial Letters*, he published *Cinq Écrits en faveur des Curés de Paris contre les Casuistes relâchés* (1658); *La Nouvelle Hérsie*, and *Les Illusions*, i.e., of the Jesuits (1662); *Cinq Dénonciations* (1689-90); *La Morale Pratique* (1683), and many other works. Finally, the Jesuits induced King Louis to issue an order for his arrest. He consequently was obliged to retire into Belgium (1679), where he passed the rest of his life. He died at Brussels, 8th August 1694. His works, of which there are upwards of 100 volumes, were published at

Paris, 1775-83. Socially, A. was celebrated for equanimity and gentleness. His bitter spirit of controversy doubtless resulted from an earnest love of what seemed to himself the truth, with a lack of capacity for seeing more than one side of a question; but he was beyond question a man of brilliant, versatile, and acute genius, a ripe theological scholar, and a profound metaphysician. See Sainte-Beuve's *Histoire de Port-Royal* (Paris, 1840-62).

Arnauld, Marie Angélique, a daughter of Robert A. d'Andilly, and granddaughter of Antoine A., the advocate, was born 28th November 1624. Of a resolute and strongly devotional character, at an early age she became a nun at Port-Royal des Champs. Here, when twenty-nine years old, she was made sub-prioress, an office which she continued to hold on her subsequent removal to Port-Royal de Paris. In 1640 there had appeared a posthumous work of Jansenius, Bishop of Ypres. This work laid down with Calvinistic rigour the doctrines of predestination and of the depravity of human nature. These doctrines were embraced by Marie Angélique with enthusiasm, and maintained with the heroism which they have so often inspired. Her convent was broken up by royal edict, its inmates distributed among the more orthodox convents in France, and every endeavour made by the Jesuits to induce them to recant; in vain, however, as regards Marie Angélique at least. In 1669 Pope Clement IX. endeavoured to effect a compromise between the Jansenists and the Jesuits. The nuns of Port-Royal des Champs, who had already been restored to their nunnery under restrictions, received back their privileges. Marie Angélique was again elected prioress, and in 1678 she was made abbess. To some extent persecution was revived on the death of her protectress the Duchess de Longueville. She died 29th January 1684. Her *Mémoires pour servir à la Vie de la Mère M. A. A. de Sainte Madeleine, Réformatrice de Port-Royal*, were published in 1730, and her *Conférences* in 1760.

Arnauld, Robert d'Andilly, eldest son of Antoine A., the advocate, was born at Paris in 1583. For some time he was a man of considerable consequence at the French court, but at the age of fifty-five he retired from the world, and devoted himself to religious history and biography. He died 27th September 1674. His daughter, Marie Angélique (q. v.), is more famous than himself.

Arnd, Johann, a Protestant divine, born at Ballenstätt, Anhalt, 27th December 1555; died at Celle, Hanover, 11th May 1621. His *Wahres Christenthum* ('True Christianity'), still popular in Germany, had at one time a European reputation. An English version by W. Jacques, in 2 vols., was published at London in 1815. A. was tinged with mysticism, but the aim of his work is to promote practical religion. He wrote several other works, none of which are now much read.

Arndt, Ernst Moritz, a German patriot and martial lyricist, was born in the island of Rügen, December 26, 1769. He was made Professor of History at Greifswald in 1800, but had to take refuge in Sweden after the fatal battle of Jena, having made himself conspicuous as the author of the *Geist der Zeit* ('Spirit of the Time,' Altona, 1806). On his return in 1810 he actively supported the minister Von Stein, and by his many writings and songs did much to fire the German patriotism. An interesting work relating to this period is his *Wanderungen und Wanderungen mit dem Reichsfreiherrn von Stein* (2d ed. 1858). His song, *What is the German Fatherland?* may be termed the national hymn of Germany. A. was appointed to the chair of history at Bonn in 1818, but was actually suspended till 1840, for 'demagogic' tendencies. In 1848 he was made a member of the German Parliament, at once joined the national party, and seceded with Gagern (q. v.) in 1849. He died January 29, 1860. His *Gedichte* were published in a collected form at Frankfurt, 1818 (new ed. Berl. 1860). See *Life of A.* by Baur (2d ed. 1862), and by Schenkel (6th ed. 1868).

Arne, Thomas Augustine, Mus. Doc., a famous English composer, was born in 1710. In 1733 he produced his first opera, *Rosamond*, which was received with universal applause. His other compositions include two oratorios, *Zara* and *Judith*; the operas of *Eliza* and *Artaxerxes*; a comic operetta, *Tom Thum*; *Comus*; and *The Masque of Alfred*, in which the

national air *Rule Britannia* first appeared. A. died in 1778. His son Michael inherited much of his talent, and set several operas to music.

Arnee', or **Arna** (*Bos Arnae*), a species or variety of ox inhabiting India, and forming the largest member of that family (*Bovidae*). Some naturalists regard it as a variety of the buffalo. The horns are very large, measuring, in some cases, 6 feet each along the outer or greater curve.

Arn'hem, the *Arenacum* of the Romans, and the *Arnolds Villa* of the middle ages, is the capital of Guelderland, Holland, on the Rhine (Lek), here spanned by a bridge of boats. It is strongly fortified, stands at the foot of a slight range of hills, in a healthy locality, and has an active transit trade with Germany. A. is connected by railway with Amsterdam, Rotterdam, Zutphen, &c. It has the most picturesque situation of any town in Holland, and is a favourite residence of Dutch E. India merchants when they come home. Here Sir Philip Sidney expired (7th October 1586), after being mortally wounded at the battle of Zutphen. In 1813 the Prussians took A. from the French. Pop. (1870) 33,081.

Arnica, a genus of Dicotyledonous plants of the order *Compositae*. *A. montana* is the mountain tobacco of the French. The plant has acrid properties; at one time was extensively employed on the Continent as a stimulant in fever, ague, and palsy. A tincture prepared from the plant was applied externally to fresh wounds and bruises, which promoted their speedy healing. The plant has now fallen into neglect, and in Germany has received the name of *Panacea lapsorum*.

Arnim, the name of a very ancient and noble German family, which professes to derive its origin from the town of Arnheim, in Holland, as far back as the 10th c., but whose historical distinction properly begins with a Heinrich von A. in 1280. The family gradually acquired extensive possessions in the Uckermark, the Altmark, the Magdeburg region, Pomerania, E. Prussia, Silesia, Saxony, Bavaria, Hanover, Mecklenburg, &c., and divided into two main lines, Biesenthal and Zehdenik, each of which has several subdivisions.

Arnim, Bettina von, sister of the rhapsodical novelist Clemens Brentano, and wife of Ludwig Achim von A. (q. v.), was born at Frankfurt-on-the-Main, 4th April 1785. She wrote several fantastic stories, and is best known as the romantic and charming correspondent of Goethe, as seen in Goethe's *Briefwechsel mit einem Kinde* ('Correspondence with a Child'), published in 1835. She died at Berlin, 20th January 1859. Of her daughters, *Gisela von A.*, married to Hermann Grimm, is known by her *Dramatische Werke* (2 vols. Bonn, 1857).

Arnim, Harry Count von, a member of the A. family, was born at Moitzelfitz, in Pomerania, in 1824, entered the service of the Prussian State 1847, and commenced his diplomatic career in 1851, when he was named secretary of legation, in which capacity he resided successively at Rome, Cassel, and Vienna. In 1862 he was appointed minister at Lisbon, created count in 1870, and in 1871, by imperial decree, minister extraordinary to the French Republic, and some time after raised to the rank of ambassador. Here he opposed the ecclesiastical policy of the German chancellor, and involved himself in such antagonism to his chief that his diplomatic career ended in one of the most remarkable state trials of late years. Recalled from Paris, 2d March 1874, he was left unemployed by the government. Irritated, it is supposed, by his humiliation and neglect, he made certain revelations to the public (2d April 1874) in the Vienna press relating to the policy of the Papal court. The discovery was then made that a large number of state papers had been taken from the archives at Paris during A.'s term of office, and failing to give a satisfactory account of them, he was arrested, 4th October 1874. He was tried by the Tribunal of the city of Berlin (9th to 15th December), found guilty of removing public documents, and sentenced to three months' imprisonment. An appeal was made to the Kammergericht, which on the 25th June 1875 found A. guilty of removing state papers from the Paris Embassy, which he subsequently refused to give up, and sentenced him to nine months' imprisonment. See *Le Procès d'Arnim* by MM. Figurey and Corbier (Paris, 1875).

Arnim, Karl Otto Ludwig von, a distinguished traveller, born at Berlin, 1st August 1779, well known as the author of *Flüchtige Bemerkungen eines flüchtigen Reisenden* ('Passing Notes by a Passing Traveller,' 6 vols. Berl. 1837-50), a narrative of his wanderings in Europe, marked by clearness and purity of style. He is also the author of several poems and translations. A. died at Berlin, February 9, 1861.

Arnim, Ludwig Joachim, usually **Achim von**, a German novelist, was born at Berlin, Jan. 26, 1781. He assisted Clemens Brentano in editing the *Wunderhorn*, a book of ballads (1806). In 1810 appeared his best-known romance, *Armuth, Reichthum, Schuld, und Busse der Gräfin Dolores* ('The Poverty, Wealth, Guilt, and Penance of the Countess Dolores'), which was greatly praised by Jean Paul. His works show imaginative, or at least fantastic, power, but are marred by tedious reflections, and a confusion of fact and fancy. A. died at Dahme, near Berlin, January 21, 1831. His *Sämmtliche Werke* ('Collected Works') were published by W. Grimm (19 vols. Berl. 1839-46).

Arno (anc. *Arnus*), an important river in Tuscany, Central Italy, rises on the S. slope of Monte Falterona, a western peak of the Apennines, about 30 miles W. of Florence. It runs S. through the long deep valley of Casentino, sweeps W. into the fertile plain of Arezzo, and here receives the Chiana; it then flows N. for 14 miles, through the Valdarno, 'where the Etrurian shades high over-arched imbower'; is joined by the Sieve, and abruptly turns its course W. to the Mediterranean. The A. passes Florence and Empoli, and enters the sea 5 miles below Pisa. It has a course of 140 miles, and is subject to sudden inundations.

Arnold, or Arnald, of Brescia (in Lat. *Arnaldus, Arnolphus, Arnulphus Brixienensis*), a monk trained under Abelard, and famous for his eloquence, preached against the corruption of the clergy, which all contemporary evidence attests was then at its worst, and excited disturbances over a great part of Italy in the early part of the 12th c. Banished by the second Lateran Council (1139), he retired to France, whence the irreconcilable enmity of St Bernard drove him to take refuge in Zürich. The spread of his doctrines having excited an insurrection at Rome, A. repaired thither, and attempted to introduce a republic, but for ten years there was continual disorder. Pope Lucius II. was killed by the populace in 1145; Eugenius III. escaped to France, but Adrian IV. restored order by excommunicating the city (1154). In 1155, on the coronation of the emperor, Frederick I., at Rome, A. was crucified, his body burnt, and its ashes thrown into the Tiber. St Bernard, who persecuted him, admits the purity of his life, and explains his singular abstinence from all carnal pleasures by the amiable hypothesis that, 'like the devil, he thirsted only for the blood of souls.' See Francke's *Arnold von Brescia* (Zür. 1825).

Arnold, Matthew, an exquisitely critical English author, eldest son of the late Dr. Arnold of Rugby, was born December 24, 1822. He was educated at Rugby and Winchester. In 1857 he was elected Professor of Poetry at Oxford. In 1859-60 he was sent by the British Government as assistant to the Commission to inquire into the state of education in France, Germany, and Holland. His early writings were poetical, showing delicacy of finish and a rare classical feeling. The chief of these are *Poems* (1853; 3d ed. 1877); *Merope*, a tragedy on a Greek model (1858); and *New Poems* (1867). In recent years he has written many prose works, as *Lectures on Translating Homer* (1861), *Essays in Criticism* (1865), and *Lectures on the Celtic Literature* (1867). His chief writings on education and other social subjects are a *Report on Education in France, Germany, and Holland* (1861); *A French Eton or Middle-Class Education and the State* (1864); *Schools and Universities of the Continent* (1868); *Culture and Anarchy, an Essay in Political and Social Criticism* (1869); *Higher Schools and Universities in Germany* (1874); and *Mixed Essays* (1879). His treatment of such subjects is at once subtle and trenchant, and animated by an intense disdain of insolent stupidity and vulgar pretence. In his *St. Paul and Protestantism* (1870), and *Literature and Dogma* (1872), he has developed a system of literary criticism as applied to religion marked by a singular freedom and incisiveness.

Arnold, Thomas, D.D., the greatest schoolmaster of modern

times, was born at W. Cowes, Isle of Wight, June 13, 1795. He was educated successively at Warminster and Winchester schools, and in 1811 entered Corpus Christi College, Oxford. His university career was auspicious, and he formed friendships with such men as Keble, Whately, and Justice Coleridge, which lasted through life. In 1818 he was ordained deacon at Oxford; in 1819 he settled at Laleham, near Staines; and in 1820 he married Mary, youngest daughter of the Rev. John Penrose, rector of Fledborough. At Laleham he remained for nine years, taking seven or eight private pupils in preparation for the universities. Here he employed himself chiefly on a lexicon of Thucydides, and an edition of that author; and here he first became acquainted with Niebuhr's *History of Rome*, on a perusal of which he determined to delay any work of his own till he had further studied this new field of inquiry. In 1827 he was elected to the head-mastership of Rugby, and in 1828 entered on that distinguished career of educational reform and administration by which he changed the face of education throughout the public schools of England. His theory of education may best be gathered from his own words: 'If there be anything on earth which is truly admirable, it is to see God's wisdom blessing an inferiority of natural powers, where they have been honestly, truly, and zealously cultivated.' 'It is not knowledge, but the means of gaining knowledge, that I have to teach.' He placed implicit confidence in a boy's assertion, so that there grew up a general feeling 'that it was a shame to tell A. a lie—he always believes one.' He kept punishment in the background as much as possible, and by kindness and encouragement attracted the good and noble feelings of those with whom he had to deal. 'Till a man learns that the first, second, and third duty of a schoolmaster is to get rid of unpromising subjects, a great public school will never be what it might be, and what it ought to be.' 'It is not necessary that this should be a school of 300, or 100, or 50 boys; but it is necessary that it should be a school of Christian gentlemen.' A. took a warm interest and an active part in the political and theological discussions of the stirring period in which he lived. In politics he was a Whig: 'There is nothing so revolutionary, because there is nothing so unnatural and so convulsive to society, as the strain to keep things fixed, when all the world is by the very law of its creation in eternal progress.' A. was an earnest advocate of the belief that Church and State are identical, and that there is no Christian priesthood as distinct from a Christian laity. He died suddenly at Fox How, near Ambleside, July 12, 1842. He published five volumes of sermons, a *History of Rome*, and an edition of Thucydides, besides numerous pamphlets. His *Life and Correspondence*, by his favourite pupil, Mr (now Dean) Stanley, appeared in 1844; and Mr Hughes, another Rugbeian, has given us, in *Tom Brown's School-Days*, a graphic picture of Rugby in A.'s time.

Arnott, Neil, M.D., F.R.S., &c., a distinguished physician of the present century, was born at Arbroath in 1788. On completing his medical course at Aberdeen, he went to London in 1806, and after some experience in the navy, started practice in the metropolis in 1811, where he died March 2, 1874. A.'s principal works are *Elements of Physics* (1827), treating of natural philosophy in its bearing upon medicine; and a *Survey of Human Progress* (1861). In 1865 he gave to each of the Scottish universities £1000 for prizes, in order to promote the study of natural philosophy among medical students; and to the London University £2000, for the foundation of a scientific scholarship.

Arnott's. See ANOTTO.

Arnsberg, an important district of the province of Westphalia (q. v.), Prussia, forming part of the highlands of the Lower Rhine; area, 2900 sq. miles; pop. 791,360. It is rich in coal, iron, lead, and silver; and there are numerous factories and mills, owing to the abundant water-power, but only in a few valleys is the surface arable. The capital is A., on the Rhur, with manufactures of linen, broadcloth, and potash; pop. 4784. The court of the Holy Fehme (see FEMGERICHTE) used to be held here.

Arnstadt, the chief town in the upper part of the principality of Schwarzburg-Sondershausen, on the Gera, 13 miles S.W. of Gotha. It is one of the oldest of the Thuringian towns, its history going back to the beginning of the 8th c., and has

considerable manufactures, chiefly in gloves, pottery, beer, and paper. Near it are extensive copper and salt mines. Pop. (1871) 8603. Its history, ancient and modern, is recorded in Hesse's *A.'s Vorneit und Gegenwart* (Arnst. 1842).

Arókszállás, a town in Hungary, 44 miles N.E. of Pesth, an entrepôt for the trade between Upper Hungary and Pesth, and the centre of a rich agricultural and grazing district. Pop. (1869) 8170.

Aromatic's, substances which are possessed of an agreeable odour, and are prized on that account. Many of them are the sources of perfumery, and will be treated of under that head; but there are other substances, the odours of which are too faint or fugitive to be capable of extraction or application as perfumes. Aroma or any form of smell is given off by substances in a state of exceedingly minute gaseous subdivision, and it has been calculated that the human nose is capable of perceiving the odour of one thirteen-millionth part of a grain of oil of resin, and a much smaller proportion of musk. Only such bodies as are energetically acted on by oxygen give off odour, such gases as nitrogen and hydrogen, which mingle without combining, being inodorous. In chemistry, benzoic acid, and a series of its homologues, are termed the aromatic series.

Aromatic Vinegar is a perfume compounded of strong acetic acid and various essences, according to the taste of the perfumer. The pungency of the acetic acid, combined with fragrance of the perfumes, makes A. V. a refreshing and stimulating preparation of great value in case of headaches, and in the sick-room generally. Originally it came into repute as a prophylactic in infectious disease; and the 'four thieves' vinegar' (*vinaigre des quatre voleurs*), a complex preparation containing with the acetic acid wormwood, rosemary, sage, mint, rue, lavender, spices, camphor, alcohol, &c., is said to have enabled four persons to attend and rob a multitude of individuals at Marseille, sick and dead from the plague, without themselves being affected.

Aronia, the name given to a species of hawthorn. See CRATÆGUS.

Arpád, the first Grand-Duke of the Magyars, and founder of the kingdom of Hungary, was born about 870. Leo the Wise, Emperor of Constantinople, obtained his aid against the Bulgarians, and Arnulf, Emperor of Germany, against the Moravians (892). About 894 he appeared in force on the Carpathians, and by a series of conquests took possession of the land far beyond the Theiss, then in the possession of Slaves, Bulgarians, Walachians, and others. Juhutun, his chief captain, conquered Transylvania. A. himself was more a statesman than a mere soldier, and showed great prudence and sagacity in organising a settled government in his new dominions. In 899 he conquered the region between the Danube and the Drave. The Magyars comprised seven great clans, subdivided into houses, and the Constitution was based on these distinctions till King Stephen, by the establishment of a monarchy, broke their power. A. died in 907. The A. dynasty expired with Andreas III. in 1301, but its founder is still the hero of Hungarian ballad and romance. See the *Codex Anonymus*, in Schwandtner's *Scriptores Historie Hungarice* (1746), and Endlicher's edition (Vien. 1827).

Arpeggio (Ital.), a musical term, denoting that the notes forming the chord so marked are to be played in rapid succession, beginning with the lowest.

Arpino (anc. *Arpinum*), a town in the province of Caserta (Terra di Lavoro), S. Italy, midway between Rome and Naples, and about 65 miles from each. It was the birthplace of Cicero and Caius Marius, and in 188 B.C. obtained the Roman franchise. A. has a beautiful situation on the slope of a rugged hill, 6 miles W. of the river Garigliano, and near it are rich marble quarries and iron mines. It has considerable manufactures of woollens, parchment, paper, and leather. Pop. 12,648.

Arqua, a village in the province of Padua, N. Italy, among the Euganean Hills. Pop. 1200. Petrarch died here, July 18, 1374; his furniture is still preserved, and his grave is marked in the churchyard by a red marble monument. The house in which he lived was presented to the municipality of Padua by Cardinal Silvestri in July 1875.

Arquebus, or **Harquebus** (from the German *Hack-buss*, a cannon with catch), is frequently loosely applied to different portable firearms of the 15th and 16th centuries. The appellation specially belongs to a firearm which was provided with a match-holder, trigger, and tumbler, and was invented in the second half of the 15th c. With a barrel a little over a yard in length, it admitted of a steady aim being taken—in this respect excelling all previous hand-guns. The musket of the same period is often confounded with the A.; the only difference between them lay in the former having a calibre twice as large as the latter. The double A. had two match-holders, and a longer barrel; in some cases so long as 7 feet, necessitating the use of a support. It was chiefly employed to defend ramparts. Other arquebuses of later invention are distinguished in name by the mechanism of the lock, as the snapaunce-lock and wheel-lock A. The foot soldiers armed with these weapons were called arquebusiers.

Arracach'a, the name given by the natives in some parts of S. America to tuberous-rooted plants, and applied by botanists to a genus of Umbelliferous plants. *A. esculenta* is cultivated for its roots, which form a large proportion of the winter food of the people of Columbia and other parts of S. America. A fermented liquor is made from these roots, and an ardent spirit by distillation. The plant will not thrive in Britain, as has been proved by experiment.

Arrack, or **Baki**, a name for distilled liquors in India, Ceylon, Siam, and the Malayan Archipelago. The forms *Araca* and *Araki* are also used in other parts of the East. One of the chief sources of A. is the sweet sap of palm-trees, especially the coconut palm (*Cocos nucifera*), and the palmyra palm (*Borassus flabelliformis*). This juice is procured by binding the spathes which surround the young flowers, and afterwards wounding them, to facilitate the flow of the sap into earthen chatties, which are attached to the spathes. The sap on fermenting is called *toddy*, and yields A. on distillation. The distillation of toddy is extensively pursued at Goa and Colombo; and it has been estimated that in Ceylon alone, one-fourth (about 5,000,000) of the entire cocoa-nut trees of the island are devoted to the drawing of toddy, of which the greater part is distilled for A., the residue being boiled down to obtain jaggery or palm sugar. In rice-growing countries A. is distilled from a fermented infusion of that grain; and in Java and the neighbouring islands molasses and toddy are added. In one Javanese method the ingredients are employed in the following proportion: Thirty-five parts of glutinous rice, sixty-two parts of molasses, and three parts of toddy, which yield on distillation twenty-three and a half parts of proof A.

Arrah, a town of British India, province of Behar, and district of Shahabad, 25 miles W. of Dinapore, has a pop. (1872) of 39,386. It is notable in connection with the mutiny of 1857, when an isolated house was defended for seven days, from 27th July to 2d August, by twenty white civilians, aided by fifty Sikhs, against 3000 Sepoys, who finally withdrew.

Arraign'ment, a term in the criminal law of England, signifying the calling of a prisoner by name to the bar of the court, to answer the charge against him. Unless there is apparent danger of escape, the prisoner is produced without bonds. He holds up his hand, by doing which he is held to admit himself to be the person indicted. The indictment is read to him, and the question put, 'Guilty or not guilty?' If he plead 'Guilty,' judgment is then pronounced. If he plead 'Not guilty,' the jury is sworn, and the trial proceeds. Refusal to answer is held equivalent to pleading 'Not guilty.' In Scotch law the whole form of procedure by which a person accused of a crime is brought to trial is included in the term *Criminal Prosecution* (q. v.). The special branch of procedure corresponding to A. in England is termed *Calling the Diet*. On the day fixed (see INDICTMENT, CRIMINAL LETTERS), the accused and the prosecutor, whether public or private, must appear in court, the Lord Advocate having the privilege of appearing by deputy. If the prisoner pleads 'Guilty,' the court passes sentence. If he pleads 'Not guilty,' the case is submitted to a jury. See PLEA OF PANEL, VERDICT.

Arran (Gael. the 'lofty isle'), in Buteshire, an island in the Firth of Clyde, 20 miles long and 12 broad, with an area of 165

sq. miles. It is separated on the E. from Ayrshire by the Firth of Clyde, and on the W. from Cantire by Kilbrannan Sound. The surface in the N. and N.W. is mountainous, and the general aspect is grandly alpine. The highest elevation is Goatfell, an English corruption of the Gaelic *Gaoth-cann*, 'Windy Mountain,' 2865 feet. At its base lie Glen Rosa, Glen Sannox, and the beautiful bay of Brodick, on the southern shore of which is the village of Invercloy, with a spacious hotel. Brodick Castle, a seat of the Duke of Hamilton, proprietor of nearly the whole of the island, overlooks the bay from the N.E. Lamlash Bay, further S., is the safest and most capacious roadstead in the Clyde, sheltered on the E. by the huge rock called the 'Holy Isle,' Kildonan Castle, at the S.E. extremity, is opposite the isle of Pladda, on which a lighthouse has been erected; and 'King's Cove,' a cavern in the cliffs of the S.W. coast, was (according to local tradition) a hiding-place of Robert the Bruce. In the N. end is Loch Ranza, with a castle, once a royal residence. A. offers a richer field to the geologist than any district of equal extent in Britain. Devonian sandstone occupies the S.E. portion, trap and carboniferous strata the middle and W., granite and mica-slate the N.W., and the Lower Silurian rocks the N.E. and S. A. is a favourite summer resort, and numerous steamers ply between it and ports on the Clyde. Pop. (1871) 5234. See *Arran and other Clyde Islands*, by Dr James Bryce (Lond. 1875); and *Arran: Its Topography, Natural History, and Antiquities*, by the Landsboroughs (new ed., Guthrie, Ardrossan, 1875).

Arr'an, South Isles of, are three islets near the entrance to Galway Bay, on the W. coast of Ireland. The largest is Inishmore (the 'Great Isle'), 7 miles long and 2 broad; the other two are named Inishman ('Middle Isle') and Inishere. Total area, 11,287 acres; pop. (1871) 3050, of whom all but 57 are Roman Catholic. Inishmore has 2122 inhabitants, and is much visited on account of its monastic relics. Formerly twenty churches and monasteries were scattered over these islands, and Inishmore is still called 'A. of the Saints' (*Aran-na-naomh*). They also contain the remains of nine huge fortresses of rough, uncemented stones, said to have been built in the 1st c. by the Fir-Bolgs (q. v.), on being driven from the mainland. Fishing is the chief occupation, and the *coracle*, or basket skiff, is still in use here. The soil of the islands is mostly under rye, oats, and potatoes; but the summer drought often brings famine.

Arras, the capital of the department of Pas-de-Calais, lies on a slight elevation at the confluence of the river Scarpe with its branch the Crinchon. It is divided into four portions, the city, the upper and lower town, and the citadel, built by Vauban. A. was capital of the old province of Artois, and has been the seat of a bishop since 390 A.D. Its fine Gothic Cathedral of Notre Dame was built 1780, for the meeting of the States or local parliament. A., the *Nemetacum* of the Romans, was the capital of the *Atrebates*, a Belgic people, whose name it afterwards took, *Atrebate*, which has been gradually corrupted into A. Along with the county of Artois, it formed part of Lower Burgundy, and—except for a short time, when Louis XI. seized it—remained in the hands of the Austro-Spanish successors of Charles the Bold till 1640, when it surrendered to Richelieu. Since then it has always been a French town. A. is the birthplace of Robespierre, and during the first revolution it was domineered over by the worst Terrorists of the time. The town was famous during the middle ages for its pictured tapestry, which, in fact, was called A. in England. It has now considerable manufactures in iron-ware, woollen and cotton goods, lace, pottery, and leather; its trade is chiefly in corn, flour, oil, wine, and brandy. An important corn-market is held here. Pop. (1872) 21,447.

Arrest', an English law term in criminal and civil procedure. Criminal A. has been considered under *Apprehend* (q. v.). Civil A. means the apprehending or restraining a person in execution of the command of a court, or by an officer of justice. The A. of debtors, against whom there is a presumption of intention to abscond, is now regulated by the Bankruptcy Act, 1869, and the Absconding Debtors Act of 1870. The latter provides that the Court of Bankruptcy may, by warrant addressed to any constable or prescribed officer of court, cause a debtor to be arrested and safely kept, if, after a debtor's summons has been granted according to the Act of 1869, and before a petition of bankruptcy can be presented against him, it appears to the court that there is reason to suppose that he intends to go abroad to avoid paying the debt, or to avoid or embarrass procedure in

bankruptcy. The debtor may, however, apply to the court to dismiss the summons, or he may pay, secure, or compound the debt within time provided by the Act, without being held to have committed an act of bankruptcy. Under the Act of 1869 imprisonment for debt is abolished except in special cases. See **DEBTORS AND CREDITORS**. There are classes exempted by privilege from A. Diplomatic representatives of foreign courts are; so also are English, Scotch, and Irish peers, members of Parliament, and all persons connected with a cause before a court of justice. See **ARRESTMENT, ARRESTMENT FOR FOUNDING JURISDICTION**.

Arrest' of Judgment, the procedure in English law so termed is regulated by the Common Law Procedure Act of 1852. After the jury have given their verdict, follows the *Judgment* of the court. But judgment may be suspended or arrested where there has been any defect in the procedure, for it cannot be entered until the next term after trial, and upon notice to the other party. Causes for suspending judgment, by granting a *new trial*, may arise for want of due notice of trial, improper behaviour of the jury among themselves, or of the plaintiff towards them, by which their verdict is influenced; misdirection of the judge, or exorbitant damages. A. of J. may be made for good cause in criminal as well as in civil cases. In the Scotch criminal courts, when the prosecutor moves for sentence, the prisoner may propose reason in arrest. But no objection to the indictment or admitted proof will be heard.

Arrestment is, in the law of Scotland, the term for the procedure by which a debtor in a personal obligation is restrained from paying his creditor until a debt due by that creditor is paid or secured to the arrestee. The A. does not, however, transfer the debt. To do this, there must be a decree in the arrester's favour under an 'Action of Forthcoming,' which may be sued under either the supreme or inferior courts. The corresponding term in English law is **ATTACHMENT** (q. v.).

Arrestment for Founding Jurisdiction, or, as it is usually called in Scotch law, *Jurisdictionis Fundandæ Causa*, is a legal procedure in Scotland for bringing a foreigner under the jurisdiction of its courts. This can only be done when the foreigner has real or personal property in Scotland. In the former case arrestment is not required, as he is held to have a *forum*, and merely requires to be cited as out of the kingdom. In the latter event, however, the process in question is necessary. It is held to give the court jurisdiction both over the property arrested and its owner. The principle involved has been affirmed by the House of Lords.

Arrestment of Wages. With a view to prevent the hurtful effects produced among some of the working classes in Scotland, from credit given them by dealers in respect of their power of A. of W., the Act 33 and 34 Vict. c. 63, was passed. It exempts from arrestment earnings not exceeding 20s. per week, and prohibits their arrestment under small-debt summonses; that is, for debts under £12. In England, with one or two exceptional cases, wages cannot be arrested for debt.

Arrhenatherum, a genus of grasses. *A. avenaceum*, or oat-grass, is a British species, and grown along with others as a meadow-grass. On the Continent it is cultivated for fodder, and sometimes called French rye-grass. Its nutritive qualities, however, are low compared with some other grasses.

Arrianus, Flavius, a philosopher and historian, was born at Nicomedia, in Bithynia, about 100 A.D. He was a follower of the great Stoic Epictetus, and from a desire to be to him what Xenophon had been to Socrates he published the life, conversations, and lectures of his master, and also the famous *Manual of Epictetus*. His most important work is his account of the Asiatic expedition (*Anabasis*) of Alexander the Great, which we have complete with the exception of one gap in vii. 12. The work is of great value, A.'s tone being sober and practical, and his judgment discreet. He also wrote on the Chase, on India, on his voyage round the Euxine, and on Tactics. In A.D. 124 he gained the favour of the Emperor Hadrian in Greece, and from his hands received the honour of the broad purple. A. was appointed (A.D. 136) Prefect of Cappadocia. He died in the reign of M. Aurelius. The best editions of the *Anabasis* of A. are those by Ellendt (Regim. 2 vols. 1832), and Krüger (Berl. 1835).

Arroba, a Spanish and Portuguese weight equal to about an English quarter of a cwt., and in the former country a measure for liquids, varying, however, in the different provinces

The Castilian A. (*A. mayor de vino*) contains about three and a half English gallons.

Arrondissement (from the French *arrondir*, to make round), a subdivision of a French Department (q. v.).

Arrow. See BOW AND ARROW.

Arrowhead, the English name for *Sagittaria sagittifolia*, a handsome aquatic plant with arrow-shaped leaves found in Britain, belonging to the natural order *Alismaceæ*. It is also found throughout Europe, in Northern Asia, and some parts of India. A variety of the plant, regarded by some as a species (*A. Sinensis*), is cultivated extensively by the Chinese for its corms, which constitute an article of food. Several other species are also cultivated for the same purpose in warm countries.

Arrow-headed Characters. See CUNEIFORM INSCRIPTIONS.

Arrow-heads. See FLINT ARROW-HEADS.

Arrowroot, the general name for a pure kind of starch obtained from various plants in different countries, and being

Arrowroot (*Maranta arundinacea*).

very digestible and nutritive, is largely used for dietary purposes. W. Indian A. is remarkably pure, and is obtained from the rhizomes of *Maranta arundinacea*; that from Bermuda is regarded as the best. Brazilian A., or tapioca-meal, is obtained from the roots of *Manihot utilisima*, a plant belonging to the order *Euphorbiaceæ*. Chinese A., from the tubers of *Nelumbium speciosum*, an aquatic plant. E. Indian A., from *Curcuma angustifolia*; and English A. is the starch of the common potato tuber *Solanum tuberosum*. Oswego A. is obtained from *Zea Mays*, or Indian corn. A fine kind of A., called *Tor-ses-mois*, is obtained from *Canna edulis* in the W. Indies. *Tacca pinnatifida* furnishes A. in the South Sea Islands, and *Arum maculatum* yields what is called Portland A., or sago. The name A. is applied to the produce of various plants, but it is generally associated with that of *Maranta* (q. v.), which belongs to the order *Marantaceæ*. The annual imports of A. into Britain are very large: in 1874 they amounted to over 400 tons.

Arrowsmith, Aaron, a celebrated geographer and constructor of maps, was born at Winston, Durham, July 14, 1750. At an early age he had to face the world, and in 1769 we find him in London in the employment of Cary, for whose large county maps he soon became the principal draughtsman. In 1790-98 he published his large map of the world on Mercator's projection, which greatly surpassed everything else that had yet been produced for clearness, accuracy, and excellence of engraving. He published altogether more than a hundred maps, all of the same admirable quality, the chief of which are the *Germany* (1813, seven sheets), *Turkey in Europe* (1801), *Asia* (1801, four sheets), and *United States of America* (1796, four sheets). He also wrote *A Companion to a Map of the World* (1814), *A Memoir relative to the Construction of a Map of Scotland* (1807), and a work on the *Geometrical Projection of Maps* (1825). Many of A.'s maps were reproduced in Paris by H. Langlois. He died in London, April 23, 1823.

Arrowsmith, John, a Puritan divine, born at Gateshead, Newcastle, March 29, 1602, was educated at St John's College, Cambridge. After some years' residence as a fellow of Catherine Hall, he settled at Lynn, in Norfolk, and in the great rebellion was appointed a member of the Westminster Assembly of Divines, in which capacity he took an active part in drawing up the 'Catechism.' He was a preacher for some time at St Martin's, Ironmonger Lane, London, and subsequently held the respective posts of Master of St John's College, Vice-Chancellor of the University of Cambridge, Regius Professor of Divinity and Master of Trinity College. The principal of his works, which are chiefly polemical, are *Tactica Sacra, sive de Militie*

Spirituali Pugnante, Vincente, et Triumphante Dissertatio (Camb. 1665, Amst. 1700); *A Chain of Principles* (1622); *Theanthropos* (1660). He died in February 1658-59.

Arroyo Mollinos, a village of Estremadura, Spain, famous for a brilliant victory gained by Lord Hill over a French force under General Girard, October 28, 1811, in which 1300 prisoners were taken.

Arru Islands, a group of over thirty islands, about 80 miles S.W. of New Guinea, stretching from 5° 20' to 6° 55' S. lat., and from 134° 10' to 134° 45' E. long. The largest is 70 miles long and 20 broad. They are inhabited by a mixed race of Malays and Melanesians; and at Dobbo, on the island of Warud, there is a settlement chiefly of Chinese and Dutch merchants. The exports are pearls, mother-of-pearl, tortoise-shell, trepang, and aromatic bark.

Arsacides, the name of the dynasty of kings who wrested Parthia from the grip of the Seleucids, and founded an Eastern empire that lasted for nearly 500 years. This dynasty takes its name and its origin from *Arsaces I.*, whose history is somewhat obscure. He was probably of Scythian origin, and according to one account satrap of Bactria at the date of his invasion and conquest of Parthia (B.C. 256 or 250). He was succeeded by his brother *Arsaces II.*, *Tiridates*, who reigned thirty-seven years, and strengthened the Parthian power by his decisive victory (B.C. 238) over the Syrian king Seleucus Callinicus. He was followed by *Arsaces III.*, *Artabanus I.* (died B.C. 196); *Arsaces IV.*, *Phriapatius* (died B.C. 181); and *Arsaces V.*, *Phraates I.* (died B.C. 144), who, though he had several sons, left the government to his brother *Arsaces VI.*, *Mithridates I.* (died B.C. 136.) Mithridates was a man of splendid military genius, subdued the whole region between the Indus and the Euphrates, and made the Parthian empire alike famous and formidable. His son, *Arsaces VII.*, *Phraates II.* (died B.C. 127), by his victory (B.C. 138) over Antiochus Sidetes, freed the Parthians for ever from the attacks of the Syrian kings. About this time, however, commenced those fierce wars with the nomadic races of the interior which were only ended by the repeated victories of *Arsaces IX.*, *Mithridates II.* (died B.C. 87), who has in history the surname of 'the Great.' He had a powerful rival in Tigranes, first king of Armenia, and in the year B.C. 92 first came into relation with the Romans, whose alliance he sought and obtained. After the overthrow of the kingdom of Pontus (B.C. 69), which occurred in the reign of *Arsaces XII.*, *Phraates III.*, the Roman and Parthian frontiers touched each other, and this furnished the occasion for frequent strife between the two powers. The first Romano-Parthian war was conducted by Crassus against *Arsaces XIV.*, *Orodes I.* (died B.C. 37), which was quickly followed by a second, in which Antonius was opposed by *Arsaces XV.*, *Phraates IV.* (died A.D. 4). Of the later A., *Arsaces XXIII.*, *Vologeses I.* (died A.D. 90), was unsuccessful in a war against the Romans (A.D. 56-64) for the possession of Armenia; *Arsaces XXV.*, *Chosroes I.* (died A.D. 121), lost Mesopotamia and Assyria in the reign of Trajan, but recovered them in that of Adrian; *Arsaces XXVIII.*, *Vologeses III.* (died A.D. 192), and *Arsaces XXIX.*, *Vologeses IV.* (died A.D. 209), successively warred against the Romans, the former against L. Verus, the latter against Severus. The last of the A., *Arsaces XXXI.*, *Artabanus IV.*, was finally defeated and slain by Artaxerxes (Ardashir) son of Sassan, founder of a new Persian or native dynasty, the *Sassanids* (q. v.), A.D. 226. See *Vaillant's Arsacidarum Imperium* (2 vols. Paris, 1725), *Richter's Histor. Krit. Versuch über die Arsaciden und Sassaniden Dynastie* (Gött. 1804), and *Longpérier's Sur les Monnaies des Rois Arsacides* (Paris, 1854).

Arsenal is a magazine for naval or military arms, ammunition, and equipments, sometimes combining with this character that of a manufactory. Brest, Toulon, L'Orient, and Cherbourg are the great French arsenals; but though Portsmouth, Plymouth, Deptford, and Sheerness may be regarded as storehouses for naval clothing and provisions, Woolwich is the only place in Britain which really deserves the name, as it is not only a naval and military magazine, but also a place possessing foundries and laboratories for the manufacture and final fitting up of almost every kind of arms and ammunition. See WOOLWICH.

Arsenic, or **Arsenicum**. Some of the compounds of this element were known to the ancients, and are spoken of by Dioscorides and Aristotle. A. was also studied by the early

alchemists. Schroeder, in 1694, was the first, however, to isolate A.; and its properties were subsequently studied by Brandt, Davy, Berzelius, Bunsen, and others. It occurs sometimes in the free state, but more frequently in combination with sulphur and the metals, forming a large group of bodies called *arsenical minerals*. A. is usually prepared by heating *mispickel*—a mineral containing sulphur, iron, and A.—in iron tubes or retorts. The A. volatilises and condenses in proper receivers in the crystalline state, whilst sulphide of iron remains. A. is a brittle, crystalline substance, of steel-grey colour, and possesses considerable metallic lustre. It crystallises in the same form as antimony, with which element it is therefore isomorphous. See ISOMORPHISM. Heated to 180° C. in a closed vessel, it volatilises without fusing. Heated in contact with the air, it combines with the oxygen to form solid arsenious acid, the fumes of which have a very characteristic odour of garlic. The specific gravity of A. varies from 5.6 to 5.9, according to the method by which it has been prepared. The chemical properties of A. are more closely allied to those of phosphorus and nitrogen than to those of the metals; hence, in spite of its appearance and physical properties, which are of a metallic character, A. is generally regarded as a non-metallic substance, though chemists are not unanimous in this opinion. The atomic weight of A. is 150, and its chemical symbol As. A. combines directly with many elements. Thrown into chlorine, it burns, forming chloride of A., AsCl_3 . Heated in the air, or in oxygen, oxide of A., As_2O_3 , results; and, indeed, oxidation takes place slowly at ordinary temperatures. A. also combines directly with sulphur, if the two be heated together, forming orpiment, As_2S_3 , or realgar, As_2S_2 , according to the proportions employed. Indirectly, compounds of A. with almost every other element may be formed.

The compounds of A. exert a highly poisonous effect on animal economy, details concerning which will be found in the article ARSENIUS ACID. A. is employed in the arts to harden metals; thus lead is mixed with a small proportion of A. in shot-making.

Arsenical Minerals comprise a large number of substances which occur in nature, and contain the element arsenic combined with other bodies, chiefly sulphur and the metals.

Many of these minerals are of considerable importance, not only as a source of arsenious acid, but also on account of the metals they contain, of some of which they are the principal ores. The most important are the following: *arsenical pyrites*, or *mispickel*, $\text{FeS}_2\text{FeAs}_2$, found in Saxony, in the Harz Mountains, and in some of the Cornish mines. This mineral occurs in steel-grey crystals, having considerable metallic lustre, and is employed in the preparation of the element arsenic, and its oxide, arsenious acid. *Cobalt-glance* (*cobaltine*, *silver-white cobalt*), analogous in composition to mispickel, occurs in large crystals in Norway and Sweden. It is also found in Cornwall and in Silesia. *Nickel-glance*, $\text{NiS}_2\text{NiAs}_2$; *arsenical nickel*, NiAs_2 ; and *copper nickel* (*Kupfernickel*), NiAs , the latter found in Saxony, Bohemia, and Hesse, in copper-coloured crystals. All of these minerals are valuable ores of nickel. *Arsenical iron*, FeAs_2 . *Arsenical cobalt*, also called *tin-white cobalt*, CoAs_2 , found in Saxony; also the *arsenical fahlores* (*Fahlerze*), minerals which contain sulphur, antimony, copper, and iron, in varying proportions; and sometimes in addition to these, zinc, lead, silver, and mercury. *Realgar*, As_2S_2 , and *orpiment*, As_2S_3 , are native sulphides of arsenic. *Arsenolite*, As_2O_3 , native arsenious acid. *Red silver ore*, $3\text{Ag}_2\text{S}\cdot\text{As}_2\text{S}_3$, a sulpharsenite of silver; and *cobalt bloom*, $3\text{CoOAs}_2\text{O}_5$, arseniate of cobalt. A. M., when heated before the blow-pipe, emit the characteristic odour of burning arsenic. They are mostly soluble in nitric acid.

Arsenious Acid, commonly called *white arsenic*, or simply *arsenic*, is an oxide of the element arsenic, having the composition represented by the formula As_2O_3 . On account of its uses in medicine and the arts, A. A. is a substance of much importance. It is prepared as a by-product in the extraction of many metals from their ores, the latter containing sulphur and arsenic in addition to the metal to be isolated. As a preliminary metallurgical operation, the ore is heated in a reverberatory furnace, connected with a large chamber of brickwork, into which the products of combustion pass. Oxidation of sulphur, arsenic, and the metal takes place, sulphurous acid and A. A. being produced, and both being volatile, pass into the brick

chamber, whilst the oxide of the metal remains on the hearth of the furnace. The A. A. condenses on the cold surface of the chamber in the form of a white powder, technically called *poison-meal* (*Giftmehl*), whilst the sulphurous acid, being gaseous at ordinary temperatures, either passes up a shaft and into the air, or is employed in the manufacture of sulphuric acid. The impure A. A. is purified by subliming it in iron vessels, becoming converted by this process into a transparent, colourless glass. A. A. recently sublimed has a very high specific gravity (3.7). If it be kept for some time, a change takes place both in its appearance and properties: it loses its transparency, becomes opaque and crystalline, and ceases to dissolve to the same extent as before in water. Thus A. A. exists in two distinct conditions, called respectively the *vitreous* and *crystalline*. A. A. is only slightly soluble in water, but hydrochloric acid dissolves it in abundance, partly converting it into *chloride of arsenic*, AsCl_3 . Nitric acid and *aqua regia* also dissolve it; and on evaporating the solution, *arsenic acid*, $3\text{H}_2\text{O}\cdot\text{As}_2\text{O}_5$, remains. A. A. is also soluble in solutions of the alkalies potash and soda, combining with them to form *arsenite of potash*, or *arsenite of soda*, as the case may be: the former of these is used in medicine, and is known by the name of *Fowler's solution*. A. A. is largely employed in the manufacture of the pigments called *Schweinfurth* and *Scheele's green*, and *orpiment*, or *king's yellow*. The two former are *arsenites of copper*; the latter, *sulphide of arsenic*, As_2S_3 . The glass manufacturer uses A. A. to decolorise green glass, by conversion of green *protoxide of iron* into yellow or slightly-coloured *peroxide of iron*. A. A. is also a valuable preservative. Skins are anointed with a mixture of A. A. and soap, called *arsenical soap*.

1. *Arsenic (Arsenious Acid), Properties of, as a Drug.*—This substance acts as an antiperiodic, alterative, and tonic to the nervous system. As an antiperiodic it ranks next to quinine, and is employed in ague, neuralgia, &c. It is employed as an alterative in diseases of the skin, especially in those of a scaly kind. It has also been used successfully in chronic rheumatism. It is much used as a tonic in cases where there is nervous debility, and also in nervous diseases of a spasmodic kind, such as epilepsy, chorea, &c. It is also used externally as an escharotic, to destroy lupus exedens, masses of cancer, &c., and is the chief ingredient in all pastes used by quack doctors for the cure of cancer. Arsenic accumulates in the body, and its administration must be stopped if the conjunctivæ become swollen, the bowels loose, the stomach irritable, and the tongue silvery white. Given internally, arsenic should be much diluted, and taken after food.

2. *Arsenic (Arsenious Acid) as a Poison.*—From two to thirty grains is a poisonous dose for an adult; the average fatal dose, three grains. In acute poisoning by this substance, the symptoms may come on quickly, or not until two or three hours after the dose. There is depression, faintness, nausea, severe burning pain at the pit of the stomach, vomiting, purging; urine scanty, high-coloured, bloody; intense thirst, cramps in the legs, swollen abdomen; the pulse is thready and irregular, and death is preceded by increased faintness, spasmodic movements, hiccough, and delirium. Arsenic may also act as a chronic poison, if given in small, oft-repeated doses. The symptoms of chronic poisoning are those of gastro-intestinal irritation, red, suffused eyes, frontal headache, tremblings, and a peculiar skin eruption called *eczema arsenicale*. The treatment in cases of acute poisoning is to empty the stomach as quickly as possible by the stomach-pump, and give lime-water, or chalk-and-water. If nothing else can be had, break down the plaster of the room, mix it with water, and cause the patient to swallow the draught. Give milk and light farinaceous food after the acute symptoms have passed off. Although so poisonous, it appears that the system may become inured to it by constant use in small doses. The mountaineers of Styria and the Tyrol eat quantities often amounting to three or four grains daily, and they are said to give it to their horses also.

Arsin'oe, daughter of Ptolemy I., King of Egypt, born about B.C. 316, married in 300 to Lysimachus, King of Thrace, whose son Agathocles had married Lysandra, her half-sister. Anxious to secure the succession for her own children, she induced her husband to put his son to death. The widow of the murdered man flew to Seleucus, King of Syria, who declared war against the Thracian monarch; but Seleucus himself was soon after assassinated by a half-brother of A., who then

offered her marriage, his motive being to destroy her two sons, who might one day prove dangerous rivals; and he had no sooner obtained her consent, than he carried out his barbarous design. Fleeing to Egypt (279), she there married her own brother Ptolemy II., Philadelphus, by whom she was most tenderly beloved, and who gave her name to several cities, and to an entire district of Egypt.

Arson is the malicious setting fire to a dwelling-house. If any one is in the house when the offence is committed, it is punishable with penal servitude for life. To cause a fire by negligence is not A., but it may form ground of action for damage, if the property of another is consequently injured. An intention to set fire to a house in town, without intending to injure any one, though not A., is punishable as a high misdemeanour. The setting fire to a stack of corn, or other farm produce, or to coal, wood, &c., is punishable with from seven years' penal servitude to penal servitude for life. The injury of property by gunpowder, or other explosive substance, is similarly punishable. The analogous term to A. in the criminal law of Scotland is *wilful fire-raising*. In certain circumstances, it is still in Scotland a capital crime, though the extreme penalty is never inflicted. It is in both countries a material aggravation of the offence if it is committed with the intention of committing a fraud. Under an Act of Geo. III., applicable to Scotland as well as England, and which has not been directly repealed, the setting fire to a ship or cargo, with the intention of injuring the owner or the underwriter, is a capital crime.

Art. Under the widest signification of this word we include all mechanical skill of execution having a basis of scientific knowledge. Without this basis, no amount of mechanical skill comes under the name of A., even in its widest sense. Thus, however deft be the fingers of a button or a pin maker, he is but a clever mechanic, not an artist. To some extent, of course, even the button-maker does require science; but he does not require it to a sufficiently appreciable extent to make us regard his craft as an A. To draw a precise line between artistic and mere mechanical skill is impossible. The shoemaker is a mechanic, not an artist; but we can conceive that, by bringing some special knowledge of the anatomy of the human foot to bear on his craft, he might so elevate it as to merit the name of an A. Again, if we are asked to draw a line of distinction between a science and an A., we should say, that where the science is futile, without a requisite and largely appreciable mechanical skill, we use the word A. Where, on the other hand, the knowledge is the main point, and the mechanical skill requisite to make it effective but little, then we speak of a science. Where the two forces are nearly equally balanced, we may with propriety use either word. Thus painting is an A., because, without requisite and largely appreciable mechanical skill, no science will make a painter. Doubtless, something beyond both science and mechanical skill is required to make a great painter; but for the sake of our illustration, we need not consider this. See Mill's *Logic*, vol. ii. c. xi.

Agriculture, or navigation, we should call a science; because to be a good agriculturist or navigator much special knowledge is required, and but little mechanical skill. A skilful surgeon we might with equal propriety call either a scientific man, or an artist. Ordinarily, however, we use the latter name only in its restricted sense; and when we say that a man is an artist, we mean that he devotes himself to the making of pictures. By A., again, in its restricted sense, we denote its application to one or other of the fine arts, or to literature.

Every great painter, sculptor, poet, musician, novelist, or essayist, must be cognisant, and more or less observant, of the rules of his A. But, on the other hand, no knowledge or nice observance of these rules, however much the critic may consequently mete out approval, will enable a man to produce a really great work without the subtle power of imagination. Scientific knowledge and mechanical skill in combination—i.e., A.—will not give a man imagination—genius; and if he has none of the *mens divini*, then he must fail—not necessarily so in the world's estimation, because critics, who may themselves be destitute of genius, may approve; and critics largely influence the verdict of their generation, though not that of posterity. But if A. will not bestow genius, it enables a man to make the best of what he has. It thus does for his genius what economy does for his income.

Nature, it is said, is the artist's standard. The words are

sufficiently vague to make it impossible to say that they are not true; but the artist who copies literally from nature—who has not in his imagination a touchstone leading him to select, and even to alter—will produce a very unnatural and stiff result. It is recorded of Sir Walter Scott, that, visiting for the first time a scene which he meant to depict in poetry, he noted with infinite exactness each species of tree, flower, and shrub which beautified it. But then he did this as an auxiliary, that he might not put into his picture that which was *not*, and that he might select from that which *was* in the landscape. He did not suppose that a catalogue was poetry. He put it into the machinery of his mind, and it came out poetry. If, says Mr Ruskin, you would paint a bean-stalk, you must see in it more than a bean-stalk. A. will not give this higher vision; but it will help to make it effective. The fiction of our day shows some special examples of the additional force of genius when under the guidance of consummate A., and also of the prodigality of genius dispensing almost wholly with its laws. In *Silas Marner* we have a work of genius regulated by almost perfect A. In the *Pickwick Papers* it may almost be said that A. there is none. Yet we read and laugh, re-read and laugh again, regardless of whether the canons of criticism sanction our doing so or not. For the ludicrous is an element which, we suspect, transcends analysis; and even if it does not, the fact may remain that the intellect which can reduce it to law is not able to seize it, while he who does seize it is unable to follow the analysis. So in poetry, so in painting, the A. critic may find in one work much to approve of, nothing to condemn; in another, these conditions may be reversed; yet it may be that in the latter, he who knows nothing of the laws of A. in poetry and painting instantly feels the touch of genius which has eluded the grasp of criticism. Infinitely subtle is this touch; in poetry it will lie in the cadence of a syllable. Transpose a syllable, and the charm is gone. What a picture of the din, the glare, and carnage of war is instantly painted in the mind by the verse—

'Then shook the hills with thunder riven,
Then rushed the steed to battle driven,
And louder than the bolts of heaven
Far flashed the red artillery.' 1

Transpose by ever so little, and the vivid picture is gone—has vanished in a newspaper paragraph. Doubtless the fact is owing to ascertainable law; and hence the power of the verse is in a sense the result of A.; but we suspect that the writer of this verse, and the writers of similar poetry, are probably ignorant of the law by which they produce the effect. They do so by the intuition of imagination and feeling, beyond which fact they can probably give no account of the process.

In fiction, the main scope of A. is twofold—the construction and elucidation of the story, and the development of the characters, some authors limiting their aim to the former, others limiting theirs to the latter, while others aim at success in both. Each chapter, or portion of a fiction, should possess an interest in itself; it should derive an interest from those which have gone before, and help to sustain the interest of those which are to follow; while, at the same time, the characters unfold themselves in dialogue, easy and natural as that of everyday life, and, as occasion requires, helping to develop the tale. There are many popular fictions written quite in opposition to these rules; yet are they the rules of A. in all classical fiction.

History of Art.—This has hitherto almost exclusively concerned itself with the particular arts of painting, sculpture, and architecture, though the most comprehensive treatment of the subject, would, as indicated above, embrace a survey of all imaginative work, including literature and music. In the works of the classical writers of antiquity, Pliny and others, we find tracings of the history of A.; but the overthrow of the Roman empire by semi-barbarous races, and the slow growth of civilisation and culture among the conquerors, hindered any development of the subject for a thousand years. A. itself, indeed, silently revived, and was insensibly transformed under the influence of new ideas, but no history of A. was written. During the middle ages the student may perhaps glean a little bearing on the subject, but anything in the shape of historical criticism is utterly unknown. With the revival of letters in the 15th and 16th centuries, however, a mass of fact respecting artistic subjects was brought together and treated of by various writers. The productions of Byzantine and Italian A.—the works of Michael Angelo and of Raphael—were contrasted with

the great works of the heathen world, and the influences of Christianity on A. thus inferred. The history of A., as forming a branch of the history of civilisation, may be said to have begun with the work of Winckelmann (1764). In recent times the subject has been similarly treated by Kugler, in his valuable work, the *Handbuch der Kunstgeschichte* (5 vols. 1872). There are few more interesting subjects of speculation than that of the bearing of the development of A. among a people upon their moral and intellectual progress—or, conversely, that of the manifestation in their A. of their moral and intellectual status. That there is an intimate connection between that which is good and that which is beautiful, is what no one who has an eye to see beauty in nature and A. will doubt; but that a generally diffused sense of the beautiful promotes the practical efficiency of a people is, it is to be feared, the reverse of true. The appreciation of beautiful scenery, painting, sculpture, and music, in a very high degree, somewhat indisposes a man for toiling after gold and going to war with his neighbour; on the other hand, it *does* dispose him towards ease and luxury. Yet it must be but a barbarous nation respecting whose A. no history can be written. See, besides the works mentioned, Vasari's *Lives*, and the modern works of Schnaase (1864), Lübke (1866; English, T. C. Jack, Edinb. 1873), Springer (1870), and Carrière (1871).

Ar'ta, a town in the vilayet of Janina, Turkey, on the river A., 7 miles from the N. shore of the gulf of the same name. It is the seat of a bishop, and was a considerable town when in 1828 it was stormed by the Greeks under Marco Bozzaris. It is an entrepôt for the commerce of Janina, 39 miles N., and has manufactures of woollens, cottons, leather, and articles of attire; its floccatas, or long shaggy cloaks, are highly esteemed. A bridge of Venetian construction here spans the river. Pop. (1873) 8000. A., anciently *Ambracia*, was founded by Corinthian colonists about 635 B.C., became a flourishing city, carried on a protracted and wasting war with the Amphilochians, and was finally conquered by Philip II. of Macedonia. Later it fell into the hands of Pyrrhus, who made it capital of Epirus, and adorned it with works of art. Successively held by the Ætolians and Romans, it rapidly declined, but rose again in the later days of the empire. Under the Byzantines it was strongly fortified, and under the new name of A. played an important part in the wars of the 12th c., was wrested from the Turks by the Venetians in 1688, conquered by Ali Pasha in 1798, and reconquered by the Turks in 1821.

Ar'ta, Gulf of (anc. *Sinus Ambracius*), an inlet of the Ionian Sea, partly separates Turkey from Greece. It is 25 miles long and 10 wide, but its entrance is shallow and intricate. To the S. of the entrance is the promontory La Punta (anc. *Actium*, q. v.), and on the N. side stands the town of Preveza.

Artabazus, the name of several Persian generals, of whom the following are the best known: 1. A., the Median, who flourished in the 6th c. B.C., and is celebrated for his devotion to Cyrus.—2. A., son of Pharnaces, accompanied Xerxes on his invasion of Greece as far as the Hellespont with 60,000 men, and at a later period joined Mardonius, whom he vainly attempted to dissuade from fighting the battle of Plataea. His retreat to Asia was a proof of his capacity.—3. A., general of Artaxerxes, first employed to suppress the Egyptian rebellion, 450 B.C.—4. A., a general employed by Artaxerxes II. to crush the sedition of the imperial satraps, 362 B.C., but completely defeated by Datames, satrap of Cappadocia. He fought at the battle of Arbela, and accompanied Darius in his flight. Alexander, in appreciation of his fidelity, made him governor of Bactria.

Artan'tha. See MATICO.

Artaxerxes (according to Herodotus, the word means 'great warrior') is the name of three Persian kings.—1. A., surnamed *Longimanus*, because his right hand was longer than the other, reigned forty years (465–425 B.C.). He was the son of Xerxes I., who was assassinated by Artabanus, the captain of his guards. A. slew the latter in the presence of the army, and exterminated his partisans. The most notable events in his reign were his suppression of an Egyptian rebellion, his restoration of the independence of the Greek cities in Asia Minor, and his permission to the Jews to re-establish their worship at Jerusalem.—2. A., surnamed *Mnemon*, on account of his great memory, succeeded his father, Darius II., B.C. 405, and died B.C. 361. His long reign of forty-four years has at least one famous

episode, the revolt of his brother, the younger Cyrus, who was aided by 10,000 Greek mercenaries. The retreat of the 10,000 through the highlands of Armenia, under the command of Xenophon, is one of the finest military exploits of antiquity, and is described with beautiful simplicity by the leader himself. See ANABASIS and XENOPHON. He fought against the Lacedæmonians, and forced them to cede to him again the suzerainty of the Greek cities of Asia Minor, but was less fortunate in his attempts to subdue an insurrection in Egypt.—3. A., surnamed *Ochus*, was the son and successor of the foregoing. He ascended the throne in 360 B.C., after murdering two brothers and eighty half-brothers. He was successful in reducing Egypt to submission, but excited universal hatred by his cruelties. A gross outrage on the religious feelings of the conquered people—viz., the slaughter of the sacred bull Apis, which he ordered to be served up at a feast—induced his vizier, the eunuch Bagoas (himself an Egyptian), to poison him, 336 B.C.

Artedi, Peter, a distinguished Swedish naturalist, was born, February 22, 1705, at Anund, in the old province of Angermanland. He studied medicine at Upsala, where he became acquainted with Linnæus, and so great was their friendship that each subsequently made the other heir of his MSS. A. devoted himself to fishes, while Linnæus studied insects and birds. After residing for a year in England, A. went to Leyden in 1735, where he met Linnæus, just returned from a Lapland excursion. Here A. prematurely met his death by falling into a canal, December 27, 1735. Linnæus published, along with a memoir, his *Ichthyologia, sive Opera omnia de Piscibus* (Leyden, 1738, 2d ed., with corrections and additions by Wallbaum; Greifswald, 1788–92). Cuvier says that A. is the first writer who treats the subject of fishes in a scientific spirit.

Artemisia, the name of two famous queens of antiquity.—1. A., Queen of Halicarnassus, who, after the death of her husband Lygdamis, joined Xerxes with five ships, and distinguished herself at Salamis (B.C. 480).—2. A., Queen of Caria (died 352–350 B.C.), the sister, wife, and successor of Prince Mausolus, to whom she erected the splendid monument from which is derived the name Mausoleum (q. v.), and which was excavated by Newton in 1857.

Artemisia, a genus of shrubby or herbaceous greyish-coloured Composite plants, commonly called wormwood. *A. Absinthium*, or common wormwood, was well known to the ancient Greeks as a medicinal plant; they called it *Asinthion*. This, as well as other species, possesses aromatic, bitter, and tonic properties, and is used as a stomachic, and also as a vermifuge. The flower-stalks and heads of a number of species of A. are sold as wormseed, and are powerful anthelmintics. They are principally imported from the Levant. The Chinese prepare moxa from *A. Moxa*, which produces a sore when burned on the skin, on the same principle as a blister. The bitter aromatic *extrait d'absinthe* is manufactured from a species of A. growing in Switzerland. It is much used in France, and forms an agreeable stomachic. *A. Abrotanum* is the shrub called southernwood or 'old man' in gardens. Sprigs of this plant are often placed in wardrobes to prevent clothes being destroyed by moths, it being very obnoxious to insects. *A. Dracunculus*, the estragon or tarragon of Siberia, has a peculiar aromatic taste, without the bitterness which characterises the other species. It is used as a pickle, and to flavour fish-sauces and vinegar. *A. vulgaris* is a common British plant called mugwort.

Artereotomy is cutting into an artery, so as to permit an effusion of blood. It is now very rarely, if ever, practised in medicine.

Arteries, Diseases of. A. are liable to various diseases, of which the following are the chief:—

1. *Atheromatous degeneration*.—This is a variety of fatty degeneration in which the muscular coats are chiefly involved. It may lead to rupture of the wall of the vessel, and effusion of blood into the brain, or other important organ.

2. *Calcareous degeneration*.—In this condition, which may be preceded by atheroma, the wall of the vessel becomes brittle by the deposition of earthy salts in its coats, or in the fatty matter formed by previous fatty change. It frequently commences in the internal coat of the larger vessels. This condition may also lead to sudden rupture.

3. *Amyloid degeneration*.—This consists in the formation of a

glue or starchy-like matter, which becomes diffused through the coats of the vessel. It occurs chiefly in the middle coats of the smaller A., the walls of which become thickened. See **AMYLOID DEGENERATION**. This state of the A. is usually associated with similar morbid changes in other important structures, such as the kidneys or liver.

4. **Arteritis**, or inflammation of the A., is a very rare disease in the acute form, but it may follow surgical operations.

5. **Aneurism**.—Dilatation of one or more of the coats of an artery. See **ANEURISM**.

6. **Wounds**.—When an artery is accidentally cut, the blood, of a scarlet colour, escapes in a series of jets which correspond to the contractions of the heart. Hæmorrhage from a large artery is rapidly fatal unless arrested. Should such an accident occur, pressure must instantly be made on the side of the wound next the heart, so as to compress the artery. A tight ligature may be applied, so as to surround the limb. To effect complete stoppage of hæmorrhage, the artery must either be tied by a ligature (a proceeding requiring surgical assistance), or pressure made on the bleeding wound by a series of small compresses made of cotton or lint, so arranged as to have the smaller next the wound, larger ones over these, and so on, the whole being firmly secured by a bandage. For the different modes of arresting hæmorrhage, see **HÆMORRHAGE**.

Artery. The arteries are vessels which carry the blood outwards from the direction of the heart towards the periphery of the body. They terminate in the capillaries, from which originate the veins. The name A. was given by the ancients to these vessels because they were then supposed to contain air—an error exploded by Galen. As an A. is traced outwards, it is found to give off branches, usually at an acute angle with the main trunk; but occasionally an A. divides into several branches at once, none of which are so large in calibre as the main trunk. When arteries unite, they are said to anastomose. Arteries usually pursue a straight course, but they are sometimes tortuous, as in the case of the spermatic arteries in the ass, bull, or ram. Such a tortuous arrangement must impede slightly the velocity of the current of blood, and also admit of a considerable amount of movement or stretching. The larger arteries are highly elastic, while the smaller have less elasticity but more contractility. This will be understood after considering their structure. All arteries, except the very smallest, have three coats, named, from their relative position, internal, middle, and external. 1. The internal is formed of a layer of epithelium (sometimes termed endothelium, and continuous with the capillaries), lying upon two layers of elastic tissue, one of which is perforated by numerous apertures, and is therefore called the *fenestrated* or window-like layer, while the other consists of fibres and bands of elastic tissue arranged longitudinally. 2. The middle coat consists of involuntary muscular fibre arranged circularly round the vessel. In the larger arteries this coat is arranged in layers separated by thin septæ of connective or elastic tissue, and the elastic tissue predominates, whereas in the smaller, the muscular layer is free from these septæ, and, relatively to the calibre of the vessel, is very much thicker. This anatomical difference explains the high degree of elasticity of the larger, and the great contractile power of the smaller. 3. The external coat consists of an inner layer of elastic tissue, and an outer of white connective tissue.

Arteries are supplied with minute capillaries, and with nerves. The nerves belong chiefly to the sympathetic system of nerves, which, by acting on the muscular fibres, keep the vessel in a state of partial contraction. See **SYMPATHETIC SYSTEM**. The special vital property of arteries is contractility, dependent on the muscular coat above described. See **CAPILLARIES**, **CIRCULATION**, **VEINS**.

Artesian Wells, so named from the district of Artois, in France, where they were first made, are perpendicular borings into the ground, through which water rises from various depths to the surface of the soil. Their action is due to the well-known hydrostatic law that water constantly endeavours to seek its own level. Suppose there be three contiguous strata of earthy material, the lowest and uppermost ones, such as clay, being impervious, or nearly so, to water, while the middle layer, such as

Artesian Wells.

chalk, permits water to percolate with ease through it. If these strata are bent into a cup-shape, so that the edge of the middle one crops out of the surface, obviously water will be collected between the two impervious layers, and will exert a strong upward pressure upon the lower side of the upper of these impervious strata. Accordingly, if we bore a hole through this top layer, the water will ascend, and endeavour to attain the level of the water at the edges. A. W. are said to have been long known to the Chinese. The Austrians have used them for hundreds of years; they are numerous in and about London, those which form the ornamental fountain in Trafalgar Square descending to a depth of nearly 400 feet; while that of Grenelle, in the neighbourhood of Paris, has the extraordinary depth of 1800 feet. Algeria has been also greatly benefited by such borings; and there seems reason to hope that these may yet change parts of the African deserts into beautiful oases. The temperature of the water thus obtained is found to increase with the depth, thus affording a powerful argument in favour of the interior heat of the earth.

Artevelde, Jacob or Jacmart van, a popular leader in the early part of the 14th c., was a brewer of Ghent. He sided with England against France, in opposition to the French nobles of Flanders, whom he defeated and compelled to evacuate the city. For nine years he exercised sovereign power, proving himself in the main to be a bold and adroit leader; but his proposal that the Black Prince, son of Edward III. of England, should be chosen governor of Flanders, caused an insurrection in Ghent, in which A. was killed, July 19, 1345. His son Philip, at the head of the Ghentese, gained a great victory over Count Louis of Flanders at Bruges (1381), and was named Regent of Flanders; but after many further successes, he was defeated and slain at Rosbeke, November 27, 1382. Full of striking incident, his life has been the subject of several dramas, the best of which is Henry Taylor's *Philip van A.* (Lond. 1846.)

Art Exhibitions owe their establishment to the necessity of publicly displaying works of art, for the purposes at once of obtaining purchasers for the same, and of fostering public taste. After the time when a middle class sprang up through the extension of commerce and manufactures in the different countries of Europe, the patronage of art was no longer confined to ecclesiastics, princes, and nobles, whose pictures remained accessible to the public in churches and palaces, but was assumed by a vast class of merchants and burghers. These adorned their private houses with pictures, which exercised little or no influence on public taste, and rendered the establishment of A. E. necessary. A. E. are collections of works of painting and sculpture belonging (1) to the nation, as in the permanent exhibitions, National Gallery, South Kensington Museum, &c.; (2) to private individuals, from whom the works are obtained for exhibition on loan, as in the case of occasional exhibitions—as the Manchester Art Exhibition, the Exhibitions of National Portraits, and in a number of instances in the Gallery of the Royal Scottish Academy, &c.; or (3) to the artists who painted them, and who thus offer them for sale to the public. In the various annual A. E., the vast majority of the works exhibited belong to the class last enumerated. Besides the permanent A. E. of London, which have considerably increased within recent years—the last established being that of the Bethnal Green Museum—and the National Galleries at Edinburgh and Dublin, there are annual A. E. at Manchester, Liverpool, Birmingham, Glasgow, and Edinburgh; and at Cambridge, Coventry, Nottingham, Sheffield, and other towns, there are galleries in connection with the local schools of art. In France there are about 100 towns which have public galleries of art; and in Germany and Austria they are also very numerous. The Royal Commission of 1866 established in the clearest manner that it was to the A. E. of the country that the improvement of the public taste in art is due, especially to the Great Exhibitions of 1851 and 1862, and to the most successful Manchester Exhibition of 1857. The first exhibition of the Royal Academy took place in 1769, when few works were exhibited; while in that of 1875 there were exhibited 1408 works by 835 artists, and the receipts of the season, from the payments of visitors, realised an immense sum. Similar progress is seen in the northern part of the island. The first exhibition of the Royal Scottish Academy took place in 1826, when there were 178 works, by 27 contributors; that of 1875 contained 1029 works, by 439 artists. In both exhibitions a fair proportion of the pictures were sold.

Arthritis. This is a term usually understood as denoting a chronic or subacute inflammation of the fibrous textures of a joint, or of the fibrous coverings of muscles, dependent on the presence in the blood of an excess of uric acid. This form of the affection is known as gout. See GOUT. The term is also applied to rheumatic affections of the joints, in which, however, there is no permanent deposit. It also denotes in recent nomenclature a remarkable disease often called rheumatic gout, chronic rheumatic A., rheumatoid A., or chronic osteo-A., in which there is pain, swelling, contraction, and stiffness of the joints and limbs. In severe cases of this kind the joint is entirely destroyed. The fibrous textures surrounding it become thick, the cartilage covering the bones is absorbed, and the heads of the bones become enlarged from new ossific deposit. The causes of this disease are not known. The only treatment beneficial is such as promotes the general health and the nutrition of the body. No drugs appear to have the slightest effect.

Arthro'dia, a term first employed by an anatomist called Winslow, to denote a joint admitting of only a very slight degree of movement.

Arthrology is that department of anatomy which treats of the structure and functions of joints or articulations.

Arthropoda. The higher group of the *Annulosa* (see ARTICULATA), in which jointed limbs, articulated to the body, are present. The Arthropodous Annulosa include four classes: The *Insecta*, *Arachnida* (q. v.) (spiders, scorpions), *Myriapoda* (q. v.) (centipedes), and *Crustacea* (q. v.) (crabs, lobsters, &c.). The body, as in all Annulosa, consists of numerous joints or 'somites' arranged along a longitudinal axis. Each joint usually bears a pair of appendages. The skin is generally hardened by deposits of horny or limy matter. The head consists generally of six segments, and of never less than four. No *cilia* or vibratile filaments are developed in any of the A. The breathing is by gills, air-tubes (*tracheæ*), or pulmonary sacs. The heart lies on the back or dorsal aspect, and generally consists of an enlarged contractile chamber or cavity, which may be provided with valves.

Arthur and Arthurian Romance. A., a British warrior who flourished in the 6th c., but whose real story has been so distorted by fable and romance that it is hardly possible to feel sure of his existence. The earliest mention of him is made by the Welsh bards, that is, if we accept the antiquity assigned to their poems—an antiquity which, though assailed by Stephens and Nash, is, in a modified way, skillfully, and it seems to us successfully, defended by Skene. In these poems 'Athwys' appears as the *Guledig* ('military leader') of the Britons—a heroic prince, who successfully battles with heathen Picts and Saxons, but whose origin and history are entirely free from any obscuring halo of romance or magic. It is considered by some critics to be a fatal objection to his historical reality that neither Bede (who wrote in the 8th c.) nor the *Chronicle* (begun in the 9th) mentions his name; but it may be answered that Bede's silence extends to the century in which A. is believed to have flourished, and that the *Chronicle* concerns itself mainly with the struggles of the Britons and English S. of the Humber, while the exploits of the British prince were performed in a region far to the N. and W. This is, in fact, Skene's contention, and whether his critical analysis of the so-called Nennius produce conviction or not, it is impossible not to admire the ingenuity and consistency of his argument. After the Welsh bards, Nennius, whose name was latterly given to the work known as the *Historia Britonum*, and who flourished in the 8th c., is the oldest authority on the subject of A. In the fiftieth chapter of this work we read: 'Tunc A., pugnabat contra illos (i.e., Saxones) in illis diebus cum regibus Britannorum, sed ipse dux erat bellorum.' The writer then proceeds to mention the twelve battles in which A. vanquishes his foes. A minute examination of the chapter has led Skene to the conclusion that the popular notion of A. as a prince of S. Wales, derived from Geoffrey of Monmouth and the later romances, is incorrect, and that in all probability he was a Cumbrian or Strathclyde Briton, an hypothesis fortified by numerous traditions in the W. and centre of the country now called Scotland. We are disposed to accept Skene's conclusion that 'the A. of Nennius is the historical A.' After Nennius, there is a silence in literature regarding A. for upwards of 400 years. During that period vast changes had taken place in Western Europe, and,

above all, the belief in the marvellous and the supernatural had received an enormous development. Nowhere is this more widely visible than in the story of A. as moulded anew by the brilliant but credulous genius of Geoffrey of Monmouth. In his *Historia Britonum* we see the origin of that A. R. which fed the wonder of the middle ages. To what extent it is a creation of the Welsh archdeacon's patriotic imagination, it is impossible to say; but while we may suspect his declaration that he only translated his *Historia* into Latin out of 'a very ancient book in the British tongue,' it is not an irrational supposition that it contains, besides the splendid additions of his own invention, the gathered riches of centuries of legend, both Armorican and British. The appearance of Geoffrey's work (appropriately dedicated to the Earl of Gloucester, son of Henry I. by the daughter of Rhys ap Tewdwr, the last prince of S. Wales) marks the transference of the A. R. from Cumbria to S. Wales, and the beginning of that phantasmagoria of fiction from which all traces of historical truth or even of verisimilitude utterly vanish. Henceforth the romancers of the middle ages, whether in verse or prose, revel in the description of gorgeous scenes and incredible exploits. The simple *Guledig* of the Welsh bards, and the *dux bellorum* of Nennius, is transformed by Geoffrey into a world-famous monarch, who, after vanquishing the Saxons, Scots, and Picts at home, makes victorious expeditions abroad, successively reduces Ireland, Iceland, Gothland, the Orkneys, Norway, Dacia, Aquitaine, and Gaul, while in a great battle in the valley of Suesia he inflicts a tremendous defeat on the Romans, though they are supported by the forces of every Eastern king whom Geoffrey's memory or imagination can summon to their help. We now learn for the first time that his father was Uther Pendragon, and his mother Igera, wife of Gorlois, Duke of Cornwall. Merlin does not play any part in the reign of A., but in those of Ambrosius Aurelianus and Uther he figures as the prince of magicians, and A. himself, according to Geoffrey, owed his existence to his medicinal enchantments. A.'s somewhat mysterious fate was brought about, we are told, by the treachery of his nephew Modred (the *Medraut* of the Welsh bards), who, during his absence in Italy, had seduced his wife Guinevere, raised a revolt, and summoned the heathen Saxons to his aid. A., mortally wounded in battle, was carried to the Isle of Avalon to be healed of his wounds, and there Geoffrey leaves him. During the next two centuries (13th and 14th) the A. R. continued to grow through all Latin Christendom, until it became simply a magnificent mirror of mediæval chivalry—of its valor, tenderness, superstition, piety, and licence. New characters, unknown to Geoffrey, are introduced, legends that had originally no connection with A. are woven into the many-coloured web of the A. R., such as the saintly legend of the Holy Grail, which first becomes Arthurian in the *Quest*, the witcheries of Vivien, and the story of Lancelot of the Lake. All the splendours of Oriental fancy that had reached the West through the influence of the Crusades, the Moors of Spain, and the ceaseless action of literature, are seen shining in the Arthurian poems of the *trouvères* of France and England, and the *minnesingers* of Germany. At least six different romances are included in the Arthurian cycle: (1) The romance of A. himself, including the *Mort* or *Death* of A.; (2) Merlin (q. v.); (3) Lancelot of the Lake (q. v.); (4) The Holy Grail (q. v.); (5) The Quest of the Holy Grail; (6) Tristram and Yseult (q. v.). Finally, the romance passed into prose in the 15th c., and in an English form was printed by Caxton in 1485, from a compilation made by Sir Thomas Malory in 1461. This is the easy source from which Tennyson has drawn not a little of the spirit, the colouring, incidents, and the language of his famous *Idylls*. The best edition is that edited for the *Library of Old English Authors* by Wright (1866), from the text of the latest black-letter edition of 1634. It is from Malory that English readers have long derived their idea of A. as a peerless prince, presiding over a court of fair women and brave men, and shedding a kind of celestial influence upon his times by his unblemished virtue and unrivalled magnanimity, till the infidelity of Guinevere and the perfidy of Lancelot dissolved, as with fatal sorcery, the whole beauty and strength of the noble companionship. It is certainly not a little remarkable that a British prince, whose name was beneath the notice of contemporary history, and the earliest records of whom are meagre and indefinite, should have had the fortune in later ages to become more illustrious in romance than Charlemagne himself. Perhaps the true explanation of the phenomenon may

be that the Norman *trouvères* who first began to make the story famous in the West, took all the more willingly to a hero whom tradition represented as the implacable foe of the English race, and whose victories were grateful to the descendants of the warriors that conquered at Hastings. See Turner's *History of the Anglo-Saxons* (7th ed. 1852); Grässe's *Die Grosse Sagenkreise des Mittelalters* (Leipzig, 1842); Stephens' *Literature of the Kymry* (1849); Nash's *Tales of the Bards and Druids of Britain* (1858); Skene's *Four Ancient Books of Wales* (Edinb. 1868); and Glennie's *Arthurian Localities* (1869).

Arthur's Seat, a picturesque hill overlooking Edinburgh to the S.E. It is 822 feet high, and commands a magnificent prospect. The chief rock is trap, which in vast tabular masses has broken through the Carboniferous strata, and frequently encloses portions of hardened sandstone. Salisbury Crags, a vast crescent of rugged cliffs from 60 to 80 feet high, crown a steep hill about 500 feet in height to the N. of A. S., and overhang the older part of Edinburgh. The upper part of A. S. is formed of basalt, as are also the angular columns called 'Samson's Ribs,' on the W. side. If Skene's interpretation of the chapter in Nennius relating to A. S. be correct, it was the scene of that monarch's eleventh battle, and preserves in its name a memory of the event. See *The Four Ancient Books of Wales*, p. 57.

Artichoke, the common name for *Cynara Scolymus*, a hardy, perennial, thistle-looking plant, belonging to the order *Compositæ*. It is a native of Barbary and the S. of Europe, and has long been cultivated for the sake of its excellent flower receptacle, called the 'choke,' and the bases of the fleshy flower scales, which are used as a vegetable. They have a very delicate and agreeable flavour, and are much used on the Continent, being cooked in a variety of ways. The heads of flowers, when young, are used for pickling. Its flowers curdle milk like rennet, and the plant is said to furnish a good yellow dye. The *Cardoon* (q. v.) is a closely allied species. The Jerusalem A. (q. v.) belongs to a different genus.

Article (Lat. *articulus*, Gr. *arthron*, a joint). The Greek grammarians correctly used this grammatical term, because their A. really served as a 'joint' uniting several words together; the Latins, who had no A. in their language, applied the term more loosely to any short word, whether verb, conjunction, or pronoun; but Englishmen have no excuse now for retaining it, because their 'a' or 'an' and 'the' have no articulating power. Formerly it was different, at least as far as the A. 'the' is concerned, which, in the earliest English, could be used as a relative pronoun, like the modern German *das*, and therefore had an articulating power. The best English grammars now discard the name A. from the parts of speech, and consider 'a' or 'an' and 'the' to be still what they were in the beginning, the former (*an*, 'one') a numeral, and the latter (*that*, 'that') a demonstrative adjective.

Articles, The Six, were passed through Parliament in the year 1539, in the reign of Henry VIII., when the king had become reactionary in religion. They are as follows: (1) That the Eucharist was really the present natural body and blood of Christ; (2) that the Communion under both kinds was not necessary to salvation; (3) that priests could not by the law of God marry; (4) that vows of chastity, whether in man or woman, priest, monk, or nun, must be observed; (5) that private masses must be retained as essential; (6) that the use of auricular confession is expedient and necessary. They were subsequently called the 'Bloody Statute,' because the penalties attached to their contravention sent many persons to the stake.

Articles, The Thirty-nine, is the name given to the Confession of Faith of the Church of England. The first attempt at a Protestant Confession was made in 1536 by Henry VIII., who prescribed what doctrines should be taught in the Church. According to which instructions, the Scriptures and the ancient creeds were made the standards of faith; the doctrine of justification by faith was set forth; four of the seven Roman Catholic sacraments were left out; purgatory was left doubtful; but transubstantiation, auricular confession, and the worship of saints and images were retained. The above, in substance, was what was enforced by the Bloody Statute passed in 1539, which remained in force till the end of Henry's reign. Under Edward VI. Cranmer and Ridley drew up a confession of faith (1551), which, being approved by a commission of divines and the king,

184

was published in forty-two articles. This confession, however, does not seem to have been approved by Convocation, and was not ratified by Parliament, although the king ordered it to be subscribed by all clergymen, schoolmasters, and churchwardens. But immediately after its publication Edward died; and one of the first acts of the Convocation summoned with Mary's first Parliament, was to declare that these forty-two articles had not been set forth by the agreement of that House, and that they did not agree thereto. A new confession for the Reformed Church was drawn up by Parker, Cranmer's successor in the see of Canterbury (1559), under Elizabeth. For this purpose he revised the forty-two articles of Edward VI., rejecting four entirely, substituting four in their place, and altering seventeen others. By Convocation (1562), the thirty-ninth, fortieth, and forty-second were rejected altogether; and thus the number was reduced from forty-two to thirty-nine. When they were printed, the twenty-ninth was omitted; but it was restored in 1571, in which year they were ratified by Parliament, and finally accepted as a fair declaration of the doctrine held by the Church.

Articles of War are regulations for the government of the army, including the forces in India, for the marine forces, and for the navy.

Articles of War for the Army are issued under the authority of the annual Mutiny Act (q. v.). The operation of these laws is confined to military offences, and in no way exempts the officer or soldier from the jurisdiction of the civil courts of the country; and in the event of a collision between the military and civil laws, the latter is supreme. The A. of W. relate to the duties of the soldier, to military offences, and to military rank. These articles issue directly from the crown.

Articles of War for the Marine Forces.—These articles are framed under the authority of another Mutiny Act, relating solely to the marines. They do not issue directly from the crown, but from the authority of the Lord High Admiral, or that of the commissioner for executing the duties of that office. The marines are subject to these articles only when on shore. At sea they are under the A. of W. for the Navy.

Articles of War for the Navy.—These are not framed under the authority of the Mutiny Act, but under that of the Naval Discipline (1866) Act. They are, in the letter, eminently severe; but, by the superior officers and naval courts, they are usually leniently and wisely administered.

Articulata, a name sometimes used synonymously with the newer term *Annulosa* to indicate a sub-kingdom or primary division of the animal world. The sub-kingdom is represented by worms, insects, centipedes, spiders, &c., and crustaceans. In all the body is composed of a series of joints or somites arranged in a longitudinal manner; hence the names 'A.' and 'Annulosa,' meaning 'jointed.' The outer skin may be horny or calcareous, and to the hard investment, when present, the muscles are attached. The heart, when developed, invariably lies in the dorsal or back region; the digestive system runs through the middle of the body; and the nervous system exists typically as a double chain of nerve-knots or ganglia, lying on the floor or ventral aspect of the body. The oesophagus or gullet pierces the nerve-chain at the anterior extremity of the body. The limbs are developed in pairs, and when present, are turned towards the nervous side or front of the body. The A. are divisible into the *Anarthropoda*, or Lower A., represented by the various kinds of worms; and into the *Arthropoda* (q. v.), or Higher A., represented by *Insects*, *Myriapoda*, *Arachnida* (q. v.), and *Crustacea*. The *Anarthropoda* possess no jointed limbs, the *Arthropoda* being provided with these appendages.

Articulate Sounds. See LETTERS.

Artificial Horizon is obtained by means of a perfectly calm and plane surface of a liquid (such as mercury) whose reflecting power is great. In obtaining the altitude of any object by this means, the sextant is brought as close as possible to the reflecting surface, and the true and reflected images of the object are made to coincide, so that the true angle is evidently half the observed angle.

Artificial Limbs. These are substitutes for limbs lost by accident or removed by operation. From the time of Ambrose Paré, in the middle of the 16th c., mechanicians have devoted much skill to the construction of artificial arms, hands, legs, and

feet. First constructed an arm and hand of iron, but it was so heavy that it could only be worn for a short period. The famous iron hand of Götz von Berlichingen, by which he could wield a sword, was three pounds in weight. In the beginning of the present century, Bailif, of Berlin, constructed, of lighter materials, a hand which could seize and retain an object, such as cloth, a hat, or a pen. Since that time many improvements have been effected, and motion has been secured in the elbow, wrist, and fingers, so that hands are now made by which a glass may be raised to the lips, or a pin picked from the ground. The best stump for the attachment of an artificial arm and hand includes two-thirds of the forearm. For details see a *Manual of Orthopraxy*, by Heather Bigg, 2d ed., London, 1869, pp. 134-160.

With regard to the lower limb, the first point of importance is the nature of the stump, because on it rests the weight of the body when the limb is used. In amputation above the knee, the length of stump most convenient for an artificial leg is two-thirds of the thigh. In amputation below the knee, the stump should not be shorter than one third of the leg. By careful arrangements, however, an artificial leg may be adapted to a stump only a few inches in length. In the language of orthopraxy, the part of the artificial leg which receives the stump is termed the *bucket*, the *bolts* are the various centres which fix the parts of the leg together, and around which there is axial motion; while the *springs* may be regarded as elastic motor appliances for regulating the action of the ankle and toe joints. The simplest form of leg is the common *pin* leg used by the poor, which consists of a bucket and a *pin* which reaches to the ground. Another form is the *box* leg, such as is worn by pensioners, and is suitable for amputations below the knee. It consists of a trough to receive the knee, a pin to stretch from the trough to the ground, and a shaft to fix it to the wearer's body. There are numerous other contrivances for obtaining movement at the knee and ankle. The chief of these are the Anglesea leg, contrived by the late Marquis of Anglesea, the Palmer leg, and Dr Bly's leg. The latter is an admirably constructed artificial leg, admitting of rotation and lateral action of the ankle joint, and having a self-acting spring in the knee joint which urges the leg forward in walking. For details see Heather Bigg, pp. 616-623.

Artillery is a term used with a variety of significations (1) It denotes cannon or other ordnance, (2) the shot and shell along with the cannon; (3) the body of men who manage the cannon, (4) both the cannon and the men. For a description of the larger pieces of ordnance, see the article *CANNON*. *Equipment of A* comprises the *personnel*, *matériel*, and *transport*. The different kinds of equipment are divided into *Batteries* (q. v.) for more convenience. The battery is the *tactical unit* of A.

Artillery Corps, first recognised as a distinct part of an army by Gustavus Adolphus, now occupy with all European nations as important a place as infantry and cavalry. They are divided into land-A. and marine-A., the former comprising field, garrison, and siege A., of which the field-A. is subdivided into horse and foot, and also into light, heavy, and reserve A. Military opinion has varied as to the number of guns which should accompany an army in the field, but since the Franco-German war of 1870—which was essentially a war of A.—most authorities are agreed that there should be four field guns for every 1000 infantry, and five or six horse-A. guns for every 1000 cavalry. This proportion, however, necessarily varies according to the nature of the country and the means of transport.

Artillery, Park of, is a term used to denote all appurtenances, guns, carriages, ammunition, &c., requisite for the working of A., and includes besides whatever is necessary for their repair. It does not, however, include the *personnel*, that is, the officers and men, together with the necessary smiths, armourers, wheelwrights, and other mechanics and labourers. In battle or siege the park of A. is protected from the enemy's fire, and its position is always chosen with a view to easy access. Tools and instruments for field purposes, such as intrenching and pioneering, are placed nearest the field of action, while the laboratories for the preparation of shot, shell, and other ammunition are at a greater distance.

Artillery, Schools of, are institutions for the instruction of officers in the tactics and art of A. warfare. The first school for this purpose was established by the Venetians in the beginning of the 16th c.; and soon after similar schools were founded at Burgos and in Sicily by Charles V., and in France by Louis

XIV. In 1795 the famous French school, the Polytechnic, was established. Germany has its most important school at Berlin; and Russia, Austria, and Italy have also thoroughly-equipped institutions for A. instruction. The great A. school of England is the Royal Military Academy at Woolwich, which possesses twenty-two professors and instructors. The students enter between the ages of seventeen and twenty, and are recruited by competitive examination. In connection with the Woolwich Academy are some subordinate institutions, such as the *Department of A. Studies*, and the *School of Gunnery* at Shoeburyness. See Lieutenant-Colonel Owen's *Modern Artillery* (Lond. 1871).

Artillery Company, Honourable, the oldest existing volunteer corps in England, dates as far back as the reign of Henry VIII. In 1537 that monarch granted power to three persons, who were nominated 'Overseers of the Science of Artillery,' to establish such a company for the practice of shooting both with bow and arrow and firearms. James I. and Charles I. successively ensured the preservation of shooting and shooting-grounds about London for the A. C.; and in 1638 the corporation of London presented to the company the artillery-grounds near Moorfields for military exercise. The company has never experienced actual warfare, but in 1780, during the Gordon riots, it successfully defended the Bank of England from the attack of the No Popery rabble. The members are elected by ballot, and pay an annual subscription of one guinea, besides furnishing themselves with the necessary dress and accoutrements. The corps is made up of ten companies, six of which are infantry, one grenadier, one artillery, one rifle, and one light infantry. Since 1849 the crown has appointed the officers. See Rankes's *History of the H. A. C.* (vol. 1, 1875).

Artillery, Royal Regiment of, the collective name for the whole A. of the British army, which consists of two parts, namely, the Royal A. and the Royal Horse-A. It was first formed during the reign of Queen Anne, and though greatly increased since that time, and now forming quite an army in itself, it has always constituted but one regiment. This is different from the arrangements prevailing in Germany, France, Russia, and other great powers, where the A. force is divided into numerous regiments. The foot A. of the British army consists of *heavy* and *light* A., the former for siege-work or the defence of fortified places, the latter for field-work. The horse-A. accompanies the cavalry, and is provided with much lighter guns. The former is divided into brigades (Nos. 1 to 25), the latter into six brigades, named according to the first letters of the alphabet. The army estimates of 1874-75 show for the horse-A. a force of 5711 men, of which 242 are commissioned officers, and for the foot A. a force of 29,055, of which 1159 are commissioned officers, thus indicating a total force of 34,766. In 1877 it was resolved to reorganise the 'regiment' by grouping the batteries irrespective of the brigade system.

Artiodactyla, a section of Ungulate or Hoofed quadrupeds, represented by the hippopotami, the swine, and all ruminants, and characterised by the fact that the included animals possess an even number of toes—two or four. The third toe on each foot forms a pair with the fourth toe. The vertebrae of the back and loins (dorsal and lumbar) collectively number nineteen. When horns exist, they are invariably developed in pairs. The stomach is generally of complex or compound nature. The A. are divided into the *Omnivora* (hippopotami and swine) and *Ruminantia* (sheep, oxen, deer, antelopes, camels, giraffes, &c.).

Artocarpus, an order of Dicotyledonous plants found in tropical countries, and abound in a milky juice. The genus *Artocarpus* is the type of the order. *A. incisa* is the Bread-fruit (q. v.) of the South Sea Islands; and *A. integrifolia*, the Jack (q. v.) of the Indian Archipelago, which is a favourite food among the natives. *Galactodendron utile* is called Palo de Vaca, or cow-tree, in Demerara, from its nutritive juice being used as milk. *Antiaris toxicaria* is the source of the famous poison called Bohun or Pohon upas. See UPAS. *A. saccharosa* is the sacker-tree of the W. Indies. The wood of *Pithecellobium guanensis* is the snake wood or letter-wood of Demerara. The seeds of many of the A. are eaten. *Brosimum alcastrum* yields bread-nuts, which are a nutritious and agreeable food when boiled or roasted.

Artois, a former province in the N.W. of France, now chiefly represented by the department of Pas-de-Calais. It was made a county in 1239 by Louis IX., afterwards belonged to the Counts of Flanders and Dukes of Burgundy, but was finally ceded to France in 1678. Charles X. for some time bore the title Count d'A. Arras (q. v.) was the capital. Artesian wells derive their name from A., where they were known in early times.

Arts, Degrees in. On the institution of universities in the middle ages, the 'Faculty of A.' comprised the students in science and philosophy, in contradistinction to those in the faculties of theology, law, and medicine. The 'A.,' or 'liberal A.' were seven: grammar, logic, rhetoric (the *Trivium*); music, arithmetic, geometry, and astronomy (the *Quadrivium*). Originally a teacher was a Master or Doctor, but the former term came to be appropriated by the teacher in the 'A.' When it became necessary for every teacher to establish his fitness for his office, examinations were instituted, the result of which was to class the candidates in different 'grades' or 'degrees.' The initiatory degree of *Bachelor* (q. v.) was instituted by Gregory IX. (1227-41). The *master*, who had a further and higher examination to undergo, was not only entitled but required to teach—a practice long discontinued. See **DEGREE**.

Art Unions are associations for the purchase of pictures to be distributed by lot. They originated in France early in the present century, and were subsequently extended to Belgium, Germany, England, America, and other countries. The first important Art Union was that of Mechlin or Malines (1811); but Munich Art Union (1823) became the model for most Continental institutions of the kind, though in point of importance it is now far surpassed by that of Düsseldorf (1829). In England the first Art Union was founded at Liverpool (1834), and was followed in 1836 by the London and Scottish A. U. In the same year appeared a 'report,' issued by a select committee of the House of Commons, appointed 'to inquire into the best means of extending a knowledge of the arts and of the principles of design among the people (especially the manufacturing population) of the country.' In pursuing this inquiry, the attention of the committee was drawn to the '*Kunst-Vereine*,' or A. U. of Germany. 'These associations, for the purchase of pictures to be distributed by lot,' say the committee, 'form one of the many instances in the present age of the advantages of combination. The smallness of the contribution required brings together a large mass of subscribers, many of whom, without such a system of association, would never have been patrons of the arts.' Before this committee Waagen was examined, and this eminent authority on artistic matters highly estimated the advantages conferred on the arts by such associations, which had prospered in Prussia since their first introduction there by the king and his minister Humboldt. Ten years after the issue of the report referred to the A. U. Act (9 and 10 Vict. c. 48) was passed. It exempts societies which have been formed for the distribution of works of art from the operation of the Lottery Laws; but it was opposed by Sir R. Peel, who entertained great doubt whether these A. U. had a tendency to encourage a high style of art. The Act might lead to an increased demand for inferior productions, but he did not think it would encourage any productions which might not be dispensed with without any great detriment to the interests of the arts. In June 1866 appeared the 'Report from the Select Committee on Art Union Laws, together with the Proceedings of the Committee, Minutes of Evidence, and Appendix.' This most valuable document traces the history of the chief A. U. of the country, and arrives at the deliberate conclusion, on the evidence of a number of eminent artists and other witnesses, that these associations are not of any real benefit to art or artists. 'The tendency of A. U. has been to foster the love of chance and speculation rather than to encourage high art.' And while these institutions have failed to further the advancement of art, that object has been attained, so far as it is possible to attain it, by quite other institutions—namely, Schools of Design (q. v.) and Art Exhibitions (q. v.). 'The London Art Union, and the Glasgow Art Union,' says the report already named, 'are superior to all the others, for each subscriber annually receives an engraving or book of prints to the full nominal value of his subscription. A considerable profit or surplus remaining over to the credit of the society, the surplus is expended in buying pictures, or in producing statuettes, bronzes, medals, and chromo-lithographs, for distribution by lot. The average value of prizes in the London

Art Union is £32. 10s. The chance against winning a prize is 99 to 1. In the year 1859 the chance against winning a £35 prize was 144 to 1. In the Shilling A. U. the average value of prizes is from £5 up to £15. In the Birmingham Shilling Art Union, the chance against winning a £15 prize, in 1859, was 325 to 1. The expenses of the Shilling A. U. generally swallow up at least 50 per cent. of their revenues. The London Art Union has, since its commencement, received £326,100 in subscriptions, while it has given £165,697 to the public in prizes, besides £86,260 worth of engravings distributed to the subscribers. Shilling subscriptions to A. U. were not heard of until 1858. The Liverpool Shilling Art Union was found to engender so much evil that the artists of Liverpool entirely withdrew from it. Like all the other Shilling A. U., it was a mere lottery, worked by the secretary for his own profit. The secretary was paid £500 a year, and he also received large sums of money for clerks and 'office expenses.' There was no check upon the sale of tickets, and each prizeholder received from the secretary a prize, the value of which was not more than half the amount supposed to have been won. It was, moreover, always doubtful whether a ticket obtained even the chance of a prize, for it could never be ascertained whether every ticket had been put into the wheel. The percentage of expenses to receipts in the Shilling A. U. was very high, amounting to as much as 50 per cent. The expenses consisted partly of commissions to agents, and partly of the cost of advertising; they were in some measure due also to frauds by local agents. As the expenses were so great, it follows that the public paid twice as much for their shares as those shares were worth. It having clearly appeared from the evidence taken by the Royal Commission of 1866 that the Shilling A. U. were by no means beneficial to art, and were, moreover, liable to gross abuses of management, certain conditions were proposed for their better regulation, but it remains to be seen if they will prove successful.

Artvin, a town in the vilayet of Trebizond, Asiatic Turkey, 100 miles E. of Trebizond, with a trade in oil, honey, wax, and butter. Pop. about 6500, the majority of whom acknowledge the authority of the Bishop of Rome.

Arum, a genus of Monocotyledonous plants of the order *A. Zea*, characterised by having a large spathe enclosing the flowers. All the species of A., and those of allied genera, possess a similar combination of acrid properties, along with starchy matter, which can be separated, however, from the poisonous matter by means of water or heat. *A. maculatum* is a British species found in damp woods and under hedges, it is commonly called cuckoo-pint, lords-and-ladies, or wake-robin. At one time it was extensively cultivated in the Isle of Portland for the preparation of arrowroot, which was obtained from its corms, and sold under the name of Portland arrowroot or sago. The plant is still cultivated in India for food, the acidity being got rid of by boiling. In Switzerland its corms are used as a substitute for soap; and in France the cosmetic called cypress powder is prepared from them. *A. Indicum* is also cultivated in some parts of India for its esculent stem and corms. *A. Italicum* is found in the Isle of Wight. The corms of *A. montanum* are employed in India to poison tigers. *A. Dracunculus* or dragon-plant has a snake-like spotted stem, and is commonly cultivated in British gardens as an ornamental plant. A large amount of heat is given off from the flowers of different species of A. during the period of flowering.

Arum maculatum.

Arundel, a market town of Sussex, on the Arun, 5 miles from its mouth, and 19 miles W. of Brighton. It consists chiefly of a long, steep street, rising to the brow of a hill crowned by a castle, the ancient residence of the Dukes of Norfolk. The river is navigable for small vessels, and is here crossed by a stone bridge. There is some export trade in timber, bark, and corn. Pop. (1871) 2956. The castle is a Norman structure,

covers 5½ acres, and has a massive dungeon-keep. During the civil wars it was destroyed, but it has in late years been restored, and is still the Norfolk family residence.

Arundel, Thomas, Archbishop of Canterbury, second son of Richard Fitzalan, Earl of Arundel, was born at Arundel Castle, Sussex, 1253. At the age of twenty-one he was consecrated Bishop of Ely, in 1286 was appointed Lord High Chancellor of England, and was raised to the primacy in 1296. Richard II., having struck a sudden blow at the party of the Duke of Gloucester, A., a chief supporter of the duke, was condemned to exile, and fled to Rome. It was A. that urged Gloucester's nephew, the Duke of Hereford (afterwards Henry IV.) to undertake that invasion of England which resulted in the deposition of Richard, and in his own restoration to the see of Canterbury in 1399. He was a fierce persecutor of the Wickliffites. The Act for burning heretics (*De Heretico Comburendo*), 'the first legal enactment of religious bloodshed which defiled our statute-book' (Green's *Short History of the English People*, p. 258), was passed during the reign of Henry IV., and vigorously worked by A. and his brother bishops. A. also forbade, by synodal decree, the translation of the Scriptures into English. He died February 20, 1413.

Arundel Marbles, the remains of a collection of ancient sculpture formed by Thomas, Earl of Arundel, early in the 17th c., and presented by his grandson, afterwards Duke of Norfolk, to the University of Oxford in 1667. The collector—the earliest liberal patron of the fine arts among the aristocracy of England—employed Evelyn (q. v.) and Petty to procure for him the best obtainable examples of ancient art. His magnificent collection of sculpture, embracing 37 statues, 128 busts, 250 inscribed marbles, &c., was disposed of after his death, together with his other collections. The gems were purchased in Venice for £10,000. The A. M. bequeathed to Oxford include the 'Parian Chronicle,' fragments of an inscription in marble, said to have been executed at Paros, 263 B.C., and, in its complete state, containing a record of the great events of Greek history from the time of Cecrops (1582 B.C.) to that of Mogenetus (264 B.C.).

Arun'do, a genus of grasses. See REED.

Ar've, a tributary of the Rhone, which it enters immediately below the Lake of Geneva, rises on Mont Blanc, and flows through the famous valley of Chamouni. It has a course of 50 miles, is a violent Alpine stream (according to Coleridge 'raves ceaselessly'), and is liable to sudden and destructive floods.

Arvic'ola. See VOLE.

Aryan is the name now applied to a group of languages and of races which formerly went under the name of Indo-European, or Indo-Germanic. It is derived from a Sanskrit word *arya*, which in the later Sanskrit means 'noble,' 'of a good family,' but which was originally a national name, being preserved in the Sanskrit name for India, *Aryavarta* ('the abode of the Aryans'), and in the Zend, *Airya*, which in the Zend-avesta of the Zoroastrians means 'venerable,' and is also the name of the people. The knowledge of the family relationship which exists among the different languages belonging to this group we owe to the genius of Schlegel, Humboldt, Bopp, &c., following up the discovery by Wilkins, Jones, and Colebrooke, some ninety years ago, of Sanskrit, the ancient sacred language of the Hindus. The discovery made by these men, which so completely revolutionised the views formerly entertained of the ancient history of the world, was this, that Sanskrit, Zend, and the languages of the Greek, Roman, Celtic, Teutonic, and Slavonic races were all varieties of a common type, and stood in the same relation to each other as the Romance languages do as dialects derived from the Latin. 'They all count with the same numerals, call their individual speakers by the same pronouns, address parents and relatives by the same titles, decline their nouns upon the same system, compare their adjectives alike, conjugate their verbs alike, and form their derivatives by the same suffixes.' The classification of the languages thus related, as given by linguists, is as follows: 1. The *Indic*, or Sanskrit, from which were derived the Prakrit dialects, partly seen in Pali, and finally corrupted into the modern Hindi, Hindustani, Mahratti, and Bengali. 2. *Iranic*, comprising Zend, Old and Modern Persian, Kurdish, Armenian, &c. 3. *Græc*: Classic and Modern. 4. *Italic*: Umbrian, Oscan, Sabine, Latin,

and, derived from the last, Italian, French, Spanish, Portuguese, Provençal, Rumanic. 5. *Teutonic*: (1) Low German, including Gothic, Anglo-Saxon, Old Saxon, Old Frisian; (2) Old High German; (3) Old Norse: with the existing forms of these three Teutonic dialects—English, Dutch, German, Danish, Norwegian, and Swedish. 6. *Slavonic*: Russian, Bulgarian, Polish, Bohemian, Illyrian. 7. *Lithuanian*: Lettish, Old Prussian. 8. *Celtic*: Welsh, Erse or Gaelic, Manx, Breton, Cornish.

The original home of the ancestors of the A. races, who spoke the primitive language from which all these cognate languages, with their derived dialects, sprung, is held by universal consent to have been the plateau of Central Asia. From this region the various tribes migrated at different times, those furthest W. in Europe probably going first, as is indicated by their languages having a fainter family likeness to the primitive language than have those of the tribes who settled in the East. The tribes that remained behind split into two parts, the one going S.E., the other S.W., and taking possession of India and Persia respectively.

Arzigna'no, a town in the province of Vincenza, N. Italy, with manufactures of woollens and leather, and a trade in wine and cattle. Coal and lime abound in the neighbourhood, and brickworks have also been established there. Pop. 7287.

As, a Roman pound; also a bronze coin, originally weighing a pound, though afterwards reduced to 1-48th, and even to 1-60th of a pound. Its value varied from three farthings to a halfpenny, and the oldest form bore the figure of some animal (*pecus*), whence, it is said, *pecunia*, money, is derived.

A'sa, son of Abijah, and third king of Judah, succeeded to the throne in 956 B.C. He was so zealous a rooter out of idolatry, that he deposed his grandmother Maachah from the important and influential position of 'king's mother' for having set up an 'idol' (literally, a 'horror') in a grove (1 Kings xv. 13). He set himself to fortify frontier cities, and levied an army of 580,000 men (according to 2 Chron. xiv. 8), with which he utterly routed the host of Zerah the Cushite, who had invaded Judah. A peace of twenty years followed, which was broken by Baasha, a king of Israel, against whom A. purchased the aid of Benhadad of Damascus with the treasures of the temple. For this he was censured by the prophet Hanani. A., whose heart is said to have been perfect with the Lord all his days, died in 916 B.C.

Asadul'cis, a plant belonging to the genus *Thapsia*, of the natural order *Umbellifera*, a native of the S. of Europe, which was valued by the ancients as an antispasmodic, diuretic, and purgative. It is not used in modern medicine.

Asafoetida, a drug formed of the concreted milky juice of *Narthex A.* (q. v.), and of that of various species of *Ferula* (q. v.),

two genera of Umbelliferous plants. It is imported from Persia and Afghanistan, and is largely used in medicine. It possesses stimulant and antispasmodic properties, and is employed as a stimulant in hysteria with excellent effect, and also in cases of flatulence and chronic catarrh. It has a disgusting odour, which is a serious impediment to its use, although the Persians use it as a condiment, and call it 'food of gods,' in strange contrast to 'devil's dung,' the popular name for it in this country.

Narthex asafoetida.

A'saph, St., a cathedral city, near the confluence of the Clwyd and Elwy, in Flintshire, Wales, 15 miles N.W. of Flint. It stands on a slight hill, in the richly-wooded vale of Clwyd. The cathedral—a miniature building—was erected in 1480, on the site of a wooden church said to have been founded in the 6th c. by Kentigern. With the Flint district burghs St. A. returns one member to Parliament. Pop. (1871) 1900.

St A., from whom the place takes its name, is traditionally reported to have been its first bishop, but we know almost nothing about him, and have no proof that he is the author of the writings attributed to him—viz., the *Ordinationes Ecclesie Sancti Asaphi*, and the *Vita Sancti Kentigerni*, contained in the first volume of the *Acta Sanctorum*.

Asarabacœs, the common name for *Asarum Europæum*, a plant doubtfully native in Britain, belonging to the natural order *Aristolochiaceæ*. Its roots and leaves are acrid and aromatic. Formerly A. was much used as a purgative and emetic. The powdered A. is employed in cephalic snuffs, to promote sneezing. In France it is called *cabard*, from its common use by drunkards to produce vomiting.

Asarum, a genus of Dicotyledonous plants of the order *Aristolochiaceæ*. *A. Europæum* is the most important species. See **ASARABACCA**.

As'ben. See **ARZ**.

As'calon, or **Ashkelon**, once a city of Palestine, on the Mediterranean, 36 miles W.S.W. of Jerusalem. Remains of the walls of a palace, and of some churches, still exist. Anciently one of the five cities of the lords of the Philistines, it came early into the possession of the tribe of Judah. It was embellished by Herod the Great, was long under the dominion of Rome, and was taken by the Arabs in the 7th c. After being repeatedly captured by Crusaders and Moslems in turn, it was utterly destroyed by Sultan Bibars in 1270. Near A. was the temple of Derecto, the Syrian Venus, and 'within the walls and towers now standing Richard (of England) held his court' (Stanley's *Sinai and Palestine*, p. 257). The neighbourhood is celebrated for its cypresses, figs, olives, pomegranates, and bees.

As'caria. This is a genus of intestinal worms which infests the alimentary canal of man and many other animals. It belongs to the group of *Nematoda*, or round worms. The one most common in man is *A. lumbricoides*. It resembles the common earthworm in size and general appearance. The body is smooth, tapering at both ends, and marked by many fine transverse rings. At the anterior extremity there is a mouth, surrounded by three small papillæ. The male worm is from 4 to 6 inches in length, while the female attains a size of from 12 to 14 inches. The manner in which the young enter the human body is not known; but it is generally held by naturalists that the ova are matured in water, and the young enter the body probably by direct transference from river or pond water. These worms do not usually exist in great numbers in the intestinal canal, but Küchenmeister mentions the case of a child which harboured about 400 of these worms. Their habitat is the upper part of the small intestine, and occasionally they reach the stomach, and may be dislodged by vomiting. One or two worms in the intestinal canal of a child produce usually no bad effects; but cases are on record in which these creatures have perforated the wall of the bowel, and passing into other cavities, have given rise to serious disease, and even death. The most effective remedy for their dislodgment is santonine, the active crystalline principle of *Artemisia Santonica*, a species of wormwood. Children may have from one to three grains of this substance twice or thrice daily, until six or eight doses have been taken, after which a small dose of castor oil should be administered. For further details see **INTESTINAL WORMS**. A variety of A. infests the cat, called *A. mystax*, the development of which has been carefully studied. See *Entozoa*, by Dr Spencer Cobbold, London, 1864, pp. 316-331.

Ascen'sion, a solitary island in the S. Atlantic, about 800 miles N.W. of St Helena, nearly midway between Africa and Brazil. It is 8 miles long and 8 broad; area, 35 sq. miles. A. was discovered by the Portuguese in 1501, on Ascension-Day, it is said, whence its name. It is of volcanic origin, rocky, and desolate, with one peak 2870 feet high. In 1815, when Napoleon was confined at St Helena, the English took possession of the still uninhabited island as an additional security against attempts to liberate their illustrious prisoner. Its productions are the tomato, castor-oil plant, and pepper; exports chiefly turtle and birds' eggs. Pop. about 400, mostly military.

Ascension, Right, in astronomy, is the arc of the equator intercepted between the first point of Aries and the point at which the circle of declination, passing through the star, inter-

sects the equator. It thus corresponds to longitude upon the earth. The old terms, *oblique ascension*, and *ascensional difference*, were given respectively to the R. A. of the point of the equator which rose simultaneously with the body, and to the difference between the oblique and right ascensions.

For the method of determining R. A. see **TRANSIT INSTRUMENT**.

Ascension-Day, or **Holy Thursday**, an ecclesiastical festival in commemoration of the ascension of Christ, held on the second Thursday before Whitsunday. It has been observed, as some believe, from the 1st c. of the Christian era. The Roman Catholic and Anglican Churches still observe it. On A.-D. parochial processions were made to fix the boundaries, a practice still continued in some places. This was called *riding the marches*.

Asceticism is generally regarded at the present day as a peculiar product of Christianity, its advocates finding a complete justification of the practice, as well as the explanation of its prevalence, in Matt. xix. 21 and 1 Cor. vii. 37. But although it undoubtedly formed the foundation on which the systems of penance and monasticism were reared, its roots are to be found in certain beliefs regarding the nature of the universe and of man which prevailed before the origin of Christianity, and which were properly opposed to the spirit of that religion. It sprang, in short, from the belief, which was so characteristic of the Eastern systems of philosophy and religion, that all matter was essentially impure and evil; that the human soul, formed of the purest ether, was fettered by the impure body; and that the only means of purifying the soul and attaining to communion with God was deliverance from the contamination of matter, from flesh and lust. The practice to which this belief naturally gave rise was abstinence from all gratification of the senses and appetites, and a general mortification of the body. Accordingly practices of this kind, of various degrees of intensity, have prevailed among religious devotees in the East from a remote antiquity down to the present day.

The Jews were to some extent infected with dualistic notions during their captivity in Babylonia, and it is probably as an outcome of these that we find various ascetic practices among certain of their sects. A. was one of the characteristics of the Pharisees, and in a much more extreme degree of the Essenes. Ascetic practices were early developed in the Christian Church, the corruption in this direction being directly fostered by the influence of the Neo-Platonic philosophy, according to which a distinction was made between two modes of living—the one, 'according to nature,' for ordinary persons; the other, 'above nature,' for those who aspired to a higher degree of virtue. The rule prescribed for the latter was, that the soul ought to be withdrawn as far as possible from the debasing influence of the body, and that therefore all sensual gratifications were to be avoided, and the mind to be absorbed in contemplation. In imitation of this the Christian teachers, early in the 2d c., prescribed a twofold rule of holiness—the one lower, for ordinary persons; the other higher, for those who sought to attain to a higher standard of holiness here and higher glory hereafter. This, again, soon gave rise to a class of persons who professed to strive after that higher degree of holiness, and therefore supposed many things to be forbidden to them which ordinary Christians could enjoy, such as flesh, wine, matrimony, and business. They were called ascetics (Gr. *askētes*), from practising (*askēo*, to practise or exercise) severe religious exercises. Ascetics, then, were the genus from which sprang the different species, Monks (see **MONASTICISM**), Anchorites (q. v.), Cœnobites (q. v.), Eremites (q. v.), Stylites (q. v.), &c.

In the after-history of the Church, A., turning chiefly on celibacy, poverty, and mortification of the body, formed the basis of all the rules of the various orders of monks and friars, and also of penance, which occupied such an important place in the doctrine of the Church. The Reformation, the fundamental principle of which was that salvation is secured by justification through faith alone, and not through dead works, struck at the root of A. Nevertheless it has continued to manifest itself in various forms even among Protestants. The Shakers maintain the practice of celibacy, and generally among evangelical Christians crucifying the flesh, a phrase of Paul's which, like a great deal more of his language, has a remarkable affinity with the philosophy of the Alexandrian Philo, is regarded as a highly spiritual exercise.

Asch, a town in the W. of Bohemia, near the borders of Saxony and Bavaria, on the Ascha brook, at the foot of the Hainberg, with manufactures of cotton, linen, hosiery, woollens, leather, and paper. Pop. (1869) 9405.

Aschaffenburg, a town in the Bavarian circle of Lower Franconia, on the right bank of the Main, where it receives the Aschaff, 20 miles S.E. of Frankfort, and on the railway from Bamberg to Frankfort and Darmstadt. It is the seat of a court of appeal for Lower Franconia, and of various other government offices. A. is surrounded by walls, and the streets are steep and narrow, but the situation is pleasant; and the environs (e.g. the *Schönenthal*, the *Fasanerie*, the *Schöne Busch*, with a royal *Lustschloss* and orangery) are noted for their beauty. It is overlooked by the castle of Johannisberg, built by the Elector of Mainz (Johann Schweikhardt) between 1605 and 1614. A. was founded before the Roman invasion of Germany, and its municipal existence dates from before the 9th c. It has a collegiate church, founded in 974 by Otto I., Duke of Swabia and Bavaria, and a valuable library, rich in *incunabula* and copper engravings. The town has now considerable trade in wood, building-stone, tobacco, and wine; and its coloured papers are noted. In the war of 1866 it was the scene of a battle between the Prussians and the Austrians, in which the latter were defeated (July 14). Pop. (1872) 9212.

Ascham, Roger, a writer who merits equal praise for the purity of his English and the beauty of his Latin prose, was a native of Yorkshire, and was born at Kirkby-Wiske, near Northallerton, in 1515. At the age of fifteen he entered St John's College, Cambridge, then the most famous school of learning in England, and threw himself with ardour into the revolutionary movement in favour of the Greek classics which had now reached Cambridge. Though he had many brilliant contemporaries during his academic career, none became a more illustrious scholar. At the age of eighteen he took the degree of B.A.; was elected a fellow of his college a month later, and soon became the foremost Greek tutor of his day. From 1539 to 1541 he held a mathematical lectureship, but in spite of his great reputation for scholarship, the suspicion of heresy in religion—of Protestantism, in fact—appears to have at this period hindered his success, and for some years he was unhappy and straitened in his circumstances. But his letters show that he mixed himself up in every strife great and small that broke out in the university, and this may have added to his embarrassments. Meanwhile he had commenced his first work, *Toxophilus, the Schole of Shootinge conteyned in two Bookes*, which appeared in 1545 with a dedication to Henry VIII. The king granted him a pension of £10, and in the year following A. succeeded Cheke as public orator at Cambridge, in which capacity he had to write all the public letters of the university, a task for which he was eminently qualified, as he was one of the best penmen of his age, and acted as writing-master to Prince Edward and the Princess Elizabeth. During 1548-49 he was classical tutor to the latter, and in 1550 he proceeded to the Continent as secretary to the English embassy to the court of Charles V. Here he remained for three years, Augsburg being his headquarters, though some of his letters are dated from the Tyrol, Carinthia, and the Palatinate. The result of his foreign observations was his *Report and Discourse of the Affairs and State of Germany, and the Emperour Charles the Great*, probably written from Spire in 1552, in which year it was printed, and again in 1570. During the reactionary reign of Mary, A. not only managed to escape the ordeal of a 'recantation,' but actually obtained the office of secretary to the queen. Cardinal Pole, himself a fine scholar, admired and availed himself of A.'s accomplishments, and, in short, he was as great a favourite as if he had always been a sound Catholic. When Elizabeth ascended the throne, he was continued in his office; but in spite of a fair salary, a pension, a canonry, the lease of a farm, and other sources of income, his letters indicate a desire or a necessity for more money, the reason of which is not easy to ascertain. In 1563 he was invited to write the *Scholemaster* by Sir Richard Sackville, but left the work unfinished at his death, 30th December 1568. It was published by his widow in 1570, and has been frequently reprinted. By far the best edition is that of Mayor (Lond. 1863). Although an exquisite Latin scholar, as his letters and poems show, the fame of A. now depends on two

of his English works, the *Toxophilus* and the *Scholemaster*, the latter of which is incomparably the more important in regard to its matter. It is a treatise on the best methods of educating, with some excellent criticisms on Latin authors, and is written in unadorned, yet graphic and idiomatic, English. There have been two collections of his English works—one by Bennet (Lond. 1761), with a life by Dr Johnson, and another by Cochrane (Lond. 1835); but the best and the only complete edition of his entire writings is that by Dr Giles in the *Library of Old Authors* (Lond. 1865, 3 vols.).

Ascheraleben, a town of Prussia, province of Saxony, district of Magdeburg, on the Elbe, about 50 miles N.W. of Leipzig and 32 S. of Magdeburg. It is the chief town of a district of the same name, and has several industries of growing importance. Its chief manufactures are woollens, lincens, machinery, and paraffin oil, and it also possesses beetroot-sugar factories, breweries, and potteries. About 2 miles from A. is Wilhelmshof, and still nearer are some ruins erroneously supposed to be the remains of the old town of Askanien, the original home of the house of Anhalt. Pop. (1872) 16,734.

Asciá'no, a town in the province of Siena, N. Italy, 12 miles S.E. of Siena, on the S. bank of the Ambrone. Pop. 2082.

Ascid'ian, the popular name applied to Molluscous animals belonging to the class *Tunicata*, and familiarly known as 'sea-squirts.' The genus *Ascidia*, which may be taken as a familiar and typical form, is represented by many examples on our shores. The name 'Ascidia' is derived from the Greek *askos*, a wine-bottle or wine-skin, and has been applied to these animals in allusion to the form of the body, enclosed in its *tunic* or investing sac, with its double apertures or 'necks.' The one neck or aperture corresponds to the mouth, which leads into a large ciliated chamber, the *branchial chamber* or breathing organ of these animals. The gullet and stomach are continued from this breathing chamber, the intestine terminating in a second sac or chamber lying parallel with the first, and known as the *atrial chamber*. Water is admitted to the branchial chamber for breathing purposes, and after being so used, passes to the atrial chamber, with which the breathing sac is in communication. The effete water of respiration is ejected from the branchial chamber by the second neck of the sac or second opening of the body, known as the *atrial aperture*. The water being sometimes expelled forcibly in a jet, has procured for these forms their popular name of 'sea-squirts.' Food is brought to the digestive system in the water admitted to the breathing sac. The heart exists as a simple tube, and is capable of propelling the blood either to or from the heart—the circulation being thus periodically reversed. Tentacles fringe the inner opening of the mouth. The nervous system consists of a single mass or ganglion of nervous matter lying between the two apertures of the body, and from this nerves radiate to the various tissues. These animals are found round our coasts, attached and rooted by one extremity to rocks and stones. Some species are of considerable size—one Mediterranean species (*Cynthia microcosmus*) being used for food. The outer *tunic* or coat of the body is composed in greater part of *cellulose*, a substance nearly identical with starch, and largely found in vegetables. The inner coat or *mantle* is muscular, vascular, and highly contractile, and is the agency whereby jets of water are expelled. *Ascidians* may be *simple*, *social*, or *compound*. The young appear at first as swimming tadpole-like bodies, which sooner or later lose their tail, and fix themselves. The further structure and classification of these forms will be found in the articles MOLLUSCA and TUNICATA, &c.

Ascites, a term denoting a swollen, tense condition of the abdomen, due to the accumulation of an excessive quantity of watery fluid in the cavity of the serous membrane by which the abdomen is lined. This membrane is called the peritoneum. The blood circulating through the alimentary canal from the stomach to the rectum has to pass through the liver before it re-enters the general circulation. The veins of the abdominal viscera unite to form a great vein going to the liver, termed the *vena porta*. The *vena porta* conveys the blood to the liver, and from the liver it reaches the general circulation by another vein termed the *hepatic vein*. Any obstruction, therefore, to the flow of blood through the liver will speedily produce A., and any obstruction to the general circulation, by preventing blood from

passing freely from the liver, will ultimately have the same effect. Accordingly A. may be caused by disease of the liver, by pressure on the portal or hepatic veins, by disease of the kidney, and by disease of the heart. The most common cause is disease of the liver. The treatment is to remove the cause if possible. If this cannot be done, temporary relief may be obtained by draining away the fluid by purgatives, or by stimulating the functions of the kidney. If the accumulation be so rapid as not to be quickly enough removed by these means, then it must be removed by tapping. This consists of pushing through the wall of the abdomen a cylindrical instrument called a trocar, having a sharp point, and carrying on it a tube known as a canula. The trocar is withdrawn and the canula left, and through it the fluid escapes. This may have to be done repeatedly. The relief is usually temporary, and the patient sinks from exhaustion.

Asclepiadaceæ, an order of Dicotyledonous plants, embracing fully 1000 species, inhabiting chiefly warm and tropical regions; but many extend to northern climates, although absent in Britain. The plants of the order have acrid, purgative, emetic, and diaphoretic properties. Many of them have a milky juice, which is usually bitter and acrid; but occasionally it is bland, and used as milk, as in the cow-plant of Ceylon (*Gymnema lactiferum*). The fragrant roots of *Hemidesmus Indicus* are used in Madras as a substitute for Sarsaparilla (q. v.). The bark of the root of several species of *Calotropis* furnishes a substance called Mudar (q. v.), which is used as a diaphoretic in India. *Cynanchum montepelliacum* furnishes Montpellier scammony, and *Periploca mauritiana* Bourbon scammony. These act as purgatives, and are used to adulterate true Scammony (q. v.). Various species of *Asclepias* (q. v.) are of economic value. The leaves of a species of *Solenostemma* are used to adulterate Alexandrian senna. See ARGEL. *Marsdenia tinctoria* and *Gymnema tingens* yield a dye like indigo. Species of *Stapelia* are called carrion flowers, from their fetid odour. *Hoya carnosa* is a beautiful climber, cultivated in hothouses under the name of wax-flower.

Asclepiades, a Greek physician, who flourished in the 1st c. B.C., but the precise date of whose birth or death is unknown. He was a native of Prusa, in Asia Minor, and finally settled at Rome. It is not wonderful that he proved a popular practitioner, for he maintained that a physician ought to cure his patients surely, swiftly, and agreeably. But if he was the first to recognise the distinction between chronic and acute diseases, he deserves to be honourably remembered in the history of his science. Gumpert has collected and edited the *Fragments of A.* (Weimar, 1798). A little poem, *Præcepta Sanitatis*, which has come down to us under his name, but which probably belongs to the 7th c., has been published by Welz (Wurz, 1841).

Another A., surnamed Sikelides, from his father, Sikelos, was the friend and contemporary of Theocritus. His name is attached to thirty-nine epigrams, mostly erotic, in the Greek anthology; and a certain kind of verse (of which Horace furnishes examples), beginning with a spondee and ending with an iambus, is named from A., *Asclepeidian verse*.

Asclepias, a genus of plants called swallow-worts, belonging to the order *Asclepiadaceæ* (q. v.). The species are mostly found in America, are Herbaceous plants, with milky juice, and are all more or less poisonous. *A. Syriaca* is misnamed, being a native of America, and not of Syria, as was supposed, and is commonly called Virginian swallow-wort. In Canada its young shoots are used as asparagus. *A. tuberosa*, butterfly-weed, or pleurisy-root, is used in N. America as a cathartic and diaphoretic. *A. Curassavica* is called wild ipecacuanha in the W. Indies, from its emetic properties. The *Soma* plant, referred to as an object of adoration in

Asclepias.

the Sanskrit Vedas, is supposed to be a species of A.

Ascoli (anc. *Asculum Picenum*), the capital of the province of Ascoli-Piceno, Central Italy, on the river Tevere, 16 miles W. from the Adriatic, and 15 N. of Teramo. It has a strong military position on the crest of a hill, with a splendid view towards the Apennines. Its chief manufactures are glass, majolica, silk, and leather, and its port, at the mouth of the Tronto, has considerable coasting trade. Pop. (1872) 22,937. A. was anciently the chief city of the Piceni, and was taken in 268 B.C. by the Romans. By the murder of Q. Servilius in 90 B.C., it gave the signal for the outbreak of the Social War, in which the town suffered severely. In 1426 Pope Clement V. united A. to the Papal States.

Another A., known as *A. di Satriano*, a town in the province of Foggia, on the E. slope of the Apennines, about 40 miles from Beneventum, is the ancient seat of a bishop, but is mainly famous as the scene of a great battle of two days' duration, B.C. 279, between Pyrrhus and the Roman consuls P. Sulpicius and P. Decius, in which the former was victorious, but with such heavy loss that he is reported to have said, 'Another such victory and I must return to Epirus alone.'

Aselli, **Asellio**, or **Asellius**, Gasparo, an Italian physician, was born at Ticino or Cremona about 1580, and died at Milan, February 14, 1626. His great merit lies in his discovery of the lacteal vessels, which he first observed while dissecting a living dog in 1622. His results were published by his friends and fellow-physicians, Alessandro Tadino and Septalius, in a book entitled *De Lactibus, seu Lacteis Venis, Quarto Vasorum Mesaraicorum Genere, Novo Invento, Dissertatio* (Mil. 1627).

Ases. See AESIR.

As'gill, John, pamphleteer, born about the middle of the 17th c., and studied at Lincoln's Inn. His penchant for pamphlet writing involved him in continual pecuniary embarrassments. In 1699 he passed over to Ireland, then filled with litigation arising from disputes as to forfeited estates, hoping to find scope for his legal talents; and in this he was not disappointed. He was soon after elected a member of the Irish Parliament, but was, four days after, expelled on the ground of blasphemy contained in a tract published in 1700, in which he had attempted to prove that 'man might be translated into eternal life without passing through death.' In 1705, returning to England, he was elected member for Bramber, in Sussex, but expelled 18th December 1707, for the same blasphemous allegation. The last thirty years of his life were spent between the Rules of the Fleet and of the King's Bench. He died in November 1738, getting up pamphlets to the last.

Ash, or **Ashes**. On the complete incineration of any organic body, either animal or vegetable, an incombustible A. always remains, to which the term A. is applied. The A. is as essential to the organised body as is the organic matter, and it is difficult to draw a clear line of separation between the two. Generally it may be said that organised matter is, or may be, derived from the atmosphere, whereas A. invariably comes from the earth. Compounds of potash, soda, and lime, with phosphoric and other acids, are the most abundant constituents of A. Potash (pot-ashes) is derived from the burning of wood, and when refined is commercially known as pearl-ashes.

Ash, the common name for the various species of *Fraxinus*, a genus of Dicotyledonous trees belonging to the order *Oleacea*. The common A. (*F. excelsior*) is a native of Britain, Europe, N. of Africa, and some parts of Asia. It grows to a height of 100 to 150 feet, is graceful in form and elegant in foliage; the latter is late in making its appearance, and falls off very early in autumn. The timber is very valuable, being white, hard, and tough, and is used for various purposes. There are several varieties which have been produced by cultivation, such as the curled-leaved A., the simple-leaved A., and the weeping A., originally derived from a single tree discovered about one hundred years ago growing in Cambridgeshire. The A. is the badge of the Clan Menzies, and has many superstitions connected with it. We have only space to refer to one very ancient usage, but one which was practised till recently in Warwickshire. Evelyn writes: 'I have heard it affirmed with great confidence, and upon experience, that the rupture to which many children are obnoxious, is healed by passing the infant through a wide cleft made in the bole or stem of a growing A.-tree; it is then carried

a second time round the A., and caused to re-pass the same aperture as before. The rupture of the child being bound up, it is supposed to be in the cleft of the tree closes and coalesces. According to the Slavonian mythology, the first man and woman formed were *ash* and *ambala*, or A. and elm. The mountain A., or Rowan-tree (*R. v.*) of Scotland, belongs to a different order of plants. There are many species of A. found in America, such as the white A. (*F. Americana*); the red A. (*F. pubescens*); the water A. (*F. sambucifolia*); the blue A. (*F. quadrangulata*); the green A. (*F. juglandifolia*); and the Carolina A. (*F. Caroliniana*). These, and others, are all valuable timber-trees. On the shores of the Mediterranean, the small-leaved A. (*F. parvifolia*) and the lentisk A. (*F. lentiscifolia*) form graceful trees. The flowering A. (*F. ornus*, or *Ornus Europea* of some) of the S. of Europe is commonly called manna A. from the saccharine substance it yields, commercially known as Manna (*q. v.*).

Ashanti', or **Ashantee**, the most powerful native kingdom of Guinea, W. Africa, is bounded W. by the river Assinie, E. by the Volta, N. by the Kong Mountain, and S. by the S. Atlantic Ocean. Lat. some 6° to 8° N.; long. 5° W. to 1° E. Area, 72,000 sq. miles; pop. about 400,000. It is in great part hilly, well watered, and covered with dense tropical vegetation. The climate is unhealthy; from April till November the rains are almost unceasing, but during the remainder of the year the northerly or inland wind (*harmattan*) brings the 'healthy season.' Along the coast tropical diseases are common, but inland, where the country undulates, it is much healthier. The cutting of roads through the impenetrable jungle of bamboo and brushwood with which A. is overgrown, is a task of great difficulty, and communication is therefore defective. The chief natural products are maize, millet, rice, yams, tobacco, sugar, cotton, gums, dye-woods, the pine-apple and other fruits. Coomassie (*q. v.*) is the chief town. There is a considerable export of gold-dust and palm-oil. The natives are well made, intelligent, and warlike, and are skilled in the manufacture of cottons, sword-blades, gold ornaments, and earthenware. They are almost entirely fetish worshippers, indulging largely in human sacrifice, but there is also a sprinkling of Mohammedans. The early history of A. consists of vague and uncertain traditions. In the beginning of the present century the country had risen to considerable importance, embracing not fewer than forty-seven conquered states, chief of which were Akim, Assin, Sanem, and Wassau. In 1807 the Ashantis defeated the Fantees, who inhabited a region near Cape Coast Castle, afterwards attacked the Dutch and English, and were completely repulsed by a strong English force in 1826. The cession of the Dutch forts to Britain led to another collision in 1873, but A., despite strong natural defences, was quite unable to resist an English expedition. Sir Garnet Wolseley, at the head of a force of 1600 men, marched on Coomassie, routed the enemy, and before returning to the coast burned the capital. King Coffee Calcali, ruler of A., finally surrendered, and a treaty was signed by which England was to receive 50,000 ounces of gold as war indemnity. Later events seem to confirm the fear that A. in her feeble state will fall a prey to some of the more savage tribes by which she is surrounded. See Sir Charles Adderley's *Colonial Policy*; *Fanti and Ashanti*, by Captains Brackenbury and Wilson; and the *Edinburgh Review* for October 1871.

Ashbourne, a market town in the W. of Derbyshire, on the Dove, with manufactures of cotton, lace, and iron, and an active trade in cheese and malts. It has a cruciform church, built in 1241, with a fine spire 212 feet high. The troops of Charles I. were defeated at A. in 1644 by the forces of the Parliament. Pop. (1871) 2083.

Ashburton, Lord (Alexander Baring), born October 27, 1774. He was trained to commerce in the Canadas and the United States, and in 1810 became head of the great house of Baring Brothers & Co. He was elected M.P. for Taunton in 1812, and for N. Essex in 1832; was President of the Board of Trade and Master of the Mint in the Peel Administration of 1834-35; created Baron A. 1835; and in 1842 was appointed special Ambassador to the United States to settle the N.W. boundary, which was fixed by the treaty of Washington in August of that year, somewhat to the advantage of the United States. Provisions were made in it for abolishing the African

slave trade, and for the extradition of suspected criminals. A. died 13th May 1848, and was succeeded in the title by William Bingham Baring, his eldest son, who was born 1799; educated at Oxford; elected member for Taunton 1836; appointed Secretary to the Board of Control 1841, Paymaster-General of the Forces and Treasurer of the Navy 1845, and President of the Geographical Society 1860. He died March 23, 1864.

Ashburton, a small town in the S. of Devonshire, 16 miles S.W. of Exeter, with considerable copper and tin mines, slate quarries, and serge manufacture. It has a cruciform church in the Perpendicular style. Pop. (1871) 2335.

Ashby-de-la-Zou'ch, a market town in the N.W. of Leicestershire, on the Mease, a branch of the Trent, 15 miles S. of Derby. It has some leather, hat, and hosiery manufactures, and considerable iron-smelting. Near it are extensive mines of coal, lead, ironstone, and limestone. The ruined castle of A., built in the reign of Edward IV., was for some time the prison of Mary Queen of Scots. The church of St Helen here contains the tombs of the Hastings and Huntingdon families, including that of Selina, Countess of Huntingdon, founder of the religious sect named after her. Pop. (1871) 7302.

Ashdod. See AZOTUS.

Ashera, a goddess referred to in the Old Testament, although the name is always translated 'grove' in the authorised version. In numerous passages 'grove' (*i.e.*, holy wood) means a wooden object, generally close to the altar of Baal (Judges vi. 25; see 'grove' in authorised version); this was undoubtedly the *linga* or phallic symbol, represented by a tree stripped of its branches, or a tree-stem driven into the ground. But in several other passages it is evidently used as the proper name of a goddess. In Judges iii. 7, *e.g.*, analogy requires it, thus: 'the baals and the groves,' = Baalim and Asheras; Manasseh, as well as the mother of Asa, made an *image* for A. (1 Kings xv. 13; 2 Kings xxi. 7); and in 1 Kings xviii. 19, mention is made of priests of A. along with those of Baal. A. represented the female side of Baal—Baal'tis, or Mylitta, and therefore was served along with Baal (Judges vi. 25). She is not to be confounded, however, with Astarte or Ashtoreth (*pl.* Ashtaroth), notwithstanding Judges ii. 13; x. 6; 1 Sam. vii. 4; xii. 10, where the latter is put in conjunction with Baal. In all the other passages Ashtoreth and A. are kept distinct; and on closer investigation their characters are found to be quite distinct and even antagonistic. Astarte was the moon-goddess, as appears from Ashteroth-Karnaim, the name of a trans-Jordanic city (Gen. xiv. 5, and Deut. i. 4), meaning 'Ashteroth of the two horns,' *i.e.*, of the crescent moon. She was at any rate a severely chaste goddess, probably the same as the 'queen of heaven,' whose worship by the Israelitish women was approved by their husbands (Jer. vii. 18; xlv. 15). The worship of A., on the contrary, was of the most unchaste description; the special service of her priests and priestesses being to prostitute themselves for hire to her worshippers (Deut. xxiii. 17, 18; 2 Kings xxiii. 7).

Ashford, a market town of Kent, on the Esse, a branch of the river Stour, 14 miles S.W. of Canterbury. It has a Gothic church, and is now an important railway junction, with some damask and linen manufactures. Pop. (1871) 8458.

Ashlar, in architecture or masonry, is the name given to any kind of squared and polished building-stone, as distinguished from the undressed rubble of the quarries.

Ashley, Lord. See SHAFTESBURY, EARL OF.

Ashmole, Elias, antiquary, born at Lichfield, 23d May 1617, and became a Chancery solicitor in 1638. In the civil wars he joined the Royalists, and was a captain in Ashley's regiment, studying at the same time mathematics and astrology at Oxford. In 1646 he became intimate with the great astrologers Lilly, Moore, and Booker; married Lady Mainwaring in 1649; and in 1650 published, under the feigned name of Hasalle, his *Fasciculus Chemicus, or Chemical Collections, expressing the Ingress, Progress, and Egress of the Secret Hermetic Science*. Two years later appeared his *Theatrum Chymicum Britannicum*, which procured for him the friendship of Selden. He next devoted himself to antiquarian studies, of which a valuable result is his *History of the Order of the Garter* (1672); and in 1682 he pre-

sented Oxford with a valuable collection of curiosities, given to him by a family named Tradescant, to which he added many collected by himself. This is named the Ashmolean Museum. A. left a diary containing a minute account of his life, which was published at London in 1774. He died May 18, 1692.

Ash'mun, Jehu'di, born at Champlain, New York, in 1794, educated for the ministry, held for a short time a professorship in the theological seminary of Bangor, Maine, and then became editor of the *Repertory*, a Washington monthly magazine. As agent of the African Colonization Society, he conducted a band of liberated negroes from Baltimore to Liberia, landing at Cape Mesurado 8th August 1822. After six years assiduously devoted to the task of establishing the colony on a solid basis, his health gave way, and returning to America, he died at Newhaven, Connecticut, 10th August 1828. See *Gurley's Memoir of A* (Washington, 1835.)

Ashtabula, a post town in the county of the same name, State of Ohio, N. America, 3 miles from Lake Erie. A. has an active commerce, and is rapidly increasing. Pop. 3394.

Ashton-in-Makerfield, a township of S. Lancashire, with extensive collieries, potteries, and cotton-mills. Wigan is its post town. Pop. (1871) 7463.

Ash'ton-under-Line, a town in the S. E. of Lancashire, on the river Jame, 6 miles E. of Manchester, with which it is connected by two canals and by railway. There are several handsome municipal buildings and numerous churches. One of the oldest buildings is the Manor Hall, ancient seat of the Asshetons. The chief employment is the cotton manufacture; but there is also bleaching, dyeing, calico-printing, engineering, and brickmaking. Near A. is a large bog, abounding in black oak and resinous fir trees. Pop. (1871) 37,389.

Ash'toreth. See **ASTARTE**.

Ash-Wednesday, the first day of Lent, derives its name from the practice in the Roman Catholic Church of the priest's making on that day the sign of the cross on the forehead of the people with the ashes of the palms that had been consecrated on previous Palm-Sunday. He made use of this formula: *Memento, homo, quod cinis es, et in cinerem reverteris* ('Remember, man, that thou art ashes, and shalt return to ashes'). This custom, of very ancient standing, was sanctioned by the Council of Beneventum, 1091. In the Anglican Church the communion service is read on A. The Protestant Churches of the Continent do not celebrate it, but in some parts of N. Germany a memorial of it survives in a children's pastime called *Asche-abbekken* ('ash-brushing').

Asia, the most extensive of the great divisions of the globe, lies in the eastern hemisphere, and extends over fully 180 degrees of longitude, for the most part within the temperate zone. It forms at least four-fifths of the continent of the Old World, being fully four times the size of Europe, and in the S. E. is fringed by a numerous group of islands. Its area is estimated at about 20,000,000 sq. miles; pop. nearly 850,000,000. In reference to population, it may be noticed that not only is it the most populous continent, but that it contains more people than all the rest of the globe. In fact, it supports two-thirds of the human race. China and India are the most densely, Siberia the most sparsely, peopled regions. On the W. side it is partly connected with Europe and Africa, but otherwise is surrounded by the ocean. It is bounded N. by the Arctic Ocean, E. by the Pacific, S. by the Indian Ocean, and W. by Europe, the Black Sea, the Mediterranean, and the Red Sea. In the S. W. it is joined to Africa by the Isthmus of Suez, and in the extreme N. E. is only separated by Behring's Strait from N. America. Its greatest length, from Singapore to the N. E. cape of Siberia, is 5300 miles; breadth, from Smyrna to Japan, 6000 miles. The mass of the continent is nearly a square, with seven great projections stretching out from it in the form of peninsulas—viz., Europe and Asia Minor on the W.; Hindustan and Further India on the S.; Corea and N. E. Siberia on the E. It is a curious fact that each of these great projections has a smaller peninsula or island closely connected with it. Thus Europe has the British Isles; Asia Minor, the *Ægean-Archipelago*; Arabia has Oman; Hindustan has Ceylon; Further India has the Malay Peninsula; Corea has Japan; while N. E. Siberia has Kamchatka.

192

The political divisions, with their area and population, as given by the latest authorities (1869-73), are

State.	Area.	Population.
Arabia,	2,000,000	5,000,000
Chinese Empire, including China Proper, Dependencies of Mongolia, Tibet, Corea, Manchuria (estimated 1873),	4,700,000	425,146,530
Japan (1873),	140,399	33,110,825
Further India (i.e., beyond the Ganges)—		
Anam or Cochín-China, with Tonquin and part of Cambodia,	198,043	9,000,000
Burmah,	190,517	4,000,000
Siam,	309,024	6,000,000
E. Indian Islands,	190,359	27,164,728
Afghanistan and Herat,	258,530	4,000,000
Beloochistan,	165,830	2,000,000
Turkestan—		
Hokhara,		2,500,000
Khokan,		3,000,000
Maymene,		200,000
Turcomania,		770,000
Khiva,		1,500,000
Perma or Iran (estimated 1872),	562,344	5,000,000
British Possessions in Asia—		
Hindustan (1872)—

Anatolia (Asia Minor),	220,000	10,700,000
Syria, Mesopotamia, Kurdistan,	450,870	4,450,000

The physical geography of A. is singularly interesting. This vast continent contains at once the widest plains and the highest mountain peaks in the world. It stretches far into the Arctic circle, and penetrates the tropics by three great peninsulas, thus embracing the utmost extreme of climates. Its mountains, plains, and river systems may be best considered separately.

The great mountain chains of Central A. are four in number—(1) The Himalayan range (q. v.), separating India from Tibet, and extending from the Bolor Tagh to the grand curve of the Brahmaputra, whence it branches off into the lower ranges of China and Further India; (2) The ranges which stretch from the Bolor Tagh to Behring's Strait, and from the N. E. boundary of the central plateau, including the Thian Shan in Kashgaria, the Altai and Sayansk in S. Siberia, and the Stanovoi and Aldan ranges in E. Siberia; (3) The Hindu Kush range, between Afghanistan and Turkestan, running W. from the Bolor Tagh, and finding its continuation in the Elbrus Mountains S. of the Caspian, the mountains of Armenia, and the Taurus range; (4)

The ranges forming the southern boundary of the central plateau, the chief of which are the Karakoum and Kuenlun Mountains of Tibet; Pe-ling, Yun-ling, and Nan-ling in China, Inshahr and Kinghan S. and E. of the Shamo desert. In addition to the main series there are lesser ranges, such as the Suliman and Hala Mountains, separating India from Afghanistan and Beloochistan, and forming the E., as the Zagros or Kurdistan Mountains form the W. wall of the plateau of Iran, the Eastern and Western Ghats of India, and the Ural Mountains, which in part separate Asia and Europe. Away to the S.W. again, the Arabian mountains may be considered as forming a link of connection with the lofty snow-clad mountains of Africa, lying beyond Abyssinia. The mean height of the Himalayas greatly exceeds that of any other mountain range, being variously estimated at from 12,000 to 20,000 feet; certainly not fewer than forty peaks are over 21,000 feet, and a considerable number of them are above 25,000. This range contains the loftiest known point on the globe, Mount Everest, which towers to the gigantic height of 29,006 feet. The snow-line is exceedingly high on the Himalayas, and on the S. side the descent to the narrow valleys or gorges is extremely precipitous. There are comparatively few passes, and all have a great altitude; several are higher than Mont Blanc, and one is estimated at 20,000 feet. To the N. of the main range many of the peaks are volcanic; the higher mountains, however, are either of granite, gneiss, or quartzite.

The two great plains of A., the Eastern and Western, are tablelands. The latter, called the Plateau of Iran, has an estimated area of 1,700,000 sq. miles, and a general elevation of 4000 feet, the salt desert of Persia and the tablelands of Armenia being nearly double that altitude. This vast region, together with that of Arabia, is singularly arid and barren, being rarely varied by the appearance of vegetation. The great Eastern Plateau or tableland of Tibet lies N. of the Himalayas. It includes over 3,500,000 sq. miles, and is traversed by several large rivers. This enormous tract, which is little known, is of great height (17,000 feet) in the S., and descends towards the mountain range forming its N. boundary. A lowland plain occupies the entire N.W. of A., embracing W. Siberia and W. Turkestan, with an area nearly double that of Europe. The southern part of India forms the tableland of the Deccan, which is bounded on the E. and W. by the Ghats, or hill ranges of the coast.

The river systems of A. are on the same grand scale as its mountains and plains. They may be divided into three separate series: those which flow into the Arctic Ocean, those which enter the Pacific, and those which drain into the Indian Ocean. Of the first class there are nine large rivers, the chief of which are the Lena, Yenesei, and the Obi, each having a direct course of nearly 1500 miles, without including windings, and draining nearly half a million sq. miles of territory. They all rise at very inconsiderable elevations in the Altai Mountains, pass through immense desolate plains, have sluggish courses, and form occasionally vast marshes, which occupy a great part of Siberia. The deltas formed by the Lena and Yenesei are frozen for nine months annually; and the latter river, in its upper course, expands into the great Lake Baikal. Of rivers that flow into the Pacific the chief are the Hoang-ho and Yang-tse-kiang, each with a course of 1200 miles, not including windings. They both rise in Central Asia, drain about half a million of sq. miles, and carry down a great amount of mud, which is deposited at their mouths in the Yellow Sea. The next largest river is the Amur, which, with a drainage even greater than that of the two former rivers, forms a part of the southern boundary of the Russian dominions, and enters the Sea of Okhotsk. The rivers which empty into the Indian Ocean—the Ganges, Brahmaputra, Irawaddy, and Indus—are inferior to those of Northern A. in everything but historical interest and commercial importance. A singular double river system is formed by the Ganges and Brahmaputra, which both rise in the Himalayas and unite their voluminous waters to form an immense delta covered with the densest jungle vegetation. The Euphrates and Tigris, rising in the tableland of Armenia, also combine before entering the Persian Gulf. In addition to rivers which flow into the ocean, there are several in Central A. which have no drainage beyond the high tableland, and no outlet except the lakes, where their superfluous water is carried off by evaporation. The chief of these, the Amur-Daria (anc. Oxus), rises in the Hindu Kush, and enters the Sea of Aral after a course of about 1700 miles.

The lakes are few, and mostly of inferior dimensions. There are several of large size, however, the principal of which are the Caspian Sea, the largest lake in the world; Lake Aral, in the steppes of Turkestan; and Lakes Baikal and Balkash, the former in the S. of Siberia, the latter at the eastern edge of the steppes of the Kirghis. In the tableland of Chinese Tartary are Lob-nor and Koko-nor; in Tibet, Tengri-nor; in the basin of the Yang-tse, Lakes Poyang and Tong-ting; in Iran, Lakes Hamun and Urmiah or Urumiyah; in Armenia, Lake Van; in Syria, Galilee and the Dead Sea; and Tüz-Gül in Asia Minor. Several of these are salt—Tüz-Gül being reputed the saltiest in the world.

In metals A. is exceedingly rich, having indeed been celebrated from the remotest times for the profusion of its mineral wealth. The precious metals are distributed more liberally than in Europe, especially in China, the Altai and Ural Mountains, India and Burmah, and are associated with diamonds. In the Altai and Urals, iron, lead, and platinum are found; in India and Mongolia, rubies and other gems; salt in Central A.; coal in various places; petroleum in the Caspian region; and bitumen in Syria. The E. of Turkestan abounds in silver, lead, copper, iron-ore, sulphur, coal, besides jasper and turquoise.

The botany of A. is unsurpassed in richness and variety by that of any other continent, and ranges from the scant flora of the circumpolar region to the prodigal vegetation of the tropics. The southern zone is especially notable for the number of its native fruits and esculent vegetables, India, Indo-China, and Arabia abounding in trees yielding gums, spices, balsams, resins, and dyes. Among the more characteristic specimens may be mentioned the birches, willows, larches, and stone pines of N. Siberia; the root plants of Central A., including rhubarb, angelica, and cow-parsnip; the palm, date, fig, cedar, banian, and other S. Asiatic trees; and the nutmegs, cloves, and other spices peculiar to the Eastern Archipelago. China and Japan are famous for the cultivation of tea, and India for the production of rice, cotton, coffee, opium, indigo, and maize.

The zoology embraces one-third of all known quadrupeds, including a large variety of wild animals of great strength. Bears, lions, tigers, rhinoceroses, leopards, are the chief of these; besides which there are the badger, wolf, Arctic fox, hyæna, jackal, and monkey. Among the domestic animals are the ox, buffalo, sheep, goat, horse, ass, camel, elephant, and dog. Birds and reptiles are very numerous: of the former may be mentioned the peacock, pheasant, bird of paradise, besides numerous singing-birds; of the latter, the boa-constrictor, python, cobra, crocodile, &c. The insects are of large size and splendid tints.

The principal islands are those in the S.E., known unitedly as Malaysia, or as the Eastern, Indian, or Asiatic Archipelago, and comprising five principal groups: (1) The Sunda Islands (Java, Sumatra, &c.); (2) the Celebes, including the Sangir group; (3) the Moluccas or Spice Islands; (4) the Philippines; (5) Borneo, including the Sulu group. Borneo is the largest island in the world. Other islands of A. are Ceylon, in the S. of India; the Japanese Islands, E. and N. of Corea; Formosa, E. of China; Cyprus, S. of Asia Minor; and New Siberia, in the Arctic Ocean.

In a political aspect the various countries of A. present a curious combination. The forms of government range from the primitive rule of the nomad sheik to Chinese despotism, while the wandering tribes of Siberia and Turkestan remain almost un-governed by the Russian Czar, who claims them as his subjects. The vast territory of India has been brought by British government directly under European influence, and Japan is freely modelling her institutions on those of the West. The great political power of A. belongs, however, to the past. In ancient times it embraced many powerful monarchies, the chief of which were those of Assyria and Persia. The Huns, who overran Europe in the 5th c., issued from a region E. of the Caspian Sea; the fanatical armies of Arabia conquered the greater part of the ancient world; and the Osmanli, who rose on the ruins of the Seljukide Turks, of whom they were merely a sept, overthrew the Roman empire in the East and established the Turkish dynasty. But, with some brilliant exceptions, the Oriental governments for the last two hundred years have either remained stationary or have lapsed into feebleness and decay.

As to ethnography, the entire population of A. embraces three main groups, the Turanian (q. v.), Aryan (q. v.), and Semitic (q. v.). The peoples in the N., E., and S.E. of A. are Turanian; those of Northern India, Afghanistan, Persia, and

a portion of Asiatic Turkey are Aryan; and the inhabitants of Arabia, Palestine, and Syria belong to the Semitic family of races.

The religions of A. are numerous and diverse. The most important are the Brahminism of India, the religions of Buddha, Confucius (if his system of practical ethics, minus a deity, can be called a religion), and Lao-tse in China, and the various forms of Islamism in Arabia, Persia, and India. There are, besides, many native Christian sects in India, Armenia, Kurdistan, and Syria. The subject of religion is dealt with in the articles on the various religious creeds.

In point of civilisation many of the countries of A. had in the earliest times made great industrial and intellectual progress. Many of the arts originated in A., which is regarded as the birthplace of humanity itself. The history of Eastern civilisation, however, exhibits a singular phase. Development entirely ceases after a certain stage has been reached in the evolution of art, science, industry, law, and commerce; conservatism then becomes the ruling principle, and the result is what is seen in the rigid and unchanging systems of India and China, though the former country shows signs of awakening from its long intellectual slumber, and may perhaps again reach distinction, if its educated youth do not lapse into mere scientific scepticism. The Arabs, Turks, and Persians still retain slavery; Hindu society is fixed by a rigorous system of *caste*; but in China there prevails civil and political equality in a sense, *i.e.*, there is no aristocracy to modify the absolute despotism of the imperial rule, all being thus alike powerless.

Asia'go, a town in the province of Vicenza, N. Italy, 22 miles N. of Vicenza, noted for the manufacture of straw hats, and for turning. The inhabitants speak a corrupt form of German. Pop. 5140.

Asia Minor, the ancient name of the modern Anatolia, a district of great historical interest, as having contained some of the most famous cities of the ancient world—Troy, Ephesus, Smyrna, &c. On this theatre were transacted events of the greatest magnitude and interest, as the wars of the Greeks with the Persians; of the Romans with Mithridates; and the more recent contests of the Arabs and Turks with the decaying Empire of the East—events stretching over a period of more than 2000 years. Under Turkish rule A. M. has gradually lapsed into poverty, sterility, and barbarism, in striking contrast to its wealth, fertility, and civilisation in earlier ages. The most important countries of A. M. in ancient times were Ionia, Phrygia, Lydia, Cilicia, Galatia, Bithynia, Pontus, and Cappadocia.

Asiat'ic Chol'era. See CHOLERA.

Asinalun'ga, or **Sina Longa**, a well-built town in the province of Siena, N. Italy, 22 miles S.E. of Siena, with a fine collegiate church, containing several valuable paintings. Pop. of commune, 8500.

Asmannshau'sen, a village in the Prussian province of Wiesbaden, on the Rhine, famed for the splendid wines to which it gives name. The ducal vineyards here yield red wine superior in some respects to those of Burgundy.

Asmode'us (Heb. *Ashmedai*, the destroyer) figures in the Book of Tobit as an evil spirit, who slew in succession the seven husbands of Sara on the bridal night. Tobias burned the heart and liver of a fish caught in the Tigris, the smell of which forced A. to flee into Egypt, where the angel bound him. According to the Talmud he drove Solomon from his kingdom, and for this he was afterwards forced to serve in building the temple.

Asmon'e'ana. See MACCABEES.

Aso'la, an ancient fortified town in the province of Brescia, N. Italy, 19 miles W.N.W. of Mantua, known for its manufacture of silk-twist. Pop. of commune, 5500.

Asp, the name of a poisonous serpent, the zoological position of which is but doubtfully indicated. The term appears to have been used by popular authors and writers in a very general sense. It is supposed to correspond to the *Naja Haje* of Egypt, a snake allied to the famous *Naja tripudians*, or *Cobra di Capello* of India. See NAJA. By other naturalists the A. is believed to be one of the *Viperidae*, or vipers; the *Cerastes*, or horned snake of Egypt, and the *Vipera Echis* being two of the forms thus suggested. The former is regarded as the snake or

A. by aid of which Cleopatra wrought her tragic end. The A. or *Vipera Aspis* of the Alps, Sicily, and S.E. Europe generally, is another form to which the term A. is applied. This latter has a broad head, and somewhat resembles the common viper in appearance.

Asparagine is a crystalline substance occurring in the young shoots of the asparagus, also in the climbing vetch, marsh-mallow, bean, pea, and other plants. It is related chemically to malic acid, and may be converted into that substance by treating it with nitrous acid.

Asparagine.

Malic acid.

Asparagus, a genus of Monocotyledonous plants belonging to the order *Liliacea*. *A. officinalis*, common A., is a Herbaceous plant indigenous to Britain; and in the southern parts of Russia and Poland it grows so abundantly that cattle and horses eat it as grass: it is also found in Greece, and was formerly used as a vegetable by the Romans. In some parts of England it is cultivated extensively for the London market: the young shoots alone are used as a culinary vegetable. Both the shoots and roots are diuretic, and have been beneficial in cases of gravel and dropsy. The seeds of the plant have been used as a substitute for coffee, and a kind of spirit has been made from its berries. *A. albus*, and other species found in the S. of Europe, are used in the same way as the common A. *A. scaber* is not used, owing to its bitter properties. *Prussian A.* is the young shoots of a plant belonging to a different genus—viz., *Ornithogalum pyrenaticum*, which grows abundantly in some parts of Somersetshire, especially near Bath.

Asparagus Stone. See APATITE.

Aspa'sia, a Milesian, daughter of Axiochus, possessed rare mental accomplishments. Coming to reside at Athens, her beauty and culture fixed the affections of Pericles, who had parted from his wife with her own consent. His union with A. was as close as the law permitted, marriage with a foreign woman being strictly prohibited. Her ascendancy over Pericles was supreme, and her house became the rendezvous of the most polished society of Athens. The comic writers were habitually unjust to her, falsely ascribing to her influence both the Samian and Peloponnesian wars. In the *Menæxenus* of Plato there is a discourse composed by A. in honour of the soldiers who died for their country at Lechæum, of which Cicero says that the Athenians were so proud that they caused it to be declaimed once a year, and adds that the custom prevailed to his own time. On the death of Pericles she attached herself to Lysicles, a cattle-dealer, whom she succeeded in moulding into a brilliant orator. Her son by Pericles, legitimated by a decree of the people, assumed his father's name. See Plutarch's *Life of Pericles*.

As'pé, a town in the province of Alicante, Spain, 21 miles W. of Alicante, with flour and oil mills, a trade in wine and brandy, and soap manufactories. Pop. 6744.

As'pect is an old astronomical term, now completely disused, applied to the position of one planet with respect to another, as seen from the earth. There were five aspects, which received distinct names: *Conjunction* (symbol ☿), when the two bodies had the same longitude; *Sextile* (*), when they were 60° apart; *Quartile* (☐), when 90°; *Trine* (Δ), when 120°; and *Opposition* (☿), when 180°. Conjunction and opposition are the only two now in use.

As'pen, or **Trembling Poplar**, the common names for *Populus tremula*, a tree native in Britain, many parts of Europe, and Siberia. It is common in damp soil in the Highlands of Scotland, ascending to 1500 feet above the level of the sea. It has received its name from the leaves having a quivering motion, caused by the petioles or leaf-stalks being flattened or compressed laterally, so that the slightest breath of wind moves the leaf. The wood, which is white, light, and soft, has been used for a variety of purposes. The smaller branches make good gunpowder charcoal. It is a fast-growing tree, with a smooth, greyish bark, and is supposed to be the mulberry-tree of Scripture, referred to in 2 Sam. v. 24, and 1 Chron. xiv. 15. It belongs to the natural order *Amentifera*, or the Willow family.

Aspergillum, or **Watering-Pot Shell**, a genus of *Lamelibranchiate Mollusca*, in which the body is contained within a calcareous or limy tube, formed by the calcified siphons or breathing-tubes. The two valves of the shell consist of two small structures embedded in the front part of the tube. The tube, at the anterior portion, terminates in a perforated disc, like the 'rose' of a watering-pot—hence the popular name of these forms—and its opposite extremity often possesses ruffle-like folds. These animals bore into sand, or burrow in stone or wood; the elongated tube serving to convey water and food to the enclosed animal. *A. Javanum* and *A. vaginiferum* are familiar species.

Aspergillus, a genus of Filamentous fungi. See MOULD.

As'pern, or **Gross As'pern**, a village 5 miles E. of Vienna, on the left bank of the Danube, famous for a battle in 1809 between the French and the Austrians. The French, under Napoleon I., entered Vienna on the 12th of May, and on the 21st began crossing the river to attack the Archduke Charles, who had posted his forces on the opposite bank. The Austrians charged the French with the utmost fury, but the day's combat was not decisive. Renewing the attack next morning, the Austrians forced the French, after an obstinate resistance, to withdraw, first to the island of Lobau, in the middle of the river, and afterwards to the right bank, with a loss in killed and wounded of more than 30,000. Marshal Lannes was among the slain.

Asperula, a genus of Dicotyledonous plants belonging to the order *Rubiaceæ*. See WOODRUFF.

As'phalt, **Asphaltum**, **Bitu'men**, or **Min'eral Pitch**, is a solid amorphous mineral, resembling common pitch, found abundantly in almost every quarter of the globe. Many theories exist regarding its origin, but that most generally received holds it to be the product of the distillation of carbonised vegetable matter by the action of subterranean heat and moisture in the absence of atmospheric air. The existence of naphtha, petroleum, and allied mineral substances, is ascribed to the same cause. B. occurs in nature in three distinct forms—the earthy, the elastic, and the compact. They are all readily inflammable, and possess a black or brownish-black colour, with a specific gravity from 1 to 1.6, according to the amount of impurities present. B., when pure, however, has a density rather less than water. Earthy B. breaks with a rugged edge; and the soft, flexible, or elastic variety, sometimes called 'mineral caoutchouc,' from its capability of removing lead-pencil markings, is extremely rare. The compact variety, commonly termed A., is the most abundant kind. It fractures conchoidally, with a brilliant resinous lustre; fuses at 212° F.; burns with a thick red smoke; and when rubbed, emits a pitchy odour. It is insoluble in water, partly soluble in alcohol and ether, and almost wholly so in spirit of turpentine. According to Boussingault, it is composed principally of an oxygenated hydrocarbon, called by that investigator *asphaltene*. The largest known asphaltic deposit occurs in the island of Trinidad, where there is a lake of it 1½ miles in circuit. It also exists abundantly in Barbadoes, Cuba, New Grenada, Peru, United States, Canada, and New Brunswick—the A. of the latter place being called *albertite*. Burmah, Turkey in Asia, France, Albania, and many other European localities, also furnish considerable quantities. After an earthquake, large masses of A. are found floating on the surface of the Dead Sea (the *Lacus Asphaltites* of classical authors), which circumstance seems to point to the existence of bituminous springs in the bed of the sea, probably identical with the 'slime-pits' of the Vale of Siddim. From the earliest historic times A. has been used for various purposes. The Egyptians employed it in embalming the dead; and bricks from Babylon exhibit adherent bitumen, indicating its use as mortar. At the present time it is turned to account in the preparation of artificial pavement, as a covering for roofs, and a lining for cisterns and iron pipes; it also forms the principal ingredient in Japan varnish. —**A. Stone** is a dark-brown compact limestone, impregnated with from 6 to 10 per cent. of B., found at Seyssel, department of Ain, France; in the Val de Travers, canton of Neuchâtel, Switzerland; and other places in the Jura Mountains. Its suitability for roadways, when powdered and mixed with 7 per cent. of B., has led to its adoption for that purpose in many cities; and in noiselessness, comparative cheapness, and dura-

bility it displays decided advantages over any other material. On account of its smoothness it is not well adapted for steep inclines, and the objection of slipperiness after slight rain has been raised against it.

In 1873 Great Britain imported 11,690 tons of A., the greater portion being furnished by the W. Indies and France.

As'phodel, the common name for the genus of plants *Asphodelus*, belonging to the order *Liliaceæ*. The species, which are not many, are perennial herbs with thick fleshy roots: they are natives of Southern Europe. The yellow A. (*A. luteus*); the white A., or king's spear (*A. albus*); and the branching A. (*A. ramosus*), are very ornamental garden plants. The last named, which is regarded as a variety of the white A., is very abundant in some parts of Italy, where it affords excellent food for sheep. The bog or Lancashire A. is the *Nartharium ossifragum*, a common British plant in wet moors, belonging to the order *Funcaceæ*. The name of Scotch A. is often given to *Tofieldia palustris*, a British plant belonging to the Colchicum family (*Melanthaceæ*).

Asphodelus ramosus.

Asphyx'ia is death beginning at the lungs. It is characterised by loss of consciousness and muscular power, stoppage of the movements of the chest, and afterwards of the pulsations of the heart, along with accumulation of blood in the right cavities of that organ, and throughout the venous system generally. It is caused by any interference with the passage of air to and from the lungs. When from any cause this occurs, the venous blood carried to the lungs by the pulmonary artery is not arterialed in the capillaries, and consequently is returned to the left side of the heart still in a venous condition. This venous blood is at once distributed by the left ventricle to the brain, nervous centres, muscular system, and to the heart itself—all of which organs require a proper supply of arterial blood for the due performance of their respective functions. This accounts for the confusion of ideas, delirium, unconsciousness, muscular spasms, convulsions, and failure of the heart's action. The blood quickly stagnates in the pulmonary capillaries, and the backward effects of the disturbed circulation ultimately distend the right side of the heart and venous system with very dark venous blood. The cause of the stagnation of the blood in the pulmonary capillaries is not well understood. After death, the left chambers of the heart contain only a small quantity of dark-coloured blood, and the vessels of the membrane and the sinuses of the brain are filled with dark blood.

A. may be caused in any of the following ways: (1) Breathing an irrespirable gas, which quickly causes spasm of the glottis, and thus prevents air from passing into the lungs; (2) mechanically, by pressure on the windpipe, as in strangulation; or by the impaction of a foreign body in the trachea, as in choking; (3) by puncture of both pleural cavities, which allows the air to press the lungs towards the back part of the cavity of the chest; (4) by pressure on the outer surface of the chest, so as to prevent the movements of inspiration, as in death caused by a squeeze in a crowd of people; or by sand or gravel so falling on a labourer as to surround his chest and leave the head free; (5) by paralysis of the respiratory nerve-centres in the medulla oblongata, as in hanging, where, as practised in this country, death is caused by the odontoid process of the axis (the second cervical vertebra) being fractured and crushed into the medulla; (6) by narcotic poisons, which paralyse the respiratory centres; (7) by immersion in water, or any other fluid which prevents air from passing into the lungs; and (8) by any mechanical impediment placed in front of the mouth. The general rules for treating an asphyxiated person are—(1) to remove the cause as quickly as possible; (2) to admit around him abundance of fresh air; and (3) to excite artificial respiration. For further details see DROWNING and RESPIRATION.

Aspidium, a genus of Ferns (q. v.).

Aspinwall, a town on the small island of Manzanilla, in the United States of Colombia, founded in 1852, and ceded in perpetuity to the Isthmus of Panama Railroad Company, is the terminus on the Atlantic side of this railway, which, connecting the Atlantic and Pacific, has been termed the *highway of the world*. Already seven great lines of mail steamers touch at A. Pop. about 4000.

Aspirate means a breathing (Lat. *spiro*, I breathe). The strong breathing (Lat. *spiritus asper*; Gr. *pneuma dasu*) corresponds to the letter *h*, and is formed by the free emission of breath through the perfectly open glottis. There is also a soft breathing (Lat. *spiritus lenis*; Gr. *pneuma psilon*), a slight sound heard on the pronunciation of any initial vowel, as in *old*. The mark of the rough breathing was originally *h*, afterwards *H*; finally the rough and soft breaths were expressed by the halves of this mark, thus *h* and *h̄*, whence came the present signs; and Max Müller denies, on physiological grounds, the identity of the *h* with the *spiritus asper*. The term A. is also applied to combinations of *h* with the letters called mutes or checks, from the fact that in their formation the emission of breath is quite checked. When *h* is breathed immediately after a check, sounds are produced occurring in Greek *kh*, *th*, *ph* (hard aspirates), and occurring in Sanskrit, *gh*, *dh*, *bh* (soft aspirates). Whether the original Aryan language possessed both hard and soft aspirates is a point much disputed among philologists.

Aspirator is an apparatus used in physics and chemistry to draw a continuous stream of air through tubes or other vessels.

Aspirator.

Canine teeth are developed in the males only. The dental formula shows six incisors, two canines, six præmolars, and six

Wild Ass.

Onager, a native of Central Asia, is the progenitor of the common A. and other domesticated varieties or breeds. In Persia, Tartary, &c., these animals occur in large herds, migrating towards India in winter. The 'Kiang Djiggetai' (*Equus* or *Asinus hemionus*) of Central Asia appears to be a second distinct species of wild A. It is coloured a pale grey or tawny, with a blackish dorsal line. This form neighs like a horse, and appears in certain points to resemble the domesticated A. more closely than the wild A. The domestic A. is used as a beast of burden in Arabia,

Persia, and Syria. The costamongers in London use it almost exclusively in their trade, and it is only right to say that it is well treated as a rule. Of late years Baroness Burdett Coutts and others have taken much interest in the A., and have endeavoured to raise its status by offering liberal prizes in competitions at agricultural shows, but the effort has been a comparative failure. The A. in its nature is much harder than the horse, and subsists upon much coarser food. It can find meat when other beasts of burden would starve, as it is fond of thistles and other prickly plants. In Ireland, on small farm-holdings, it is often employed in ploughing and harrowing, and shows no obstinacy. Its milk contains less caseine and more saccharine matter than cow's milk, and it is used in cases of debility.

Assagay-Tree, the name at the Cape of Good Hope for *Curtisia jaginea*, a large tree belonging to the order *Cornaceae*. The natives in the districts where it abounds use its wood for shafts for the javelins, or *assagays*; hence its common name. The genus is named in honour of *Curtis*, a well-known English botanist.

Assai, the name of a beverage used by the inhabitants of Pará, which they manufacture from the ripe fruit of *Euterpe edulis*, a palm-tree which grows in swampy places, and attains a height of 30 or 40 feet. It is very nutritious when sweetened with sugar and mixed with farina, such as Manioc (q. v.). It forms the daily food of a large number of the inhabitants.

Assal, a salt lake in Adel, E. coast of Africa, near the mouth of the Red Sea, 25 miles S.W. of the seaport of Tajurrah. It is 8 miles long and 4 broad, lies 700 feet below the sea-level, and yields vast quantities of salt for the Abyssinian caravans.

Assam, since February 1874 a separate province of India, is a long curving valley watered by the Brahmaputra and other rivers, bounded on the N.E. by the mountains of Tibet, and separated also by mountains from Burmah on the S. and S.E. Area, 27,800 sq. miles; pop. according to census report (1873), 1,682,692; chief town, Cowhatti. Timber abounds, the reserves being under the management of the Forest Department, the open forests under civil officers. The tea-plant was introduced in 1826, and in 1874 the yield of tea was 11,082,958 lbs. For 1875 it is estimated at over 13,000,000 lbs. The teas from A. are especially valued on account of their strength, and are preferred to those of other districts for mixing purposes. Rice, the precious metals, lead, petroleum, and coal are other products. Wild animals, tigers, elephants, rhinoceroses, and buffaloes are very abundant. A. was ceded to the British at the close of the Burmese war (1826), but was not placed completely under British administration till 1838. *Annals of Ind. Admin.*, 1872-73, by Dr G. Smith (Seramp. 1874).

Assasins (Lat. *Assassini* and *Assisini*), the name given by the mediæval chroniclers to a branch of the Ismaelites (q. v.) of Persia and Syria, belonging to the Shiite sects. It is thought the name is a Latinised form of the Arabic *Hashashin* ('herb-eaters'), because they were wont to madden themselves with various intoxicating plants when about to proceed to their bloody work. Eastern writers, however, rarely use the name *Hashashin*; here and there we find *Fedkwi* ('the self-sacrificers'), but in general the A. are not distinguished from the larger sect of Ismaelites from which they sprung. Hassan-ben-Sabbah-el-Homairi, the founder of the A. proper, whose convictions of the truth of Islamism were not deep, was of Persian origin, had studied under Mowasek, at Nishpur, about the middle of the 11th c., and had been partially initiated into the mysteries of the Ismaelites. But having quarrelled with the heads of the Grand Lodge at Cairo, he was expelled, and escaping to Persia, proceeded to found an order of his own, which should exert an organised terrorism over the neighbouring districts. Seizing the Persian fortress of Alamut in 1090, he quickly acquired territory and influence by intimidation and assassination. The order so founded consisted of seven degrees. At the head of it was the Prince or Old Man of the Mountain (*Sheikh-al-Jebel*), who had lieutenants (*Dai-al-kebir*) in Jebel, Kuhistan, and Syria. Under these were the *Dair* and *Rofiks*, whose initiation was imperfect, and who were not accredited as teachers. The novices and mechanics rigidly observed the Koran, an obligation from which the initiated were relieved. So great was the dread inspired by the *Sheikh-al-Jebel*, that princes were wont to ensure their safety by secretly paying him tribute. Hassan died, aged

seventy, in 1124. In 1183 Hassan II. was slain by his brother-in-law for abolishing Islamism in the whole order, but it was re-established by Hassan III. The seventh and last *Sheikh-al-Yemen*, or chief of the Persian A., was Rokn-eddin, who was crushed in 1256 by the famous Mongol, Hulagu, and the Syrian branch was completely destroyed in 1272 by Bibar, the powerful Sultan of Egypt. See Von Hammer's *Geschichte der Assassinen* (Stutt. and Tüb. 1818); Sir John Malcolm's *History of Persia* (2d ed. Lond. 1828); and Weil, *Die Assassinen*, in Sybel's *Hist. Zeitschrift* (Jahrg. 1863).

Assault' (Lat. *ad* and *salio*, to spring towards) is a sudden attack upon a fortified place. The attacking body is divided into 'storming-parties,' 'support-parties,' and 'firing-parties.' The storming-parties endeavour to force their way into the place, and are sometimes accompanied by 'ladder-parties' with ladders for scaling purposes. The firing-parties, or musketeers, serve to a certain extent to shield the storming-parties from the enemy's fire. The support-parties follow in the rear.

Assault, in law. See BEATING AND WOUNDING.

Assay, or **Assaying**, is the method by which the proportion of the precious metals present in any of their alloys is determined. Silver-plate must by law be made of a certain degree of fineness in Great Britain, and each article made has to be assayed, and, if approved, stamped at the Goldsmiths' Hall. Assays of gold jewellery are similarly made and guaranteed, and it is besides a matter of great commercial importance to test the degree of fineness of coin and bullion, &c. The principal method of estimating the alloys with the baser metals is by the cupel, or cupellation. The operation of cupellation depends on the ready oxidation of lead at high temperatures, and by the action of lead oxide, copper and other metals, added to gold and silver, are freely oxidised. The oxides so formed are, in a state of fusion, absorbed by the porous body of the cupel in which they are reduced, leaving the noble metals in the form of a round metallic globule on the surface of the cupel. A cupel is a form of crucible made out of pure bone-ash, and is highly porous in structure. A sufficient number of such cupels for the tests to be made are introduced into a muffle, or covered fireclay pot, placed in a furnace of special construction, and heated gradually to a bright redness. A minute quantity of the metallic compound to be assayed is carefully weighed, and wrapped up with a proportion of pure lead, varying according to the supposed degree of fineness. This is introduced by means of a pair of tongs into the heated cupel, in which it fuses, and the lead quickly forms films of oxide on the surface of the globule, which are absorbed by the cupel till, when the pure silver or gold is only left, the surface assumes a bright metallic lustre. It is then gradually and carefully cooled, and the weight of the globule left on the surface, compared with the weight of the original sample, gives the means of determining the degree of fineness of the alloy to within a small fraction of the absolute composition. In the A. of a gold alloy, a larger proportion of lead has to be employed than is required for silver, and bismuth may be substituted for lead in the process of cupellation. In cases where it is necessary to estimate separately the gold and silver in any alloy, the process of cupellation is only employed, if necessary, for first eliminating the base metals. The proportions of gold and silver are ascertained by the process of parting or quartation. The silver is dissolved out of the compound by the action of hot nitric or sulphuric acid, but as the gold will not part with the silver unless the latter be present in large quantity, as much pure silver is added to the A. sample as will make the weight of the silver three times that of the gold. When the two metals, in these proportions, are thoroughly incorporated, the globule is hammered out, and twisted into a small spiral, in which state it is termed the cornet. The cornet is submitted twice to the action of boiling nitric or sulphuric acid, which dissolves out the silver, and the weight of the gold is determined after it has been compacted by heating to redness in the muffle.

The humid process is a method of A. applicable only to silver alloys, and depends on the chemical reaction between a solution of chloride of sodium and nitrate of silver. The chlorine combines with the silver, forming an insoluble chloride of silver, and the nitric acid takes up the sodium to form nitrate of sodium, thus, $\text{AgNO}_3 + \text{NaCl} = \text{AgCl} + \text{NaNO}_3$. A solution in nitric acid of the alloy to be tested is prepared, to which a

standard solution of common salt is gradually added so long as a precipitate is formed. The quantity of the solution of salt required to precipitate the whole silver as chloride gives a basis for calculating the proportion of silver present in the alloy. The humid process produces much more accurate results than can be obtained by the cupel, and it is now used in most mints for estimating silver alloys.

A close approximation to the value of gold can be made by means of the streak produced on a touchstone or a piece of slate. The streak made by the article to be tested is compared with the streaks made by a number of pencils of gold of known composition. The streak may be tested in various ways, in addition to the ocular evidence it affords, and it is of value as a preliminary test when an estimation of the proportions of gold and silver is to be made, affording as it does an indication of the amount of silver which ought to be added for the process of quartation.

Assaye, a village in the fork of the Juah and Kaitna. Here Wellington, then Major-General Wellesley, gained a signal victory over the Mahrattas, 23d September 1803, which established British supremacy over a great part of India.

Asseerghur, a formidable mountain fortress in the N. E. of the presidency of Bombay, taken by the British in 1803, and again in 1819. There are only two approaches, both of them steep, and strongly fortified with escarpments nearly 100 feet high. The town stands at the foot of the rock on which the fort is built. Pop. about 2500.

Assema'ni, **Jos. Simon**, a celebrated Orientalist, born at Tripoli, in Syria, in 1687. He belonged to a Maronite family of Lebanon. In his travels through Egypt, Syria, &c., he collected numerous Oriental MSS. for the papal library, of which he was keeper. A. died 14th January 1768. His most important works are *Bibliotheca Orientalis Clementino-Vaticana* (4 vols. Rome, 1719-28), an edition of the *Opera Ephraemi Syri* (6 vols. Rome, 1732-46), *Kalendaria Ecclesie Universae* (6 vols. Rome, 1755-57), and *Bibliotheca Juris Orientalis Canonici et Civilis* (4 vols. Rome, 1762-64). His sister's son, **Stephan Evodius A.**, born at Tripoli, 1707, keeper of the Oriental MSS. in the Vatican Library from 1768, and Archbishop of Apamea, died 1782, is the author of three valuable works: *Bibliotheca Medico-Laurentina et Palatina Codices Manuscripti Orientales* (2 vols. Flor. 1742), *Acta Sanctorum Martyrum Orientalium et Occidentalium* (2 vols. Rome, 1748), and a fragmentary catalogue of the MSS. in the Vatican Library (Rome, 1757). A brother of Stephan, **Josephus Aloysius A.** (born 1710, died 1782), is the author of a *Codex Liturgicus Ecclesie Universalis* (13 vols. Rome, 1749-66), *De Catholicis seu Patriarchis Chaldaeorum Nestorianorum* (Rome, 1775), and other works. A later kinsman, **Simon A.** (born 1752, died 1821), is the author of several useful treatises: *The Museo Cusico Naniiano Illustrato* (2 vols. Pad. 1787-88), *Saggio sull' Origine degli Aravi* (Pad. 1787), *Catalogo dei Codici Manoscritti della Biblioteca Naniiana* (Pad. 1787), and *Globus Calesis Cusico-Arabicus* (Pad. 1790).

Assembly, General, the chief court of a Presbyterian Church. That of the Church of Scotland comprises both a lay and a clerical membership, and composed of representatives from each of the eighty-four presbyteries, of representatives from the four universities, and of elders from the royal burghs. It assembles annually at Edinburgh in May, is presided over by a moderator elected every year, has a principal and deputy clerk, a procurator, and an agent. In all matters ecclesiastical the G. A. possesses supreme legislative and judicial authority; but the civil power, on the other hand, possesses the right of determining whether a matter is ecclesiastical or not. The civil authority is represented by a royal commissioner. The constitution of the G. A. of the Free Church is the same, with the exception of the royal commissioner. The business not overtaken during the sitting of the G. A. is handed over to a commission which meets quarterly, and of which the moderator is convener.

Assembly, National, the name assumed by the Commons or *Tiers-etat* of the States-General, convoked by Louis XVI. of France, May 5, 1789. The clergy and nobles, from fear of their votes being outnumbered, having refused to sit in the same chamber with the Commons, the latter constituted themselves a N. A., and were afterwards joined by deputies of the two

privileged orders. They framed a new constitution, based on the sovereignty of the legislative body, subject to the veto of the king, whose person was declared inviolable. In little more than two years the Assembly passed 3250 decrees, by which feudal France was swept away. The chief of these measures were the suppression of monastic orders, the declaration of the Rights of Man, the introduction of free-trade, the confiscation of Church property, the issue of Assignats (q. v.), and the abolition of all aristocratic titles. In September 1791 the king accepted the new constitution, and the Assembly, called also from its functions the Constituent Assembly, then made way for the Legislative Assembly, intended to reform the civil and criminal laws in the spirit of the Revolution. Former members were formally excluded from the new Assembly, which, carried away by the excitement of the times, abolished monarchy, and imprisoned the royal family. A National Convention (q. v.) was summoned to license these infractions of the new constitution, to which all parties had so recently sworn allegiance.

There was a N. A. elected after the revolution of 1848, and another in February 1871, on the termination of the Franco-Prussian war. A N. A., professing to represent Germany, met at Frankfort in 1848, and the Cortes of Spain constituted itself a N. A. on the abdication of Amadeus I., 16th February 1873.

Assembly of Divines, or Westminster Assembly, appointed by an ordinance of the two Houses of Parliament, June 12, 1643, 'to confer concerning the liturgy, discipline, and government of the Church of England, or the vindicating the doctrine of the same from all false aspersions and misconstructions;' was composed of 149 members, of whom 119 were clergymen, 10 were from the Lords, and 20 from the Commons. To these were added 4 clerical and 2 lay commissioners from Scotland. The place of those who had died, or who refused to attend, was supplied by *superadded* members. From the first meeting, July 1, 1643, till February 22, 1649, the Assembly sat 1163 times. Almost complete unanimity existed as to doctrine, but there was great divergence respecting Church government. After some opposition, the *Solemn League and Covenant* was sanctioned, and Parliament ratified the *Directory of Public Worship*, October 2, 1644, and the doctrinal part of the *Confession of Faith*, March 1648. The *Shorter Catechism* and the *Larger Catechism* date respectively from November 5, 1647, and September 15, 1648. The theology of these formularies, which are the standards of all Presbyterian Churches, is Calvinism, and the mode of Church government sanctioned is the Presbyterian. Hitherto Baillie's *Letters* and Lightfoot's *Journal* have been the chief authorities for the details of the proceedings of this Assembly; but in 1874 William Blackwood & Sons, Edinburgh and London, published the *Minutes of the Sessions of the Westminster Assembly of Divines, while engaged in preparing their Directory for Church Government, Confession of Faith, and Catechisms, 1644-49*. Edited by Rev. Alexander F. Mitchell, D.D., and Rev. John Struthers, LL.D. A list of the members is given in Masson's *Life of Milton*, 1871, pp. 509-527.

Ass'er, John, the biographer of Alfred, was a monk of St Davids, in Wales, and most probably of Welsh origin, for he speaks of the English as if they were a people foreign to him, calls Wales his 'own country,' and states that he was 'bred and educated there.' Alfred invited him, about 885, to the court of Wessex on account of his skill in literature; and he certainly exercised a direct influence over the king's studies, for he expressly tells us that during an eight months' visit to Alfred (before finally settling in Wessex) he 'read to him whatever books he liked.' Alfred was greatly attached to his learned and pious friend, bestowed on him many gifts, and finally made him Bishop of Sherburne. The *Chronicle* gives the year 910 as the date of his death. A. will always be remembered by his *Annales Rerum Gestarum Alfridi Magni*, an historical memoir which embraces the greater part of Alfred's life. As a contemporary record of the noblest of English princes, it possesses the highest value. It was first published, but in a very corrupt form, by Archbishop Parker, in 1574. The best edition is that of Wise (Oxf. 1722). It gives the text of the 10th c., and is accepted by most scholars, English and German, as in the main the work of A. The question is critically discussed in Dr Reinhold Pauli's *Alfred the Great* (Bohn, Lond. 1857).

Asses, Feast of. See FOOLS, FEAST OF.

Assessed Taxes. These include various domestic taxes assessed on houses, menial servants, carriages, and other private articles. In 1851 duties on windows were abolished, and instead a duty was put on inhabited houses worth £20 a year or upwards of rent. The inhabited house duty is, for dwelling-houses, 9d. per £; for shops, and some other classes of houses, 6d. per £.

Assess'ors are persons appointed to advise and assist a judge as to procedure, and in forming his judgment. They are usually barristers; in Scotland, advocates. In ecclesiastical law procedure, functionaries of the Church are usually joined to a barrister of good standing.

Assets, derived from the old French *assets*, enough, originally meant the property of one deceased equivalent to his debts. It is now, however, generally used in contradistinction to the word 'liabilities,' in mercantile affairs; hence its meaning is apparent. In a mercantile Balance-Sheet (q. v.) the A. are placed on one side, the liabilities on the other. If the former exceed the latter, the concern is solvent; otherwise, it is insolvent. In English law, A. are *legal* or *equitable* according to the nature of a procedure which a creditor may use against the executor or heir. A. is not a technical term in the law of Scotland; but it is much used in mercantile affairs, in which it has the same signification as in England.

Assid'ians. See CHASIDIM.

Assigna'tion is a legal term in Scotch law analogous to the English term Assignment (q. v.). It is applied to a written deed of conveyance in favour of another, made by the creditor in any obligation, or by the proprietor of any subject not properly feudal. The maker of the A. is called the *cedent*. The receiver is called the *assignee*, or *cessioner*, or *cessionary*; and where the right or subject assigned is a debt or obligation, the obligant or debtor in this is called the *common debtor*. To complete the transference to the assignee, the A. must be intimated to the common debtor; and if there is more than one A. of the same subject or debt, the first intimated is preferable, though another be of prior date. The intimation ought to be notarial; but it may be made effectively by other formal notice. Some assignments, however, require no intimation. Indorsation of a Bill of Exchange (q. v.) and Adjudication (q. v.) require none. In Scotland, A. of movables, while the cedent retains possession of them, is not effectual against an onerous creditor.

Assignats. This was the name of a paper issue, under the authority of the French National Assembly, after the revolution of 1789. The notes were for the values of from five to a hundred francs. They were nominally on the security of land held to be assigned to the holder. The first issue alone bore interest. The law, so far as it could, made the acceptance of the A. at full nominal value compulsory. But the law of political economy proved stronger than that of the National Assembly, and in March 1796 twenty-four francs in gold were worth 7200 in A. In July of the same year the forced currency was withdrawn, after doing a great deal of mischief to the public.

Assignee in Bankruptcy. See BANKRUPTCY.

Assign'ment, in English law, is a deed or instrument of transfer; the operative words of which are to 'assign, transfer, and set over' to another, some right, title, or interest in real or personal property. A possibility, right of entry, or matter in an action or suit, cannot be assigned; nor can arrears of rent, and matters similar. Some things are assignable by custom and under statute which would not be so by the natural operation of English law. Thus promissory notes and bills of exchange (see BILL OF EXCHANGE) are so. An A. for the benefit of creditors is generally of the whole of the debtor's property; which A. the creditors accept in place of their claims. Unless, however, all creditors assent, such an A. may be a fraud under the Bankrupt Act of 1869. By it a fraudulent A. is an Act of Bankruptcy (q. v.). An A. with intent to defraud is void. This word is also sometimes used in the law of Scotland to denote the transference of property in patents, copyrights, and registered ships.

Assignment of Error, in English law, is the statement of grounds on which alteration of the judgment of a court of law is asked from a higher tribunal. Under the Common Law Pro-

cedure Act the term is now limited to certain grounds of objection there defined.

Assigns, in the law of England, is the term applied to parties in whose favour an Assignment (q. v.) is made. The analogous Scotch term is Assignee. See ASSIGNATION.

Assimilation. See NUTRITION.

Assiniboine, a river in the S. of the Dominion of Canada, Hudson Bay Territories, flowing W., and joining the Red River at Fort Garry.

Assisi, an episcopal town of Central Italy, in the province of Perugia, with manufactures of needles and files, and famous as the birthplace of St Francis, founder of the Franciscan order of Mendicants, who built here the Convento Sacro, a beautiful specimen of early Gothic, containing many exquisite paintings by Cimabue and Giotto. The tomb of the saint is said to have been sometimes visited by as many as 100,000 pilgrims in one day. The poet Metastasio was also a native of A. Pop. 14,033. Some remains of the ancient Umbrian town *Assisium* exist, including a portico of the temple of Minerva, with fluted Corinthian columns, the whole constructed of travertino.

Assize. The word, according to Sir Edward Coke, is derived from the Latin *assideo*, to sit together. In England, assizes are held twice, or, in some counties, three times a year, except in Middlesex, before two judges appointed by the Queen's special commission. These judges sit in virtue of five several commissions—namely, of commissions of the peace, of *oyer and terminer*, of gaol delivery, of A., and of *nisi prius*.* A. also signifies any statute or ordinance for regulating the weight, measure, or quality of the thing which it concerns, as formerly the A. of 'w' or ale.

In Scotland, A. sometimes signifies the sittings of a court, sometimes its chances, and sometimes the jury. A jury or A. in the Court of Justiciary consists of fifteen men, formerly chosen by the court, now chosen by ballot from a greater number (not exceeding forty-five), summoned by the sheriff; of these a list must be served on the defender, with a copy of his indictment.

Associate Synod was the designation adopted by that party among the Seceders (see UNITED PRESBYTERIAN CHURCH) who affirmed that it was lawful to take the Burgess oath, and who were therefore popularly known as 'Burghers.' As the other party, the Antiburghers, denied this, a 'split' became necessary, and accordingly it took place in 1747. The Antiburgher Synod called itself the *General Associate Synod*.

Association. See CO-OPERATION SOCIETIES, LEAGUE, COMPANY.

Association of Ideas is a general name for the orderly sequence which obtains among mental states. Aristotle says, 'Each mental movement is determined to arise as the sequel of a certain other.' He then states that reminiscence, whether voluntary or spontaneous, proceeds according to the law of similars, the law of contraries, and the law of coadjacents (including order in space and in time). Hume says, 'To me there appear to be only three principles of connection among ideas: resemblance, contiguity in time or place, cause and effect.' Hamilton and others have pointed out that 'cause and effect' is merely a case of contiguity in time—viz., succession. The association of contrary ideas is also generally admitted to be due to often-repeated contiguity, assisted by the mental shock of contrast: in the connection of relatives proper, e.g., son and father, the one idea may be said to be a part of the other. James Mill attempted to reduce the connection of similar ideas to the law of contiguity, on the ground that we generally see like things together. On this view, which is affirmed on a large scale by evolutionists, mental association would depend entirely on the order in which the original sensations presented themselves. Similarity is, however, admitted by psychologists to be an independent source of attraction among ideas. Vivid impression, frequent repetition, and retentiveness of the particular mind affected are the main conditions of strong association. Mr Bain thus states the law of contiguity: 'Actions, sensations, and states of feeling, occurring together, or in close succession, tend to grow together, or cohere

in such a way that when any one of them is afterwards presented to the mind, the others are apt to be brought up in idea.' A good example is in the association of the feelings of vocal effort which so largely assists pure memory. The idea of a nauseous taste calls up the feeling to a certain extent. Mr Bain states the law of similarity thus: 'Present actions, sensations, thoughts, or emotions, tend to revive their like among previous impressions.' This property of mind is at the root of the scientific faculties which trace identity in the midst of diverse conditions. Although the laws of A. of I. have long been known, it was only by degrees that they were applied in explanation of particular mental operations or faculties. Thus Locke notices A. of I. in a short chapter dealing chiefly with the prejudices of children; while Bain abandons the subdivision of the mind into faculties, and proceeds entirely on the laws of A. of I. The controversy as to the origin of knowledge has consisted chiefly in attempts to explain by A. of I. indissoluble or 'necessary' connections of ideas. Aristotle confined himself to habitual connection, not thinking that a necessary connection required explanation. Berkeley, however, has successfully applied A. of I. to the perception of distance; and some psychologists even maintain that the belief in an external world is due to the association of possible sensations with movements. Physiologists assert that when impressions are received together or in succession, a connection along a definite tract of nervous force is established. Nothing is known, however, with regard to the actual changes taking place in the substance of the brain.

Assouan, **Essuan**, or **Eswan**, the Syene of the Greeks, who formed the word from the Coptic (A., *souan*, the opening, to which the Arabs have added their article *el*, softened into *es*), a town in Upper Egypt, on the right bank of the Nile, near the last cataracts, best known for its quarries of a kind of granite, called, from Syene, syenite. In these quarries there are still remains of partially-cut blocks, and numerous inscriptions, which served to indicate what material had been quarried and removed, and by the order of what king. The staple trade is in dates, the palm flourishing well here. The traffic in slaves has not yet been suppressed, and there is no other trade of importance. Pop. 4000.

Assumption of the Virgin Mary, a festival of the Greek and Roman Churches, held on the 15th of August since the 7th c., in commemoration of the assumption of the soul and body of the Virgin into glory by Christ and his angels. From the 4th c. to the 7th the same day was observed in memory of her death.

Assurance. See INSURANCE.

Assurance, Common, is the legal evidence of the conveyance of property. See CONVEYANCE, DEED.

Assyria was a part of the Mesopotamian plain nearly as large as Great Britain, bounded on the N. by Mount Niphates in Armenia, on the W. by the Khabur and the Euphrates, on the S. by the alluvial plain which forms the N. of Babylonia and Susiana, and on the E. by Media, from which it is separated by Mount Zagros (mod. Mountains of Kurdistan). E. of the Tigris A. consists of fertile plains in the lateral valleys; W. of the Tigris it consists of an undulating tract and a level plain, both sterile and with little water, lying N. and S. of the Sinjar Hills. Eastern A. is the scene of its history, the warlike expeditions to the W. being always described as 'across the Tigris.' Adiabene, the most fertile district, watered by the two Zab rivers, was near the sites of the capital cities Asshur, Nineveh, and Calah. Ruins of cities and strongholds are frequent on the E. bank of the Tigris. About the origin of A. nothing is certainly known; but the traditions of Nimrod, the Biblical statement that Nineveh was founded by Asshur from Babylon, and the similarity of Assyrian race and civilisation to the older Babylon, suggest that A. was colonised from Lower Mesopotamia, which is supposed to have been the source of Semitic emigration to Arabia and Palestine. The original capital of A. was Asshur (now Kalah Shergat), on the W. bank of the Tigris, 60 miles S. of Nineveh. Till lately the Kalah Shergat cylinder was the earliest historical document: it gave the names of five kings, going back to the 13th c. B.C. We have now a tablet giving the names of four kings in the 14th c., and the list of kings is hypothetically completed to 1850 B.C. Asshur is said to have existed in that century, but it may have been partly dependent on Babylon. Twenty-one kings, commencing

* There are eight circuits annually—the Home, the Midland, the Norfolk, the Oxford, the Northern, the Western, the N. Wales, and the S. Wales.

with Ismidagan, and including two of the name of Samsivul, must have reigned at Asshur. Of these, Belnirari (1370-50) and Vulnirari I. (1330-1300) both defeated the Babylonian Kassi. From 1300 to 745 (when the Canon of Ptolemy introduces certainty into dates) we have twenty-two kings, ending with Assurnirari II. Shalmaneser I. (1300-1271) built the city of Calah, 40 miles N. from Asshur. It is now represented by the mounds of Nimrud, near Nineveh. Shalmaneser made Nineveh the seat of government. His son, Tigulti-ninip, or Tiglath-nin (1271-1240), drove the Arabian kings from Babylon, and established there an Assyrian dynasty for seventy years. Assur-risilim (1150-1120) warred with Nebuchadnezzar I. of Babylon. His successor, Tiglath-Pileser I., whose history was written on the duplicate cylinders in the British Museum, simultaneously translated by four English scholars in 1857, subdued the Syrians, Moschians, and others, took tribute from the Armenians, Shuhites, &c., and stormed Babylon. He also restored the temples at Asshur, and built the Zab canal, and a palace at Calah. Assur-n'zir-pal (885) is mentioned among others as repairing and rebuilding the Nineveh temple of Ishtar, daughter of the god Hea. Shalmaneser II. (860-825) defeated Benhadad and Hazael of Damascus, received tribute from Jehu of Israel, and extended the Assyrian power from the Persian Gulf to the Mediterranean—'the seas of the rising and the setting sun.' The black marble obelisk in the British Museum shows his victories. In this reign the Ninevites, complaining of power being transferred to Calah, revolted in favour of Assur-dani-pal, but were suppressed by Samsivul IV. (Shamas Iva.) In 810 Vulnirari III., the husband of the famous Semiramis, succeeded. Pul, mentioned in 2 Kings xv., was probably an officer of Tiglath-Pileser II. (745-727), who called himself King of Babylon. He defeated Rezon of Syria and Pekah of Samaria, besieged Damascus, and received tribute from Media, Chaldaea, Arabia, Moab, Gaza, and Tyre. He comes into contact with Azaiah and Ahaz of Judah, and Menahem and Hoshea of Israel. In 722 Sargon appears, of whose expedition against Ashdod, called 'my ninth expedition to the land beside the great sea,' Mr G. Smith has recovered an account on an octagonal cylinder. In spite of the combination of Judah, Edom, Moab, and Philistia, Sargon defeated the Egyptian Shebek (Sabago), reduced Samaria and Arabia Petraea, crushed Merodach Baladan at Baladan, and received tribute from Cyprus. He used widely the policy of deportation. His palace at Khorsabad is said to have been capable of holding 80,000 persons. His son Sennacherib (705-681), whose history in the Bellino and Taylor cylinders has been supplemented by Mr Smith, overran Phoenicia, smote Egypt at Altaku, took Ekron, and after besieging Hezekiah in Jerusalem, carried off 200,000 Jews, and exacted a heavy tribute and indemnity, part of which was stripped from the temple. The destruction of Sennacherib's army at Pelusium by the 'angel of the Lord' (2 Kings xix.) is not referred to in the Assyrian inscriptions. Sennacherib also defeated at Khaluli a combination of Susub of Babylon and the Elamites. He built the great Nineveh Palace. His son Esarhaddon (681-668) resided sometimes at Babylon, the Babylonian contract-tablets of the period being dated by reference to his reign. His ten expeditions penetrated further than any of his ancestors. Cilicia, Tyre, Edom, Arabia, were all visited: he crushed Tirhakah of Egypt, and established Neco at Memphis. He pardoned Manasseh of Judah, but secured his power by augmenting the foreign population in Palestine. Twenty-two kings contributed materials to his palace at Calah, which is fully described in the inscriptions: he also built thirty-six temples, 'beautiful as the day.' Assur-bani-pal, or Sardanapalus (668-626), was the greatest of Assyrian kings, 'the principal patron of Assyrian literature,' the greater part of the library at Nineveh being written during his reign. He succeeded in two campaigns against Tirhakah and Undamane of Egypt, established Assyrian power at Sais, Memphis, and Thebes, and carried on an exterminating war in Susiana, where he took twenty-six cities, including Susa. His brother, Saulmugina of Babylon, frequently revolted, in league with Vaitch of Arabia. His palace at Kouyunjik is remarkable for the number of hunting-scenes it contains. Cruelty in war and magnificence at home are traceable in all the inscriptions of this reign. Little is known of the reigns of Bel-zakir-ishun and Assur-ebil-ili (Saracus), from 627 to 607, except that Phraortes the Mede attacked A., that there was a Scythian invasion, and that finally Nineveh was burned and the Assyrian empire destroyed by a league between the Babylonians under

Nabopolassar, and Cyaxares of Media. A. then becomes a satrapy of the Persian empire, which was overthrown by Alexander the Great, B.C. 312. His general, Seleucus, founded the dynasty of the Seleucidae, whose capital was on the Tigris, below Bagdad. In 248 B.C. (a date fixed by Mr Smith from Babylonian tablets) Arsaces founded the Parthian dynasty of Arsacidae, which again was destroyed (A.D. 226 or 237) by Artaxerxes, a tributary king of Persia. The Persians were succeeded by the Califs of Bagdad. Finally, in 1638, the Turks obtained A. Under their rule A. is scantily populated, in great measure by Arab tribes, and there is little cultivation of the soil. Nineveh has long been in ruins. It is last mentioned (A.D. 116) as having been captured by Trajan in an expedition against the Parthians. The modern Mosul, in the pashalic of Bagdad, has a good trade with Aleppo.

Religion.—'My Lord Asshur,' corresponding to the Babylonian Il or Ra, and represented by a winged circle enclosing the figure of an archer, was the supreme deity of A.; he is generally first mentioned in the inscriptions. Then comes a governing triad, Anu, Bel (whose wife was Beltis or Mylitta, 'mother of the gods'), and Hea; Sin, Shamas, and Vul 'in his stormy coil,' form a triad of the elements. 'My Lady Ishtar,' of Nineveh and Arbela, resembles Venus or Astarte. The Babylonian legend represents her as in love with Izdubar. 'Ninip fierce, the great warrior with his mighty arrows,' or Nin, represented by the winged bull, and Nergal, the winged lion, were also popular. Nebo and Nushu ('the glorious attendant') were inferior divinities. Each god had a goddess.

Discoveries, &c.—In 1842, M. Botta, French consul at Mosul, began work at Kouyunjik, a large mound opposite Mosul, and in the northern part of the site of Nineveh. He soon went to Khorsabad (Dursargina), some miles to the N.E., where he discovered Sargon's palace, and obtained many sculptures of mythological figures, battle scenes, processions, most of which in 1846 were deposited in the Louvre. The work, continued by M. Place (French consul), was taken up in 1845 by Mr Layard, who discovered the palace of Sennacherib at Kouyunjik, and one of the Nineveh gates, the palace of Esarhaddon at Nebbi-Yunas, a mound to the S. of Kouyunjik, and several palaces and temples at Nimrud (Calah). Since then Sir Henry Rawlinson and Mr Loftus have carried on important excavations; and in 1877 Mr George Smith, of the British Museum, made valuable additions to our knowledge. Grotefend was the first decipherer of the cuneiform (arrow-shaped) writing, but Sir H. Rawlinson, by the light derived from his interpretation of the trilingual Behistun inscription (genealogy and life of Darius), was first able to translate, in 1851, some official Assyrian documents. Dr Hinch and Mr Fox Talbot are among the best cuneiform scholars in England. Of the results of Mr Smith's expedition, the most important has been the completion of the tablets containing the Izdubar or Flood Legends, or Chaldaean story of the deluge, supposed to have been composed during the early Babylonian empire, about 2000 B.C. Izdubar, or Nimrod (who ruled in Erech, modern Warha, on the Euphrates), hears the story told by Ihasisadra (Xisithrus), who built the Chaldaean ark at Surippah. The deluge was caused by man's wickedness, but, unlike Noah's, it lasted only seven days, and many more than eight people escaped in the ark, which stranded, not on Ararat, but on a mountain to the E. of Adiabene. Hasisadra was translated to heaven. Mr Smith has also found the Babylonian legend of the seven evil spirits, which illustrates the Assyrian pantheon. Anu rules, passive and supreme, in the upper heaven; his son, Vul, in the atmosphere; on earth, Bel, the active god of the middle region; in ocean, or the deep below the earth, Hea, who represents the mind or wisdom of God. 'There is chaos in heaven, and Bel wishes to create order by placing there Shamas (the sun), Sin (the moon), and Ishtar (Venus). This change the evil spirits resist, but are ultimately vanquished, though Shamas, Ishtar, and Vul take their side. Mr Smith observes that the Assyrian year consisted of twelve lunar months, to which they occasionally added an intercalary month, according to the relative positions of the moon and a certain star, 'the star of stars,' which was just in advance of the sun at the vernal equinox. He also gives interesting copies of Assyrian deeds of sale, with the designations and sales of the parties, the extent and boundaries of the subject (in one case 15 lbs. of silver for 500 acres), and the names of seven witnesses. The excavations show that the Assyrians were a luxurious, but a brave and ener-

getic people, fond of war and hunting. Enriched with costly tribute, and with the help of imported labour, they excelled in magnificent architecture, their sculpture being much superior in design and execution to that of the Egyptians. Their public drains and aqueducts show their knowledge of the arch; and from the Scriptures we see that the lever and the roller were used in building operations. Like the Babylonians, they made constant observations of the stars: a valuable astrolabe was discovered by Mr Smith in Sennacherib's palace. The link between A. and the subject states was payment of tribute; service in the field was not required, and very seldom were the Assyrian gods forced on the conquered. The agreements to pay tribute were more frequently broken as the empire extended; hence the exhaustion and sudden fall of A. See Rawlinson's *Five Great Monarchies of the Ancient World* (4 vols. 1862-67), and George Smith's *Ancient History from the Monuments—A.* (1875).

As'tacus. See CRAYFISH, LOBSTER.

Astar'te (the Ashtaroth, or, more correctly, the Ashtoreth, of the Old Testament), the chief goddess of the Phœnicians and Syrians, and erroneously confounded with the Greek Aphrodite. See ASHERA. Tyre and Sidon were the chief seats of her worship. Originally typified by a cow, her later emblem was a star, which is said to be the signification of the word Ashtoreth. There is little doubt that she was the moon-goddess, and more like Diana than Aphrodite.

Aster, a genus of Composite plants embracing about 200 species. They are mostly perennials and herbaceous, and a few are shrubby. They are found sparingly in Europe, Asia, and S. America, but abound in N. America. They generally flower late in the season, hence they are called Michaelmas daisies. There is only one species native in Britain, the *A. Tripolium*, which grows in salt marshes. There are many N. American species cultivated in gardens, the more showy kinds being *A. spectabilis*, *A. Nova-Anglia*, *A. versicolor*, and *A. turbinellus*. *A. Sikkimensis* from the Himalaya, and *A. anellus* from the S. of Europe, are also cultivated. The China A. of gardens is the *Callistephus Chinensis*, a very showy annual, of which there are numerous varieties.

Asterisk (Gr. *asteriskos*, a little star) was a mark (*) anciently used by grammarians in opposition to the obelisk, dagger, or cross, to denote that a passage was either unjustly suspected of not being genuine, or was otherwise notable. The Church fathers, however, introduced a certain laxity in the application of these signs. Thus Jerome, in his translation of the Bible, employed the A. to point out where the Greek version of *Theodotion* had more words than the Hebrew text. Since the invention of printing, the A. has served as a reference to a note at the bottom or on the margin of a page (though the letters of the alphabet and numerals are now much in use for this purpose), and also to mark omissions of one or more letters or words. A number of asterisks indicates that there is a gap in the text.

Asteroidæa, an order of the class *Echinodermata*, including the Starfishes (q. v.), which possess a central body or disc, giving origin to a greater or less number of arms or rays, containing prolongations of the organs and viscera of the body. The skin is calcareous or horny. The mouth, situated on the inferior aspect of the body, is unprovided with a dental apparatus. The tube-feet or *ambulacra* exist in grooves in the under-surface of the rays. The larva or young form is worm-like, and does not possess any calcareous skeleton.

Asteroid Polypes, a term applied to the Alcyonarian Polypes (see ALCYONIUM), in allusion to the star-like appearance presented by the tentacles or feelers around the mouth of each polype.

Asteroids, less commonly, but more correctly, called planetoids, the name given to a zone of small planetary bodies revolving in orbits situated between those of Mars and Jupiter. The first was not detected till the beginning of the present century, but the singular gap which, according to Bode's Law (q. v.), seemed to exist between the orbits of Mars and Jupiter, had suggested previously to astronomers the probability of there being one or more planets in that region hitherto unobserved, on account either of their small size or feebly luminous power. On the 1st day of January 1801, Piazzi of Palermo discovered a small planet, which he named Ceres; and within three years three more, Pallas, Juno,

and Vesta, were discovered by Olbers and Harding. For nearly forty years no more were noticed, though astronomers generally accepted Olbers' theory that the A. were fragments of some large planet, and that, probably, other such fragments would yet be discovered. Hencke's detection of *Astræa* in 1845, and the rapid succession of discoveries that followed, were hailed as a corroboration of this theory by its supporters; but it has since been shown upon dynamical principles, that the diversities existing between the elements of the individual orbits are inexplicable on the disruptive theory alone. The magnitudes of these planets are very small, the largest not exceeding 450 miles, while the majority are considerably smaller. The orbits are more eccentric than those of the larger planets, that of Nysa having an eccentricity amounting to almost one-half of the major axis. The inclinations to the plane of the ecliptic vary much—from only 41' 7" in the case of *Massalia*, to 34° 42' 41" in the case of *Pallas*. *Feronia* has the shortest year (1148 days), and *Sylvia* the longest (2374 days). From 1847 one or more have been discovered yearly, and in 1868 there were no less than twelve added to the list. At present (1875) there are 148, of which 137 have had their elements determined. The mean breadth of the zone in which they all lie is almost as great as the distance of the earth from the sun; but owing to the great eccentricity of several of the orbits, some of them venture much farther into space. Another interesting feature of these orbits, first pointed out by Mr Cooper, of Markree Castle, is that more than 70 per cent. have their perihelia within the semicircle from 0° to 180°. There must be some hidden cause for this speciality, for the laws of probability are utterly opposed to the casualty of such a distribution. As regards the mass of these small bodies, Leverrier has shown that their total mass cannot exceed one-fourth that of the earth; for if it did, the perihelion of Mars would have been disturbed within a century to a quite perceptible degree. In conclusion, it remains to be said, that notwithstanding the eccentricities and inclinations of these orbits, and the intricate net-like appearance which they, taken as a whole, present, yet even these minute orbs rigorously obey Kepler's three laws, thus affording a further proof, if such were necessary, of the truth of the Newtonian theory of the universe.

Asterophyllites ('star-leaved'), a generic name in palæontological botany, including certain fossil plants found in the Carboniferous rocks. The different forms of A. have recently been proved to belong to the foliage of the genus *Calamites*, the fossil stems of which they are generally associated with. The plants are allied to the horse-tails or *Equiseta* of the present day.

Asthénia. Life is maintained by the circulation of warm arterial blood. If no blood circulates through the arteries, or if the blood be entirely venous, that is, containing a deficiency of oxygen, death is the result. When no blood circulates, death is said to occur by Syncope (q. v.). This is of two kinds. First, there may be no blood to circulate, as in cases of profuse hæmorrhage: this is death by anæmia, or want of blood. Or the contractile action of the heart may fail: this is death by A. A. may be caused by disease of the heart, or by the action of various poisons; or it may be brought on by lightning, concussion of the brain, or intense mental emotion. A. is therefore a mode of death.

Asthma is a nervous disease, attended by great difficulty in breathing, hence the origin of the name, 'gasping for breath.' It is caused by spasm of the circular muscular fibres which surround the smaller bronchial tubes, which so contracts their lumen as to admit only a small quantity of air into the air-cells. A fit or paroxysm of A. frequently occurs during the night. The sufferer awakes with a sensation of suffocation, which sometimes is so severe as to cause him to sit up at an open window, and with livid countenance and outstretched arms to struggle in vain attempts to obtain relief. The expression is anxious, the eyes staring, the skin cold and clammy, or bathed with a hot sweat, the pulse small and weak. Gradually the symptoms abate, and there may be an intermission for hours, days, or even weeks. The irritation which excites spasm of the bronchial tubes (see REFLEX ACTIONS) may be central, in the *medulla oblongata* (the great respiratory centre), or it may commence in the peripheral branches of the pulmonary or gastric portions of the pneumogastric nerves. Dust, cold winds, irritant vapours,

ipeacachuan powder, smoke, improper food, intestinal irritation, may be the proximate cause or causes of an attack. A. is not a fatal disease in itself, but it is apt to produce congestion of the lungs, emphysema, hypertrophy, with dilatation of the right side of the heart, and repeated attacks render the patient's existence miserable. The treatment may be divided into two parts—(1) during the attack, and (2) during the interval. During the attack, remove the cause, admit fresh air, and, in many cases, give an emetic to relieve the stomach. Attention must then be directed to remove the spasm by the use of nitrous ether, spirit of chloroform, breathing the fumes of burning filtering or blotting paper which has been soaked in a saturated solution of nitrate of potash and dried, or by the inhalation of chloroform. Smoking tobacco often gives great relief, while tincture of *Lobelia inflata* and tincture of *Stramonium* are also useful. Between the attacks everything must be done to improve the general health by the use of tonics, and the patient must live on light, easily-digested, nutritious food. Residence in a climate of equal temperature, not too moist, is also to be recommended.

As'ti, a large city of Piedmont, N. Italy, in the province of Alessandria, on the river Tanaro, 27 miles E.S.E. of Turin, on the Turin and Genoa Railway, the *Asta Pompeia* of the Romans, so called because it was rebuilt by Pompey the Great after it had been destroyed by the Gauls. It is the seat of a bishop, and carries on a considerable trade in silks, stuffs, and a celebrated wine like champagne, called *vino d'A.*, produced in the district. Pop. (1872) 31,033. A., which is a very ancient city, was burned by the Emperor Frederick Barbarossa in 1154. It was in the possession of France from 1387 to 1529, when it was ceded to Charles V. at the peace of Cambray, who gave it to his aunt, Beatrice of Savoy. Alfieri the poet was born at A., where a monument was erected to him in 1862.

Astigmatism is that condition of the eye in which the refractive powers of the horizontal and vertical meridians are unequal. It is due to the degree of convexity of these meridians being different, so that corresponding rays, instead of converging into one point, meet at two foci. The consequence is, the individual does not see objects in the same plane, although they may really be so. The defect may be corrected by the use of cylindrical glasses. See EYE.

A'ston, Luise, a German authoress, born about 1820. After separating from her first husband (an Englishman), she appeared as a champion of 'woman's rights,' displaying herself in male attire, and, by her conduct, was twice obliged to leave Berlin. During the Danish war, however, she showed great devotion as a nurse. She married Dr Meier of Bremen in 1851. Among her works is one entitled *Meine Emancipation, Verweigerung, und Rechtfertigung* ('My Emancipation, Exile, and Vindication,' 1846).

As'tor, John Jacob, born in Walldorf, Heidelberg, Germany, July 17, 1763, was the son of a peasant. He came to London at sixteen, and emigrated to America in 1783. There he engaged largely in the fur trade, founding Astoria (q. v.), in the state of Oregon, as a dépôt. After the war of 1812 his mercantile enterprises were extended to all parts of the world, and he amassed the largest fortune in America (£4,000,000). By a gift of £80,000 he founded the A. library in New York, one of the largest and best for reference in the United States. A. died March 29, 1848. The A. property, mostly in New York, is still managed by the son, William B. A., and is valued at £12,000,000.

Astor'ga, Emanuele d', an eminent musical composer, born at Palermo in 1681. His father, a Sicilian nobleman, was executed by the Spaniards in 1701, during a war for the annexation of the island. Educated through the kindness of a Spanish princess at Astorga, in Leon (whence his name), he displayed a great talent for music, and became a great favourite at the court of the Emperor Leopold of Austria, after whose death he travelled through the greater part of Europe, staying in London two years. The original score of his best composition, the *Stabat Mater*, still much admired, is still preserved at Oxford. A. died about 1755.

Asto'ria, a village and port of entry in Oregon, U.S., 10 miles from the mouth of the Columbia river, formerly a dépôt

for the American fur trade. It was founded in 1811 by Astor (q. v.), and is notable as a chief point on which the American claim to the Oregon Territory (q. v.) was based.

Astrabad', a town in the province of the same name, Persia, at the N. base of a high and densely-wooded spur of the Elbrus Mountains, 20 miles from the S. shore of the Caspian. It was formerly the capital of the Kajar princes, from whom the present sovereign family of Persia is descended, and is still surrounded by mud walls. The number of half-ruined buildings, among which the remains of the splendid castle of Shah Abbas are conspicuous, give a somewhat waste appearance to the town, but this effect is modified by its large bazaar, its numerous mosques, and its gardens rich in fig, pomegranate, orange, and citron trees. The trade is hampered by the insecurity of property, for the Turkoman tribes approach, and sometimes break through, its walls. But since the Russians of late years have established a consulate here, and obtained possession of the island of Ashur-adeh (Great Ashur), not far off, its prosperity has begun to revive, and will probably increase. Unfortunately it is so unhealthy as to be called by the Persians 'the city of the plague.' Pop. 6000 to 8000.

Astræa, daughter of Zeus and Themis, was the goddess of justice, hence also called *Dike*, and was the last divinity to leave the earth on the expiry of the Golden Age. She took her place among the stars as *Virgo*.—A. is also the name given to the planetoid discovered by Hencke, December 8, 1845. Its sidereal revolution is 1511 days.

Astræa. See CORAL and MADREPORE.

Astrag'alus, a genus of Dicotyledonous plants belonging to the order *Leguminosæ*. It embraces a great many species, distributed throughout Europe, Asia, and N. and S. Amer.ca. Some are found in the Arctic regions, and there are three indigenous to Britain. In Persia and Asia Minor the gum-like substance called Tragacanth (q. v.) is obtained from *A. gummifer*, and some other shrubby species. *A. Boeticus* is a native of the S. of Europe, and is cultivated for its seeds, which are roasted and used for mixing with coffee. *A. glycyphyllos*, called 'wild liquorice' from the sweetness of its roots, is occasionally cultivated as fodder for cattle. *A. alpinus* is a beautiful alpine plant found in Northern Asia, N. America, Europe, and the Arctic region. In Britain it occurs only in two localities—viz., on a lofty crag at the head of Glen Dole, in Fife-shire, and on the mountain Little Craig-an-dal, in Aberdeenshire.

Astragalus (in anatomy) is the bone of the foot which receives the weight of the body from the leg. It articulates with the tibia above, with the os calcis below, and with the scaphoid in front. It is a strong irregularly-shaped bone, and is connected with the others by powerful ligaments. For details see FOOT.

Astrakhan', the capital of a Russian government of the same name, on an island of the Volga, 14 miles from its nearest, and 36 from its farthest, mouth. It is the seat of a Greek archbishop, and has a large brick-built cathedral with five cupolas (1646), which stands within the Kremlin, a fortified square. The old town, in former times the stronghold of the Tatars of the Volga, from whom it was taken by the Russians in 1554, lay farther up the river. A., besides twenty-five other Greek churches, has two Roman Catholic, one Lutheran, and four Armenian churches, sixteen mosques, and a Lamaite pagoda. It carries on considerable trade with Khiva, Bokhara, Persia, and India, and employs not fewer than 1300 vessels. The chief exports are Russian leather, linens, woollens, caviare, salted sturgeon, and isinglass; imports, raw and spun silk, jewels, rice, rhubarb, drugs, and gold-embroidered goods from Persia. Many of the inhabitants are employed in the fisheries of the Volga, and in large salt-works near the town. Pop. (1867) 47,839.

Astrakhan, a government of Russia on the Caspian Sea, with an area of 50,000 sq. miles, and a pop. (1867) of 319,278, among whom are numbers of Kirghis, Calmucks, Cossacks, &c. It is mainly a vast barren waste of salt marshy steppes, intersected by the Volga, and has much sturgeon-fishing, and manufacture of Caviare (q. v.). The climate is one of extremes, the temperature varying from 13° F. in winter to 70° in summer.—A. is the name of a rich fur produced in Southern Russia, Persia, and Bokhara by a peculiar breed of sheep.

Æstral Spirits (Gr. *astron*, a star), in the old Eastern religions, were the spirits or souls of the stars. The belief in such spirits naturally originated from the worship of the heavenly bodies. From the Persians and Arabs it passed, with modifications, to the Greeks and Jews, and from them to the early Christian Church. Under the quickening influence of the new religious ideas it rapidly developed into a wild and wondrous system. In the middle ages, when demonology was regarded as a science, A. S. were variously conceived of, but generally as born of fire, and having no proper connection with earth, heaven, or hell. In the 15th c., when superstition and moral scepticism were both at their height, the A. S. were assigned the highest rank among evil spirits.

Astringents are medicines which have the property of diminishing secretion, repressing hæmorrhage, and giving tone to the muscular system. Nearly all A. coagulate albumen and precipitate fibrin, and they thus constrict many dead animal matters. Their specific action is to cause contraction of muscular fibre. Among A. may be mentioned tannic acid, turpentine, bismuth, acetate of lead, the mineral acids, sulphates of iron, zinc, and copper, perchloride of iron, alum, corrosive sublimate, nitrate of silver, &c.

Astrocaryum, a genus of prickly palms found in tropical America. *A. vulgare*, or Tucum palm, is cultivated in Brazil for the strong and durable fibre obtained from its young leaves, which is used for bowstrings, fishing-nets, hammocks, &c. *A. Tucuma*, the Tucuma palm, which is quite distinct from the last mentioned, yields an edible fruit, as does also *A. Murumuru*, the Murumuru palm of Para, the flavour of which resembles that of a melon.

Æstrolabe (Gr. *astron*, a star; *lahein*, to take) was the name given in the days of Ptolemy to any circular instrument used for astronomical observations. In the middle ages, however, it was used in the same sense as the word planisphere, the projection of a sphere upon a plane, and was the peculiar badge of the astrologer.

Astrology (Gr. *astron*, a star; *logos*, a word or discourse) signified originally the science of the stars, but became at length restricted to the so-called science of foretelling future events by means of the positions of the heavenly bodies. Considering the profound ignorance of the real laws of the universe, and the large area over which star-worship prevailed, it is not surprising that a belief in the influence of the heavenly bodies upon terrestrial and human affairs should have arisen in the early ages of the world. In the oldest seats of civilisation, the empires on the Nile, the Euphrates, the Ganges, and the Hoang-ho, we find the belief already established in the very beginnings of history. From Persia and Chaldaea it passed to the Jews and the Græco-Latin races, and began to be popular at Rome about the close of the Republic. The Arabs were given to A. before the days of Mohammed, but from the 7th to the 13th c., when their military and literary renown were at the highest, they cultivated it as a science with the greatest ardour. The names of Messalah, Albumazar, Ali-ben-Rodoan, Alia-ben-Ragel, Almansûr, Zahel-Bebis, were once illustrious in the forgotten roll of astrological experts. Latin Christendom received A. partly from the Moslem conquerors of Spain, partly through direct intercourse with the East, and it continued to exercise a kind of fascination over the students of physical science long after the dawn of real knowledge had begun. Cardan, Tycho Brahe, and even Kepler, clung to it, though with a relaxed hold, and it is said even yet to have obscure votaries in Europe. But the discovery of the true system of the world by Copernicus was fatal to the permanence of its hold on the educated human mind. It gradually sunk down till it finally became the property of illiterate charlatans, who seized upon its quaint phraseology to assist them in the fabrication of impudent almanacs, and it is now cultivated as a science only by Mohammedans.

Astronomy (Gr. *astron*, a star; *nomos*, a law) treats of the motions and natures of the heavenly bodies. The first step towards the foundation of such a science is observation, which, combined with mathematical operations, gives us correct ideas of the distances, magnitudes, shapes, &c., of the heavenly bodies. *Physical A.*, which dates from the time of Newton, inquires into the nature of the forces and laws which produce and regulate the heavenly motions, and gives a method of calculating these motions from those laws. *Sidereal A.* directs its special atten-

tion to the nature and characteristics of the fixed stars. *Practical A.* is the application of such knowledge to practical life, as, for instance, in the case of navigation. This branch of the subject has been termed *Mathematical* or *Geometrical A.*

A. is in all probability the most ancient, as it is unquestionably the noblest, of the physical sciences; but its very antiquity tends to throw a considerable degree of obscurity around it.

It can scarcely be disputed that the Chinese have the oldest authentic observations on record, which they assert go back 2857 years B.C. The first recorded phenomenon is a conjunction of five planets in the reign of Emperor Schuen-hin; and M. Bailly has calculated that in the year 2449 B.C. a conjunction of Mercury, Mars, Jupiter, and Saturn occurred. It is also recorded that Tchong-kang put two astronomers, Ho and Hi, to death for neglecting to announce a solar eclipse which took place in 2169 B.C.

The Hindus assert that their Tirvalore tables go back as far as 3102 B.C., the beginning of the Kali-yug or Iron Age of the Hindus, at which time a conjunction of sun, moon, and planets is said to have occurred; but they are, as far as the date is concerned, quite unreliable, and the tables bear internal evidence of being derived from more recent sources, as, for example, in the case of the equation of the moon's centre, which presents a suspicious resemblance to that of Hipparchus.

The Chaldeans, however, seem to have been the first to make really reliable observations. Porphyry and Simplicius mention that a catalogue of eclipses observed during 1903 years prior to the time of the conquest of Babylon by Alexander the Great was sent from there to Aristotle. Ptolemy, however, quotes none anterior to the year 720 B.C. It was from these records that Halley discovered the moon's acceleration—that is, that her velocity in her orbit is greater now than it was formerly.

The Egyptians were probably the first instructors of the Greeks in A., but they seem to have left behind them no valuable observations, for Ptolemy and Hipparchus were always forced to have recourse to the Chaldaean records.

The A. of Greece undoubtedly begins with Thales (640 B.C.), the founder of the Ionic school. He predicted the year of a great solar eclipse, taught that the earth was a sphere, and taught the Greeks the use of the constellation of the Little Bear in navigation. Anaximander is said to have held that the moon shone by reflected light, and that the earth had a diurnal rotation round its own axis. Pythagoras (500 B.C.), the next astronomer of eminence, was far before his age. He promulgated the true doctrine of the motion of the earth round the sun, and showed that the morning and evening stars were one and the same planet.

The next important epoch in the history of A. was the foundation of the Alexandrian school. Of the many distinguished astronomers who have made this school famous, we may mention Aristyllus, Timocharis, Eratosthenes, and Aristarchus, the last of whom is the author of a very ingenious but impracticable method of determining the distance of the sun. But of all the Alexandrians, Hipparchus of Nicæa (150 B.C.) stands pre-eminent. He discovered the precession of the equinoxes, fixed the sun's apogee and perigee, and determined the mean motion of the moon, her eccentricity, the equation of her centre, the inclination of orbit, and the motion of her apogee. His most important service perhaps to A. was his compiling a catalogue of 1081 stars.

After Hipparchus, A. seems to have made no advance for almost three centuries, till Ptolemy (q. v.), famous as the founder of the system which bears his name, appeared. The Ptolemaic system made the earth the centre of the universe, and accounts for the irregular motions of the planets by supposing each to move in a circle whose centre revolved uniformly round the earth. His greatest discovery was the libration or evection of the moon, which Hipparchus seems to have suspected.

Between the times of Ptolemy and Copernicus we must look to the Arabs for any new information regarding A. The most illustrious of these Arab astronomers were Albategnius or El Batani (880 A.D.), and Ibn-Yunis (1000 A.D.), the former of whom discovered the motion of the solar apogee, while the latter made some important observations upon the eccentricities and disturbances of Jupiter and Saturn. Trigonometry also underwent great improvements at this period.

In the 13th c. A. again began to be cultivated in Europe, the first notable evidence being the translation of Ptolemy's

Almagest, by the command of the Emperor Frederick Barbarossa, about 1230; and among others who did much to promote the science were Purbach, Regiomontanus, and Waltherus, in the 15th c.

The most eminent of European astronomers in the 16th c. was Copernicus (q. v.). Struck with the complexity of the Ptolemaic system, this great man meditated on the true system of the world for nearly forty years, and but a few months before his death published his work *On the Revolutions of the Heavenly Bodies*, in which he holds that the planets, including the earth, revolve round the sun, which is fixed immovably in the centre of the universe.

In the latter half of the same century appeared the famous Danish astronomer Tycho Brahe (q. v.), who held that the earth was fixed in the centre of the universe, and that round it revolved the sun and moon, while the planets revolved directly round the sun. His observations were of immense service to his contemporary, Kepler (q. v.), in discovering those famous laws known as Kepler's laws, and which ultimately led Newton to the grand theory of universal gravitation. About this time also Galileo (q. v.) applied the telescope to astronomical observation, adding additional evidence in favour of the Copernican system by the discovery of Jupiter's satellites and the phases of Venus.

The next great epoch was the publication of Newton's *Principia* in 1687, in which the law that holds the universe together was first revealed to the world. While physical A. was taking such gigantic strides, the astronomers proper were not idle. Three successive astronomers—royal, Flamsteed, Halley, and Bradley, made great and important discoveries—notably the aberration of light by Bradley, which proved incontestably the fact of the earth's motion. The close of the 18th c. was marked by the magnificent discoveries of Sir W. Herschel, and by the splendid analytical researches of Lalande, Lagrange, Delambre, and Laplace. The 19th c. opened with the discovery of the first four asteroids. Then followed the greatest achievement of modern analysis, the simultaneous and independent prediction by Leverrier and Adams, in 1845, of another planet more distant from the sun than Uranus. Of late years much has been done in sidereal A.; great advances have been made in the knowledge of the constitution of heavenly bodies through the aid of the spectroscopic; mathematical researches have shown the arrangement of the solar system to depend, not upon chance, but upon the conditions of stability deduced from the universal law of gravitation. For detailed information regarding the state of astronomical knowledge at the present day, the reader is referred to such special articles as PLANETS, ASTEROIDS, SUN, MOON, &c.

See Delambre's *Histoire de l'Astronomie ancienne* (Paris, 1817), *Histoire de l'Astronomie du Moyen Age* (Paris, 1819), *Histoire de l'Astronomie moderne* (Paris, 1821), and his *Astronomie théorique et pratique* (Paris, 1814), Herschel's *Outlines of A.* (1849), and Grant's *History of Physical A.* (Lond. 1852).

Astur. See FALCONIDÆ and GOSHAWK.

Asturias, now called **Oviedo**, a province in the N. of Spain, lies between 42° 57' and 43° 30' N. lat., and 4° 30' and 7° 10' W. long. It is bounded N. by the Bay of Biscay, E. by Santander, S. by Leon, and W. by Galicia. Area, 3686 sq. miles. The country descends gradually from the mountainous southern border to the N., where there are tracts of fertile land along the coast. Maize, wheat, barley, and fruits grow in the wide valleys, and there are extensive forests of oak, chestnut, and fir. Cattle and horses are reared, and fishing is successfully prosecuted on the coast. Iron, copper, lead, antimony, marble, coal, &c., are found. The manufactures are trifling. Pop. (1870) 610,883. The chief towns are Oviedo, the capital, and Gijón and Aviles, on the coast. The ancient *Astures* ('Highlanders'), allied to the Cantabri, were the last natives of the Peninsula to submit to the Roman yoke, being only subdued in the reign of Augustus. After the overthrow of the Visigothic dynasty by the Arabs, the Christian nobles found a refuge in the hills of A., where no Moslem foot ever penetrated, and its fastnesses became the cradle of the later Spanish monarchy. Here Pelayo was elected king in 718 A.D., and his successors (10th c.) became kings of Leon. Since 1388 the eldest son of the King of Spain has borne the title Prince of A.

Asylum, anciently a place to which individuals might flee for refuge, e.g., the temples and altars of the gods. The Jews had 204

cities of refuge (Num. xxxv.), and in Greece and Rome asylums became so numerous as seriously to interfere with the course of justice. Hence their sanctity came to be disregarded, and the refugees were often driven from them by force. After the establishment of Christianity, churches, and all the enclosed ground belonging to them, were made asylums; but criminals abused the privilege of sanctuary to such a degree that it was from time to time modified, and gradually withdrawn. See ARSEY. It was abolished in England by Acts passed in 1534 and 1697. The word now denotes a retreat for the destitute, and especially for lunatics. See LUNACY.

Asymptote (Gr. *asymptotos*, not coinciding) is a term applied in mathematics to a straight line which continually approaches, but never meets, a given curve. Of such curves we may mention, as the best known, the hyperbola, the logarithmic curve, the conchoid. Some curves, especially those of the higher orders, have several asymptotes. The A. may also be defined as the tangent at infinity.

Atacamite, an ore of copper originally found as sand in the province of Atacama, in Chili. It also occurs in veins in various parts of Chili, Bolivia, Australia, &c. It has a bright-green colour, and is a compound of oxide and chloride of copper.

Atahualpa, the last of the Incas of Peru, son of Huayna Capac, on whose death in 1525, seven years before the arrival of the Spaniards, he became ruler of Quito, his elder brother, Huascar, having ascended the throne of Peru. Dissension springing up between the brothers, A. made war upon Huascar, defeated and threw him into prison, and seized his kingdom in 1532. A few months later the Spaniards, led by Pizarro (q. v.), landed in Peru, and the conquest of the country was practically begun and ended by the seizure of the person of A. and the massacre of many of his chiefs, who had been invited to assemble unarmed within the square of Caxamalca, from which egress was impossible, and in which the terror-inspiring artillery of the strangers was first brought to bear upon them. With the object of purchasing his freedom, the captive A. offered as ransom to fill a room 22 feet long by 17 feet broad up to the height of 9 feet from the floor with gold. Immense quantities of plate, embracing goblets, ewers, salvers, tiles, and plates for the decoration of public buildings, representations of plants and animals, ornaments, &c., were accordingly collected and divided among the Spaniards. A. now demanded his liberty, which Pizarro refused; and having obtained as much booty (amounting in value to £3,500,000) as could be readily obtained from A., the Spanish leader found it most convenient to put the Peruvian monarch out of the way. He accordingly accused him of plotting against the Spaniards, tried him, and condemned him to be burned—the sentence being subject to commutation to death by the garrote, on the condition that A. should accept the Christian religion. This A. agreed to do, and he was strangled accordingly, 29th August 1533, within a year after the arrival of the Spaniards on the Peruvian shores. See *Helps' Spaniards in Peru*, and Prescott's *Conquest of Peru*.

Atalanta (properly *Atalante*), in Greek mythology an Arcadian, daughter of Jasus and Clymene, was exposed on the Parthenian hill by her father, who had wished for a son. She was suckled by a she-bear, slew the centaurs who pursued her, and took part in the hunt of the Calydonian boar. The condition she imposed on those who sought her in marriage was that they should outstrip her in the foot-race, or suffer death. A suitor named Meilanion, dropping three golden apples, the gift of Venus, A. stooped to gather them, and, being defeated, became Meilanion's wife.—The Boeotian A., about whom the same myth is told, is probably identical with the Arcadian A.

Atarapu, or 'Devil's Rock,' a remarkable granite peak in British Guinea, which springs abruptly from the plain to the height of 900 feet.

Atavism is a term now employed by physiologists to denote the tendency to a reversion to ancestral form which is observed in successive generations of certain animals and plants. It is well known, for example, that from the common rock pigeon (*Columba livia*) no fewer than 160 distinct races of domestic pigeons have been produced. It has been observed, however, by Darwin and others, that in many broods of pure varieties,

such as fan-tails, tumblers, or pouters, individuals appear resembling the ancient progenitor, the blue rock. The same tendency to the reappearance of peculiarities of progenitors in their offspring, even after many generations, has been observed in other animals. Even in the human genus similar facts occur, and occasionally in a family an individual is born unlike in many respects father, mother, sisters, or brother, but reproducing not only the outward form, but even the mental qualities of an ancestor. See DARWINISM, PANGENESIS.

Atchafalaya Bayou, an outlet or branch of the Red River, which enters a bay of the same name in the Gulf of Mexico, after a course of 130 miles. It strikes off just before the Red River joins the Mississippi, and is navigable for steamboats.

Atchevement. See HATCHMENT.

Atchin', or **Acheen'**, a Mohammedan kingdom in the N.W. of Sumatra, strong enough in former times to drive the Portuguese from the island, extends from 95° 20' to 97° 40' E. long., and from 2° 50' to 5° 40' N. lat. Area, 2260 sq. miles; pop. 500,000. It is comparatively healthy, and is intersected by a chain of lofty and rugged mountains. Its chief heights are Abong (11,000 feet), Loose (11,000), Golden Mountain (6460), and Batu Gapit (6155). The natives, active and sagacious, but perfidious, traffic largely in gold-dust, pepper, camphor, sulphur, benzoin, betel-nuts, edible nests, and satin-wood, receiving in exchange opium, cotton stuffs, and arms. In 1873 Holland declared war against the Sultan of A., having gained the acquiescence of England by a cession of territory on the Gold Coast, but the Atchinese unexpectedly met the hostile expedition with a stubborn and disastrous resistance. But in January 1876, and after severe loss, A. was still unconquered by the Dutch. The capital, A., stands near the mouth of a river, in a valley overshadowed by hills, and has 36,000 inhabitants.

A'te, daughter of Zeus according to Homer, but of Eris according to Hesiod, a goddess who prompted gods and men to rash deeds, and to consequent suffering. The name signifies 'mischievous folly,' and in the Homeric poems she is nothing more. As such, Zeus banishes her from Olympus for causing Eurystheus to be born before Heracles. In the tragedians, she becomes a fate or doom resting on a house after the shedding of innocent blood, and almost identical with Nemesis and Erinys.

Atelec'tasis is a peculiar condition of the lungs of infants, in which a portion of the organs does not become filled with air. The lungs appear healthy, but they remain in the foetal condition. Dr Jörg of Leipzig, who has investigated this subject, regards the condition as a diseased state of the lungs. He points out that any circumstances likely to weaken the vital powers of the child before birth are liable to be followed by A. A child may live for several days with portions of the lungs in this condition. If the parts are not soon dilated, they become so consolidated that all trace of air-cells is lost. In some cases the ductus arteriosus, which during foetal life carries blood from the pulmonary artery to the descending aorta, is not quickly closed, so that little blood passes to the lungs even after birth. In these circumstances A. occurs.

A'teles, a genus of Platyrrhine monkeys, or Quadrumana, found in S. America, and popularly known as spider monkeys, from the extreme length of the limbs, and their agile nature. The tail is very long and prehensile, and thus serves as a fifth hand. The thumbs are absent or rudimentary. *A. Paniscus* and *A. arachnoides* are familiar species. See MONKEYS and QUADRUMANA.

Ateles.

Ateliers Nationaux, or **National Workshops**, were established in France after the revolution of 1848. In no country has the lack of a popular comprehension of the elementary principles of political economy led to so great disasters as in France. This was strongly illustrated in the establishment of the A. N., and in the results. The principle was that all work-

men were entitled to the means of living, whether able to provide this for themselves or not; and that the rate of payment should be on a uniform scale, without having regard to the merits of the workman. The system was of course highly attractive to a great number of men; but it proved too attractive. It was soon found that there were over one hundred thousand people to be provided for, and that the trade of Paris was fast going to ruin. The experiment was wound up by a bloody battle, and by the restoration of despotism. It is hardly worth while to refute the absurd doctrine involved in the establishment of the A. N. If the skilful and the unskilful, the industrious and the slothful, are to be all paid alike, the result is self-evident.

Atella'næ, or **Atellanæ Fabulæ**, improvised farces, which afterwards came to be written, were introduced at Rome from Atella, in Campania. The interlocutors, who used the Oscan dialect (hence their other name, *Ludi Osci*, 'Oscan Sports'), represented various classes of country-people. The humour was not coarse, and neither dancing nor obscene buffoonery was permitted, as in the mimes. It is thought that the modern Italian *arlechino* (harlequin) is derived from this source. Free-born Romans acted in the A. without incurring degradation. The names of several writers of A. are known, as Fabius, Dorsennus, Quintus Novius, Lucius Pomponius, and Mummius. Bothe has published fragments of the A. in his *Pœdorum Latinorum Sceniorum Fragmenta* (Leipz. 1834).

A Tempo (Ital. 'in time'), a musical term used after any alteration in the time, to denote a return to that originally marked. *A T. giusto* means that every note must receive its exact value in time.

At'esgha (Pers., 'the place of fire'), a naphtha spring on the peninsula of Apsheron, on the W. side of the Caspian Sea. It emits in dry weather a bright flame, which the Guebres (q. v.), who visit it, reverence as 'holy fire.'

Ates'sa, a town in the province of Chieti, S. Italy, 23 miles S.S.E. of Chieti. Pop. of commune, 9171.

Atou'chus. See BEEFLES and SCARABÆUS.

Ath, a town in the province of Hainault, Belgium, on the navigable river Dender, 12 miles N.W. of Mons. It has large manufactures of linen, calico, gloves, lace, cutlery, and heavy hammers, and also carries on an active trade in coal and grain. Its oldest structure is a tower, La Tour du Burbant, which dates from 1150. The church of St Julien, built 1393, had a beautiful spire 150 feet high, which was destroyed by lightning in 1817. A. was thrice taken by the French, in 1697, 1745, and 1792. The English and Dutch allies, under Owerkerke, also took it in 1706. It is now strongly fortified, and has an arsenal hospital, and college. Pop. 8050.

Athabasca, a lake in British N. America, lat. 59° N., and between 106° and 112° W. long. Length about 200 miles, breadth about 20 miles. It is fed by a river of the same name, which rises in the Rocky Mountains, near Mounts Hooker and Brown, flows N.W., and falls into the lake at its S.W. extremity. The river A. then emerging on the N. side, joins the Peace, changes its name into Slave River, and discharges itself into the Great Slave Lake, about 170 miles to the N.E. of Lake A.

Athali'ah, daughter of Ahab and Jezebel, and wife of Jehoram, King of Judah. On the death of her son Ahaziah, who had succeeded Jehoram, she 'destroyed all the seed-royal,' that she might reign alone. But Joash, the youngest son of Ahaziah, was saved by his aunt Jehosheba; and after having been 'hid in the house of the Lord six years,' was placed on the throne by Jehoiada, the high priest (878 B.C.). A., astonished to find one whom she supposed dead invested with royalty, shouted 'Treason!' but by the orders of Jehoiada she was conveyed beyond the precincts of the temple, and slain in the gateway of the king's house (2 Kings xi. 16).

Athan'aric, a king of the Western Goths in the 4th c. He was attacked by the Emperor Valens, against whose arms he maintained himself during two campaigns, but was defeated in a third (369 A.D.), when a peace was concluded. Soon after, the Huns, an Eastern Turanian race, burst into the settlements of the Goths, in the plains of Dacia, and committed such havoc

that the Goths implored the aid of the Roman emperor. In 374 they were provided with settlements on the S. of the Danube. A., however, did not accompany them, but retired westward, whence he was soon compelled to retreat by fresh attacks from the irresistible savages, who had wasted the plateaus of Asia from the borders of China. Repairing to Constantinople in 380, he was received with great pomp by the Emperor Theodosius, with whom he concluded a treaty, the effect of which was the incorporation of the Western Goths with the other subjects of the empire. A. died in 381, having, it is said, surfeited himself at the emperor's table.

Athanasian Creed. Before the questions regarding the nature of the person of Christ which agitated the Church after the Council of Nicæa were decided, the so-called A. C., although never sanctioned by any general council, was adopted by the Western Church. The substance of its contents is a full and unmistakable statement of the doctrines of the Trinity and of the Incarnation. It has come now to be almost universally agreed that Athanasius was not the author of it, but that, according to a very prevalent fashion of the time, it was merely fathered upon the great opponent of Arianism in order to give it a factitious value. As it contains allusions to subsequent controversies regarding the person of Christ, its composition is referred to some period between 450 and 550; there is no indication of its being received as authoritative before 800. As an exposition of doctrine, it is received by all the Protestant Churches, as well as the Roman Catholic; but its peculiar use in the public worship of the Church of England has given rise to a bitter controversy, many both of the clergy and the laity objecting strongly to the continued use of what used to be called the damnable clauses, by which it is declared that any one who does not believe the whole, 'without doubt he shall perish everlastingly.' In deference to the outcry against these clauses, there is now a tendency on the part of those who wish to retain them to smooth down the interpretation put upon them, and such euphemistic names as minatory, monitory, cautionary clauses, are much in vogue.

Athanasius, a Christian theologian who has made a lasting impression on the creed of the Church, was born at Alexandria about 298. He was ordained a deacon in 319, and became the chief counsellor of his bishop, Alexander, whom he accompanied to the Council of Nice. The following year (326) Alexander died, and A. was elected bishop and patriarch. When ordered by the emperor soon after to restore Arius to his pastorate in Alexandria, he refused. He was thereupon cited to appear before a council at Cæsarea (334), which he refused to do; but, at the peremptory command of the emperor, he appeared at one held at Tyre next year, and many absurd charges having been brought against him, he was deposed. He was again condemned by a council held at Rome next year, and banished to Treves in the W. of Europe. In 338 he was allowed to return to Alexandria, but disturbances having arisen, owing to disputes with the Arians, and the latter being at the time in the majority, the Council of Antioch (341) decreed that no deposed bishop could ever return to his see. A. fled to Rome, where a council acquitted him of all the charges laid against him, a decision which was confirmed by the Council of Sardica (344). In 347 A. was permitted to return to his see; but in 350, Arianism being again in the ascendant, he was once more accused and persecuted. He was condemned by the Council of Arles (354), and that of Milan (355). He concealed himself at Alexandria for two years, and then retired to the desert of Egypt, where he composed most of his best works. On the accession of the Emperor Julian (361), he returned to his see. Having given offence to the pagans, however, by reviling their religion, these joined with his Arian enemies, and prevailed on the emperor to banish him again (363); but the emperor died the same year, and he returned to Alexandria, to be once more expelled in the reign of Valens, and again restored by the prayers of his party. A. died in 373, at the age of seventy-five. His writings are chiefly directed against the Arians in relation to the doctrine of the Trinity. See **ARIUS** and **COUNCIL OF NICE**. It cannot be denied that to his indefatigable zeal and fearless ardour in the cause of orthodoxy the Church owes its profound sympathy with the Trinitarian creed. He created the belief in the greatness of the controversy. Clear, strong, and deep in his thinking, he left on the heart of Catholic Christianity an indelible conviction that Christ is God. Before this potent

mystery of faith even the fierce energy of the Arian Teutons finally gave way, and in less than three centuries after his death the triumph of his doctrine was absolute and universal. The first edition of A.'s works appeared in a Latin text at Vicenza (1482). The Greek text, with the Latin translation of Nannius, was first published at Heidelberg (1600). The best edition is the Paduan of 1777.

Atheism (Gr. *atheos*, godless) is the creed of the atheist. Perhaps the first mention of atheists is made by the apostle Paul, who calls the Ephesians (Eph. ii. 12) in their immoral, pagan state, 'atheists in the world,' meaning that they had lived as if there were no God; according to which definition multitudes of professed Christians would belong to the class. The proper meaning of an atheist is one who denies the existence of a God; but popularly the term has been applied to all who reject the vulgar notions about God. The first atheists in this sense were the Greek philosophers who, disgusted with the coarse polytheism of their countrymen, first denied that any truth was attainable on such subjects, and then held that, though there might be supernatural beings, they stood in no moral relation to man. Atheists, then, in the popular sense, are those who refuse to reverence and pay homage to a being whose attributes and actions, according to the popular creed, shock their moral nature, while reverently retaining, it may be, conceptions of their own about a divine being. Real atheists are those who, from indifference, or some worse motive, reject the popular creed, without taking the trouble to consider whether it is true or false, or whether there is any truth in it whatever.

Athelney, Isle of, a patch of dry land, about 100 acres in extent, in a marshy district near the confluence of the Tone and Parret, Somersetshire. It was the temporary refuge of King Alfred, who here erected a Benedictine abbey in 888. The name, originally *Æthelin ga ig*, means 'island of the nobles.' A gold ornament found here, bearing the name of Alfred, is preserved in the Ashmolean Museum, Oxford.

Athelstane, more correctly **Æthelstan**, grandson of Alfred the Great, was born about 893 A.D., and succeeded his father, Eadward the Elder, in 925. In some respects he was the greatest of the English kings before the Conquest. None triumphed more splendidly in the field, or exercised greater authority as a sovereign. The battle of Brunanburh (937), in which he utterly crushed a formidable coalition of Danes, Scots, Strathclyde Britons, and Welsh, and the glory of which is commemorated by a splendid chant in the *Chronicle*, virtually made him master of the island, and justified the title, which he was the first to adopt, of *Emperor of Britain*. His father Eadward had indeed prepared the way for the assumption of this dignity by the son, for at his death he was 'King of the English' and 'Lord of all Britain,' but A. was the first who made his monarchy indisputable. The French king, the Celtic princes of Bretagne, found a refuge at his court; the son of Harald of Norway was sent thither to be educated. A. reformed the national laws, built monasteries, and fostered literature. He died at Gloucester in 940, in the forty-seventh year of his age. No English prince before his time had ever possessed so much influence abroad, or so much power at home.

Athensum (Gr. *Athenaion*).—1. The Temple of Athene (Lat. Minerva) at Athens.—2. A college at Rome, founded by the Emperor Hadrian, with a staff of professors in rhetoric, philosophy, and law, to which young men resorted from all parts to finish their education. It was in high repute till the 5th c. The name is now frequently adopted by literary and scientific institutions, and is also borne by more than one important review.

Athens'us, of Naucratis, in Egypt, a litterateur, called, on account of his erudition, the 'Varro of the Greeks,' flourished at the beginning of the 3d c. His *Banquet of the Learned* (*Deipnosophista*, lit. 'The Sophists at Dinner'), in the form of a dialogue, exhibits no dramatic power, but is an exhaustless fund of anecdote, extract, and criticism from the commonplace-book of a Greek gentleman of the 3d c. fond of reading and good eating. He cites more than 1200 books. What we possess is only an abridgment. The idea of the work is this: Twenty-one artists and men of letters, among whom are musicians, poets, grammarians, philosophers, doctors, and lawyers, are supposed to be brought together at a feast given by a rich Roman named

Laurentius or **Laurensis**. In their conversation everything comes up that belongs to the social usages of the Greeks—meats, wines, perfumes, garlands, flowers, vases, sports, &c.—nothing is overlooked. The best edition is by Dindorf (3 vols. Leipz. 1827). It is translated into English in Bohn's *Classical Library*.

Athenag'oras, an Athenian proselyte to Christianity, author of an *Apology*, or, as he styles it, an *Embassy* (Gr. *Presbeia*) for *Christians*, addressed to the Emperor Marcus Aurelius and his son Commodus, 177 A.D., in which, with much elegance and force, he defends his co-religionists from the charges of atheism, incest, and cannibalism, usually brought against them. He also wrote a treatise on the Resurrection. A. is considered one of the ablest of the early Christian apologists. The best edition of his works is that by the Benedictines, published in 1742 at Paris, along with the writings of Justin Martyr and others. A. has been translated into English, and forms, along with the translation of Justin Martyr, a volume in Clark's *Ante-Nicene Library* (Edin. 1867).

Athena'is, daughter of Leontius of Athens, born about the close of the 4th c. A.D., celebrated for her learning and beauty. On the death of her father she went to Constantinople, and made so favourable an impression on Pulcheria, the sister of Theodosius II., that she brought about a marriage between her and the emperor, A. having been previously baptized and named Eudocia (421 A.D.). In 438 A.D. A. brought the relics of St Stephen from Jerusalem, whither she had gone on a pilgrimage. In consequence of a quarrel with the emperor, she retired to the Holy Land, and died at Jerusalem 460 A.D., and was buried in the church of St Stephen, built by herself. She wrote several poems, which have been lost.

Athens, the capital of ancient Attica, is said to have been founded by Cecrops, the mythical hero of the Pelasgian race, to whose reign there is no historical basis for assigning any date. The tradition that Erechtheus introduced the worship of Athene, and built a temple to the goddess on the Acropolis, whence the name A., is also of doubtful antiquity. The city, originally confined to its Acropolis, was afterwards extended over the plain and the adjacent hills. The Acropolis, called by Pindar the 'navel of the city,' was an irregular oval, 1000 feet in length by 500 feet in breadth, while its summit was 150 feet above the plain. It was inhabited down to the Persian wars, when it was reserved for a fortress and a sanctuary. The first enlargement of the city beyond the bounds of its fortress rock was made by Theseus, to accommodate that increase of population which followed his organisation of the twelve independent Attic states into a confederacy, with A. for its capital. Connected with the N.W. angle of the Acropolis was the craggy height of the Areiopagus; S.W. arose the Pnyx, on which the citizens held their assemblies; and S. of the Pnyx was the hill known as the Museum. On these heights, and on the ground reaching southward from the Acropolis to the Ilissus, the principal public buildings were erected; but the city itself gradually extended toward the N. To the E. and then S. of the city ran the Ilissus, and W. the Cephissus, two small streams, nearly dry in summer, emptying into the Phaleric Bay. To the S. lay the Saronic Gulf, with the three harbours of A., the principal of which, the Peiræus, was connected with the city by a carriage-road between the two Long Walls, erected by the advice of Pericles, to preserve an uninterrupted communication between the city and its harbour during the continuance of a war. The other two harbours were Phalerum and Munychia.

The Acropolis was so covered with masterpieces of art, that it may be regarded as having constituted a museum crowded with objects of inestimable value. Architecture, sculpture, and painting were equally represented. The Propylæa, at once a fortress and an imposing work of art, formed the entrance to the Acropolis. When the gates were opened, a cluster of imposing objects met the view. Conspicuous above the rest were, on the left, the colossal bronze statue of Athene Promachus, the loftiest object in the Acropolis, and on the right the Parthenon, whose harmony and grand proportions, even in its ruins, make it still one of the wonders of the world. Opposite the Parthenon, on the N. side, stood the Erechtheum, containing the olive-wood statue of Athene Polias, the most venerated of Athenian relics, as believed to have fallen from heaven. Statues, shrines, and

smaller temples covered the rest of the area. The Areiopagus, on whose summit met the famous council, was connected in the Athenian mind with the most sacred associations, and it is no less sacred to the Christian as the scene of Paul's memorable discourse to the 'men of A.' On the Pnyx was the Bema, or tribunal from which the orators addressed the people, and before which the citizens assembled at daybreak—the heat of the sun being intolerable at noon—to listen to such orations as those of Themistocles and Demosthenes; while close to the south-eastern angle of the Acropolis was the Dionysiac theatre, capable of holding more than 20,000 persons, where the citizens could listen to the masterpieces of Sophocles, Euripides, and Aristophanes, while their eyes rested on the flanks of Hymettus, and on the waters of the Saronic Gulf. The great Temple of Olympian Zeus, commenced by Pisistratus, and finished by Hadrian, the greatest temple ever erected to the supreme deity of the Greeks, contained the statue of the god in ivory and gold, the workmanship of Phidias. The Academy of Plato—Milton's 'olive-grove of Academe'—the Lyceum, where Aristotle expounded his philosophy, and the Cynosarges, a gymnasium set apart for persons not of pure Athenian blood, where the cynic Antisthenes held his school, are memorable as educational centres in A. The best preserved monument of ancient A. is the Temple of Theseus, at once a sanctuary and a tomb. Another well-preserved structure is the Horologium, or octagonal Temple of the Winds.

Theseus, who has been already mentioned as having selected A. as the capital of the confederacy of the Attic states, divided the citizens into the three classes of nobles, agriculturists, and mechanics. The government was monarchical till the death of Codrus in 1068 B.C., when archons were elected from the nobility, at first for life, next for a period of ten years, the office being still dynastic, or confined to the family of Codrus; and in 684 B.C. the office was made annual, its duties being divided among a college of nine, chosen from the patricians generally. The government was thus an oligarchy. Solon, in 594 B.C., introduced, though with extreme caution, the elements of a democratic constitution. The great landowners held in pledge for debt the persons of the mass of the population, who, driven to desperation, were prepared for revolt. He forbade for the future the pledging of one's own person, or the persons of members of his family, for debt, and gave all freemen a vote in the elections of the archons. The basis of the constitution was extended by Cleisthenes (510 B.C.), when the government became a pure democracy. The victories of Miltiades at Marathon, and of Themistocles at Salamis, while they shattered the resources of the Persians, gave new life and hope to Greece. In 444 the glory of A. culminated under Pericles, but the seeds of decay were planted by the declension of morals. The capture of the city in 404 by the Lacedæmonians was followed by a brief glimmer of prosperity, but the defeat at Charoneia (338 B.C.) made A. subject to Macedon. The old spirit of freedom was dead. The yoke of Macedon was indeed thrown off, but only to be succeeded by the sterner yoke of Rome. Sulla destroyed the Peiræus; he inflicted, however, no further outrage; and for ages Rome sat as a docile pupil in philosophy and art at the feet of her illustrious captive.

The census of Demetrius Phaleareus, taken B.C. 317, gave 527,000 as the aggregate of the whole population of Attica. A. contained at least a third of this number, which agrees very nearly with the estimate of Böckh, who reckons the population of the city and harbours at 180,000. Of these, for each free-born person, or alien resident, there would be, at the lowest calculation, three slaves. Among the most striking episodes in the history of A. are its devastation by Xerxes, B.C. 480; its capture, and the destruction of the fortifications, by the Lacedæmonians, B.C. 404; its subjection to Macedonia, B.C. 338; its capture by the Romans under Sulla, B.C. 86; and the renewal of its splendour under Hadrian and the Antonines. After the abolition of the schools of philosophy by Justinian in the 6th c., its temples were converted into churches, the Parthenon becoming the church of the Virgin Mother, while the Temple of Theseus was dedicated to St George of Cappadocia. The Goths forced their way into the city in A.D. 267; and in A.D. 396, Alaric, during his invasion of Greece, consented to enter the city as a guest, since its defences were too strong for his barbaric soldiery. A. was in the hands of the Latins from 1204 till 1456, when it was incorporated into the Turkish empire, and the church of the Virgin Mother was converted into a mosque. In

1687 the Venetians, under Morosini, captured the city, when an explosion of gunpowder, placed in it by the Turks, reduced the Parthenon to a ruin. The Turks got possession of the city in the following year. For a century the finest remains of antiquity were used as quarries, and marble statues of inestimable value were calcined to obtain lime. After the War of Liberation, A. was in 1834 declared the capital of the new kingdom of Greece; new streets were built, of which the most noteworthy are the *Hermes*, *Aeolus*, and *Athene*, and the royal palace, begun in 1836, was finished in 1843. The University of A. (founded 1834) is attended by between 500 and 600 students, and has a large staff of professors and tutors. The trade of the city is insignificant. Pop. (1871) 44,510.

Athens, a town of Georgia, U. S., on the Oconee river, 92 miles N.W. of Augusta. It has a college called Franklin College, and is the centre of a rich cotton-growing district. Pop. about 4000. A. is the name of over twenty other places in the United States, of which the most noteworthy is the A. of Ohio, 72 miles S.E. of Columbus, and the seat of Ohio University. Pop. about 2000.

Atherina, a genus of fishes belonging to the Mullet family (*Mugilidae*), and represented by the sand smelt (*A. Presbyter*). These forms are sometimes included in a distinct family, that of the *Atherinidae*. They are small fishes, about 6 inches in length, and inhabit the southern coasts of Britain. They ascend rivers with the tide. These fishes are sold in many provincial markets as true 'smelts.'

Atheroma is a name given to a disease of the lining membrane of the arteries. Severe strain on the vessels, or a peculiar constitutional taint, as in gout, leads to a chronic form of inflammation. This causes an exudation on the inner surface of the lining of the vessel, giving rise to broad elevations of an opaque yellowish-white appearance. The effused matter may subsequently undergo degenerative changes. The principal effect of A. on the blood-vessels is a diminution of the elasticity of their coats.

Atherstone, a market town in Warwickshire, 16 miles N.E. of Birmingham, on Walling Street, the old Roman road to the N., with manufactures of hosiery, ribbons, and hats. Pop. (1871) 3667.

Athlete (Gr. *athlētēs*, a combatant, especially a prize-fighter), a competitor for the prizes in the Greek games. The Greek A. held an entirely different social position from that of the modern prize-fighter, and stringent inquiries were made as to his birth, position, and character. The most illustrious philosophers entered the lists, at least as *amateurs*, if not as *professionals*, e.g., Pythagoras, Plato, Chrysippus, and Cleanthes. The victor in the Olympic games brought so much honour to his city, that a breach was made in the walls to admit him on his return, through which he passed in a chariot drawn by four white horses; he was maintained at the public expense, and at his death had a public funeral. M. Fulvius introduced athletic contests at Rome 186 B.C., at the close of the Ætolian war, and during the empire they became extremely popular, but never attained the dignity they held in Greece.

Athlone (*Ath-Luain*, the ford of Luan, originally *Ath-mor*, the great ford), a town and strong military station, partly in the county of Westmeath and partly in that of Roscommon, lies on the Shannon, three miles below Lough Ree. It has manufactures of felt hats, friezes, soap, and beer. The Shannon is here crossed by a handsome stone bridge and an iron railway bridge. A. Castle was built in the reign of King John, and near it, in late times, have been erected barracks for 3000 men, and fortifications 15 acres in extent. A. returns one member to Parliament. Pop. (1871) 6565.

Athole (Gael. 'pleasant land'), a hilly region in the N. of Perthshire, at the S. base of the Grampians, 450 sq. miles in extent. It was formerly one of the best Scotch hunting districts, and its forest still contains about 6000 head of deer. The most famous spot in A. is the Pass of Killiecrankie, about 17 miles N.W. of Dunkeld, where Claverhouse fell in 1689. A. gives the title of duke to the ancient house of Murray.

Athor, or **Athyr**, properly *Het-her* (i.e., 'dwelling of God'), the name of an Egyptian goddess of the second class, 208

daughter of Ra, the sun, and identified by the Greeks with Aphrodite. Her symbol was the cow; and sometimes she is represented with the sun's disc between her horns, and sometimes with a temple on her head. Her chief sanctuary was at Denderah. The third month of the Egyptian year, corresponding to our November, was named after her.

Athos, **Hag'ion Oros** (whence the Turk. *Aineros*), or **Mon'te Santo**, the Holy Mount, so called from the numerous monasteries with which it is covered, a lofty mountain at the extremity of a Macedonian peninsula projecting into the Ægean, between Gulfs Contessa and Monte Santo, 6349 feet above the sea-level. Herodotus gives the names of five towns that were built on A. Xerxes cut a canal through the isthmus, of which traces are still visible. The principal village in the peninsula is Karyæ, with a pop. of 1000. The monasteries, having about 8000 monks (who devote themselves to agriculture, gardening, and the care of bees, and are abstinent, not ascetic, in their mode of life), constitute a kind of republican federation, under the suzerainty of Turkey, to which they pay a yearly tribute of about £4000. The largest are Ivoron and Hagia-Laura; the richest, Vatopædi. Their libraries, of which nearly every cloister possesses one, are now much neglected. Besides printed works, they are rich in old and beautiful MSS., many of which have been brought to Western Europe by fortunate scholars. Classical literature is not well represented, but its ecclesiastical MSS. are valuable, particularly those in the Georgian language at Ivoron, and in the Old Slavic or Bulgarian language at Docheiру. Paintings and frescoes are numerous, and assist greatly in giving us clear ideas of Byzantine Christian art. Those at Hagia-Laura and Vatopædi, ascribed to Michael Panselinos, are particularly interesting. See Pischon, *Die Mönche Republik des Berges A.* in the *Histor. Taschenbuch* (Leipz. 1860).

Athy ('ford of Ae,' a Munster chief who fell here in one of the half-fabulous conflicts of early Irish legend), a town of Kildare, Leinster, on the Barrow, where it is joined by the Erand Canal, 33 miles S.W. of Dublin. A. is of some note in the early history of the country, and was taken and plundered by Edward Bruce in 1315. It is a station on the South-Western Railway, and exports grain. Pop. (1871) 5693.

Athyrium, a genus of graceful ferns closely allied to *Asplenium*. See FERNS.

Atlanta, a city of Georgia, U. S., 69 miles N.W. of Milledgeville, in a district rich in cotton and grain. It was founded in 1845, and became a flourishing centre of trade, and the focus of the four chief railways of the state. General Sherman, after two sanguinary battles, 22d and 28th July 1864, forced the Confederates to evacuate the city, which he subsequently destroyed, but which has since recovered something of its old prosperity. Pop. (1870) 21,789.

Atlantes was the name given in the architecture of the Greeks to male figures more or less colossal in size, which, like the female caryatides, were used instead of columns or pilasters to support entablatures, and even the beams of public structures. Examples of such A. were obtained from the baths of Pompeii. The Romans also called them Telamones, in allusion to Ajax, the handsome Hercules of the Trojan War.

Atlantic Ocean, the great thoroughfare between the Old and New Worlds, washes the eastern shores of America and the western shores of Europe and Africa; stretches from the Arctic Ocean in the N. to the Antarctic Ocean in the S., a distance of 9000 miles; presents a most irregular boundary in the northern hemisphere, giving off numerous and extensive ramifications, such as Baffin and Hudson Bays, Gulf of St Lawrence, Bay of Fundy, Gulf of Mexico, and the Caribbean Sea, on the American side; the North Sea, Baltic Sea, English Channel, Bay of Biscay, and Mediterranean Sea, on the European side; and is bounded towards the S. by the bold unbroken coasts of Africa and S. America. Its breadth varies from 900 (between Norway and Greenland) to 4000 miles (between Morocco and Florida); and its computed area is about 25,000,000 sq. miles.

The principal islands studding its broad expanse are Iceland, Faroe, Bermudas, Azores, Ascension, St Helena, the Falkland Islands, S. Georgia, and Sandwich Land.

It is only within recent years that the nature of the A. O. at different depths, and of animal life abounding at these depths,

has been at all made out; and what is known has been obtained from the expeditions of H.M.'s ships *Porcupine* and *Challenger*. Animals are found at much greater depths than was formerly supposed, and several new species of invertebrata have been discovered. The greatest depth measured by the *Challenger* was at a point about 90 miles off St Thomas, W. Indies, where the soundings reached 23,250 feet. The 'Telegraph Plateau,' along which the Atlantic cable is laid, is a remarkable ridge about 400 miles wide, extending along the bottom, at a depth of from 10,000 to 12,000 feet, from Cape Clear in Ireland to Cape Race in Newfoundland.

In the A. there are two great currents, known as the Equatorial Current and the Gulf Stream, which latter may be regarded as a continuation or offshoot of the former. See CURRENTS, OCEAN.

Over the whole of the eastern portion of the A., from lat. 45° northwards, the prevailing winds are S.W.; and this, together with the warming effect of the Gulf Stream, considerably ameliorates the winter climate of the western coast of Europe. The isothermal lines, or lines of equal temperature of the A., show remarkable peculiarities. The temperature reaches a maximum in the equatorial regions, and from thence it diminishes towards the poles; but owing to the Gulf Stream, the lines in N. temperate regions, and especially during the winter season, are excessively eccentric. Besides varying with latitude, the temperature of the water diminishes as the depth increases; and the rate of diminution also decreases, thus affording an argument in favour of the internal heat of the earth.

Atlantic Telegraph. See TELEGRAPH, SUBMARINE.

Atlant'is ('the island of Atlas'), first mentioned by Plato in his *Timæus* and *Critias*, in an imaginary conversation between Solon and a priest of Sais, in Egypt, in which it is represented as lying in front of the Pillars of Hercules, and as being larger than Libya and Asia Minor taken together. Some consider it to have been part of the W. shores of Europe or Africa, while others assign it to the New World, on the shores of which they suppose Phœnician merchantmen may have been at some time driven, and hence the tradition, of which they may have brought home the news that gave birth to the tradition. The name furnished Bacon with the title of his political romance, *The New Atlantis*.

Atlas, a son of Japetus and Clymene, according to Hesiod, though Apollodorus and Hyginus assign him each a different parentage. For having led the Titans in their attempt on heaven, Zeus condemned him to bear the heaven on his head and hands, though the myth has been explained by representing A. as having been skilled in astronomy, and the first who taught that heaven had a globular form. The name A., applied to a collection of maps, was first used by Mercator in the 16th c.

Atlas, a large mountain range in N.W. Africa, stretching from Cape de Ger in a N.E. direction through Morocco, and thence E. through Algeria and Tunis, till it is gradually lost in the wastes of Tripoli. The A. is less correctly described as a single range than as a vast mountain mass containing many ranges connected by ridges, and several outlying mountains of great elevation; but still one can clearly enough discern a coast-range parallel to the Mediterranean, and another more to the S., overlooking the desert. The A. culminates in the peak of Mitsin, one of the *Jebel-el-Thelji*, or 'Snowy Mountains' of Morocco, which is 13,000 feet high, but the elevations decrease gradually towards the E. The mountains are clad on the N., W., and S. with forests of valuable timber, and contain much mineral wealth, which, however, has not as yet been developed. They are intersected by numerous fertile valleys, capable under proper cultivation of yielding valuable crops.

Atlas (in anatomy) is the first vertebra, and is so named because it supports the head. It differs from the other vertebræ in having no body, that part being represented by the odontoid process of the axis or second vertebra. It articulates above with the condyles of the occipital bone, and below with the axis. For details see VERTEBRAL COLUMN.

Atmosphere (Gr. *atmos*, vapour, and *sphaira*, a sphere) is properly the gaseous envelope of any celestial orb; but, when used without any qualifying adjective phrase, it applies only to

that of the earth. As regards the atmospheres of the sun, planets, and satellites, the little we know of them will be found under the special articles on these bodies.

That the A. had weight was suspected by Aristotle, and asserted by Epicurus; but till the experiments of Otto de Guericke and Torricelli, which proved that the air could be weighed and exerted an enormous pressure, it was commonly accepted that the A. was imponderable. The latter showed that this pressure at the earth's surface was capable of equilibrating a column of mercury 30 inches high, from which it follows that the A. exerts a pressure of 14 lbs. on every square inch of the earth's surface. This pressure must obviously decrease as the height above the sea-level increases; but the law according to which this takes place is extremely complex even in theory. Besides this, however, the pressure varies also with the latitude, the maximum being about the 30° or 40° parallel; but it has been stated that there is a second maximum at the pole. Lines drawn through localities having the same mean annual atmospheric pressure are termed *isobaric* or *isobarometric* lines. Further, the pressure of the A. is subject to diurnal and annual variations, in both of which there are two maximum pressures, and consequently two minima. In the former periodic variation, the maxima occur at 9.37 A.M. and 10.11 P.M., and the minima at 3.45 A.M. and 4.5 P.M. In the latter, the maxima occur in midsummer and midwinter, and the minima at the equinoxes.

As regards the true height of the A., little is definitely known, since great discrepancies exist between results obtained by different methods. Thus, from the duration of twilight, the depth of the atmospheric sea surrounding our earth was fixed at 45 miles; Sir W. Herschel fixed the height of an aurora, which is almost indisputably an atmospheric phenomenon, at 83 miles; while M. Lias, from experiments on the polarisation of the sky, determined the height of the A. at 212 miles.

The law of the variation of the density with the altitude may be stated thus: as the height increases in arithmetical, the density diminishes in geometrical, progression. This law, however, is not strictly true, on account of the imperfect gaseous characters of the air. According to thermo-dynamic principles, change of density should produce change of temperature; and this is found to be the case, but the law regulating this variation has not been as yet fully investigated.

Chemical Composition of the Atmosphere.—Just a century has elapsed since Lavoisier proved that the air is a mixture of the two gases oxygen and nitrogen, and showed that they were present in the proportion of $\frac{1}{4}$ of the former to $\frac{3}{4}$ of the latter. Before the time of the great French chemist, air was believed to belong to the elements, and was classed with earth, fire, and water. A further analysis of the ingredients of the A. has shown that in addition to the two substances already mentioned, it contains a small but variable amount of carbonic acid, and aqueous vapour, also traces of ammonia and organic matter, and sometimes other impurities, such as nitric and sulphurous acids, sulphuretted hydrogen, carbonic oxide, &c., these being derived from local sources. The fundamental ingredients are, however, oxygen and nitrogen, both of which exist in the air in the free or uncombined condition, and not in chemical combination with one another. The oxygen, though present in a much smaller proportion than the nitrogen, is nevertheless the active ingredient upon which the two most important properties of air depend—namely, its power of supporting combustion and respiration. The nitrogen acts simply as a diluent to moderate the too energetic effects of the oxygen. Analyses of the air have been made by many distinguished men of science since the time of Lavoisier, and these all tend to show that the composition of the air is constant, or very nearly constant. In spite of the millions of animals continually using up the oxygen, and the other numerous processes of oxidation, artificial and natural, going on from day to day, the air does not appear to vary by more than $\frac{1}{10}$ per cent. in the amount of oxygen it contains, a difference only to be detected by the most skilled experimenter. This constancy in the composition of the A. may be traced in part to the action of vegetable life on carbonic acid gas, in part to the enormous bulk of air surrounding the globe. For whereas animals in the act of respiration absorb oxygen, and return it to the air combined with carbon as carbonic acid, plants, on the other hand, absorb carbonic acid and abstract the carbon from it, thus leaving pure oxygen, which they return as such to the A. The amount of carbonic acid present in the air

in open country amounts on an average to 4 volumes in 1000. The ammonia, though playing an important part in vegetable existence, is present in the air in only minute quantity, varying from about 50 to 0.1 volumes in 1,000,000 of air.

Atmospheric Electricity. Since the time of Franklin, who showed the identity of lightning with electricity, there have been numerous observers in this department of electrical science; but it is only within recent years that the difficulty of making accurate quantitative measurements has been overcome by the construction of delicate and portable electrometers, for the vast improvement of which we are specially obliged to Sir William Thomson of Glasgow; and as yet sufficient observations have not been made, or sufficient facts established, to enable us to satisfactorily explain many curious phenomena traceable to the presence of electricity in the atmosphere.

In ordinary weather, the earth is negatively electrified, and the atmosphere positively electrified, with the exception of the first few feet, which are neutral. When the weather is wet and stormy, however, the electricity of the atmosphere becomes *negative*. The intensity is found to increase as the height increases, and is subject to diurnal and annual periodic fluctuations. In one day there are found to be two maxima and two minima—the maxima occurring a few hours after sunrise and sunset. This variation has been explained as due to the change in electrical conductivity of the lower strata of air produced by variation of temperature. The annual period is also double, the maxima occurring at midsummer and midwinter—the greater maximum at midwinter, which fact may be explained as being caused by the greater *humidity* of the air in winter than in summer. The direction of the wind has also a marked effect; thus, Sir W. Thomson could almost predict the occurrence of an E. wind by finding a particular high electrification.

As to the cause of A. E., there have been various theories advanced, all of which, however, require experimental proof. For instance, it has been suggested that evaporation may have produced this electric tension; chemical action has been urged as the cause; and, more recently thermo-electricity. Meanwhile, there can be little doubt that the friction occasioned by the currents of air has no slight effect.

Atmospheric Railway is a railway on which locomotion is effected by means of the pressure of the atmosphere. The first methods aimed at producing a difference of pressure on the two ends of a carriage fitted closely, but movably, into a long tunnel, either by forcing air in behind, or by exhausting it in front of the carriage. These were, however, unsuccessful, owing to the great waste of energy, and to the interference of the air in a dark tunnel. About 1835, Henry Jenkins proposed and patented another plan of propulsion; and this method, with a few alterations, was for a time worked with a certain amount of success on the Kingstown and Dalkey line. The essential difference between this and the former methods was that the carriage was external to the tube, but was connected by a rod to a piston fitted air-tight into the tube, which piston was forced along by exhaustion of the air in front. The result showed, however, that, except in peculiar circumstances, the A. R. could not commercially compete with the ordinary locomotive.

Atoll, the Polynesian name for the perfect form of coral island, which consists of a more or less circular ring of coral, enclosing a lake termed an *A.* or *lagoon*, communicating with the outer sea by a break in the coral ring. According to Mr Darwin's theory of coral-reefs, the A. marks the complete subsidence of original land; the coral structures being built up around the land as it is depressed. Some atolls are of large size. Bow A. is 30 miles long by 6 broad; Rimsky, 54 miles long by 20 across; Suadiva A. is 44 miles in one diameter by 34 in another.

Atom (Gr. *atomos*, an indivisible particle; from *a*, negative, and *temno*, I cut). With regard to the ultimate state of matter, there have been two rival theories from a very early age—viz., first, that matter is indefinitely divisible; and second, that however much you may divide and subdivide any portion of matter, a stage is at last reached beyond which it is impossible to go: in other words, you have arrived at the small, hard, *indivisible* particles known as *atoms*, which constitute matter. The latter theory is that now generally accepted; and it is especially useful in the theoretical discussion of chemical compounds. There is

one difficulty, however, in the conception of such atoms; for their indivisibility presumably depends upon their hardness, which must of necessity be capable of resisting any force, i.e., must be infinite. To obviate this difficulty, Sir W. Thomson has brought forward his theory of vortex atoms. See **VORTEX**. This well-known physicist has also made an approximation to the size of atoms, which may be best conceived of from the following description: If a drop of water were magnified to the size of the earth, the atoms composing it would appear of a size somewhere between a small shot and a cricket-ball.

Atomic Theory. The A. T. teaches that all matter (that is to say, that which has weight) is composed of minute particles or *atoms*. All the atoms of the same *element* (or substance containing but one kind of matter) are of the same weight, and possess the same properties, but the atoms of different elements have different weights, and possess different properties. All matter is composed of the elements; and as up to the present time science has revealed only sixty-three of these, it follows that but sixty-three kinds of atoms are as yet known. *Compounds* are formed of atoms of different elements united together by the force called *affinity* or *chemical attraction*. The smallest particle of a compound obviously contains two or more atoms, and this smallest particle or complex of atoms is called the *molecule* of the compound in question. As, however, the smallest particle of an element that can exist in the uncombined or free condition often contains more than one atom, the term *molecule* is not restricted to compounds, but is employed generally to designate the smallest particle of any body which can exist in the free or uncombined condition.

Atoms are represented for the sake of brevity by *symbols*—usually the first letter or letters of the name of the element. Thus 'O' stands for an atom of oxygen, 'Sn' for an atom of tin (*Stannum*), 'Hg' for an atom of mercury (*Hydrargyrum*). In writing the formula of a molecule, the symbols of the element or elements composing it are placed side by side, and on the right hand, below each, a small figure is placed to indicate the number of atoms of the element in question contained in the molecule. Thus 'C₂' represents a molecule of oxygen, and shows that it contains two atoms of that element: 'H₂O', a molecule of water, containing two atoms of hydrogen and one atom of oxygen.

The atom of each element is characterised by its *weight* and power of combining with other atoms (*atomicity*). As to the *absolute* weight of any atom nothing whatever is known, but it has been found possible to determine the *relative* weights of the atoms of all the elements; and this is a point of fundamental importance in chemical science. The atom of hydrogen, on account of its extreme lightness, offers a convenient standard with which to compare the weights of the atoms of other elements; its weight is therefore taken as unity, and the weights of other atoms expressed in terms of it. The *atomic weight* of an element, then, is the weight of its atom compared with the weight of the atom of hydrogen. The atomic weight of oxygen, for instance, is 16; that is to say, the atom of oxygen is 16 times as heavy as the atom of hydrogen. See **ATOMIC WEIGHTS**. The A. T. well explains the laws of chemical combination (from which, indeed, it was first deduced, and established as a rational hypothesis).

The first of these is known as the *law of definite proportions*, and may be thus stated:—

The same compound, no matter what its origin, contains the same proportions of its constituents.

A quantity of any compound consists of a number of *molecules* characteristic of it, each of which contains the same *number* and *kind* of atoms. The sums of the weights of the different atoms in the molecule will necessarily also be the proportions in which the respective elements are present. Thus the compound water, no matter from what source (providing it be pure water), is found on analysis to contain 8 parts by weight of oxygen, and 1 part by weight of hydrogen, and these proportions never vary. It has been stated above, that the smallest particle of water capable of existing contains two atoms of hydrogen united to 1 atom of oxygen, and that the atom of oxygen weighs 16 times as much as the single atom of hydrogen; and thus it follows that oxygen and hydrogen are present in water in the proportions 16:2 or 8:1.

The second, or *law of multiple proportions*, teaches that—

When two bodies unite in more than one proportion, the quantities of each contained in the different compounds bear a simple relation to one another.

In any series of compounds containing the same elements, the difference between the members of the series is owing to the number of atoms the molecule of each contains, hence the proportions by weight in which each element is present will vary according to the number of the atoms contained in the molecules of the different compounds.

The subjoined table of the composition of the oxides of nitrogen will render the above explanation clear.

Oxides of Nitrogen.	Formula.	Composition.	
		Nitrogen : Oxygen.	
Nitrous oxide (laughing-gas), . . .	N ₂ O	28	16
Nitric oxide,	N ₂ O ₃	28	32
Nitrous anhydride,	N ₂ O ₅	28	48
Peroxide of nitrogen,	N ₂ O ₄	28	64
Nitric anhydride,	N ₂ O ₅	28	80

Atomic weight of nitrogen, 14
Atomic weight of oxygen, 16

The laws of *equivalent proportions* will be treated of in art. EQUIVALENT.

The belief that matter is composed of minute particles or *atoms* is a very ancient one, and appears to have had its origin in India or Persia. A very complete A. T. was taught by the Grecian philosopher Leucippus, and after him Democritus (460 B.C.); indeed it is surprising in how many respects the views of the latter philosopher coincide with those of the present time, although Democritus supported his theory on metaphysical argument only. It was reserved for John Dalton (1804-8) to establish the atomic hypothesis on a firm experimental basis, and to show that without its assistance the facts of chemical combination would be altogether inexplicable.

Atomic Weights The atomic weight of an element has been defined in art. ATOMIC THEORY; it remains to describe the methods by which these have been determined.

As all compounds are formed by the union of whole atoms of different elements, each atom possessing a definite weight; and as in the same compound the same number and kind of atoms are contained, it follows that the proportions by weight in which the elements combine together will be directly as their respective A. W., or as multiples of these; hence from the analysis of a series of compounds which an element forms, its atomic weight may be arrived at.

The atomic weight of mercury was deduced by Erdmann and Marchand from the analysis of the *red oxide of mercury*. In 118.3938 parts by weight of this compound, they found 109.6308 of mercury, and hence by subtraction 8.7630 of oxygen. Assuming the atomic weight of oxygen to be 16, the quantity of mercury combined with 16 parts of oxygen is arrived at by the proportion

$$8.763 : 109.6308 :: 16$$

which gives 200.2; and this number is considered to be the atomic weight of mercury, assuming that the red oxide of mercury contains a single atom of oxygen and mercury (HgO). But here arises a difficulty. There is a second compound of oxygen and mercury containing 400.4 parts of mercury combined with 16 parts of oxygen. Is the atomic weight of mercury 400.4, and the formula of the first oxide HgO₂, that of the second being HgO? or is it 200.2, and the formula of the two compounds HgO and Hg₂O respectively? This question cannot be answered by analysis, but fortunately a discovery made by two French physicists—Dulong and Petit—enables a decision to be made. These two observers, from a series of experiments, found that the amount of heat necessary to raise a given weight of an element through a certain interval of temperature—in other words, the *specific heat* of the element—is inversely proportional to its atomic weight, hence the product of specific heat and atomic weight is a constant number (6.4).

$$S \times A = C = 6.4$$

And by means of this law the atomic weight of an element may be deduced by dividing the number 6.4 by the specific heat of the element in question.

$$A = \frac{6.4}{S}$$

The atomic weight of mercury, as arrived at by this method, is 199.8, a number closely approximating 200.2.

Another important aid to the determination of A. W. is afforded by Gay Lussac's *Law of Atomic Volumes*, which may be thus stated: *The densities of all gases are proportional to their A. W.* If the weight of a volume of any gas be compared with the weight of the same volume of hydrogen (at the same temperature and pressure), the number expressing the relation between the weights of the two gases will be the atomic weight of the gas in question.

TABLE OF THE ELEMENTS WITH THEIR ATOMIC WEIGHTS.

Name.	Symbol.	Atomic Weight.	Name.	Symbol.	Atomic Weight.
Aluminum	Al	27.5	Molybdenum	Mo	96
Antimony	Sb	122	Nickel	Ni	59
Arsenic	As	75	Niobium	Nb	94
Barium	Ba	137	Nitrogen	N	14
Bismuth	Bi	210	Osmium	Os	199
Boron	B	10.9	Oxygen	O	16
Bromine	Br	80	Palladium	Pd	106.5
Cadmium	Cd	112	Phosphorus	P	31
Cæsium	Cs	133	Platinum	Pt	197.1
Calcium	Ca	40	Potassium	K	39.1
Carbon	C	12	Rhodium	Rh	104.3
Cerium	Ce	92	Ruodium	Ru	85.3
Chlorine	Cl	35.5	Selenium	Se	79.5
Chromium	Cr	52.5	Silicon	Si	28
Cobalt	Co	59	Silver	Ag	108
Copper	Cu	63.5	Sodium	Na	23
Dickmum	Di	66	Strontium	St	87.5
Erbium	E	112.6	Sulphur	S	32
Fluorine	F	19	Tantalum	Ta	182
Gadolinum	G	95	Tellurium	Te	129
Gold	Au	196.6	Thallium	Tl	204
Hydrogen	H	1	Thorium	Th	238
Iodine	I	127	Tin	Sn	118
Iridium	Ir	197.1	Titanium	Ti	50
Iron	Fe	56	Tungsten	W	184
Lanthanum	La	92	Uranium	U	120
Lead	Pb	207	Vanadium	V	51.3
Lithium	Li	7	Yttrium	Y	61.7
Magnesium	Mg	24.3	Zinc	Zn	65
Manganese	Mn	55	Zirconium	Zr	89.5
Mercury	Hg	200			

Atonement, as used in the Bible, means, in the Old Testament, the reconciliation of God to men, when alienated from them by sin, by means of sacrifices; in the New Testament, simply reconciliation. A consciousness of guilt in relation to a divine being, accompanied with the belief that it could be condoned by sacrifices, seems to have been a universal sentiment in human experience. The finest of certain animals were offered in this way, and, when the sacrifice required to be peculiarly precious, even human beings. Dr Magee, in his learned work on *Sacrifice*, has adduced abundant proof of the fact that human sacrifices have been offered by every nation of the known world *except the Jews*, and perhaps he need not have made even that exception. An elaborate system of sacrifice was, at any rate, in vogue among the ancient Israelites, and continued among the Jews until the time of Christ. It is generally believed by those who hold what is known as the unity of the Old and New Testaments, that these sacrifices were typical of the A. of Christ, so that the great central truth of Revelation, 'without shedding of blood is no remission,' was set forth in the Old as well as the New Testament. According to this view, all the Old Testament sacrifices had relation to a covenant between God and man; the sin-offering implied that that covenant had been broken, but might be knit together again through the shedding of blood; or that, because the wages of sin is death, an A. was made for the sin that existed in man by the vicarious suffering of an appointed victim. All this sacrificial phraseology is distinctly applied in the New Testament, especially in the Epistle to the Hebrews, to Christ, who united in his own person the office of priest, offerer, and sacrificer, and made an A. which is at the same time the vicarious sacrifice rendered necessary by the sin of man, and also the completion of that perfect obedience to the will of God which is the natural duty of sinless men. In order to give an intelligible account of the subsequent development of the doctrine of the A., it will be necessary to make a classification of the different opinions that have prevailed regarding it. The most important of these may be included in one or other of the following five classes:—

1. It will be most convenient to start with the orthodox theory, which, in its essential features, is common to the Roman Catholic, Lutheran, and Reformed Churches. This theory was developed by Anselm (11th c.), on the foundation of the Augustinian theology. See AUGUSTINE. The propositions laid down in his famous book *Cur Deus Homo* are—(1.) That it is necessary that man should be redeemed. (2.) That this redemption cannot be made without satisfaction. (3.) That satisfaction can be made only by a God-man. (4.) That it is in fact accomplished in Christ's passion. His argument is founded on the assumption that the pardon of sin requires a satisfaction of infinite merit, which can only be rendered by a person of infinite dignity. According to this theory, which has been more fully developed since the time of Anselm, 'the work of Christ is a real satisfaction, of infinite inherent merit, to the vindicatory justice of God; so that he saves his people by doing for them what they were unable to do for themselves, satisfying the demands of the law in their behalf, and bearing its penalty in their stead; whereby they are reconciled to God.'

2. Another theory of the A., which was held by many of the early fathers (including Augustine and Jerome), regarded the work of Christ solely as a deliverance of man from Satan, into whose power he had fallen through sin. Under this general theory three different phases prevailed. (1.) Satan was regarded as the owner of man, by conquest in Adam. To deliver man from this bondage Christ offered himself as a ransom to Satan, which was accepted; and then Satan, having no power over a sinless being, found that he could not keep his ransom. (2.) As Satan had conquered man, so Christ was regarded as having conquered him, and thus acquired the right to set free his victims and consign himself to chains. (3.) A third form of the theory was, that as Satan's right over man was founded on sin, he exceeded his authority when he brought about the death of Christ, and so forfeited his authority over mankind.

3. A third (the Moral) theory rejects all idea of expiation, or satisfaction of justice by vicarious punishment, and attributes all the efficacy of Christ's work to the moral effect produced by his character, teaching, and acts. Different theories of the A. are associated with certain well-known names—e.g., F. D. Maurice, F. W. Robertson, Professor Jowett, J. M'Leod Campbell, Dr John Young, Dr Bushnell, &c.—all of which, as well as the Socinian, are referable to this third class, and perhaps some of them partly to the next two. An analysis of each of these, however, cannot here be given; it must suffice to notice three different phases of the theory. (1.) The work of Christ as a redeemer is confined to his office of teacher. He introduced a new and higher form of religion, by which men were redeemed from the darkness and degradation of the service of sin. (2.) The real benefit conferred by Christ was in his doctrine; but by his death his doctrine was sealed with blood. He saves us as a martyr. (3.) The power of Christ for our redemption was due to the manifestation he made of self-sacrificing love. As no such instance of it as that of Christ had ever occurred before or could occur again, he is the Saviour by pre-eminence.

4. What may be called the Governmental theory was first developed by Grotius (17th c.), in opposition to the Socinians. The main idea of it was adopted by some of the Arminians, and has been reproduced by many modern writers both in Germany and America. Its principal features are as follows: (1.) In the forgiveness of sin God is not to be regarded as an offended party, a creditor, or a master, but as a moral governor. (2.) The end of punishment is the prevention of crime and the promotion of the best interests of the community. (3.) As a good governor cannot allow sin to be committed with impunity, God cannot pardon sin without an adequate exhibition of his displeasure; he therefore punished sin in Christ as an example.

5. The last theory (the Mystical) regards the effect of Christ's work as produced upon the sinner, and accomplished by the mysterious union of the divine and human natures brought about by the incarnation. (1.) Among some of the early fathers there was an obscure notion that in some way the coming of Christ had reversed the effect of the Fall, and produced a physical effect upon our race to render it immortal. (2.) By the Platonists, however, the mysterious operation of the incarnation was connected with their doctrine of the Logos. The Logos being one with God, and also with the inner life of the world (including man), these two were made one by the incarnation. This theory was developed by Origen (3rd c.) and other writers during the middle

ages, and the ideas and language connected with it are found to a considerable extent in the writings of the Reformers. See Anselm's *Cur Deus Homo*, Calvin's *Institutes*, Baur's *Christliche Lehre von der Versöhnung*, Neander's *Christliche Dogmengeschichte*, Gieseler's *Lehrbuch der Dogmengeschichte*, Maurice's *Theological Essays*, M'Leod Campbell's *Nature of the A.*, Crawford's *Doctrine of Holy Scripture respecting the A.* (2d ed. 1874), and Hodge's *Systematic Theology* (1873).

Atra'to, a river of the United States of Colombia, S. America, rises in the W. Cordilleras of the Andes, about 30 miles from the Pacific, flows N. with an average fall of 3 inches to a mile, and after a course of 250 miles, enters the Gulf of Darien by nine mouths. It is navigable for 140 miles, and a scheme for connecting it with the Pacific by means of a canal is said to be feasible.

At'ri, the *Atria* or *Adria Picena* of the Romans, is an episcopal town in the province of Teramo, S. Italy, 14 miles S.E. of Teramo, with numerous remains of antiquity, walls, mosaic pavements, &c. Its ancient coins are among the heaviest known. There are some excavated chambers in a neighbouring hill, of perfectly regular form, and evidently of ancient date, the purpose of which has not been ascertained. Pop. 3632.

At'riplex, a genus of Dicotyledonous plants belonging to the order *Chenopodiaceæ* (q. v.).

At'rium, the name applied to the entrance-hall of Roman mansions, and in zoology to the sac or chamber in the Tunicate mollusca, or 'sea-squirts,' into which the effete water of respiration is sent, to be thence ejected from the body. The intestine also opens into the atrial chamber, which in turn communicates with the exterior by a definite aperture—the atrial orifice. See ASCIDIAN, MOLLUSCA, and TUNICATA.

At'ropa, a genus of plants belonging to the order *Solanaceæ* (q. v.), sub-order *Atropaceæ*. See BELLADONNA.

At'rophy is a term used in pathology to denote wasting of a part of the body. It may be either general or partial, and it may occur from simple diminution in size of the organ or tissue without organic change, or it may be associated with fatty or other degeneration or infiltration. General A. occurs, for example, in old age; simple A. may be seen in the wasting of any special organ from a deficient supply of blood or of nervous energy; and A. with degeneration is seen in the case of a fatty heart, in which, in addition to wasting, the fibres are found to contain numerous fatty molecules. The causes of A. are—(1) a deficient supply of blood; (2) a deficient quality of blood; and (3) a deficient action of the nervous system. If we partially cut off the supply of blood to a limb, or sever the nerve distributed to its various parts, it quickly undergoes A. Disease of the nerve centres may also cause A. The antithesis of A. is hypertrophy.

Atro'pia, or **Atropine**, is an alkaloid contained in the different parts of *Atropa Belladonna* and *Datura Stramonium*. It is a white crystalline substance, of bitter and unpleasant taste, and has the chemical composition represented by the formula $C_{17}H_{23}NO_3$. It is an exceedingly poisonous substance, but is given in medicine in small doses. It has the peculiar property of dilating the pupil of the eye when its tincture is applied as a lotion.

Atrow'li, or **Attrow'lee**, a town of British India, in the N.W. Provinces, executive district of Allypore, 63 miles N.N.E. of Agra, with a copious water supply and good bazaar. Pop. (1872) 15,052.

At'taché (Fr.) is the name given to a young diplomatist who accompanies an embassy to assist his superior and obtain a knowledge of political business.

Attachment is an English law term for the judicial procedure corresponding to that which in Scotland is called Arrestment (q. v.). By means of it a creditor may obtain the security of the personal property of his debtor in the hands of a third person, for the purpose, in the first instance, of enforcing the appearance of the debtor to answer to an action, and secondly, upon his continued default, of obtaining the property absolutely in satisfaction of the demand.

An A. is also sometimes issued by order of the judges of a court of record against a person for 'Contempt' (q. v.). The offender is committed without appeal, indictment, or information; for though, under Magna Charta, no one can be imprisoned without

the judgment of his peers or the law of the land, yet this summary proceeding is considered necessary for the due administration of justice, and is now confirmed as the law of the land.

Attack, in military language, signifies an advance on the part of an organised force, with the view of dislodging the enemy from his position, either in the open country or in a fortress. The A. may be conducted by cavalry or by infantry, but in either case there should always be a reserve of infantry and artillery to follow up the A. if successful, or to cover the retreat of the attacking body if repulsed. As a rule, the A. is made upon one or other of the flanks, which are generally the weakest portions of the enemy's line; but the first Napoleon preferred to direct one strong A. upon the central column. In usual circumstances, attacks and assaults are best conducted at early dawn; but unless the attacking party be well acquainted with the surrounding country, a night A. is seldom to be recommended. The artillery generally does effective service before the A. proper has begun, thus paving the way, so to speak, for the infantry and cavalry, by creating confusion to a certain extent in the enemy's ranks.

Attainder is the degradation and loss of civil rights which attached to a person, and to his descendants, when adjudged guilty of treason or felony. It is of feudal origin, and under it the convict could have no heir, his estate falling to the crown. Nor could he succeed to any ancestor. These absurd penalties, by which many innocent persons were made to suffer for the crime of one guilty one, have now been mitigated, so as to bring them into harmony with the civilisation of our own time. Now, even in cases of treason and murder, no penalty is inflicted upon the family or heirs of the convict. He may be condemned to pay the costs incurred in procuring his conviction. During imprisonment—if imprisonment be involved in the sentence—he cannot sue. Administrators are appointed to take charge of his property. Out of it they are allowed to give compensation for any loss or damage occasioned to another by the crime or fraud of the convict. They may also make a provision for the support of his family. When the prisoner is liberated, the administrators must account to him, and pay over to him any balance of his property remaining in their hands. Any property which falls to a convict during the period of the sentence, is held to vest in himself, and not in the administrators.

In Scotch law, the word A. is only applied to the penalty of treason; but in this case, and under the term generally, as applied in English law, the penalties for A. in Scotland are nearly the same as in England.

Attainder, Bill of. See BILL OF ATTAINDER.

Attaint, Writ of, a procedure in English law by which the plea is urged of already A. In Scotch law, A., or 'attaynt,' means simply 'convicted.'

Attalea, a genus of palms found in S. America. The most of the species have lofty stems. From the leaf-stalks of *A. funifera* a valuable fibre is obtained in Brazil, called *Passaba* (q. v.), and used for ropes, brooms, &c. Another fibre of the same name is got from a different palm, called *Leopoldinia Passaba*, which is largely imported into Britain from Brazil. What are known as Coquilla nuts are the hard brown seeds of *A. funifera*, and are used in this country for making umbrella handles, &c. The fruit of *A. compta*, the Pindova palm of Brazil, is edible, and much esteemed. A valuable oil is obtained from what are called Cahoun nuts, the produce of *A. Cohune*. Indiarubber, which is formed of the juice of *Siphonica elastica*, is generally dried by means of burning the nuts of *A. excelsa* and other species.

Attar or Otto of Roses. See PERFUMES and ROSE.

Atterbury, Francis, Bishop of Rochester, was a son of the Rev. Dr Lewis A., rector of Milton Keynes, Bucks, and was born at the rectory 6th March 1662. He was educated at Westminster School and Christ Church, Oxford, and came to London in 1691, where his eloquence brought him into notice. He became chaplain to William and Mary, lecturer of St Bride's, and preacher at the Bridewell Chapel. A staunch churchman, he distinguished himself (1700) in a controversy with Dr Wake, as the champion of ecclesiastical against civil authority, especially maintaining the authority of convocations. The House of Convocation was not slow in showing its gratitude. The degree of D.D.

was conferred on him, with the thanks of the House. In 1704 he was made Dean of Carlisle, in 1707 a Canon of Exeter, in 1712 Dean of Christ Church, and in 1713 Bishop of Rochester and Dean of Westminster. But the tide of fortune turned on the death of Queen Anne in the following year. He refused to sign the bishops' declaration of fidelity to George I., which brought upon him the dislike of that monarch and the suspicion of the government. In 1722 his complicity in Jacobite plots threw him into the power of his enemies. He was committed to the Tower on a charge of treason. On this he was found guilty. He was sentenced to deprivation of all his ecclesiastical offices, declared incapable of holding any civil or ecclesiastical office in the king's dominions, and condemned to perpetual banishment. He left the country in June 1723, settling shortly afterwards in Paris, where he died 15th February 1732. The interest which the life of A. has in our day, and his reputation as a writer, are from his letters to Pope, Swift, and other celebrated men of his own time. These show him to have been a man of native wit and ability, and of cultivated literary power. In his lifetime, however, it was his controversial writings, his rhetorical power, and his practical energy to which he was indebted for his intellectual reputation, and for his worldly success. His elder brother, Lewis A., I.L.D., also became a clergyman, and held latterly the rectories of Shepperton and Hornsey, in Middlesex. He died 20th October 1731. Some volumes of his sermons and tracts are in print. The school for girls at Newport Pagnell was endowed by him.

Attestation is in English law the verification of deeds and bills by witnesses. The clause at the end of the instrument is called the A. clause. In Scotland it is called the Testing Clause (q. v.).

Attic is the name given in architecture to a low storey rising above the entablature, or a cornice which marks the height of the principal part of a building. According to Professor Goldstücker (*Transactions of the Philological Society*, 1854), the word is from the Sansk. *attaka*, a room on the top of a house, which corresponds pretty closely with its ordinary application, viz., to denote a skylighted room in the roof of a house.

Attica, a political division of Greece, was of triangular shape, and was bounded on the E. by the Ægean, on the W. by Megaris and the Saronic Gulf, and on the N. by Bœotia. It is distributed into the following natural divisions: The Eleusinian plain; the Athenian plain; the highlands; the midland district; and the sea-coast district. The principal hills are Cithæron, Parnes, Hymettus, famous for its bees and honey, Pentelicus for its marble, and Laurium for its silver mines. The principal streams are the Cephissus and the Ilissus, which water the Athenian plain. The soil was well suited for the growth of fruits, of which the olive and the fig were most abundant. From the earliest times the people of A. were divided into four *phyle* or tribes. Tradition ascribed to Cecrops the distribution of the country into twelve communities, and to Theseus their consolidation under one government. The old tribes were gradually increased to thirteen, and each tribe was subdivided into *demi* or townships, the number of which is supposed to have been about 170. A. became a Roman province under Vespasian. In 396 A.D. it was overrun by Alaric, king of the Goths. At the present day, along with Bœotia, it forms a nomarchy of the kingdom of Greece.

Atticism (Gr. *attikismos*). Among all the Greek dialects, the Attic was the most finely developed, and as an instrument for the expression of poetic and philosophic thought, was most widely spread in Greece. After the rise of the Macedonian power, it became the language of literature and politics over the greater part of the known world, but its very extension exposed it to the corruption of foreign influences, and it soon began to lose its purity. Against this evil the grammarians strove hard, and sought by every means in their power to preserve the pure Attic of earlier times. This was the A. of the ancients, and those who distinguished themselves by the purity of their Attic style were Atticists. The term is now used to denote any refined and concise mode of expression.

Atticus, Titus Pomponius, born at Rome B.C. 109, of an old equestrian family, the school-fellow, friend, and correspondent of Cicero. On the breaking out of the first civil war,

he withdrew to Athens, B.C. 85, ostensibly to prosecute his studies, but really to keep himself free from political complications, but returned to Rome B.C. 65, at the request of Sulla. He was intimate with the chiefs of all parties, to whom he gave wholesome advice. He inherited great wealth both from his father and his uncle, and this he increased by judgment and enterprise as a mercantile speculator. His taste was exquisite, and authors eagerly solicited his criticism. Nepos composed a life of A., and from Cicero's *Epistles to A.* we gather additional details. A. was profoundly versed both in Greek and Roman literature. He starved himself to death, B.C. 32, when he found that he was labouring under an incurable illness. None of his writings have been preserved, but his *Annales*, an epitome of Roman history from the earliest times to his own day, and rich in genealogical lore, was highly valued by his contemporaries.

Attila (the name is a Latinised form of the Tartar *Atalik*, father-like; to this day a title among the Usbeks of Bo'hara), king of the Huns, son of Mundzuk, a scion of the royal stock of the Huns, in A.D. 434 succeeded to the sovereignty of the innumerable Turanian hordes between the Carpathians and China, and had under him an army of at least half a million of barbarians, who believed him invincible as the possessor of the sword of the Scythian god of war. The career of one who boasted that no grass grew where the hoof of his horse had trod sufficiently explains how he came to be regarded with an awe that found expression in the title of 'the Scourge of God,' first applied to A., and afterwards to the whole race of the Huns. In 447 he ravaged that portion of the Eastern empire lying between the Euxine and the Adriatic, defeating in three sanguinary engagements the forces of Theodosius II., who, after forming a treacherous design against his life, had to cede to him a large territory S. of the Danube, and an annual tribute. A. next attacked the Western Empire, allying with himself the Vandals and Franks. He crossed the Rhine at Strasburg, and marched on Orleans; but the arrival of Aëtius compelled him to retire to the plain near which Chalons-sur-Marne now stands, where he was defeated with immense slaughter, not fewer than 250,000 to 300,000 having been left on the field. Next year, having recruited his forces, he crossed the Alps, took and destroyed Aquileia, and ravaged the whole of Lombardy. He now prepared to march on Rome, which was saved by the mediation of Leo the Great, whose majestic mien awed the savage into clemency. Then he retired to his palace beyond the Danube, and on the night of his marriage to a beautiful maiden named Iilda or Ildiko, died by the bursting of a blood-vessel, A.D. 454. A. was short of stature, dark complexioned, large headed, with a stately gait, and small, quick, brilliant eyes. The circumstances of the times made his barbaric expeditions peculiarly formidable to Western civilisation, but on his death his enormous empire fell to pieces as rapidly as it had risen, though saga and song long preserved among the Germanic people the memory of the mighty monarch. See Klemm, *A. nach der Geschichte, Sage und Legende* (Leipz. 1871); Therry, *A. dans les Gaules* (Par. 1852); and Ilagge, *Geschichte A.'s* (Celle, 1862).

Att'ock, a town and fort of the Punjab, on the Indus, where it becomes navigable for steamboats, 450 miles from its mouth. It was built by the Emperor Akbar in 1581, near the supposed site of the ancient *Taxila*, where in 326 B.C. Alexander the Great crossed the Indus. About two miles above A. the Indus is joined by the Cabul river, the valley of which forms the great commercial highway of Central Asia. Pop. (1878) 1454.

Attorney, in its general meaning, signifies one appointed by another to act for him.

Attorney, Letter or Power of. This is a deed requiring legal execution and stamp. It may be either general or special. In the first case, it empowers the agent of the grantor to transact his entire business during absence; in the second case, the power of the agent is specifically restricted. The deed, until revoked, gives the agent the full power of his constituent.

Attorney, Warrant of (English law term). This instrument is sometimes inchoitously given by debtors who are pressed by their creditors. A W. of A., as well as a *cognovit*, authorises the creditor to enter judgment and levy execution, either in-

stantly or within a certain time specified in the deed. The grantor is liable, when the judgment comes into operation, at any moment to have all his property taken from him and sold at a ruinous price. Moreover, the warrant or *cognovit* must be filed in a public office within twenty-one days from its date; and this being done, credit is thereby completely ruined. The Debtors Act of 1869 gives some protection to the unwary. It provides that no W. of A. or *cognovit* shall be effective unless the attorney of the grantor be present to inform him of the nature and effect of the deed before execution, which attorney is to subscribe his name as a witness to the execution. A W. of A. is also void against creditors unless filed in the Queen's Bench.

Attorney-General, the title of the first law officer of the crown in England and Ireland. To some extent the powers and duties are the same as those of the Lord Advocate (q. v.) of Scotland; but those of the latter are relatively to Scotland greater. The duty of the A. may be broadly stated to be to advise and protect the crown and state; hence he conducts prosecutions relating to revenue, files informations for wrongs committed on the property of the crown, and guards the legal interests of charitable endowments, the crown being of these the legal guardian. All crimes which tend to affect the peace of the state fall under the cognisance of the A. In his absence, his duties are discharged by the Solicitor-General (q. v.). Both officers are members of the government, and on a change of ministry their tenure of office ceases.

Attorneys and Solicitors are persons duly admitted to the Queen's courts, where they act for their clients. Being considered as public officers belonging to the courts, while allowed certain privileges, they are under the summary jurisdiction of the judges in everything connected with their profession. The functions of an attorney and of a solicitor are exactly the same. The practitioner in the courts of common law is called an attorney; the practitioner in the courts of Chancery is called a solicitor. In the transaction of business out of court, solicitor is the word used.

For permission to practise as attorney or solicitor, it is generally necessary to be bound and duly serve under articles of clerkship to a practising attorney or solicitor for three years, and to pass an examination; also to have the degree of Bachelor of Arts or of Bachelor of Laws in the University of Oxford, Cambridge, Dublin, Durham, or London, or in the Queen's University in Ireland; or the degree of Bachelor of Arts, Bachelor of Laws, or Doctor of Laws, in a university of Scotland. A barrister may plead in a county court without previously receiving his instructions from an attorney or solicitor. In Ireland the position of attorney and solicitor is almost exactly the same as in England. In Scotland the corresponding professional classes are called Writers to the Signet (see WRITER TO THE SIGNET) and Solicitors before the Supreme Courts (see SOLICITOR BEFORE THE SUPREME COURTS). The relations of these bodies to one another, and the law generally respecting law agents, has been considerably altered by the Law Agents (Scotland) Act of 1873.

Attraction is a general name for any force which draws or tends to draw different portions of matter together. Gravitation is a case in point, as also cohesion, adhesion, chemical affinity, electric and magnetic attractions. Cohesion, adhesion, and chemical affinity are called *molecular* forces, because they are sensible only at insensible distances.

Attribute, in logic, is a term used to denote a property or quality of a substance. It is by means of attributes alone that we can conceive substances, yet they are not to be considered the substances themselves. They inhere in substances, and have no true existence as entities apart from them. Thus 'omnipotence' and 'omniscience' are attributes of God, but they are not God himself. Similarly whiteness is an A. of snow, and redness of blood.

Att'wood's Machine, a machine devised by Attwood for testing experimentally the laws of motion, by reducing the velocity of a falling body so as to give time to investigate the motion. Two equal weights are attached to the ends of a fine silk cord, which passes over a pulley whose axis turns on friction wheels. In this position the apparatus will evidently be in equilibrium. A third weight (very small in comparison to the other two) is then

added at one end, which immediately begins to descend. Now the only force which acts upon the three weights is the force of gravity due to the smaller weight. Hence, if m represent either of the equal weights, n the small weight, f the force which acts upon the three weights, and g the force of gravity, we have the equation

$$f(2m + n) = gn \text{ or } f = g \frac{1}{1 + \frac{2m}{n}}$$

where $\frac{2m}{n}$ may be made as large as we please, by making n small enough, so that the proportion of f to g may be made as small as we choose, and thus the velocity reduced as much as may be required. By this means we establish experimentally the law that the spaces described are proportional to the squares of the times. If we allow the heavier end to pass through a ring of such size as to lift off the smaller weight, we produce uniform motion; for there being now no force acting, the body will proceed only by reason of the velocity impressed upon it at the moment of change. Practically, a clock beating seconds, and a scale for measuring the spaces described, are attached to the apparatus.

Atwisha, an Indian poison, supposed to be obtained from a species of aconite.

Aubagne (anc. *Albania*, the capital of the *Allicii*), a town of the department of Bouches-du-Rhône, France, 9 miles E. of Marseille. A. has a church founded in 1164, and manufactures of tiles, pottery, and paper, and some distilleries and tanneries. Pop. (1872) 4903.

Aube, a department in the N.E. of France, lies in the basin of the Seine on the S.W., and of the river A. on the N.E., and consists of the S. portion of the old province of Champagne and a small part of Burgundy. Area, 2351 sq. miles; pop. (1872) 255,687. A. is mostly arable; in the S.E. abounds in rich meadow-land; and yields grain, hemp, rape, hay, wine, and timber. The chief manufactures are woollens, cotton and linen goods, ribbons, leather, porcelain, and paper; there are also large distilleries, beetroot-sugar factories, and bleaching-fields. The bacon and sausages of A. are *spécialités*. Troyes (q. v.) is the chief town. The river A. rises near Pralay, in the department of Haute-Marne, flows N.W., and joins the Seine, after a course of 90 miles.

Aubenas, a town in the department of Ardèche, France, on the right bank of the Ardèche, 14 miles S.W. of Privas, with some cotton, silk, paper, and leather manufactures. It has a ruined castle, and is partly encircled by an old wall. Pop. (1872) 4647. About 4½ miles N.W. of A. is the village of Vals, noted for its mineral springs. In the neighbourhood is the famous 'Ravine of Hell,' with a waterfall of 500 feet.

Au'ber, Daniel François Esprit, a facile, graceful, and frequently original musical composer, chiefly of opera-comique, born at Caen, Normandy, 29th June 1784, was the son of a Paris printseller, and was sent at the age of twenty to acquire knowledge of business in London. In youth he had attained proficiency in several instruments, including the piano, and while in England he devoted himself most assiduously to the study of music. Returning to Paris, he wrote several *concertos pour basse*, and published them under the name of the celebrated violoncellist Lamare. After several unsuccessful operas, his three-act opera, *La Bergère Châtelaine* (1820) was the first of a long and brilliant series of triumphs. By far the best known of his works in England are *Fra Diavolo* (1830) and *Les Diamants de la Couronne* (1841). His later style was much influenced by that of Rossini, but in many respects he was not inferior to the Italian *maestro*, and he is often spoken of as the Rossini of France. His *Amour sacré de la Patrie* became a second *Marseillaise*, and sung by Nourrit, it was the signal of revolution at Brussels on the 25th August 1830. A. died 14th May 1871.

Aubign'e, Merle d'. See MERLE D'AUBIGNÉ.

Aubigne, Théodore Agrippa d', a Huguenot historian and poet, born 8th February 1550, at Saint-Maur, near Pons, in Saintonge. Adopting the military profession, he rendered good service to the Protestant cause in 1567, for which he was made vice-admiral of Guienne and Bretagne by Henri IV., after

whose death he retired to Geneva, where he devoted himself to study till his death, April 29, 1630. His chief works are, *Histoire Universelle*, from 1550 to 1601 (Amst. 1616-20); *Histoire Secrète de Théodore Agrippa d'Aubigné, écrite par lui-même*, which first appeared in Cologne in 1721; and *Les Aventures du Baron de Fierste* (Gen. 1630). The two last are singularly pungent, and full of that epigrammatic virulence which marked the man, and cost him the favour of a prince who knew his sterling worth. See Sayon's *Vie de D'Aubigné* (Gen. 1841).

Au'bry de Montdidier, a French knight, according to tradition assassinated in 1371 by Richard de Maccuire, as was discovered by the implacable enmity displayed against the murderer by A.'s dog. Charles V. hearing of this, compelled Maccuire to fight the dog, which dragged him down, upon which he confessed his crime. The story became the subject of many ballads, and finally under different names took dramatic shape both in France and Germany. No melodrama was ever more popular in Paris or Vienna than the *Dog of Montargis* or the *Forest of Bondy*.

Au'burn, the name of numerous towns in the United States of America, the best known and most important of which is A., in the state of New York, 174 miles W. of Albany, on the outlet of Lake Owasco. Pop. (1871) 17,225. A. has manufactures of wool, cotton, iron, &c., besides numerous mills. The state prison at A. is conducted on the principle of isolating the convicts during the night, but of employing them in joint labour during the day. The proceeds of their labour is said to defray the expenses of the institution.

Aubus'son, a town of the department of Creuse, France, 125 miles W. of Lyon, noted for the manufacture of carpets, the most famous in France after those of the Gobelins and Beauvais. A. has also tanneries and dye-works, and a trade in wine. Pop. (1872) 5890.

Aubusson, Pierre d', grand-master of the order of St John of Jerusalem, born in 1423, was the fourth son of Renaud d'A., and belonged to the old French family of the Vicomtes de la Marche, the narrative of his biographer, Father Bonhours, being for this period almost destitute of dates and authorities, and frequently contradictory. He was one of the young seigneurs who accompanied the Dauphin in his expedition against the Swiss in 1444, and helped to win the battle fought near Basel; but soon after, when peace was concluded between France and England, he betook himself to the East. From this point his history is clear, and abundantly authenticated. At Rhodes he became a knight of the Christian brotherhood, obtaining the approbation of the successive grand-masters, Jean de Lastic and Jacques de Milly, by the punishment which he inflicted on the pirates of the Greek islands. In 1458 he was sent by De Milly to the French king to stir up his zeal as a Christian prince against the growing power of the Turks, and succeeded in effecting a league between Charles VII. of France and Ladislaus II. against Mohammed II. In 1461 we find A. castellan of Rhodes, procureur of the grand-master, and military commander of the order in his absence. In 1467 he was present at the chapter-general of the order held at Rome, and signalled himself by his wisdom, tact, and eloquence. Elected grand-master in 1476, at a moment when Mohammed II., irresistible in the East, was threatening the independence of Latin Christendom, A. showed undaunted courage and incomparable skill in the presence of his formidable adversary. In 1480 he repulsed 100,000 Turks with enormous loss in an attack on the island. A second expedition which Mohammed planned was put an end to by his death in May 1481. For some time after this A. devoted himself to the improvement of the internal organisation of the brotherhood, in which endeavour he won the respect and admiration of Christendom. In 1501 he was appointed to command the forces of the German emperor and his allies against the Turks. He attacked Mitylene, but through internal dissension the allies were baffled. A. died at Rhodes in 1503, aged eighty. The age cannot show a more chivalrous Christian warrior and sage than A. See Bonhours' *L'Histoire de Pierre d'A.* (Par. 1676, new ed. Par. 1806.)

Auch (the *Climbernum* or *Elinberis* of the Gauls), the capital of the department of Gers, France, on the river Gers, 42 miles W. of Toulouse, with woollen, cotton, and leather manufactures, and some trade in wine and brandy. It is the seat of an arch-

bishop, and has a splendid cathedral, founded in 1489. In the time of Cæsar it was the chief town of the *Ausci*, hence its name; then of Roman Aquitania; and in later times it was the capital of Gascony and of the county of Armagnac. Pop. (1872) 9414.

Auchenia, a genus of Ruminant mammalia, represented by the llamas and alpacas of S. America, which are included in the *Camelidae* or Camel family. The llamas, however, do not possess humps, and the two toes of each foot are free, and each toe possesses a strong curved nail. The neck is elongated. The head is small. The upper lip is deeply cleft and mobile. Four kinds are known, but it is doubtful if more than two of these are distinct species. See LLAMA and CAMEL.

Auchterarder (Gael. 'the upper high land'), a town in the S.E. of Perthshire, 12 miles S.W. of Perth, on the Scottish Central Railway. Its chief industry is cotton-weaving. In 1839 the parishioners of A., by resisting the presentee of Lord Kinnoul, began the contest which ended in the formation of the Free Church. Pop. (1871) 3795.

Auckland, capital of the province of the same name, New Zealand, founded in 1840. Pop. (1870) about 12,000. Till the transference of the seat of government to Wellington, it was the capital of New Zealand. It possesses two harbours, 6 miles apart, and many substantial public buildings. It is well situated for commerce, and has a remarkably mild and equable temperature.—**A.**, the most northerly province of New Zealand, 400 miles long; greatest breadth, 200 miles; pop. (1871) 62,335. Its mineral treasures are valuable, comprising coal, iron, &c. It also produces much wool, and heavy grain crops.

Auckland, Bishop, a town in Durham, on the Wear, 10 miles W.S.W. of Durham, containing the palace of the Bishop of Durham. It is situated in the S. Durham coal field. Pop. (1871) 8736.

Auckland Islands, a group of islands S. of New Zealand, with some good harbours, which make them a valuable station for the whale fisheries of the Southern Pacific. Lat. 50° 48' S., long. 166° 42' E. They are almost uninhabited.

Auckland, William Eden, Lord, third son of Sir Robert Eden, Bart. of West Auckland, diplomatist and statesman, was born in 1744, called to the bar in 1768, became Under-Secretary of State in 1772, M.P. for Woodstock in 1774, and a Lord of Trade in 1776. In 1778 he was appointed one of the commissioners to treat with the insurgent colonists of N. America; held the office of Chief Secretary for Ireland, 1780–82; concluded a commercial treaty with France, September 1786; was ambassador to Spain, 1788, and to Holland, 1790. In 1793 he was made a British peer. He died 28th May 1814. A., who was a vigorous supporter of Pitt, wrote several political pamphlets, not without influence in their day.

Auckland, George Eden, Earl of, second son of the foregoing, was born August 25, 1784. In July 1834 he became First Lord of the Admiralty in the Cabinet of Earl Grey. From 1835 to 1841 he was Governor-General of India, and nearly the whole of his administration was occupied with the deplorable Afghan war. One gleam of light, however, is shed across the gloom. It was during A.'s rule that the British government ceased that connection with the native worship of Hindustan which affronted Christianity, and did not honour Brahminism. A. was recalled in 1841, and died at the Grange, near Alresford, 1st January 1849.

Auction, or **Roup**, is a mode of selling property by a competition of bidders, under certain conditions. These conditions are partly implied under common law, and are so far applicable to all sales by A. Such as, that no attempt be made to raise the price by fictitious offers, and that no attempt be made to keep it down by combination of the bidders. Besides these general conditions, an A. has generally its special conditions. These are written and exhibited or read over before the sale begins, and they are binding both on the seller and on the purchaser. This contract is in England called 'Conditions of Sale;' in Scotland, 'Articles of Roup.' There are many points of law respecting A. over which there is a good deal of obscurity. Thus there are doubts as to whether or not an exposé may bid

on his own account, or engage some one to bid for him. Sale announced as 'without reserve' is, however, certainly held to render his doing so illegal. What is called 'puffing' at an A. may vitiate a sale; that is, where the owner of the subject for sale raises the price by means of bidders acting for himself. The law regarding puffing is, however, very obscure. See PUFFING AT AUCTIONS.

Auctioneer, one who conducts an auction. He may act as agent, if he act in good faith, for any one wishing to bid. He is responsible to the seller for ordinary skill and assiduity. See APPRAISER.

Aucuba, a genus of Evergreen shrubs belonging to the natural order *Cornaceæ* (q. v.). *A. Japonica*, or Japan laurel, is a common garden shrub with variegated leaves, and capable of thriving even in the atmosphere of towns. The plant is dioecious. Its berries, when ripe, are of a beautiful coral red. *A. Himalatica* has wholly green foliage and orange-red coloured berries.

Audæus (the name is the Latinised form of the Syriac *Udo*), a native of Mesopotamia, born in the early part of the 4th c. He has an obscure place in the history of the Church as the founder of a sect which expired in the century that gave it birth. A. began by assailing the clergy for the impurity of their lives, and set an example of rigid austerity in morals, but along with his asceticism he seems to have combined certain anthropomorphic views of God which the Church could not tolerate. In A.D. 338 he was banished to Scythia or Sweden, where he formed a new sect among the Goths, and where he died about 370. His party became extinct soon after, but the anthropomorphic heresy spread through many monastic communities in the following century. See Augustine, *De Hæresibus*, c. 50, and Epiphanius, *Contra Hæreticos*.

Aude, a maritime department in the S. of France, formerly part of the province of Languedoc. It is for most part mountainous, but is intersected by rich, well-watered valleys, which yield cereals, olives, wines, and fruits. The chief industrial products are woollens, silks, leather, and paper; there are also many flour-mills, distilleries, and iron-foundries. Carcassonne (q. v.) is the chief town. A. is rich in iron, antimony, copper, and c. π . Pop. (1872) 285,297. The river A., 120 miles long, rises near Mont Louis in the Pyrenees, is fed by many tributaries in the department through which it flows, and enters the Mediterranean 6 miles E.N.E. of Narbonne.

Audebert, Jean Baptiste, a French naturalist and engraver, was born in 1759 at Rochefort. He excelled in designing and painting animals, and was much employed in this work by authors. His first work, *Histoire Naturelle des Singes, des Makis, et des Gallophilhèques* (Par. 1800), created a great sensation among naturalists. It was one of the earliest and most splendid attempts to print in oils, and to imitate the tints of nature. His *Histoire des Colibris, des Oiseaux-Mouches, des Jacanars, et des Promérops* (Par. 1802) is considered the most perfect work of the kind that ever appeared. Fifteen specimens have been printed in letters of gold. A. died in 1800.

Auditor, one who is appointed to examine accounts, public or private. The Commissioners of Audit are government officials appointed to look after the expenditure of certain branches of the public service. Their establishment is called the Audit Office. It consists of a chairman, a secretary, and five commissioners, with a staff of subordinates. The army, navy, ordnance, and land revenue accounts are now under the supervision of the Audit Office. The duties of a private A., or A. under a judicial remit, are very onerous, as, under common law, he may be held liable for the consequence of any blunder or oversight on his own part.

Auditor of the Court of Session, in Scotland, is an officer appointed by the crown, to whom either division of the court, or any Lord Ordinary, remits to tax the costs, in Scotland called expenses, of a suit found due by one litigant to the other. The A. reports to the judge, who will, if desired, hear objections on either side. He then decides on the accounts summarily and finally.

Auditory Nerve is the special nerve of the organ of hearing. It is sometimes also termed the *portio mollis* of the seventh pair of cranial nerves. It arises from the floor of the fourth ventricle at the back of the medulla oblongata. It passes into

the petrous portion of the temporal bone through the internal auditory meatus along with the facial nerve, or portio dura. It ultimately is distributed exclusively to the internal ear. See EAR, HEARING.

Au'dran, the name of several celebrated French engravers, among whom may be mentioned **Claude A.** (born 1592, died 1677), his three sons, Germain, Gérard, and Claude, of whom the first—himself a famous engraver—had three sons, all artists of note in their day; the last was a painter, who almost equalled Lebrun, and the second, **Gérard**, born at Lyon, August 2, 1640, achieved the reputation of being the greatest engraver. While practising his art in Paris, his abilities procured for him the patronage of Lebrun, the painter of Louis XIV. He afterwards studied three years under Carlo Maratti at Rome, where he executed an excellent engraving of Clement IX. The celebrity he acquired by this led to his being recalled to France, and to his appointment as engraver to the king. A work of his in folio, *Les Proportions du Corps humain mesurées sur les plus belles Figures de l'Antiquité*, was published at Paris in 1683. His finest productions are his illustrations of the battles of Alexander. G. died at Paris in 1703.

Au'dubon, John James, a very eminent American ornithologist, was born at Louisiana, May 4, 1780, of French parents. From his earliest years he displayed a passionate enthusiasm for the study of nature, especially of birds. His father established him in a farm in Pennsylvania, where he married; but neither his love for his wife nor for his family could diminish the irresistible attraction of the primeval forests of America. In a series of wanderings, commencing in 1810, and lasting fifteen years, A. executed on the spot, and from nature, those drawings which are to be found in his magnificent *Birds of America*. This work was of too costly and artistic a nature to find at that time an American publisher, but, nothing daunted, A. crossed the Atlantic, and after several delays and disappointments it was finally published at London (1826-39, 3d ed. 1864, 6 vols.), accompanied with a literary description (*Ornithological Biography*, Edinb. 1831-39). On the first appearance of the *Birds of America*, a thrill of admiration went through the savans of Europe, and even now the language of Cuvier does not appear extravagant—'It is the most magnificent monument that Art has yet raised to Nature.' While the publication was going on, A. continued his wanderings and observations. He visited the coasts, rivers, islands, lakes, forests, and mountains of N. America, from the Gulf of Mexico to Labrador, and in 1843 commenced his *Biography of American Quadrupeds*, which he finished in 1850 (2d ed. 1854, 3 vols.). A. died 27th January 1851. See *Lives of A.*, by St. John (1855) and Buchanan (2d ed. 1869.)

Au'ér, Aloys (*Ritter von Melsbach*), born May 11, 1813, at Wels, Upper Austria. At an early age he exhibited a great facility in acquiring modern languages, and in 1837 became Professor of Italian in the College of Linz, Upper Austria, and from 1841 to 1868 was Director of the National Printing Office in Vienna. But he is best known by his photographic discovery, known as *Nature Printing*. See *Die Entdeckung des Naturselbstdrucks* (Vien. 1856). In 1847 he published the *Lord's Prayer* in 200 languages, each exemplar being in the national alphabet. A. died at Vienna, July 11, 1869.

Auerbach, Berthold, a German poet and novelist of Jewish origin, was born 28th February 1812, at Nordstetten, in the Black Forest, studied from 1832 to 1835 at Tübingen, Munich, and Heidelberg, and first appeared as an author in 1836, when he published *Das Judenthum und die Neueste Literatur*. It was followed by a series of romances from Jewish history under the collective title of *Das Ghetto*. To this period also belong his *Spinoza* (2 vols. Stuttg. 1837; 2d ed. 1854), *Dichter und Kaufmann* (2 vols. Stuttg. 1839; 2d ed. 1854), and a translation into German of the whole of Spinoza's works (5 vols. Stuttg. 1841). Soon after, however, he entirely abandoned philosophy and criticism for creative art, and it soon became visible where his strength lay. The precursor of his new style was *Der Gebildete Bürger* (Karlsr. 1842). This was followed by his charming *Schwarzwälder Dorfgeschichten* (2 vols. Manh. 1843; 4th ed. 1848; people's ed. 1861-62). These 'Village Tales of the Black Forest' at once gave him a foremost place among popular German novelists, and in translations soon found their way into almost every European language. They are imbued

with the finest spirit of S. German life, and are marked by the most pleasant humour. One of the very best is *Die Frau Professorin*. In his *Schrift und Volk* (Leips. 1846) he discussed the conditions and characteristics of popular literature. A.'s later works are *Andree Hofer* (Leips. 1850), an historical tragedy of slender merit; *Deutsche Abende* (Manh. 1851; 3d ed. 1853); his continuations of the *Dorfgeschichten*; *Der Wahrspruch* (Leips. 1859), a drama; and the widely-admired tales, *Barfüssle* (Stuttg. 1856; 5th ed. 1863), *Joseph im Schnee* (Stuttg. 1860), and *Edelweiss* (Stuttg. 1861). A collection of his writings was published at Stuttgart in 22 vols. (1861-64). A. was editor of the *Deutsches Volks Kalender* from 1859 to 1869.

Aufrecht, Theodor, one of the first Sanskrit scholars in Europe, was born at Leschnitz, Silesia, in 1822, and was educated at the University of Berlin. He came to England with a high reputation, and was employed at Oxford (1859-62) in compiling the catalogue of the Sanskrit MSS. in the Bodleian Library. In 1862 he was appointed Professor of Sanskrit and Comparative Philology in the University of Edinburgh, and in 1875 returned to Germany to become Professor of Sanskrit and Comparative Science of Language at Bonn. A.'s works are, *De Accentu Compositorum Sanscritorum* (Bonn, 1847); *Die Umbrischen Sprachdenkmäler* (Berl. 1850); *Zeitschrift für Vergleichende Sprachforschung* (Berl. 1850); *Ujvaladutta's Commentary on the Unadisutras* (Bonn, 1859), from a MS. in the India House; *Halayudha's Abhidhanaratnamala: or, A Sanskrit Vocabulary, edited with a Sanskrit-English Glossary* (Lond. 1861); *The Hymns of the Rig-Veda transcribed into English Letters* (Berl. 1861); *A Catalogue raisonné of Sanskrit MSS. in Trinity College, Cambridge* (Camb. 1872); *The Anthology of Sarvagadharma* (Leips. 1873); *Blüten aus Hindustan* (Bonn, 1873). At present (1875) A. is preparing for the University of Oxford a larger work on the ancient dialects of Italy.

Au'geas, or Augeias, King of Elis, and one of the semi-mythical Argonauts. He fed 3000 oxen in his stalls, which Hercules in one day cleansed of the accumulated ordure of years, by leading through them the waters of the Peneus and Alpheus. A. refusing the payment agreed on—viz., 300 oxen—was slain by Hercules, with all his sons save one, named Phyleus, whom the victor placed on his father's throne.

Au'gereau, Pierre François Charles, one of Napoleon's greatest generals, was born at Paris, 21st October 1757, of humble parentage. At the age of seventeen he enlisted in the French carabineers; but tiring of military service, he quitted France and settled in Naples as a fencing-master. Returning to France after the outbreak of the Revolution, he volunteered into the army, was nominated captain of a regiment of hussars 26th June 1793, and on the 23d December of the same year was promoted general of division. He was sent to the army of Italy in 1795, and on the arrival of Bonaparte he became his lieutenant, and one of his most active and intrepid officers. During the Italian campaign A. immediately came to be ranked among the first generals of the Revolution on account of his unswerving resolution, the rapidity of his movements, his vigour of execution, which difficulties only seemed to intensify. He was with the emperor on most of his famous battle-fields, Jena, Eylau, Leipsic, &c. For his services he was created a marshal and peer of France, with the title of Duke of Castiglione; but having attached himself to the royalist cause, Napoleon, on his return from Elba, refused to accept the services which his old comrade hastened to Paris to offer. A. died 12th June 1816. A fine soldier, at least in his earlier years, A. was in other respects utterly destitute of culture or capacity, and far beneath the other marshals of Napoleon in manners and intelligence.

Au'gier, Guillaume Victor Emile, a French dramatic author, born at Valence, department of Drome, 17th September 1820. Though destined for the bar, at an early age he devoted himself to letters. His first drama, *La Cigüe* (1844), refused by the Théâtre Français, was accepted by the Odéon, where it was played with deserved success. Two years later the Théâtre Français, now alive to its own interests and to the genius of A., inscribed the condemned play in its repertoire. *L'Aventurière*, of a more serious cast than *La Cigüe*, was received with considerable favour. Then followed in 1849 *Gabrielle*, a comedy in five acts, full of moral reflections, and to which the French Academy decreed the Monthyon prize. *Le Joueur de Flûte*, a piece

of little value, was followed in 1852 by *Diane*, which proved a failure, though Rachel played the leading part. Many additional pieces have been composed by A. in conjunction with other writers, as *Les Lionnes Pavees* (1858) and the *Beau Mariage* (1859), with Fouscier; *L'Habit Vert*, with De Musset; *La Chasse au Roman*, with Landeau; and an opera, *Sapho* (1851), the music of which was composed by Gounod; *La Contagion*, first entitled *Baron d'Estrigaud*, created a sort of sensation in 1866, which was intensified in 1868 by what his countrymen call a 'grand drame de passion,' *Paul Forestier*, which, like others of his pieces, is distinctly indecent. His *Polsies* (1856) are characterised by delicacy both of diction and sentiment, but his plays are radically vicious in their morality. A. was elected a member of the Academy in 1858, and became an officer in the Légion d'Honneur in the same year, and a commander in 1868.

Au'gite, a mineral which forms an important constituent in basaltic and volcanic rocks. It is a variety of Pyroxene (q. v.), in which the crystals are opaque, and black or dark green in colour.

Augmentat'ion, Process of, is a procedure in the Teind (Tithe) Court (q. v.) of Scotland, raised by the clergyman of a parish against the titular and proprietors of the land (Scot. heritors) from which he draws his stipend, for an increase of it. The P. of A. cannot be raised at a shorter interval than twenty years from the date of last decree for augmentation. The decree of court, when given, is for so much grain or victual; it is, however, paid in money, the amount of which is each year determined by the Fiar (q. v.) prices. P. of A. also comprehends the apportioning or 'localling' of the augmentation among the proprietors. The summons also asks for an increase in the sum hitherto allowed for the elements of communion. The usual grounds on which augmentation is asked are increase in the number of inhabitants, or extent of the clergyman's parish, or increased cost of living.

Augsburg (*Augusta Vindelicorum*), a notable city in Bavaria, capital of the circle of Swabia and Neuburg, at the confluence of the Lech and the Wertach. Pop. (1871) 51,220, of whom 33,559 are Roman Catholics. Among its public buildings are the Council House, containing the splendidly-decorated 'Golden Hall'; the residence of the old prince-bishops, in which the Protestant leaders presented the 'Augsburg Confession' (q. v.) to Charles V.; the house of the famous merchant family of Fugger (q. v.); the Cathedral, the Bavarian Armoury, the Gallery of Art, &c. A. is a very old city. It owes its origin to the colony planted here 12 B.C. by Augustus (whence its name), and which so rapidly prospered that Tacitus speaks of it as the most splendid town in all Rhetia. In the 5th c. it was ravaged by the Huns; in the 6th it came into the possession of the Frankish kings. On the division of the dominions of Charlemagne, it fell to the Duke of Swabia; but its trade and industry ever growing, it managed to secure for itself many privileges, and at last in 1276 it became a free city of the empire. In the latter part of the 14th and all through the 15th c. it was at the height of its greatness, and its burghers were famous for their love of knowledge and art, no less than for their enterprise and wealth. While the ships of the Fuggers and Welsers were on every sea, A. was at the same time the headquarters of the German school of painting. But the discoveries of the Spanish and Portuguese gave a new direction to the commerce of the world, and other cities with greater advantages soon surpassed A. in commercial prosperity. Still it long continued to be an emporium of trade between Northern and Southern Europe. Many events of the Reformation transpired in A. When the empire was abolished in 1806, A. was incorporated with Bavaria. Its trade, long retrograde, is now reviving; printing, lithography, bookselling, and the manufacture of paper being in active operation, and there are woollen and cotton factories, and numerous breweries. A. had in 1870 ten printing and 34 publishing establishments. It is also an important seat of banking and of exchange operations, a great railway centre, and the place where the *Allgemeine Zeitung*, the most widely-circulated newspaper in Germany, is published. The ancient and invaluable records of A., when it was a free imperial city, have been published in the *Chroniken der Deutschen Städte* (vols. iv. and v. Leips. 1865-67).

Augsburg Confession, the profession of faith of the

Lutheran Church, drawn up by Melancthon, with the advice of Luther, and presented to the Emperor Charles V. at the diet held at Augsburg, June 25, 1530. Having been read in German by the Chancellor of Saxony, two copies, one in German and the other in Latin (*Confessio Augustana*), signed by John Elector of Saxony and other four magnates of the empire, were presented to the emperor. Melancthon took as a basis the seventeen articles of Torgau, which had been laid before the elector by Luther in the previous year. Of the twenty-eight articles of the A. C., twenty-one state the Lutheran tenets of faith and doctrine, while the remaining seven deal with the points in dispute between the Lutheran and Roman Churches. In 1540 Melancthon published a Latin edition, containing important variations, introduced for the purpose of reconciling the views of the Lutherans and Calvinists on the Lord's Supper. These variations were repudiated by orthodox Lutherans, and they gave rise to much controversy between the Lutheran and Reformed Churches of Germany. See Köllner's *Symbolik der Luth. Kirche* (Hamb. 1837).

Augsburg Interim. See INTERIM.

Auguries and **Au'spices** are essentially Latin modes of divination, and of greater antiquity than Rome itself. Both words are connected with *avis*, a bird, as it was believed that the flight of birds intimated in some way the will of the gods, and that by this Jupiter taught men how to act in given circumstances. The various kinds of signs observed by the augurs were five—*ex calo*, *ex avibus*, *ex tripudiis*, *ex quadrupedibus*, *ex diris*. The first, which was of prime significance, was connected with the observation of thunder and lightning. The second related to A. from birds, of which there were two classes: *oscines*, as the raven and the crow, which gave A. by their voice; and *alites*, as the eagle and the vulture, which indicated the will of the gods by their flight. The A. *ex tripudiis* were taken from the feeding of chickens, and were consulted on military expeditions; *ex quadrupedibus*, from four-footed animals, as the hare, wolf, or dog; *ex diris*, from sneezing, stumbling, and other accidents. The person who was to take the A. marked out with a wand a division in the heavens called *templum*, a term also applied to the station he occupied, which was solemnly separated from the rest of the lan. At Rome a station on the summit of the Capitoline Hill had been consecrated for this purpose once for all. The *templum* was divided into right and left, and the A. were favourable or the reverse as the birds appeared in the one division or the other. In ancient times no plebeian could take the A., while every patrician could. No important undertaking, public or private, was in the early period of Roman history entered upon without consulting the A. Hence the power and influence of the augurs were paramount, and a veto of a single member of their college could disperse the Comitia Centuriata. In war, the power of taking the A. was restricted to the commander-in-chief; any victory won by his lieutenants was said to be won 'under his auspices,' and he alone was entitled to the honour of a triumph. The phrase 'under his auspices' now simply means under the favour or influence of another; but even in classical times it had acquired this figurative use.

August (It. and Sp. *Agosto*, Fr. *Août*), the name given by Augustus to the sixth month of the Roman year, originally *Sextilis*, when he rectified an error in the method of intercalating. The decree of the Senate ratifying the change assigns as reasons for it that in Sextilis had happened some of the most fortunate events in the life of the emperor, and that 'the said month is, and had been, most fortunate to the empire.'

Augusta, the capital of Maine, U.S., on the navigable river Kennebec, 60 miles N.N.W. of Portland. It contains a handsome state house of whitish granite, and a large arsenal. In 1865 the whole business quarter was destroyed by fire, but was soon after restored. The river, on which steamboats ply for 20 miles above A., is here spanned by a bridge 520 feet long. Pop. (1870) 7808.

Augusta, a flourishing town in Georgia, U.S., on the Savannah, 120 miles from its mouth. It lies in the centre of a rich cotton-growing district, and has ample railway and river communication. A bridge here connects A. with Hamburg, in S. Carolina. Pop. (1870) 15,389.

Augustenburg, a village on the Prussian island of Alsen,

with 1116 inhabitants, near which is a fine castle, formerly the residence of the Duke of Holstein-Sonderburg-Augustenburg.

Augusti, Johann Christian Wilhelm, a German theologian, born at Eschenberga, near Gotha, in 1771, and studied under Griesbach at Jena, where in 1798 he became a lecturer in philosophy. In 1803 he succeeded Ilgen as Professor of Oriental Literature, and in 1807 became Professor of Theology. Appointed Professor of Theology at Breslau in 1811, he was transferred to Bonn in 1819, and was made Director of the Consistory of Coblenz in 1833. He died 28th April 1841. A. was originally rationalistic, but became much more orthodox in his later years. His best-known works are his *System der Christl. Dogmatik* (Leips. 1809), *Grundriss einer Histor.-Kritischen Einleitung in das Alte Testament* (Leips. 1806), *Lehrbuch der Christl. Dogmengeschichte* (Leips. 1805), and, above all, his *Denkwürdigen aus der Christl. Archæologie* (12 vols. Leips. 1817-31).

Augustine, Aurelius St., was born at Tagaste, a village in Numidia, 13th November 354. His father, who filled the office of a magistrate, was a pagan till nearly the close of his life; but his mother, Monica, to an exquisite tenderness of heart added all the graces of religion, and strove—though for years her work seemed to be fruitless—to imbue her son with her own pious convictions. After receiving a good school education, he was sent at the age of seventeen to prosecute his studies at Carthage. There he fell a prey to the temptations of the place, became exceedingly dissolute, and at the age of eighteen became the father of a natural son. By reading Cicero's *Hortensius* he became enamoured of philosophy, and not finding what he sought in the Bible, he adopted the Manichæan system. He now returned to his native town, where he gave instructions in literature; but about 380 again settled in Carthage, where he taught literature for three years; and at this period he abandoned the Manichæan system. In 383 he went to Rome, and next year to Milan, in the character of teacher of literature. There he was attracted by the eloquent preaching of Ambrose, Bishop of Milan; under whose influence he became a Christian, and was baptized, along with his son Adeodatus, in 387. Next year he returned to Africa, where, according to the practice of converts at the time (see Acts ii. 44, 45), he sold his estate, devoting the proceeds to charitable purposes, and lived as a recluse, with a few like-minded companions. In 391 he went to Hippo (Bona, Algeria), where he was ordained a priest, and preached with marvellous success both in the Latin and Punic tongues. His suppression of the stone-fights at Cæsarea, in Mauritania, by the irresistible eloquence of Christian pathos, is a splendid evidence both of his heroism and his faith. In 395 he was appointed colleague to the Bishop Valerius, and from that time till his death he was indefatigable in preaching and writing, combating error and ungodliness, and infusing spirituality into the churches far and wide. Nothing could surpass his chivalrous magnanimity, his lowliness of heart, his noble humanity. Whether teaching little children, defending the poor and the oppressed, selling the ornaments of the church and even the vessels of the altar to ransom slaves, or exhorting priests never to abandon their flocks, he was always the heroic follower of his Divine Master. The Vandal invasion of Africa broke his heart, but did not quell his courage. When the barbarians besieged the city of Hippo, A. was foremost in encouraging and consoling the inhabitants, but his death in the third month of the siege (28th August 430) rendered his enthusiasm unavailing.

From the time of the condemnation of Pelagianism (q. v.), at the Council of Carthage (412), he devoted his whole energies to refute and crush the doctrines called by that name. It was mainly in that controversy that he developed the scheme of doctrine which has been the moving power in the Church ever since. It was sanctioned by the Latin Church, repudiated by the Church of Rome in the Council of Trent, adopted by the Reformers, and incorporated more or less in all the Protestant Confessions, forming especially the backbone of Calvinism. The principal features of the scheme are as follows: 1. That solely for his own glory God purposed the creation of the universe, and the whole plan of providence and redemption. 2. That mankind were placed in a state of probation. 3. That they were brought, by the fall of Adam, into a state of condemnation, from which they are utterly unable to deliver themselves. 4. From the mass of fallen men God elected a certain number to eternal life, and left the rest to the just recompense of their sins. 5.

That the sole ground of this election is the good pleasure of God. 6. That, for the salvation of those thus elected, God gave his Son to suffer for his people; thus making a full satisfaction for sin, and rendering the ultimate salvation of the elect absolutely certain. 7. That although the Holy Spirit operates more or less on all men in restraining evil and exciting good, his efficacious and saving power is excited only on behalf of the elect. 8. That all the elect shall certainly be brought to the knowledge of the truth, the exercise of faith, and perseverance in holy living unto the end. As a thinker A. has the first place among the fathers, not merely because of the work he did, but the way he did it. 'Of all the fathers of the Latin Church,' says Villemain (*Tableau de l'Eloquence de la Chaire au quatrieme Siecle*, Paris, ed. 1849), 'St A. is the one who carried most imagination into the sphere of theology, most eloquence and sensibility into scholasticism. Give him another age, place him under a happier civilisation, and no man would have displayed a vaster or more plastic genius. Metaphysics, history, antiquities, morals, science—everything he embraced.' Perhaps a later age might have purified the style, and modified the opinions of A., but it could not have added to his faith or enriched his genius.

Of A.'s works, which fill eleven volumes of the Benedictine edition (Paris, 1679-1710; Antw. 1700-3), perhaps the most powerful is his *City of God*; the best known and most read, his *Confessions*. See Poujoulat's *Vie de Saint Augustin* (Paris, 2d ed. 1852).

Augustine, St., the founder of the English Church, and the first Archbishop of Canterbury, was abbot of the monastery of St Andrew, Rome, when he was sent by Pope Gregory I., with nearly forty companions, to preach the gospel to the pagan English, A.D. 596. According to Bede (*Hist. Eccl.*, lib. ii. cap. 1), Gregory's interest in our countrymen was first excited by seeing some English boys for sale in the Roman market. Be that as it may, the missionaries, in obedience to the papal command, set out for Britain, and landed in the Isle of Thanet. They were hospitably received by Æthelberht, the Kentish king, who was then Bretwalda, obtaining permission to evangelise his subjects and to dwell in the city of Canterbury. Probably the fact that Æthelberht had a Christian wife of the Frankish nation, who by the marriage contract was permitted to privately practise the rites of her religion, predisposed him to favour the newcomers. Bede attributes the success of the missionaries in the work of conversion to the purity of their lives and the sweetness of their heavenly doctrine. The king himself soon received baptism, but he did not, like some princes, force his subjects to follow his example. Voluntaryism, however, was more effectual than compulsion, for we are told that great numbers of the English of their own accord embraced Christianity. In the same year in which he commenced his missionary work, A. was made *Anglorum Episcopus* ('Bishop of the English people'), and thereafter sent two priests to Rome to obtain the advice of Gregory regarding the government and usages of the new Church, and the limits of his own authority. The Pope's replies are admirable for their good sense, liberality, and piety. In 601 additional missionaries were sent into the island, with all the requisites for religious service—sacred vessels, vestments for the altars and the clergy, ornaments for the churches, relics of the martyrs, and learned books. A. had, on the whole, wonderful success among the English; but the Britons, who had a Church of their own, refused to depart from their ancient customs regarding Easter and baptism, or to acknowledge his authority. For this contumacy, Bede considers, they were afterwards righteously defeated with great slaughter by the English king Æthelfrith. A. died in 604, and was buried in the church at Canterbury. See Stanley's *Historical Memorials of Canterbury* (Lond. 1855), and Green's *Short History of the English People* (Lond. 1875).

Augustines, or Augustinians, the name of numerous religious orders in the Roman Catholic Church, among which may be mentioned—(1.) The CANONS REGULAR OF THE ORDER OF ST AUGUSTINE, or AUSTIN CANONS, brought into England probably in 1105, and had their first house at Colchester, and not at Nostell in Yorkshire, as stated by Reyner. They had about 170 houses in England, and about 25 in Scotland, the earliest being founded at Scone in 1114. Their discipline was less strict than that of other orders of monks; they took the vows of chastity and poverty, and their habit was a long black cassock, with a white rochet over it, having over that a black cloak and

hood. (2.) The HERMITS OF ST AUGUSTINE, or AUSTIN FRIARS, a very austere order, who lived on the alms of the faithful, were placed by Pope Innocent IV., about the middle of the 13th c., under the rule ascribed to St Augustine; Alexander IV. in 1256 placed them under a president with the title of 'general'; and they were long governed by a code of rules compiled in 1287; but as the middle ages drew to a close, the order (like most others) degenerated, and new religious brotherhoods were formed in the hope of effecting a reformation. The DISCALCEATE (i.e., 'Barefooted'), a very austere order of A., were established in 1570; but the system of religious life which such orders embodied and sought to advance was not in harmony with the ideas of modern times, and after that great revolt against the past known as the French Revolution, the A. were almost everywhere either suppressed or curtailed. (3.) An order of nuns, said to have lived under the direction of Augustine himself, had also the name of A. Their garments were black till 1632, when they were exchanged for violet. They still minister in the Hôtel-Dieu at Paris.

Augustowo (*Augustow*), a town of Poland, province of Suwalki, on an affluent of the Bug, 138 miles N.E. of Warsaw, founded in 1557 by August I., whence its name. It has linen and woollen manufactures. Pop. 10,050.

Augustulus, **Romulus**, the last Emperor of the West, and son of Orestes, who, after driving out the Emperor Julius Nepos, had A. proclaimed emperor, A.D. 475, himself retaining all real sway. The diminutive A. was applied to him on account of his youth and the insignificance of his character. After Orestes was put to death by Odoacer at Pavia (A.D. 476), A. was exiled to the villa of Lucullus, with an annual allowance of 6000 pieces of gold, after which his name disappears from history. By a curious coincidence the last Emperor of Rome bears the same name as the mythical founder of the city.

Augustus, **Caius Julius Cæsar Octavianus**, commonly known in history as A., was the first Roman emperor. He was the son of C. Octavius and Atia, daughter of Julia, the sister of Julius Cæsar, and was born B.C. 63. The native place of the Octavian family was Velitæ. During his early years A. received many marks of Cæsar's attachment, and was adopted by him as his son and heir. After Cæsar's murder, B.C. 44, A. came from Apollonia, where he had been studying, to Rome, and claimed his inheritance. He was opposed by Antony, then all-powerful, but with great tact and skill he won the favour of the nobles, the people, and the soldiers; and, on the proposal of Cicero, he was intrusted with the command of the army against Antony, whom he drove across the Alps. Notwithstanding the opposition of the aristocratic party, A. obtained the consulship, and marched into the N., where he met Antony and Lepidus, to whom he was reconciled, and with whom he formed a triumvirate, Lepidus obtaining Spain; Antony, Gaul; and A., Africa, Sardinia, and Sicily. After the destruction of their enemies, and the extinction of the Republican party at Philippi, B.C. 42, Lepidus obtained Africa and A. Italy. The war excited by Fulvia, wife of Antony, was brought to a close by her death, and Antony then married Octavia, sister of A., the eastern provinces being now assigned to Antony, and the western to A. After defeating Sextus Pompeius and Lepidus, A. addressed himself to his great contest with Antony for the supremacy of the Roman world. Antony was now the slave of Cleopatra's charms, and the Romans, having declared war against her, gained a complete victory in the sea-fight at Actium, B.C. 31, after which Antony and Cleopatra committed suicide. In B.C. 29, A. returned to Rome and celebrated a triple triumph. Honours were showered upon him. He received in succession the prefix of imperator, the potestas censoria, the principate, the proconsular power in the provinces, and the title of A. In B.C. 27 he offered to resign the imperium, but was induced to resume it. Monarchy had already commenced, and A. gradually combined in his own person the prerogatives of various republican offices—the imperium, the principatus, the consulship and proconsular command, the potestas tribunicia, the potestas consularis, and the supreme pontificate. Broken down by the overthrow of Varus, by domestic grief, by advancing years, he retired to Campania to recruit his strength, but died at Nola, A.D. 14. A.'s wonderful personal history amply attests his possession of rare gifts as a ruler of men.

During the later portion of his life his policy was mild, and he introduced many important reforms. He greatly beautified the city of Rome: 'he found it of brick and left it of marble.' His age was the most brilliant period of Roman literature, and was adorned, amongst others, by the poets Virgil, Horace, and Ovid, and by the historian Livy.

Augustus (Ger. *August*) **I.**, Elector of Saxony, son of Duke Heinrich the Pious, born at Freiberg, 31st July 1526, married Anna, daughter of Christian III. of Denmark, in 1548, and succeeded to the electorate in 1553. In relation to the early Protestant Church, he first exercised his influence in favour of Calvinistic doctrines, but later, in 1574, he assumed a hostile attitude to Calvinism, and took up Lutheran tenets. A skilful administrator and reformer, he fostered education, agriculture, and trade. He founded the library, as well as much of the artistic and scientific institutions, of Dresden. A. married a second time in January 1586, but died a month afterwards.

Augustus II., **Friedrich**, named the Strong, Elector of Saxony and King of Poland, son of the Elector Johann Georg III., born in Dresden, 12th May 1670, succeeded his brother Georg in the electorate in 1694, and having changed his creed was chosen King of Poland in 1697, after Sobieski had vacated the throne. Failing to win back for Poland the provinces that had been ceded to Sweden, he was deprived of the crown by the Polish Diet, 14th February 1704. By the peace of Altranstädt, which he was compelled to conclude with Charles XII. of Sweden (24th September 1706), he abdicated the crown of Poland in favour of Stanislaus. The overthrow of the power of Sweden, by the crushing defeat of Pultowa (q.v.), restored A. to the throne of Poland. He now devoted himself to the object of driving the Swedes out of Germany. The death of Charles XII. in 1718 brought hostilities temporarily to a close. From the date of the death of Charles XII. to his own death, 1st February 1733, A.'s reign was unmarked by incidents especially worthy of note. His restoration to the Polish throne was unfortunate for Poland, for Saxony, and for himself. He squandered the resources of his subjects, even in times of famine, upon his mistresses, who were many, and his illegitimate children, who were 354 in number. Even his patronage of the fine arts in Saxony arose merely from that love of indulgence and luxury which was the ruling passion of his life. He is repeatedly sketched in the first and second books of Carlyle's *Friedrich*, in phrases that are unsurpassably graphic and essentially true. 'The gay, eupeptic son of Belial' has a place in history, though it is not an enviable one.

Augustus III., **Friedrich**, Elector of Saxony and King of Poland, the only legitimate son of the preceding, was born at Dresden, October 7, 1696. He succeeded to the electorate on the death of his father, and was chosen King of Poland, 5th October 1733, through the overpowering influence of Austria and Russia, and in spite of the influence of France, under whose protection, and supported almost unanimously by the Poles themselves, Stanislaus Leszcynski had been elected king on the 12th September preceding, but was obliged to fly from Warsaw before the advancing troops of Russia ten days afterwards. A. continued to be the dependant of the powers that had placed him on the throne, though the vacillating policy of his chief minister, Brühl, frequently compromised him. In the first Silesian war, he was on the side of the Prussians, but instigated by Brühl, who mortally hated the great Prussian king, A. formed a secret alliance with Austria. The result was that, in the second Silesian war (1745), Friedrich II. having defeated the allied troops of Maria Theresa and A., pushed on into Saxony, and occupied the capital, in which the state papers had been left, though the art treasures had been saved by the king. In the third Silesian war, again invading Saxony (1756), Friedrich took the whole Saxon army captive in its entrenched camp at Pirna. A. fled to Poland. On the threat of invasion by Russia, however, he returned to Dresden, where he died, October 5, 1763, the anniversary of his election to the Polish throne thirty years previously. See Carlyle's *History of Friedrich II. of Prussia*.

Auk (*Alca*), a genus of Natatorial or Swimming birds, belonging to the family *Alcedæ*, which forms a division of the *Brevipennate* or 'short-winged' swimmers. The feet are placed towards the hinder extremity of the body, the hinder toe of each foot being wanting. The three front toes are fully webbed.

The wings, although small, are yet provided with quill-feathers, and are more useful for swimming and diving than for flight.

Great Auk.

The hinder position of the feet enables these birds, when on land, to assume an erect attitude, whilst their gait is unwieldy and awkward. But in the water they are exceedingly active, and swim and dive with great facility. The bill is much compressed, and is sharp on its upper or elevated edge. These birds are distributed in the northernmost regions of the world, the penguins replacing them in the southern hemisphere. The great A. or gare-fowl (*Alca impennis*) is now but rarely met with, having been almost completely exterminated by man. The Arctic seas, the Orkney and Shetland Isles, form its chief

habitat, and it has been occasionally shot on the coasts of Britain. The great A. produces but a single egg, averaging about 5 inches in length by 3 in diameter. The lesser A. or rotche (*Mergulus* or *Alca alle*) is nearly allied to the guillemots. It possesses a short conical bill, and inhabits the northern Arctic seas, visiting Britain in winter. The Puffins (q. v.) are nearly related to the auks, but are included in the distinct genus *Fratercula*. The Penguins (q. v.) (*Spheniscus* and *Aptenodytes*) are also included in the family Alcadae. The Razor-bill (q. v.) (*Uria* or *Alca torda*) is more nearly related to the auks, however. The wings in this latter form are proportionally larger than in the auks.

Aulapalay, or **Aleppi**, a town of India, on the coast of the native principality of Travancore. It has a trade in timber, brought from the forests of the W. Ghats, in betel-nut, cocoa, coffee, and in pepper, while canals furnish facilities for internal communication. A. has no harbour, but there is good anchorage a few miles from the shore. Pop. 7000.

Aulic Council (Lat. *aula*, court), a court of the old German empire dating from 1495, and from 1654 taking equal rank with the Imperial Chamber. Though from the first performing important functions, it had no definite constitution till 1559. Its members were a president, vice-president, vice-chancellor, and eighteen councillors, the last being classed as counts, barons, and men of learning. It did not interfere with the political affairs of the empire, but confined itself to feudal processes and investitures, and to matters connected with the imperial jurisdiction in Italy. The A. C. was dissolved on the death of each emperor, and reconstructed by his successor. It disappeared with the abolition of the old German empire by Napoleon in 1806.

Aumale (Lat. *Alba Mala*, *Albamarla*, *Aumalcum*), a French title reaching back to at least the middle of the 11th c., when Eudes, son of Henri-Ftienne, Count of Troyes and Meaux, bore the title of Comte d'A. In the 13th c. it passed to the house of Ponthieu, and in the 15th to that of Lorraine. On the death of René II. (1508), the title and estates went to his younger son Claude, Duc de Guise. In 1547 Henri II. raised it to a dukedom in the person of François, subsequently Duc de Guise, who surrendered it to his brother, Claude de Lorraine. In 1638 it passed to a branch of the house of Savoy, and in 1675 it was conferred on the Duc du Maine, legitimate son of Louis XIV. At a still later period the title was borne by princes of the blood royal of France. Among the more notable D'Aumales of history are—1. **Jean d'Arcourt**, eighth Comte d'A., and **de Mortain**, surnamed *Le Mal des Anglais*, was born in 1396. He fought at Agincourt (Oct. 25, 1415), Bernay, and Crevant, but is most fondly remembered by his countrymen for his brilliant victory over the English at Gravelle (26th September 1423). He perished the year following in the disastrous battle of Verneuil, which was fought contrary to his advice.—2. **Claude de Lorraine**, first Duc d'A., born about the close of the 15th c., fought at Marignano (1515), conquered the duchy of Luxembourg (1542), and died at Joinville, 12th April 1550.—3. **Claude II. de Lorraine**, Duc d'A., third son of the foregoing, born in 1523, took part in the capture of Calais, the battles of Dreux, St Denis, and Montcontour, and in the

massacre of St Bartholomew. He was killed at the siege of Rochelle, 14th March 1573.—4. **Charles de Lorraine, Duc d'A.**, born 1554, was one of the leaders of the politico-religious league which, under the pretext of suppressing the Huguenots, attempted to raise to supreme power his kinsmen the Guises. In 1589 he seized Paris and cast the members of the parliament into prison, but shortly after he was defeated at Senlis by La Noue, and again in the same year at Arques and Ivry. He held Paris for some time against the forces of Henri IV., but finally surrendered, and suddenly joined the Spaniards, who had invaded Picardy. For this he was found guilty of high treason, and sentenced to be broken alive on the wheel. He escaped, however, and died, after a long exile, at Brussels in 1631, being the last scion of his race.—5. **Henri-Eugène-Philippe, Louis d'Orléans, Duc d'A.**, the fourth son of the late King Louis Philippe, was born at Paris, 16th January 1822. He was educated at the Collège Henri IV., and at the age of sixteen entered the army, where he rapidly rose to distinction. In Algeria he crowned a series of brilliant services by surprising Abd-el-Kader (16th May 1843), and capturing 3600 prisoners, with the emir's treasure and correspondence. A. was made governor-general of Algeria in 1847; but on the revolution of 1848, by which his father was driven from France, he resigned his post and withdrew to England. Since then he has gained considerable reputation as an author. The chief of his writings are—*Les Zouaves et les Chasseurs-à-pied* (1851); *Lettre sur l'Histoire de France* (1861); *Histoire des Princes de Condé* (1869, Engl. transl. 1871, 2 vols.); *Qu'a-t-on fait de la France?* (1868); and several important articles in the *Revue des Deux Mondes*, chiefly on political subjects. In 1871, on the repeal of the law banishing the house of Orléans, he returned to France, and was elected a member of the Assembly. On the 10th of March 1872 he was created a general of division, and in this capacity presided over the council of war which tried Marshal Bazaine (October 6 to December 10, 1873) for the facile surrender of Metz. He was elected a member of the Academy in 1871.

Aune (Lat. *ulna*, Eng. *ell*), a French measure of length = 1½ mètre = 47½ English inches. The English ell = 5 quarters, or 45 inches.

Aun'oy, Marie-Catherine-Jumelle de Berneville, Comtesse d', a French authoress, best known for her fairy tales, *The Yellow Dwarf*, *The White Cat*, &c., still popular with the young. She also wrote romances and historical memoirs, both of which have ceased to be read. She was born about 1650, and died at Paris, January 1705.

Aurantia'ceæ, an order of Dicotyledonous shrubs and trees abounding in the E. Indies, and embracing upwards of one hundred species. All the plants of the order exhibit receptacles of volatile oil in their leaves and the rind of their fruit. The genus *Citrus* (q. v.) is the most important in the order, yielding a variety of agreeable fruits (see ORANGE, LEMON, LIME, CITRON, SHADDOCK, &c.). *Egle Marmelos* also yields an excellent fruit (see EGLE). A gum resembling gum-arabic is procured from *Feronia elephantum*. *Skimmia Lauricola* is the only plant of the order found in cold regions. It grows on the tops of the mountains in Northern India, where it is covered for some months of the year with snow. *Bergera Kunigi* is known as the curry-leaf tree, its aromatic fragrant leaves being used to flavour curries. The leaves, bark, and root are also used medicinally. Simbolee oil is extracted from its seeds. The fruit of *Cookia punctata* is called wampee in China and the Indian Archipelago.

Aurelia. See CHRYSALIS.

Aurelianus, Lucius Domitius, otherwise **Valerius**, or **Valerianus A.**, a Roman emperor, born a Pannonian or Dacian peasant about A.D. 212. From being a common soldier, by his valour and skill displayed in all parts of the empire—Sarmatia, Gaul, Illyria, Thrace, and the valley of the Danube—he gradually rose to the highest commands, and on the death of Claudius, was elected emperor by the army, A.D. 270. His short reign of four years and a half presents a series of the most brilliant exploits. He routed the Goths and Vandals who had invaded Pannonia, expelled the Alemanni from Italy after inflicting on them a great defeat near Fano; then turning his arms to the East, besieged the famous Zenobia (q. v.) in

Palmyra, took her prisoner, and destroyed the city shortly after. But though Italy and the East owned his authority, and his fame was spread far beyond the Euphrates, the West was still in the hands of a rival named Tetricus. A battle fought near Chalons, however, made A. master of the Roman world. Yet fortune was in a sense unkind to this able man. Insurrections and conspiracies were frequent, in spite of his energy, courage, and liberality, and he was finally slain in March, A.D. 275, the result of a conspiracy organised by Minestheus, his private secretary. The chronology of the reign of A. is extremely confused.

Aurelius, Marcus. See ANTONINUS.

Auricles, the term applied to the lesser chambers of the heart of animals, the function of which is to *receive* the blood for transmission to the larger propelling chambers, or *ventricles* (see HEART). The name is derived from the Latin *auricula*, a little ear, and has been thus applied in allusion to the supposed resemblance of the cavity to an ear.

Auricula, a genus of *pulmoniferous* or 'air-breathing' *Gastropodous* mollusca, in which a spiral shell covered by a horny epidermis exists. There is no *operculum*, or plate for closing the aperture of the shell. The mouth of the shell is elongated, and its edges may be toothed or serrated. The spire of the shell is short. These forms are found in warm regions; they inhabit fresh-water marshes, although they are air-breathing forms. The *A. Mida*, or 'Midas' ear' shell, is a familiar species.

Auricula.

Auricula, the common name for *Primula Auricula*, a favourite garden flower belonging to the order *Primulaceæ* or Primrose (q. v.) family. The plant is a native of the Swiss Alps, and has yellow flowers, but there are now numerous fine varieties in cultivation of various shades of colour. Many of these flower freely during April and May, in open, shaded borders; some of the finer sorts, however, being generally grown in flower-pots in a greenhouse or cool frame. They succeed best in a rich soil composed of fresh loam, mixed with well-rotted horse or cow dung, and a certain amount of white sand. They can be propagated either by offsets or by seed. The leaves of A. are said to be used by the inhabitants of the Alps as a cure for coughs.

Auricular Confession. See CONFESSION.

Aurillac, the capital of the department of Cantal (Auvergne), France, on the Jourdanne, 144 miles W. of Bordeaux, at the junction of the four roads to St Flours, Rodez, Tulle, and Clermont. It has considerable manufactures of jewellery, copper utensils, blonde lace, leather, carpets, and beer. There are horse-races here from 1st to 15th May, and near the town is the famous model farm La Peyrouse. A. is the birthplace of Pope Sylvester II., and of the revolutionist Carrier. The town is said to have grown up round a Benedictine abbey founded here in the 10th c. by St Gerard. It was frequently besieged by the English in the 14th and 15th centuries, and was eight times taken and retaken in the 16th c. during the Huguenot wars. Pop. (1872) 8795.

Aurochs (*Bonassus* or *Bos Bison*), the **Urus** or **European Bison**, an ox or member of the family *Borida*, of large size, found at present in the Caucasian forests in a wild state, and also maintained by the Emperor of Russia in a Lithuanian forest—that of Bialoweiza. It formerly abounded wild in all the European forests, and has been regarded by some naturalists as the parent of our domestic breeds of cattle. The head is broad, and forehead arched; the hair of the forehead is long, and that of the chin and breast form a 'beard.' The tail is tufted. The colour is a dark or dusky brown. These animals attain their full growth at the fifth year, and the females are smaller than the males.

Aurora, the Latin name of the Greek *Eos*, the goddess of the dawn, or 'ruddy morn,' daughter of the Titans Hyperion and Theia in classical mythology. In the morning she ascended from the ocean to heaven, and announced the coming light to

gods and men. She was represented as a maiden with large wings, clad in white and purple, a star on her head and a torch in her hand, and driving a chariot drawn by four white steeds. She carried off Tithonus, with whom she lived beside Oceanus, and to whom she bore Memnon and Emathion. In the name we can still discern a form of the story antecedent to the myth. A., from *aurum*, 'gold,' and that from *urere*, 'to burn,' is really the same word as the Gr. *eos* and the Sansk. *ushas*, a name for the dawn, and points to a time when the figurative language of the solar myth had not yet begun to be misapprehended.

Aurora Borealis, or, as it should be more properly called, Polar Light, there being also an *Aurora Australis*, is a singularly

beautiful luminous phenomenon, generally in a state of incessant commotion, and often accompanied by most magnificent combinations of colours and tints. In our latitude, an aurora generally appears first as a misty fog stretching along the horizon from N.E. to N.W.; but gradually as it rises towards the magnetic zenith, it becomes more distinctly marked, resembling more or less perfectly a gigantic arch whose extremities rest on

Aurora Borealis.

the horizon, and whose apex lies very near, if not on, the magnetic meridian of the place from which it is viewed. Then commence those well-known streamers, shivering, dancing, darting, and, if prolonged sufficiently, culminating at that point in the heavens indicated by the prolongation of the dipping needle. If several rays meet at this spot *en masse*, they form a portion of a brilliant corona or crown, which has been called the *Boreal Crown*. When this stage is reached, the display has attained its maximum intensity, and gradually the brilliancy diminishes, until at last only the misty cloud remains, and it also in time fades from view. In more northern latitudes, where auroræ are seen to best advantage, the streamers combine and form indescribably beautiful and graceful folds, resembling a gigantic variegated curt. ...suspended from dingy clouds, and shaken as it were by the wind. Noises, compared to that produced by the rubbing of two pieces of rock upon one another, or even to the rattling of firearms, have been heard by some observers, but there is no trustworthy evidence on this point.

There is no doubt that the A. B. is a terrestrial phenomenon occurring at various heights, which depend to a great extent upon surrounding circumstances. Nor can there be any question of its electrical or magnetic nature, seeing what great effects an auroral display of any magnitude produces upon magnetic needles and also upon electric telegraphic erections.

Of late years a remarkable similarity between the frequency of auroræ and the variation of magnetic declination has been observed, both apparently having almost identical periodic variations. Quite recently lines, each of which is drawn through stations for which the mean frequency per annum of auroral displays is the same, have been laid down, and these so-called *isochasmen* lines are perpendicular to the magnetic meridians, and parallel to the lines of magnetic declination. The line of maximum frequency passes just N. of the Faroe Islands and Norway, through the northern portion of Nova Zembla, to the N. of Asia and Behring Straits, through Hudson's Bay and the N. coast of Labrador, and just S. of Cape Farewell. This line, as with all, tends to follow the limits of perpetual ice depending upon the form of the continents, the greatest deviations being where the ice-limits are most irregular, as in Hudson's Bay and the Gulf of Labrador. M'Clintock observes that in the Polar regions auroræ were most frequently visible when water was in sight; and Hayes has remarked that the direction depended to a great extent upon the position of a portion of water with respect to the observer. Ice or water seems, then, to have a great effect upon auroral displays; and the presence of the Alps may very probably occasion the frequent appearances in N. Italy.

Aurangabad, more correctly **Aurangabad** ('Throne-town'), a walled town in the territory of the Nizam of Hyder-

abad, formerly capital of Dowlatabad, India, on the Dūdna, a branch of the Godavery, 180 miles N.E. of Bombay. It takes its name from its founder, Aurungzebe, and contains the mausoleum of his daughter, an inferior imitation of the famous Taj Mahal at Agra. It was the residence of the Nizams till the advance of the Mahrattas forced them to withdraw to Hyderabad, but still possesses a military station. It lies at the junction of four military roads, in an unhealthy and swampy valley surrounded by naked rocky heights; but it is the best watered town in India: every house has a tank and a well. Its mosques and palaces are in ruins, but the bazaar is important, and the town is happily situated for a transit trade with Bengal, Bombay, Delhi, and Hyderabad. Pop. 30,000. A. is the name of at least other three places in India.

Aurungzebe, or Aurangzib ('Ornament of the Throne'), the last of the great Mogul Emperors of Hindustan, was the third son of Shah-Jehan, and the grandson of Akbar (q. v.), and was born 22d October 1618. The other children of Shah-Jehan were Dara-Shikoh, Sultan-Shujā, and Murad-Baksh, and the princesses Padishah Begam, and Roshnara Begam, to the latter of whom A. was much indebted for the success of the intrigues which secured him the crown. His career divides itself into three great periods. During the *first* of these, which lasted twenty-five years (1633-58), A. sought to win the support of the Mussulman priesthood by his austere zeal and fanatical devotion, which formed a striking contrast to the careless irregularities that marked the lives of his brothers. All of them governed districts of the empire under their father, and when the latter, in 1657, fell dangerously ill, Dara, the eldest, immediately grasped the reins of power. The others soon combined against him, and Dara was forced to flee. It is not necessary to trace the steps by which A. obtained the throne. One after the other his brothers and their children were assassinated or poisoned, Shujā perishing miserably in Aracan with all his family, while the aged Shah-Jehan, now fallen into imbecility, remained a captive in the hands of A., who cunningly showed him a harmless deference and homage. In 1658 A. was practically master of the empire, but in 1661 he was without a competitor. The *second* period in his career extends from 1661 to 1670, during which his dominions enjoyed, on the whole, a profound peace; but it is, nevertheless, marked by the rise of a hostile power, the Mahrattas, whose successes in the long-run fatally weakened the Mogul empire, and hastened its decay. Sevaji, the Mahratta adventurer, of whom Akbar would have made a friend, A. turned into a mortal enemy by his rancorous Mussulman bigotry, and his crafty and deceitful policy, but some time elapsed before the strife assumed an irreconcilable character. Meanwhile Shah-Jehan died, 1666; but many years elapsed before A. allowed himself to be proclaimed emperor, alleging with unsurpassable hypocrisy that he did not care for the dignity. The *third* period begins with 1670, and closes with his death in 1707. It again subdivides itself into two parts, the first reaching from 1670 to 1675, and marked chiefly by a defeat inflicted by Sevaji on the imperial forces (1672), and by an Afghan war, in which a great victory of the Afghans (1670) forced A. to take the field in person; the second occupied the remainder of his career, and is wholly taken up with the Rajput and Mahratta struggle. All the virtues and vices of A. were displayed in this protracted and desperate strife; his intolerance, superstition, narrowness of political view, habits of intrigue and dissimulation, distrust of everything and everybody, passion for glory, profound sense of order and organisation, temperance and simplicity of life, mildness of manner, and love of knowledge. But in a ruler there is no greater crime than religious bigotry, and his persecutions after 1679 of the Hindu Rajpoots alienated from A. for ever the affections and the obedience of those warlike chiefs, who were the mainstay of the Mogul empire; and, though he succeeded in capturing (1689) Sambhaji, the son and successor of Sevaji, whom he put to death with cruel tortures, yet the resistance of the Mahrattas continued unabated by successive defeats, and at the close of his career they were stronger and more enterprising than ever. During 1685-88, A. by intrigue, stratagem, perfidy, even more than by military skill, conquered Bijapur and Golconda, possessions of little value to him, except as adding to the force which he could turn against the guerillas S. of the Vindhya. The last years of his life were made miserable by the disobedience and ambitious rivalries of his sons, by remorse for the crimes he had committed, the

dissolution of discipline in his armies, the increasing disorder of his finances, and his terror at the approach of death. The picture presented to us in his correspondence, which still survives, is a deplorable one, and should convey a solemn lesson to all who would dare to 'wade through slaughter to a throne.' A. died at Ahmednuggur, 21st February 1707, at the age of eighty-nine, after a reign of half a century. Because he persecuted the Hindus, he took the title of *Mohi-Uddin*, 'Restorer of Religion'; and on account of his numerous victories, *Alamgir*, 'Conqueror of the World.' See Elphinstone and Mill's *Histories of India*.

Auscultation is the application of the sense of hearing to the detection and diagnosis of disease. It was first employed by a celebrated French physician named Laënnec, and is now practised by all physicians and surgeons. A. may be either direct or indirect. It is said to be direct when the ear is applied to the chest, and indirect when an instrument for conducting sound, termed a stethoscope, is employed. A. is employed to detect (1) diseases of the lungs; (2) diseases of the heart; (3) aneurismal tumours; and (4) pregnancy. See ANEURISM; LUNGS, DISEASES OF; HEART, DISEASES OF; PREGNANCY; and UTERUS, DISEASES OF.

Ausonius, Decius Magnus, a Latin poet, born at Burdegala (Bordeaux) about 309 A.D. His father, a man of high social position, gave him an excellent education, in the carrying out of which his whole kindred, especially the female portion, deeply interested themselves. After practising at the bar of his native town, he became professor of rhetoric there, and acquired so high a reputation, that he was appointed tutor to Gratian, the son of the Emperor Valentinian. His discharge of his new duties must have been eminently satisfactory, for, to crown a long succession of honours, he was appointed consul by his grateful pupil (A.D. 379). On the decease of Gratian, A. withdrew to a rural retreat near Burdegala, where he died about 392 A.D. There has been much controversy as to his religious belief, but there can be little doubt that he was a Christian, though the author of the obscene *Cento Nuptialis* can hardly be considered an ornament of religion. His works, which are numerous, and in many styles, both prose and verse, consisting of epigrams, idylls, and epistles, are vitiated by bad taste, though his epigrams are sometimes expressed with much neatness. The *editio princeps* of A. appeared at Venice in 1472; the best is the *Variorum* of Tollius (Amst. 1671). There are French and German translations of his works.

Austen, Jane, an eminent English novelist, was born at Steventon, in Hampshire, of which her father was rector, 16th Dec. 1775. Her first four novels—*Sense and Sensibility* (1811), *Pride and Prejudice* (1813), *Mansfield Park* (1814), and *Emma* (1816)—were published anonymously. Her two posthumous ones, *Northanger Abbey* and *Persuasion* appeared in 1818. Few whose works are now so famous have been in life so obscure. While yet in the shade, however, her power was recognised by many men of widely-different intellect. Sir Walter Scott's generous encomium is too well known to require quotation. If her scope is limited, within her scope—and she never attempts to go beyond it—she is almost unrivalled. The shafts of her delicate yet piercing humour are never tipped with the venom of cynicism. Her characters unfold themselves by imperceptible touches; yet we end by knowing them as we know our most intimate acquaintance. The structure of her tales is beautifully simple, but conceived and carried out with perfect art. We have nothing violent, nothing tragical, nothing even painful. Her material is human nature—externally as it shows itself in the drawing-rooms of the well-educated, moderately-circumstanced classes of England; and developed by just such incident and such chat as are *everyday* in that sphere of life. She died at Winchester on 24th July 1817.

Austen, William, a celebrated English metal-worker and designer of the 15th c. His great work is the tomb of Richard de Beauchamp, Earl of Warwick, in St Mary's Church, Warwickshire.

Austerlitz, a town of Moravia, circle of Brünn, 45 miles N.N.W. of Vienna, celebrated in connection with the 'battle of the three emperors.' An alliance having been formed between Austria and Russia, with the intention of checking the fiery course of Napoleon, the troops of the two nations, headed respectively by Francis I. and Alexander I., encountered those of

France near A., December 2, 1805. The allies suffered a crushing defeat, losing some 30,000 men, 40 standards, and 150 pieces of cannon. The battle of A. led to the humiliating treaty of Presburg (December 27), by which Austria ceded Venice to France and the Tyrol to Bavaria. Pop. of A. (1870) 3452.

Austin, the capital of Texas, U.S., on the Colorado, about 200 miles from its mouth. It is picturesquely situated, and is accessible to steamboats during the winter floods. Its House of Legislature is a fine structure of native marble. Pop. (1870) 4428.

Austin, John, a celebrated writer on jurisprudence, was born 3d March 1790. When a boy he served for some years in the army. In 1818 he was called to the bar. He does not, however, seem to have had a physical constitution fitted for the fatigue of legal practice; on the other hand, his genius for what he himself called 'untying knots'—that is, legal ones—seems to have been of the highest order. In London he whetted this natural acumen by social intercourse with Jeremy Bentham, James Mill, and other great intellectual powers. He further improved himself by Continental travel and by study at Bonn, then the residence of Niebuhr, Schlegel, and other famous men. Returning to England, he published his *Practice of Jurisprudence Determined* (1832); an unquestionably great work, though unsuccessful in a commercial point of view. After holding some small temporary government appointments, he removed with his family to Germany, living at Carlsbad in summer, and at Dresden or Berlin in winter. The disturbances of 1848 drove him back to England. He then settled at Weybridge, where he died in December 1859. After his death, his lectures on jurisprudence were prepared for the press and published by his widow (with a memoir) under the title of *Lectures on Jurisprudence; being a Sequel to the Practice of Jurisprudence Determined* (1861-63). Probably no better work than this exists as a foundation for the philosophical study of law. Its author has eminently the faculty of clearing his mind from the mist of words, and of seizing a meaning even amid the fogs and clouds of legal phraseology. —**Mrs Sarah A.**, wife of the above, belonged to the family of the Taylors of Norwich, which has had many members distinguished in science and literature. Faithful and devoted to her husband when he was alive, his memory is largely indebted to her for the ability and zeal with which she has edited his lectures since his death. Mrs A. is also well known for her able translations of many celebrated French and German works. From the former she has given us Guizot's *English Revolution* (1850); from the latter, Ranke's *Popes of Rome*, and his *History of Germany during the Reformation*. She is also the author of several valuable original works on subjects of social interest. She died at Weybridge, 8th August 1867. —**Charles A.**, a brother of John A., the celebrated writer on jurisprudence, was for many years a leader of the parliamentary bar, and also known in private circles as a profound thinker of the Utilitarian school of philosophy. He might have reached the highest honours of his profession, having refused the offer of the solicitor-generalship. He died December 1874.

Australasia (literally, 'Southern Asia'), the geographical name given to that portion of Oceania comprising Papua or New Guinea, Australia, Tasmania, New Zealand, New Caledonia, New Britain, New Ireland, New Hebrides, and the Solomon Islands. The general term A. serves to distinguish the entire group from Polynesia Proper on the E., and from the Malayan or Indian Archipelago in the N.E.

Australia, an island, or, as it is now considered by many, a continent, bounded on the N. by the Arafura Sea and Torres Strait; on the E. by the Pacific Ocean; on the S. by Bass Strait and the Indian Ocean; and on the W. by the Indian Ocean. It extends from 10° to 39° S. lat., and from 113° to 154° E. long. Its extreme length, from E. to W., is 2550 miles; and its extreme breadth, from N. to S., 2000 miles. Its area is estimated at 2,967,500 sq. miles—equal to about three-fourths that of Europe. The coast-line of A. is remarkably devoid of large inlets, the only one of magnitude being the Gulf of Carpentaria on the N. and N.E., which has a depth on the eastern side of 500, and on the western side of 400 miles. Next in size, but at a very large interval, are Spencer Gulf and St Vincent Gulf, both on the S. coast of South A.; and Shark Bay, in Western A. The Great Australian Bight, to the N.W.

of Spencer Gulf, is only a curve in the coast-line. Harbours are exceedingly scarce in proportion to the extent of coast; and the N.E. coast is fenced in for 1200 miles by a series of coral-reefs known as the Great Barrier Reef. The estuaries are small.

A chain of mountains runs from the southern extremity of A. almost to its northern extremity at Cape York, though less continuous between 16° and 10° S. lat. The mountains composing this chain vary in distance from the coast from 20 to 100 miles. The southernmost portion is called the Australian Alps, and is the highest section of the great range. Its culminating peak is Mount Kosciuszko, so named by its discoverer, Count Strzelecki, who estimated its height at 6510 feet. A later measurement, however, shows its altitude to be 7308 feet. It is snow-capped almost all the year. Mount Karribogong, in the same range, is 6563 feet high. N. of the Australian Alps, the Blue Mountains (q. v.) extend for 150 miles. They are remarkable for their tremendous chasms, walled in by cliffs in some instances 1500 feet in height. For twenty-five years they formed an insuperable barrier to the spread of colonisation beyond them. A railway now runs over Mount Victoria, one of the loftiest peaks, the line reaching a maximum elevation of 3494 feet above the sea-level. The Blue Mountains are succeeded by the Liverpool Range (q. v.), whose highest peak is Mount M'Arthur, 5000 feet. The Liverpool Range is joined by the New England Range, whose height varies from 2000 to 5000 feet. Farther N., the great dividing chain receives a number of different names, and is less clearly defined. Expedition Range, which runs N.W. from the main chain, forms the watershed of Queensland. The Bellenden Kerr Mountains, in lat. 17° S., rise to the height of 5400 feet. The northern coast of A. is low. The western coast presents a series of straggling mountain ranges of no great altitude, save in the two cases of Mount Bruce, 3800 feet, and Mount Augustus, 3580 feet. In the south-western portion of the continent is the Darling Range, which has a maximum altitude of 3000 feet. The southern coast, from King George's Sound to Spencer Gulf, is a long plateau, faced for a great portion of the distance by sandstone cliffs from 300 to 400 feet in height.

The result of the mountains of A. being thus for the most part close to the coast, is that the largest rivers flow towards the interior. Their inferiority is the most marked defect in the physical geography of the country. Though several of them can last of a long course, they are all of very little service for commercial purposes. The largest is the Murray, which rises in the Australian Alps, and flows W. and N.W. till, some distance after entering the colony of South A., it makes a sudden bend, or 'elbow,' to the S., and empties its waters into the Indian Ocean through Lake Alexandrina. In its course it receives on the right bank the Murrumbidgee, with its tributary the Lachlan; and the Darling, with its affluents the Culgoa, Bokhara, Bogan, and Warrego. On the left bank it receives the Mitta-Mitta, Ovens, Goulburn, Campaspe, and Loddon. After its confluence with the Darling, the Murray receives no tributary of any size. Its total length is about 1500 miles, and the area of its basin is computed to be about 270,000 sq. miles. A fleet of light-draught steamers plies upon it, as well as upon the Darling and Murrumbidgee. The last is navigable in this way for 500 miles. Lake Alexandrina, into which the Murray debouches, is about 30 miles long by 27 broad, and quite shallow. This defect, coupled with the difficulty of the entrance from the sea, renders the Murray useless save as a means of internal communication. Of the other rivers named, the Darling drains an area of 198,000 sq. miles, and the Murrumbidgee an area of 57,000 sq. miles. The Lachlan is frequently a mere chain of pools, and flows into the Murrumbidgee through a vast morass. This is the character of most of the rivers flowing towards the interior of A.; and the Macquarie, for instance, losing itself in a marsh, which occasionally overflows into the Darling. On the other side of the dividing range the rivers are of a very different character. Their courses being for the most part short and the fall great, the rivers partake largely of the character of torrents; and only two, the Fitzroy and the Hawkesbury, can in any sense be regarded as navigable streams. The latter has been known to rise in flood 97 feet above its ordinary level. Proceeding from N. to S., the principal rivers on the E. coast are the Burdekin, Fitzroy, Burnett, Brisbane, Clarence, M'Leay, Hunter, Hawkesbury, Shoalhaven, and Snowy. On the S. coast the only rivers (exclusive of the Mur-

ray) deserving notice are the Yarra-Yarra and Glenelg. On the W. coast the chief are Swan River and the Murchison. These likewise are torrents. On the northern slope there are several large streams, the chief (from W. to E.) being the Alligator, Roper, Albert, Flinders, and Gilbert. The Roper has been ascended for 100 miles by a steamer of 600 tons register, and is a fine stream. The four rivers last named all flow into the Gulf of Carpentaria.

The coast-line of A. consists, as has been shown, in a very large measure of mountain slopes. The interior descends from fine upland downs to immense open plains, in nearly all places scantily watered, but still capable of depasturing vast numbers of sheep and cattle. In other parts, more especially towards the centre of the continent, along the Great Australian Bight, and for many miles inland from the latter, large tracts of desert exist. Low ranges of hills streak the heart of A., becoming fewer and less elevated towards the N. The extensive explorations made within the last five years have revealed the fact that a much larger portion of the interior of A. is suitable for pasturage than was formerly supposed. Since the construction of a line of telegraph (finished in 1872) across the continent from Adelaide to Port Darwin, and since the gold discoveries near the latter place led to an influx of population thither, stock have been driven across from both South A. proper and Queensland. Salt lakes and marshes are found in numerous places in the interior. The largest of these is Lake Torrens, which is shaped like a horseshoe, and its inner edge in time of flood measures some 400 miles. In this lake the Barcoo, a not inconsiderable stream, is absorbed. The clear portion of Lake Torrens, save in very dry weather, is from 15 to 20 miles in breadth.

The climate of a territory such as A., stretching over 29 degrees of latitude, is necessarily very diversified. One-third of the continent lies within the Tropic of Capricorn, and its climate is therefore tropical. Of the remaining two-thirds, the climate varies according to the usual conditions, and in the most southerly portion is very similar to that of the S. of France. The mean annual temperature of Melbourne (37° 48' S. lat.) is 53°, being about 7½ degrees higher than that of London. The mean annual temperature of Sydney (32° 52' S. lat.) is 65°. The annual rainfall at Melbourne is about 27 inches; at Sydney, 49 inches; at Brisbane, 51 inches; and at Adelaide, 21 inches. A. is subject to periods of excessive drought, which are most severe in the interior, and cause great losses among live stock. The heat during the third week of January 1875 was the greatest known for a number of years. At Melbourne Observatory, on the 20th, the thermometer stood at 111° in the shade, and 148° in the sun, being only one degree short of the excessive heat of January 1862, which, again, was the greatest known since 1858. During these droughts immense tracts of pastoral country and forest are destroyed by grass and bush fires. In the northern part of A., within the range of the monsoons, there is an annual rainy season, when the country is flooded for great distances. Taking A. as a whole, however, its greatest want is the want of water.

Geologically, the greater portion of A. is composed of Tertiary rocks, which form the whole, so far as is known, of the great central plateau and basin. The coast within the tropic on the W. and on the N. consists of Secondary strata. Between these and the central Tertiary beds is a belt of Plutonic and Metamorphic rocks, which is continued round the eastern, western, and part of the southern shores. On the E. it includes within it the greater portion of the main dividing range of mountains, though in places it is mingled with rocks exhibiting a stratified structure. On either side of this range is a wide strip of Palæozoic rocks, which unite in Central Victoria, and abound with mineral and metalliferous wealth. Excellent coal is found in abundance at Newcastle, at the mouth of the Hunter River, and is exported thence to all parts of Australasia, India, China, Japan, and the Pacific ports of N. and S. America. Good coal is also found on the Bulli River, New South Wales, and near Perth, in Western A. Many attempts have been made to discover paying seams of coal in Victoria, but without success. It is in metals, however, that A. is richest. The resemblance between the great mountain chain of A. and the Ural Mountains, led Sir Roderick Murchison to express the belief, in 1845, that gold would be found there. In 1851 his predictions were verified by the discovery of gold near Bathurst (q. v.), by Mr E. H.

Hargreaves, who had had gold-mining experience in California. In August of the same year gold was discovered at Ballarat (q. v.), and Clunes, in Victoria. During 1852 the gold export from Victoria reached its maximum, viz., £15,900,000. In the 'early days' of the gold discovery the working consisted for the most part in washing the gold out of the alluvium, but in course of time these surface-deposits became in a large measure exhausted. Recourse was then had to the extraction of the precious metal from the quartz rock in which it was embedded, and from this time forward quartz-mining steadily rose, and alluvial mining as steadily declined in importance. In 1874 the dividends paid by quartz-mining companies in Victoria amounted to £806,999, while the dividends paid by companies engaged in alluvial mining amounted to only £45,065, though, if the profits of unassociated enterprise were added to the latter, the disproportion would be considerably lessened. Quartz veins, or 'reefs,' are now remuneratively worked at a depth of nearly 1000 feet. The following shows the total export of gold from A. during 1874:—

Victoria,	£3,668,000
New South Wales,	1,083,000
Queensland,	500,000
South Australia (Northern Territory), say	50,000
Total,	£5,301,000

Other metals are plentiful in A. Copper has been exported from South A. since 1844, when the once-famous Burra-Burra mine was discovered. It is now also exported from Queensland, where some remarkably rich deposits have been found. One of these, discovered in 1874, yielded up to 98 per cent. of pure copper. There are also a good many copper mines in operation in New South Wales. The value of the copper exported from Australia in 1872 was £1,075,000, of which South A. produced £800,000 worth, Queensland, £195,000, and New South Wales, £80,000. Tin has been found over an enormous area in both New South Wales and Queensland, but these deposits are not so largely worked as those of copper. In 1872 New South Wales exported £49,000 worth of tin, and Queensland, £120,000 worth. Silver, lead, iron, manganese, zinc, quicksilver, and other metals have been found in different parts of A., but are not extensively worked. Opals have been found in Queensland, and diamonds are believed to exist in the same colony.

Pastoral operations are carried on upon a very large scale in A., wool being the staple product of the continent. The following figures show the declared value of wool exported from, and the area of land under agricultural cultivation in, each of the five colonies of the Australian continent in 1872:—

	Wool.	Acres under Cultivation.
Victoria,	£5,738,628	964,996
New South Wales,	3,342,900	454,615
South Australia,	1,617,589	1,164,846
Queensland,	1,173,565	62,491
Western Australia,	122,637	53,240
Total	£11,995,329	2,700,208

The following table shows the financial position in 1873 of each of the continental colonies, similar statistics relating to Tasmania and New Zealand being appended for convenience of comparison:—

NAME OF COLONY.	Estimated Population at close of 1873.	Revenue of 1873.	Rate of Taxation per Head of Population.	Public Debt on 31st Dec. 1873.	Value of Imports for 1873.	Value of Exports for 1873.
Victoria, . .	790,492	£ 3,043,601	£ s. d. 4 10 8	£ 12,445,788	£ 16,533,856	£ 15,398,454
N. S. Wal's., .	500,275	3,324,773	2 0 4	10,849,415	11,086,988	11,843,829
S. Australia, .	198,007	377,646	1 10 7	2,174,920	3,820,830	4,597,859
Queensland, .	146,690	1,120,034	4 0 2½	4,766,850	8,881,796	3,540,513
W. Australia, .	25,761	134,812	3 8 7	35,000	997,328	205,217
Tasmania,	1,721,475	9,460,918	2 14 8½	130,264,887	34,671,228	35,513,872
New Zealand,	104,217	203,753	2 0 0½	1,477,000	1,107,167	893,556
Total, . .	2,081,922	11,342,591	2 12 7	38,269,598	41,979,357	41,909,228

Further and more detailed statistics will be found under the names of the respective colonies.

The *Botany* of A. possesses some marked characteristics. The most striking specimens of the Australian flora are the trees belonging to the genus *Eucalyptus* (q. v.), of which there are fully 100 species. They produce timber of the very best quality, though exceedingly hard when mature. A number of them also yield a gum-resin, and are hence called 'gum trees' by the colonists. The leading varieties are *E. globulus* (blue gum), *E. gigantea* (stringy bark), *E. robusta* (red gum), and *E. amygdalina* (peppermint-tree). The two first sometimes attain a height of 300 feet, and the second an occasional girth of 60 or 70 feet. The acacias are even more numerous in Australia than the Eucalypti, though less striking. The members of the *Casuarina* family (q. v.) are valued for their wood, and are very remarkable objects in Australian forest scenery, while the *Banksias* (q. v.) supply the element of beauty which is lacking in the *Casuarina*. Ferns and heaths are abundant, and of many varieties. It is a noteworthy fact, in connection with the flora of Australia, that it is all evergreen, though some of the trees shed their bark instead of their leaves.

The *Zoology* of A. is as peculiar as its botany. Its most marked feature is the abundance of marsupials (q. v.), chief among which may be mentioned the kangaroo (q. v.), opossum (q. v.), bandicoot (q. v.), and wombat (q. v.). The Australian opossum belongs to the natural order *Phalangistide*, and must not be confounded with the true opossum of America, belonging to the natural order *Didelphide*. That extraordinary creature the *ornithorynchus* (q. v.) is confined to Australia. The dingo (q. v.), or native wild dog, is not a marsupial. See THYLACINE and DASYURE. The Australian bush abounds with birds of every description and the gayest plumage—cockatoos, paroquets, lorries, &c. The most remarkable are the emu (q. v.), lyre-bird (q. v.), and bower-bird (q. v.). The coasts and rivers abound with fish, some of which constitute excellent food. Fishing for the pearls contained in the shells of the pearl-oyster (*Avicula Margaritifera*) is extensively and very successfully carried on off the north-western and north-eastern coasts. See WESTERN AUSTRALIA.

The *aborigines* of A. belong to the Papuan, Austral-negro, or Melanesian race. They rank very low in the scale of humanity, and fast disappear when brought into contact with civilisation. There are 40,000 Chinese in A., half of them being in Victoria. Polynesians are being introduced into Queensland, and Malays into the Northern Territory (South A.).

The following is a summary of the main facts in Australian discovery and colonisation:—Cape York was sighted by the master of the Dutch vessel *Duyfhen* in March 1606. This is the earliest authenticated record of the discovery of A. by Europeans, though part of the north-western, the eastern, and part of the southern coasts are laid down in Portuguese charts dated 1542, and now in the British Museum. The Spaniard Torres passed through the strait which now bears his name later in 1606. The Dutch sailed along the western coast in 1616-18, and discovered Cape Leeuwin in 1622. In 1642 Tasman (q. v.) discovered the Island of Tasmania (q. v.), which he named Van Dieman's Land. Captain Cook in 1770 first sighted the south-eastern coast at Point Hicks, and explored the whole of the E. coast up to Cape York. In 1798, Bass, a navy surgeon, discovered Bass Strait, and Flinders traced the line of the southern coast in the same year. The first settlement was planted at Botany Bay (q. v.) in January 1788. The whole of A., together with Tasmania and New Zealand, was originally subject to New South Wales, but the various colonies became independent of the latter as follows:—Tasmania in 1825; Western A. in 1829; South A. in 1834; New Zealand in 1841; Victoria in 1851; and Queensland in 1859. Among the many men who have won fame in the arduous and perilous field of Australian exploration, the names of Hume, Sturt, Leichhardt, Oxley, Eyre, Burke, Wills, Stuart, Gregory, and Forrest are honourably distinguished.

Austra'sia, a Latinised form of the German *Oester-reich*, the name given in the time of the Merovingians to the East kingdom of the Franks, comprising Lorraine, Belgium, and the right bank of the Rhine, and separated from Neustria (the West kingdom) by the Vosges, the Forest of Ardennes, and the Mâas. Capital, Metz. Under Charlemagne it became the principal part of the Frankish empire, and under his successors, part of Germany. See Haguenin's *Histoire du Royaume Mérovingien d'Austrasie* (Paris, 1863).

Austria, Archduchy of, the hereditary dominions of the house of Austria, and nucleus of the empire, lies on both sides of the Danube, and extends from Bavaria on the W. to Hungary on the E. It consists of three crown-lands, or provinces of the empire—Lower and Upper Austria, on either side of the river Enns, and the duchy of Salzburg. The chief towns are Vienna, Wiener Neustadt, Salzburg, Linz, and Ischl. Area, 15,053 sq. miles; pop. (1869) 2,880,424. A. was originally a *Markgrafsenthum* or border earldom of the Frankish empire, and was established by Charlemagne as a barrier against the Avars of Hungary. In 1156 it was raised to a duchy, and in 1453 to its present dignity of an archduchy.

Austria, Empire of, also known since 1868 by the official name of the Austro-Hungarian Monarchy, is next to Russia the largest country in Europe. It is square and compact in form, and only approaches the sea in the S.W., where Dalmatia borders on the Adriatic Sea for about 108½ miles. Three great mountain chains traverse the empire in an almost continuous semicircle from its S.E. angle to the Swiss frontier; these are the Carpathians, Sudetes, and the Rætian and Noric Alps (q. v.). The Ortles Spitze, in the Tyrol, is by far the loftiest peak in A., rising to a height of 12,808 feet. In Hungary there are several large lakes, the most important being the Platten See, 382 sq. miles in extent, and Neusiedler See (Fertö-Cava), 117 sq. miles, both of which abound in fish. Several extensive plains occur, chiefly in the centre and S., the largest of which, the great plain of Hungary, has an area of 21,000 sq. miles. This plain is watered by the Danube (q. v.), which has a course in A. of 849 miles. The chief feeders of the Danube are the Inn, March, Raab, Waag, Neutra, Gran, Theiss, Drave, Save, Bega, and Temes. Other rivers rising in A., though soon flowing out of it, are the Elbe, the Adige, Vistula, and Dniester. The climate is generally warm and healthy, but it necessarily varies much over so wide an area; the mean temperature is 10·5° C. at Vienna. The empire is divided into seventeen crown-lands, or administrative provinces, and a military frontier. The divisions, area, and population are as follows, according to the census of 31st December 1869:—

Crown-lands.	Area in Square Miles.	Pop. in 1869.
<i>German Monarchy:—</i>		
Lower Austria,	7,654	1,990,708
Upper Austria,	4,632	736,557
Salzburg,	2,767	153,159
Styria,	8,669	1,137,090
Carinthia,	4,005	357,094
Carniola,	3,856	466,334
Illyria, or coast districts,	3,084	600,525
Tyrol and Vorarlberg,	11,323	885,789
Bohemia,	20,060	5,140,544
Moravia,	8,583	2,017,274
Silesia,	1,987	573,352
Galicja,	30,308	5,444,689
Rukowina,	4,035	573,404
Dalmatia,	4,954	456,961
<i>Kingdom of Hungary:—</i>		
Hungary,	87,043	11,633,162
Transylvania,	21,216	2,115,024
Croatia and Slavonia,	8,041	1,168,037
Military Frontier,	7,841	593,232
Total,	240,955	35,904,435

The military frontier extends from Transylvania to the Adriatic, and forms part of the N. boundary of Turkey. According to the official returns of August 1874, the army of A., on the peace establishment, consists of 259,173 men, with a war contingent, raising it to 772,729. The navy comprised 47 steamers, with 87 light and 308 heavy guns. The pop. of A. is dense in the plains of the S. and N.W., but very sparse in the mountain regions. It embraces an immense variety of races, still preserving their peculiarities of feature and language. In 1870 there were 16,219,000 Slaves, the predominant race, embracing the northern Czechs, Ruthenes, and Poles, and the southern Slovaks, Serbs, Bulgarians, and Croats. Among other nationalities, the Germans numbered 9,040,000, the Magyars, or Hungarians proper, 5,431,000, the Rumanians, whose name tells us that their language is derived from that of ancient Rome, 3,456,000. There are also Gipsies, Jews, Armenians, and Russians. Of this mixed population 23,954,233 are Roman Catholics; 3,941,796 Greco-

Roman Catholics; 3,050,830 Greeks not in union with the Church of Rome; 3,570,989 Protestants; and 1,375,861 belong to the Jewish faith. There are 11 Roman Catholic archbishoprics, and 57 bishoprics; and there are about 300 abbeys, and over 500 convents in the empire. A. has seven universities (Vienna, Prague, Gratz, Innsbrück, Pesth, Cracow, and Lemberg), four of which are 'German' universities—that is, the lectures are delivered in the German language. In 1872 the University of Vienna had a staff of professors and teachers numbering 200, and 3881 students; Prague had 97 professors and 1709 students; Gratz, 70 professors and 926 students; Innsbrück, 58 professors and 612 students. There are also seven technical colleges, and many schools of science and art. The German system of education is modified here in some respects. There is a greater number of special or technical schools, and also of establishments where the pupils reside; and both preliminary and higher education is in great part provided by the communes and the state. As in Germany, attendance at the 'Volks-Schulen,' or National Schools, is compulsory.

The commerce of A. has been much retarded by the want of a sufficient means of communication. Its seaboard is not only barred off from the interior by high mountains, but the chief rivers flow into other countries before entering the sea. In late years, however, the facilities of transit have been greatly improved. The entire length of railways in 1874 was 9583 miles, and some 4213 miles were being laid down. In the same year there were 27,408 miles of telegraph lines. Not less than 20,000 miles of highways have been constructed in the present century, the most remarkable of which are those over the Stelvio Pass, the Splügen, and the Semmering. Since the introduction of steam the river navigation has greatly increased, the annual receipts of the Austrian Danube Steam Company alone amounting to over £700,000. Except in Dalmatia, which is an isolated district, all customs boundaries within the empire have been abolished. The removal of these impediments has acted most beneficially on the commerce of A., which is for the most part internal, having its headquarters at Vienna, Linz, Prague, Lemberg, Pesth, Gratz, and Brody. The chief imports are raw cotton, yarns, woollen goods, silk, sugar, dye-stuffs, and olive-oil; exports, corn, flour, cotton, and silk goods. Machinery and instruments were exported to the value of £1,146,425 in 1874. The entire imports of merchandise in 1874 amounted to £56,561,588, and of bullion £1,934,926; exports, merchandise, £45,225,710, bullion, £1,952,893.

Fully three-fourths of A. is mountainous, but the soil is fertile in many of the provinces; and including pasture and forest, more than five-sixths of the entire surface is productive. Although agriculture is still in a backward state, grain of all kinds is abundantly produced in Hungary, Bohemia, Moravia, Galicia, Silesia, and in other parts. In the mountain districts the products resemble those of Britain, and in the S. maize, millet, and mulberries are cultivated. In the Banat rice is grown; tobacco is largely raised in Hungary; Bohemia yields excellent hops; and in Dalmatia oranges and lemons are produced. The vine is cultivated in nearly all the provinces; and the wine of Hungary, called Tokay, is equal to the finest wine of France. About 400 million gallons are produced annually, but only a small quantity is exported.

In minerals A. is as rich as any country in Europe, its produce amounting to about £9,000,000 annually. For many centuries mining has been a principal occupation, and has been fostered by the state. Gold is found in largest quantity in Transylvania and silver in Hungary; quicksilver occurs in both these provinces, as also in Styria and Carinthia. Cracow and Carinthia are most productive of zinc, and iron and copper are got in various provinces. Carinthia also contains extensive lead-mines. Tin is confined to Bohemia, and Hungary alone yields antimony. A considerable quantity of graphite, arsenic, and petroleum is also found. There is abundance of good marble and fine porcelain earth. The precious stones of A. are numerous, the most valuable being the Hungarian opal and Bohemian garnets. There are, besides, cornelians, agates, beryl, jasper, amethyst, topaz, ruby, and sapphire. Immense deposits of coal exist, chiefly in Moravia and Bohemia, but this branch of mining is not yet much developed. Rock-salt abounds in Galicia, Transylvania, and Hungary, and there are large salt-works in the Tyrol and on the Adriatic coasts, some of which are carried on by the state. There are over 1600

mineral springs in A., many of which are noted, as those of Baden in Lower Austria.

Many of the animals of A. are becoming rare, but in the Alps, Carpathians, and Dalmatia, brown bears, wolves, jackals, and lynxes, are still plentiful, and the chamois is sometimes found. The culture of silk is extensively carried on, chiefly in the Tyrol, and it results in the annual produce of about 300,000 silk cocoons. Domestic animals are extensively reared in many parts of the monarchy. The state promotes horse-breeding by the establishment of 'military studs,' and also encourages the breeding of sheep. Bohemia, Hungary, and Moravia yield the finest fleeces.

The manufacturing industry of A. is making rapid progress. In 1866 the imports amounted to £21,138,215, in 1874 to £56,561,588; while the exports within the same period had increased from £32,622,530 to £45,225,710. The chief manufactures are silks, woollens, cottons, linen, twist, and iron goods. Bohemia is famous for its glass wares, and Vienna is the central market for articles of luxury. The state has a monopoly of the manufacture of tobacco, yielding nearly £6,000,000 annually. The chief seaports are Trieste, Rovigno, Fiume, Zara, Ragusa, Cattaro, Spalatro, and Buccari.

The form of government is a monarchy, secured in the Hapsburg-Lothringen dynasty, and the states of Bohemia and Hungary have the right to appoint a new king in the event of the reigning house expiring. For the other parts of the empire the last sovereign can choose his successor, who must, however, be a Roman Catholic. Since 17th February 1867, the empire has been dualistic in form, embracing a German or *Cisleithan* state, called A. proper, and the Magyar or *Transleithan* kingdom of Hungary. These two divisions have distinct laws, and separate parliaments and governments, but are united in a common parliament of 120 members, to which each returns an equal number of representatives. This body of Delegations, as it is called, exercises jurisdiction chiefly over foreign affairs, war, finance, and such other matters as affect the welfare of the whole monarchy. The parliament of A. proper, called the Reichsrath (at Vienna), consists of an upper house of 175 members, and a lower house of 203. That of Hungary is the Reichstag (at Pesth), which has 410 higher and 438 lower representatives, and the ministry of which is responsible to the emperor.

As to finance, since the beginning of the present century the credit of A. has been more or less depreciated owing to the costly wars in which the country has been engaged. There are three distinct budgets, as there are three parliaments—viz., the Reichsrath, Reichstag, and Delegations—and in 1874 the total revenue was £70,560,059, and the expenditure £75,403,459. The entire debt of this monarchy in 1874 was £333,926,906.

The land forming the present Archduchy of A. (q. v.) was occupied in the earliest times by the Taurisci, who belonged to the Celtic family, who subsequently disappeared before the Norici. In B.C. 14 the Norici were conquered by the Romans, who took possession of the land up to the Danube; while the region north of that river up to the Bohemian and Moravian borders formed part of the territory of the Marcomanni and Quadi. A part of Lower Austria and Styria, with Carinthia and part of Carniola, belonged to the Roman *municipium* of Vindobona (Vienna), the capital of Pannonia. Görz was part of the Roman province of Illyricum, and Tyrol of Rhetia. But the irruptions of the barbarians obliterated these boundaries. During the 5th and 6th centuries, Boii, Vandals, Heruli, Rugii, Goths, Huns, Longobards, and Avars dwelt in turn in the broad basin of the Danube; but after 568, when the Longobards had pushed on into Italy, the river Ens formed the boundary between the German Bajuvarii (Bavarians) on the W. and the Avars on the E. Along the Mur, the Save, and the Drave, Slaves began to appear in the beginning of the 7th c. After the abolition of the ducal dignity in Bavaria by Charlemagne (788), the Avars pushed across the Ens into the Bavarian (now Frankish) territory, and their raids brought down upon them the heavy hand of the great Emperor, who in 791 hurled them back to the Raab, and united the conquered territory (from the Ens E. to the confluence of the Raab with the Danube) with the Frankish empire, under the title of the Avaric or East Mark (*Marchia Orientalis*, or *Austria*). Charlemagne sent German colonists, chiefly Bavarians, into the new province, over which he set a *Markgraf* or border earl, while the Archbishop of Salzburg had the superintendence of all ecclesiastical matters. After the treaty of Verdun (843), which broke up the huge Frankish empire of Charlemagne into France

and Germany, A. formed the eastern frontier of the German empire. But now a new Turanian race, the Magyars or Hungarians, appeared on the scene, who repeated the incursions of the vanished Avars, and about 900 made themselves masters of the East Mark, which was first recovered to Germany by the Emperor Otho I., after the bloody fight at Augsburg in 955.

In 983 the Emperor appointed Leopold of Babenberg markgraf of A. He is memorable for his successful enterprises against the Magyars. During the rule of his son, Heinrich I. (994-1018), the name *Ostirrichi* (i.e., Eastern kingdom) first appears in a document of the Emperor Otho III., of date 996. His nephew Ernst (1050-75) was a favourite of the Emperor Heinrich IV., who called him 'the foremost and the truest prince of the empire,' and his land 'the bulwark of the empire.' In 1156 A. was raised to a duchy, declared to be indivisible, with the government hereditary in the eldest son of the Babenberg line, and not a fief of the empire, though subject to the laws of the empire. In 1246 the Babenberg line became extinct, through the death of Friedrich, 'the Quarrelsome,' in battle with the Magyars. From 1246 to 1282 there was what may be called an *interregnum* marked by much confusion, the result of conflicting ambitions; but at last Ottokar, son of the king of Bohemia, was chosen by the states of the duchy, and might have established his dynasty had he not refused to acknowledge the election of Rudolf of Hapsburg as Emperor of Germany, with whom he rashly involved himself in strife. He was slain at a battle on the Marchfeld, 26th August 1278, and in 1282 the emperor invested his own sons Albrecht and Rudolf with the hereditary possession of the duchies of A., Styria, and Carinthia.

With the Hapsburg dynasty, which continues to this day, the greatness of A. began. It is not necessary to go over the history of the Hapsburgs while they remained merely dukes of A. Albrecht left five sons, one of whom, Friedrich the Fair, was elected Emperor of Germany in 1314, but was forced to yield to a rival, Ludwig of Bavaria, in little more than a year. Another of the brothers, Albrecht II. (died 1358), greatly increased the family possessions by marriage, obtaining among others the Burgundo-Kyburg lands in 1326. Of his four sons, Albrecht III. and Leopold are the most notable. The latter, who founded the Styrian line, lost his life fighting against the Swiss at Sempach (1386). On the death of Albrecht III. (1395) additional possessions were acquired by A. In 1404 Albrecht V. married the daughter of the Emperor Sigismund, by which he acquired Bohemia and Hungary, and, as Albrecht II., became German emperor. The marriage of Maximilian I., in 1477, to Maria, daughter of Charles the Bold, secured to the house of Hapsburg the possession of the Netherlands. Spain also became an Austrian possession (1496) by the marriage of Philip, son of Maximilian. Philip's son was Carlos I. of Spain, who became German emperor, under the title of Karl V., on the death of Maximilian I. in 1519. All the German hereditary possessions, except the Netherlands, were given up by Charles to his brother, Ferdinand I. (q. v.), who in 1556 succeeded him in the imperial dignity. By his marriage with Anna, sister of the Hungarian King Louis II., who fell at the battle of Mohacz in 1526, Ferdinand secured to A. the kingdoms of Hungary and Bohemia, together with Moravia, Silesia, and Lausitz, which were subject to Bohemia. On the death of Ferdinand in 1564, the Austrian possessions were divided between his three sons, and not again united till 1619, under Ferdinand II. (q. v.). The attempt of Bohemia at this time to place the Elector Palatine, Friedrich V., leader of the Protestant union, on the throne, plunged the country into the Thirty Years' War (q. v.). By this war, the most tedious and terrible in the annals of A., the population of Bohemia was reduced from 3,000,000 to 780,000. It was soon after followed (1701-13) by the Spanish War of Succession (q. v.), arising out of a struggle between Leopold II. and Louis XIV. of France for the Spanish crown. By the peace of Utrecht (1713), concluded during the reign of Karl VI., the Netherlands, Milan, Mantua, Naples, and Sicily were secured to A.; but the latter two of these possessions were surrendered to Don Carlos of Spain in 1737. On the demise of Karl VI., the male line of the Hapsburgs had died out, and the heirship to the throne was claimed by his daughter, Maria Theresia (q. v.), wife of Franz Stephan, Duke of Lorraine. See PRAGMATIC SANCTION. A fierce war ensued, in which Maria had only England as an ally, but her government was finally secured. Silesia, however, was conquered by Friedrich II. of Prussia, and

subsequently a vigorous but unsuccessful attempt was made to recover it in the Seven Years' War (q. v.). The first partition of Poland (1772) added Galicia and Lodomeria to A.; and in 1777 Bukowina was ceded by the Sultan. The political changes begun by the empress were vigorously extended after her death (1780) by her son, Joseph II. He enacted many beneficial reforms, but his inconsiderate zeal stirred up rebellion in various parts of the empire. Joseph II. died in 1790, and was succeeded by his brother, Leopold II., Emperor of Germany, whose brief reign was marked by an alliance with Prussia against France, to which he was prompted by the fate of his sister, Marie Antoinette. In 1792 he was succeeded by his son, Franz II., against whom France declared war in the same year. A. was deprived of Lombardy and the Netherlands by the peace of Campo Formio (q. v.), receiving instead the Venetian territory. By the second partition of Poland (1799) it acquired W. Galicia. The war with France was resumed in 1799 by A. in alliance with Russia, and ended in the peace of Luneville. A. lost 42,000 sq. miles of territory by the peace of Vienna in 1809, but for this compensation was given by the treaty of Paris (1814). In 1804 Franz proclaimed himself hereditary emperor of A., with the title of Franz I., and two years later gave up the dignity of German emperor, held by the Hapsburgs for five centuries. In 1832 Franz I. died, and left to his son, Ferdinand I., the task of carrying on an oppressive system of bureaucratic government, under which the nation was already growing restless. The French revolution of 1848 was followed by an outbreak in Lombardy, Venice, Hungary, and A. proper. For a time the revolution was successful. Hungary was declared independent; the royal troops were driven from Italy; Vienna was held by the insurgents; Venice threw in its lot with Sardinia; everywhere A. seemed breaking into pieces. After a time, however, the government, which had been surprised, began to grapple with the danger. Ferdinand I. abdicated (December 2, 1848) in favour of his nephew, Franz Joseph (q. v.). In 1849 a liberal constitution was proclaimed, new ministers were appointed, and some degree of satisfaction was restored among the more moderate parties. The army in Italy was reinforced, and, under the command of Radetzky (q. v.), soon regained possession of the country. The struggle still raged fiercely in Hungary; but aid was procured from Russia, and the rebellion was ultimately stamped out by overwhelming numbers. The Hungarian army, 25,000 strong, under Görgéi (q. v.), surrendered to the Russians on the 13th August 1849. Before the end of the same year the Emperor of A. resumed his original power, the liberal constitution to which he had consented under pressure was revoked on January 1, 1852, and the ministers of Hungary and of the other provinces were declared responsible to the emperor alone. The old despotic system of government was reinstated, and the policy pursued towards Italy was insidious and threatening. Alarmed at the dangers by which she was environed, Sardinia began to prepare for war (1859). A. demanded her instant disarmament, and, on this being refused, crossed the Ticino (April 29, 1859) and began hostilities. France, as the ally of Sardinia, declared war on A. (3d May), and the Emperor Napoleon III. led the troops in person. In every engagement A. was beaten, and a treaty was finally concluded at Zurich by which Lombardy was ceded to Sardinia, and A. retained Venetia. Meanwhile between A. and Prussia the struggle which had been carried on for so many years for the leadership of the German Confederation began to assume a threatening aspect. An opportunity for deciding the question of supremacy was all that was wanted, and this was readily found in the disposition of the Danish territory. See SLESVIG. In June 1866 war was declared against A. by Prussia in alliance with Italy, and in less than a month the decisive battle of Sadowa (q. v.) brought about a peace (signed 23d August), by which A. ceded Venetia to Italy. Since the close of the war, however, A., though excluded from the German Confederation, has enjoyed prosperity and peace, and has only been temporarily disturbed by the political demands of the Slavic nationalities. The bipartite constitution of 1867 recognised the autonomy of the Magyar kingdom, which has since had a separate parliament, and laws and ministers of its own. The welfare of A. was still further promoted by the abolition in 1870 of the concordat entered into with Rome in 1855, and the consequent withdrawal of the Papal nuncio. See the general histories of Malilath, Liechnowsky, and those of Büdinger (from the 13th c. to 1858), Springer (1803 to 65), Helfert (1848 to 69), and the *Archiv für Osterr. Geschichte* (vols.

i.-xliv. 1848-71), also F. Schmitt's *Statistik des Oesterreichischen Kaiserstaats* (Wien, 1873).

Auteuil, a *quartier* of Paris, formerly a village, at the entrance to the Bois de Boulogne, and within the fortifications. From the days of Molière it has been a favourite residence of authors.

Authentic (Gr. *authentikos*, vouched for), a term applied to a writing the contents of which are true, and thus opposed to that which is false. A distinction has been made by biblical scholars between *A.* and *genuine*: the former implying that the statements made are true and authoritative; the latter, that the book has been written by the person whose name it bears. The distinction is arbitrary.

Autocracy (Gr. *autokratia*, lit. self-mastery, but used even in classical times to denote absolute or arbitrary power), the name given to that form of government in which the sovereign is absolute. Among European potentates the Emperor of Russia alone is styled autocrat, his authority being subjected to no constitutional control. In the Kantian philosophy *A.* is used in its primary sense of *self-mastery*, i.e., the subjection of a man's lower nature to his reason.
